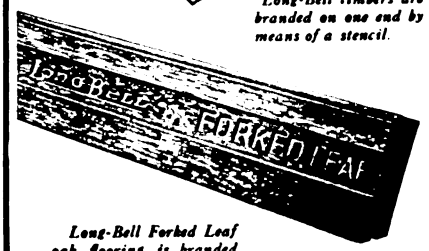
LONG-BELL

TRADE-MARKED



LUMBER and TIMBERS

Long-Bell lumber is branded mechanically on one end, just after it passes the trimmer.

Long-Bell timbers are branded on one end by means of a stencil.

Long-Bell Forked Leaf oak flooring is branded mechanically on the back as it passes through the surfacing machines. The brand is indented.

WHY a Name On Lumber?

The Long-Bell Lumber Company trade-marks its lumber and lumber products for the same reason the manufacturer of good merchandise stamps his brand on his shoes, or hats, or plumbing, or labels his paint or hardware.

Trade-marked goods are known as reliable merchandise. The manufacturer of a good product takes pride in it and naturally wants to be given credit for the goodness he builds into it.

The Long-Bell Lumber Company believes that the buyer of lumber and lumber products is entitled to the same protection that he gets on other merchandise—hence the Long-Bell brand on Long-Bell products.

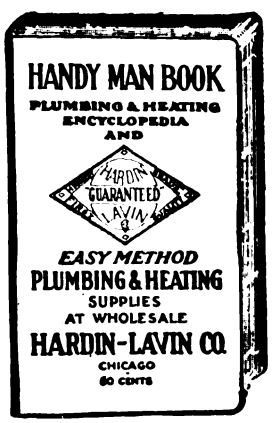
BUILDERS—INSTALL YOUR OWN PLUMBING AND HEATING BY OUR *NEW EASY METHOD*

Reduce The High Cost of Building



Contractors and Builders. Include the plumbing and heating in your next contracts. ***Our new easy method*** of installation enables you to do this without difficulty. You save the high cost of skilled labor, unnecessary material and heavy work with our simplified systems. Any handy man can do the installing by following our easily understood working plans and specifications. Our patented adjustable labor saving connections save much cutting, threading, time and unnecessary material. Even if you intend to employ a practical plumber, your big saving by using our products and ***new easy method*** of installation will surprise you. Contractors and builders are given special wholesale prices. ***Bid on the finished contract.***

Hardin-Lavin Hot Water Boiler

Send for Our Big Handy-Man Book Catalog

This well bound ***Handy-Man Book*** catalog contains hundreds of floor plans, elevations, diagrams, designs and installing sketches, from the simplest to the most difficult systems, plainly showing in detail our simplified method of installing or repairing your own plumbing and heating. Gives hundreds of mechanical rules, kinks, receipts, practical short cuts, etc.; how to repair leaks; how to lay out plumbing and heating; how to estimate costs, including labor; the proper care for heating plants. It shows and describes over 10,000

Factory Fitted Plumbing and Heating Plants

fixtures and supplies, with wholesale prices on everything; helps you select the best plumbing outfit, water supply system or heating plant to meet your needs; thoroughly describes our ***new easy method;*** shows you how to save skilled labor, unnecessary material and heavy work by this modern and quicker method. Any handy man can do his own work with the aid of this plumbing and heating encyclopedia. It is a revelation even to the most experienced contractor. It thoroughly explains

Hardin-Lavin Pipeless Furnace

Our New Inexpensive Easy Installing Method

We carry everything in first grade plumbing and heating supplies from the low priced plain designs to the larger and more elaborately designed fixtures. ***Bathroom outfits, closets, lavatories, bath tubs, sinks, laundry tubs, water supply systems, water heaters, pumps, pipeless and warm air furnaces, hot water and steam plants, pipes, fittings, valves, etc.,*** all factory fitted for the handy man, with Beauty, Lasting Durability and Ease of Installation built thru and thru.

Let Us Help You Plan and Install

Send us a rough sketch or plan of your building, or tell us about what you have in mind for a plumbing outfit, water supply system or heating plant and our ***Practical Service Department*** will show you the simplest, most inexpensive and best method of installation and will help you select the best suited fixtures or systems to meet your requirements.

Off to the scrap pile On for a Century

The only argument for the inflammable roof is the low first cost. Common-sense reasons, as well as building regulations, are against it.

The trim, artistic, permanent roof of

AMBLER ASBESTOS SHINGLES

laid in the American, the French or the Honeycomb style (Service Sheet showing these applications sent free) gives the property-owner an enduring, fireproof, weatherproof and ageproof construction.

AMBLER ASBESTOS SHINGLES are made entirely of long-fiber asbestos and high grade Portland cement. They grow tougher and harder with age. Permanent colors. No painting. No repairs. Last forever.

Ambler Asbestos Building Lumber
For siding, partitions, fire-doors and wherever strength and fire-resistance is essential.

Ambler Linabestos Wallboard (Flameproof)
For partitions and wainscoting of halls, dining rooms, libraries, attics, bathrooms, kitchens, etc. Made 48x48 and 48x96, to fit standard joists.

Ambler Corrugated Siding and Roofing
Simplest, most permanent material for industrial, railroad and farm buildings. Outlasts steel. Requires no painting. Is Damp, Dust, Vermin, Rust and Fireproof.

The first cost is but little more than that of flimsy and inflammable roofs. When you have paid your first bill you are through forever with roofing problems and expense. That "overhead" cost is saved for something else.

A Service that is Helping Contractors Build Face Brick Homes

FACE BRICK advertising in the national magazines, read by prospective home builders, is creating an overwhelming interest in home ownership, and in the unlimited possibilities of face brick for homes of enduring worth.

Actual building is encouraged and made possible by this Association's providing, at nominal cost, complete working drawings and masonry material surveys for nearly two hundred attractive, well planned small houses. The photograph reproduced above shows a delightful house built at River Forest, Illinois, from plans designed for "The Home of Beauty," by Mr. Claude Bragdon, Architect.

Every contractor and builder should take advantage of this home building campaign. The following books, presenting Face Brick methods of construction and many home designs available, should be in the hands of every progressive contractor and builder:

"The Story of Brick," sent free.
"The Home of Beauty"—featuring 50 designs . . . $ .50
"The Manual of Face Brick Construction," a practical text book containing 30 home designs 1.00
"Face Brick Bungalow and Small House Plans," 4 booklets, each containing numerous designs:
No. 1—3-4 room houses, No. 2—5 room houses, No. 3—6 room houses, No. 4—7-8 room houses, each . . .25

Grade is plainly marked on the box

BUY your window glass by grade. The American Window Glass Company maintains the highest grading standards in the United States.

Only after two careful inspections is the grade affixed. Even the lowest grade of glass packed in an American Window Glass Company box must be good window glass. "AA" quality represents the best window glass that can be made. "A" (second) quality lights are hardly distinguishable from "AA", and "B" (third) quality lights are practically as clear as ordinary seconds.

Note the grade markings on the box. If it is the product of American Window Glass Company you may be sure it is the finest window glass obtainable in that grade.

This room is the favorite

THE importance of sunlight in the home cannot be over-estimated. Next time you spend a day at home notice the unconscious preference you give to the well lighted room. Sunny, cheerful rooms are always the favorites and contribute to the health and happiness of the whole family. Large clear windows—and plenty of them—enhance the value of every house. When you build, give the windows careful thought;—specify the grade of glass and be sure it is the finest obtainable in that grade.

Winthrops on Public Buildings

The Winthrop Tapered Asphalt Shingle Roof of this hospital was laid nearly 15 years ago. It has sheltered the building and the patients within it and has withstood the storms of winter and the hot sun of summer for all these years. It appears today to be in good condition and will probably last for years to come.

You can supply your customers with just such roofing satisfaction when you furnish Winthrop Tapered Asphalt Shingles.

Dealers everywhere are realizing the need for a practically permanent roofing material. They are stocking Winthrops to meet the demand for long lasting, beautiful, fire resisting roofs.

Don't give your competitor a chance to secure all this valuable Winthrop business. Your territory may still be open. Write today for dealership information.

Address any of the five Winthrop Factories:

Chicago, Ill.
Beckman-Dawson Roofing Company

The famous Sherry's in the days of the hansom cab: Bridgeport Brass Pipe was installed when the building was constructed—and the same pipe re-installed when the building was remodeled 20 years later. This pipe is still in use today.

"Bridgeport" BRASS CO. TRADE MARK

Twenty-five Years Ago—

McKim, Mead & White approved

Bridgeport Brass Pipe

—and the same pipe is in use today

Twenty-nve years ago, when the contracts were awarded for the construction of Sherry's Hotel under specifications drawn by McKim, Mead & White, as Architects, this firm was already recognized as a leader among Architects. It was only three years later that the firm was commissioned to remodel the White House in Washington.

McKim, Mead & White did not risk its reputation on inferior materials. The specifications for the Sherry building called for the best of everything, and Bridgeport Brass Pipe was used thruout for hot and cold water service.

Three years ago when this building had outlived its usefulness as a hotel, it was remodeled under the direction of Cross & Cross as Architects, to serve as a bank building for the Guaranty Trust Company. At that time Bridgeport pipe that was removed in making the alterations was found to be in perfect condition. In fact, the same pieces that were taken out were re-installed in the new layout, *being rated as good as new pipe.*

Twenty years of service made no appreciable impression on the Bridgeport Brass Pipe, and it gives promise of lasting as long or longer than the main structural elements of the building itself.

Bridgeport Brass Company
Bridgeport Connecticut 2123

Bridgeport Plumrite *The Improved* Brass Pipe

This new residence is typical of the many fine buildings on which our earlier hardware was installed. Our new No. 8 is handsomer and even more convenient.

Good small houses, and even cottages may now have all the attractiveness and convenience of "Win-Dor" equipped casements—the new No. 105 Win-Dor adjuster costing as low as $2.00 each—and delightfully simple, strong and handsome.

"Win-Dor" adjusters will help you to achieve better windows with economy.

FILL OUT AND MAIL THE COUPON NOW

A Luxury Window Feature brought down to Small House Costs

In 1906 Mr. Robert C. Spencer, F.A.I.A., first made the outward opening casement practical for American use by the invention of adjusters or operators to control the sash from inside of screens.

Ever since then our company has specialized in the manufacture of these modern adjusters.

For sixteen years our experience with windows and equipment has been gained from close contact with the problems of all classes of buildings, and the proved, time-tested results have thoroughly demonstrated "Win-Dor"-equipped casements to be the ultimate window.

Now you can use "Win-Dor" Casements on every job

As the result of persistent research since the war we have perfected an entirely new adjuster principle. This new principle makes substantial cuts in cost.

The Casement Hardware Co.

This is Beaver Board time

Beaver Board is more popular this spring than ever before. Because a lot of long-postponed repairing and remodeling is being done. And *genuine* Beaver Board is a wonderfully economical and satisfactory material for this sort of work, as well as for new interior construction.

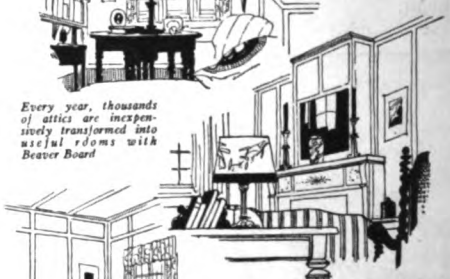
Not only is Beaver Board exceedingly inexpensive, but the work of application is very simple. At most, there are only three steps to any Beaver Board job: (1) nail the big, flawless panels over old plaster or directly to joists and studding; (2) apply paint if you want a decorated job; (3) add the finishing wood strips.

Walls and ceilings of Beaver Board cannot crack, chip or fall. Because Beaver Board is real manufactured lumber, made from long, tough white spruce fibers. You handle it just like ordinary lumber, only far more easily, with little sawing and practically no waste, muss or litter. Each panel is sized by our *patented Sealtite process*, which provides a perfect surface for painting and decoration.

Ask any carpenter or lumber dealer for an estimate on the Beaver Boarding you want to do. You'll be surprised at the low figures. Or, write direct to our Builders' Service Department in Buffalo. Send a rough sketch, giving dimensions, designating the type of room, location of doors and windows, and receive a finished plan for the work at no cost or obligation to you.

Don't put off that repair or remodeling work you've been counting on doing *some time*. Do it now—quickly, easily and economically with Beaver Board.

THE BEAVER BOARD COMPANIES
Administration Offices, Buffalo, N. Y.; Thorold, Ont., Canada; London, Eng.
District Sales Offices at New York, Atlanta, Buffalo, Chicago and Kansas City.



But insist upon having genuine Beaver Board with the Beaver Quality trade-mark on the back of every panel. That's the only way to be sure of the result.

Offices in stores and factories are quickly and easily walled in with Beaver Board.

Every year, thousands of attics are inexpensively transformed into useful rooms with Beaver Board

Beaver Board nailed over cracked walls and ceilings makes a comfortable, permanent room at small cost.

Many a property owner has added materially to the value of his home by beautifying it with Beaver Board

BEAVER QUALITY

BEAVER BOARD

FOR BETTER WALLS & CEILINGS

Contractors! Carpenters! Here's another big business-bringing Beaver Board ad—Saturday Evening Post May 6. Are you all set to get your share of the work it means? If not—write our nearest office for details of our plan for securing this business. Do it now!!

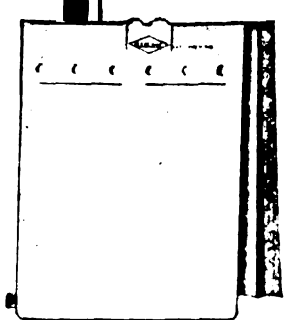
How Can You Secure More Business?

By underbidding? Yes—but there's no profit in that. By giving better jobs—something that the other builders do not do? Yes, and that's a better way. Build better roofs.

If you build "The Roof That's Always New" at the same cost as roofs which soon grow old, you give a greater value than your competitors can give without having to underbid them. Just build one roof of—

ILLINOIS



ZINC SHINGLES

"The Roof That's Always New"

—and every one can see wherein the greater value lies. They look as well as a roof of finely weathered wooden shingles. And they are superior to all other roofing materials in respect to cost, weight, durability, protection against weather, fire and lightning, total absence of painting, repair and upkeep costs.

Let prospective customers see one Illinois Zinc Shingled Roof with your name on the job. They will come to you to ask you what that roof is, and if you can't land their business then and there, your competitors DESERVE it. Because of this we will go a long way to help you build one demonstration Illinois Zinc Shingled Roof. Write for details of our "First Roof" Plan and see if you don't think the proposition is far more than worth while.

Not only is the Illinois Zinc Shingle everlasting — not only is it artistic—but it's the most convenient and practical form of shingle ever devised.

Exclusive "FARQUAR" Features and What They Mean

Electrically Welded One-Piece Steel Fire-Box Positively prevents contamination of air by gases or fire poisons.

Storage Fire-Box with large grate area insures slow combustion and fuel efficiency.

Vent and Return System. Provides a generous supply of gently warmed, pure, fresh air instead of a hot blast of super-heated air.

Automatic Regulator actuated by fire-box, completely controls fire, insuring uniform temperature regardless of weather, with surprisingly low fuel consumption.

Drawing of a piece cut from a FarQuar firebox to show the actual thickness of the steel used, also the perfect, seamless weld produced by our patented electrical process.

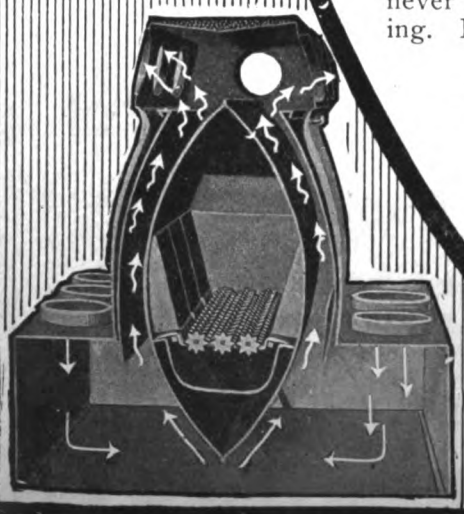
The Shape of the FarQuar Firebox —and Why

The only way to keep air fresh is to keep it moving.

Any obstruction merely retards the movement of the air and contributes that much toward stagnation—over-heating, etc.

When the cold air enters the large, roomy air chamber of

THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM



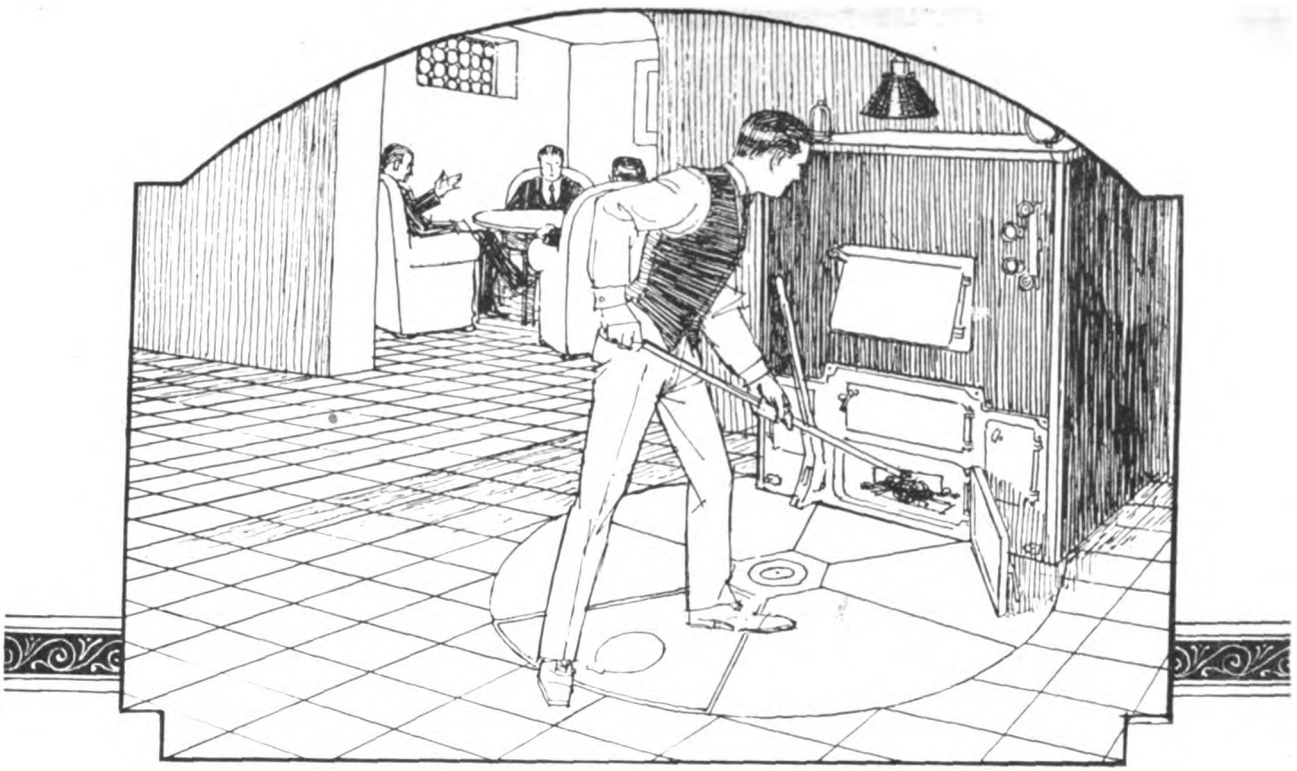
it settles directly against the lower surface of the elliptically shaped firebox, as shown in diagram cut below. This part of the firebox is warmed by the extraction of the heat units from ash pan and smoke passage, hence begins to gently warm the fresh air which comes in contact with it.

As this warmed air begins to rise, it passes upward along the smooth side of the firebox, with nothing to retard its movement. The absence of top surface prevents any "pocket" in warm air bonnet in which "dead" air can collect.

Instead it floods each warm air pipe, and passes into the rooms in a large volume gently warmed and moving at sufficient velocity to keep the rooms at a comfortable temperature in all kinds of weather.

That is why FarQuar Heated Homes are always refreshingly comfortable. The air is never devitalized and lifeless from over-heating. Instead it is pure, fresh and energizing.

Our booklet, "The Science of House Heating," tells an intensely interesting story about the healthful heating of homes. Write for free copy.



The Farquhar Furnace Co.

506 FarQuar Bldg.
Wilmington, Ohio

Sales Representatives Wanted

Thousands are becoming interested in better methods of house heating. Sales Representatives are wanted in every locality to take care of these new customers. An unusual opportunity with rare profit possibilities is open to the right parties. Write for details.

Another Room Without Added Cost

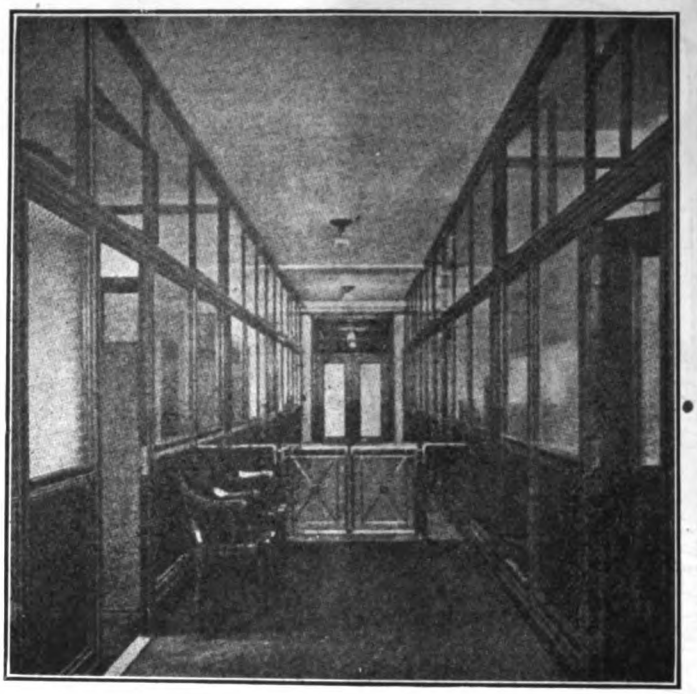
No need to build a larger house to provide space for that needed extra room. The cellar is large enough for all its accustomed purposes—and more beside. A well built and equipped cellar has plenty of available space which can be readily adapted for use as a laundry or a comfortable card or billiard room.

This can be easily accomplished by the installation of a Sharp Rotary Ash Receiver. This equipment does away with ash cans, eliminates dirty, gritty ash dust and makes the cellar as clean as the rest of the house.

The Sharp Rotary Ash Receiver can be installed with any size or style heater. It is easy to operate and never gets out of order. It consists of five, eight or twelve cans mounted on a revolving steel frame, located in a concrete pit under the heater. It can be readily installed in either new or old homes.

A chain hoist is furnished as a part of regular equipment.

Write today for illustrated booklet, catalog and specifications showing how easily it may be installed.



The cellar as clean as the rest of the house

Business Moves Forward

Business changes, whether elimination of appurtenances or expansion, require a partition that will contract or expand to meet the existing need with positive exactness.

That best explains the virtues of the EMPIRE EXTENSIBLE partition.

Put up or taken down with practically no interruption of business routine, no dirt or confusion, no loss of time or expense for ripping out plaster walls or dismantling wood partitions.

EMPIRE STEEL PARTITIONS are adjustable to any ceiling height at the lower cornice line, below which all material is of standard height. Finished in baked enamel—mahogany, circassian walnut, American walnut, oak, olive green, etc. Write for further details.

AIR-WAY

The man who places on your shoulders the responsibility of constructing his home, has faith in you. Your prestige as a builder rests in the execution of the owner's wishes.

Modern homes must be built to give plenty of fresh air and sunshine. You can be sure of satisfying in this particular through the use of *Richards-Wilcox AiR-Way* Multifold windows.

AiR-Way hardware provides a sliding-folding window which may be opened or closed from the inside without interference of outside screens and inside drapes.

AiR-Way hardware makes a beautiful job which always stands up under the most severe strain.

Your local hardware or lumber dealer can probably supply you. If not, it may be quickly obtained from our nearest branch

Our new catalog of household hardware contains many items of interest to the builder. Let us send you a copy. Ask for catalog J-4

FROM the builder's standpoint, as well as the home-owner's, "RED CROSS" Pipeless Furnaces are the most desirable to install.

With "RED CROSS" Pipeless Furnaces you are assured of a perfect system of heating and ventilating in a house or church or school building of any size—70° and fresh air in every room in the coldest weather—more heat from less fuel and the purest air.

In the end, "RED CROSS" furnaces are the lowest in cost—because they are *built to LAST*. Their rugged, well-designed construction, and our more than 50 years of experience in manufacturing heating and cooking appliances, are your insurance of long, satisfactory service.

Shipped complete with everything necessary for immediate installation. Simply and quickly installed.

The "Red Cross" PRIZE RANGE

burns wood, coal or gas. Perfect baker. Has hot water reservoir, warming closets and many other conveniences. Long service at low cost.

HESS WELDED STEEL FURNACES

(NONE BETTER)

THE latest improvement in furnaces will shortly appear, for the season of 1922.

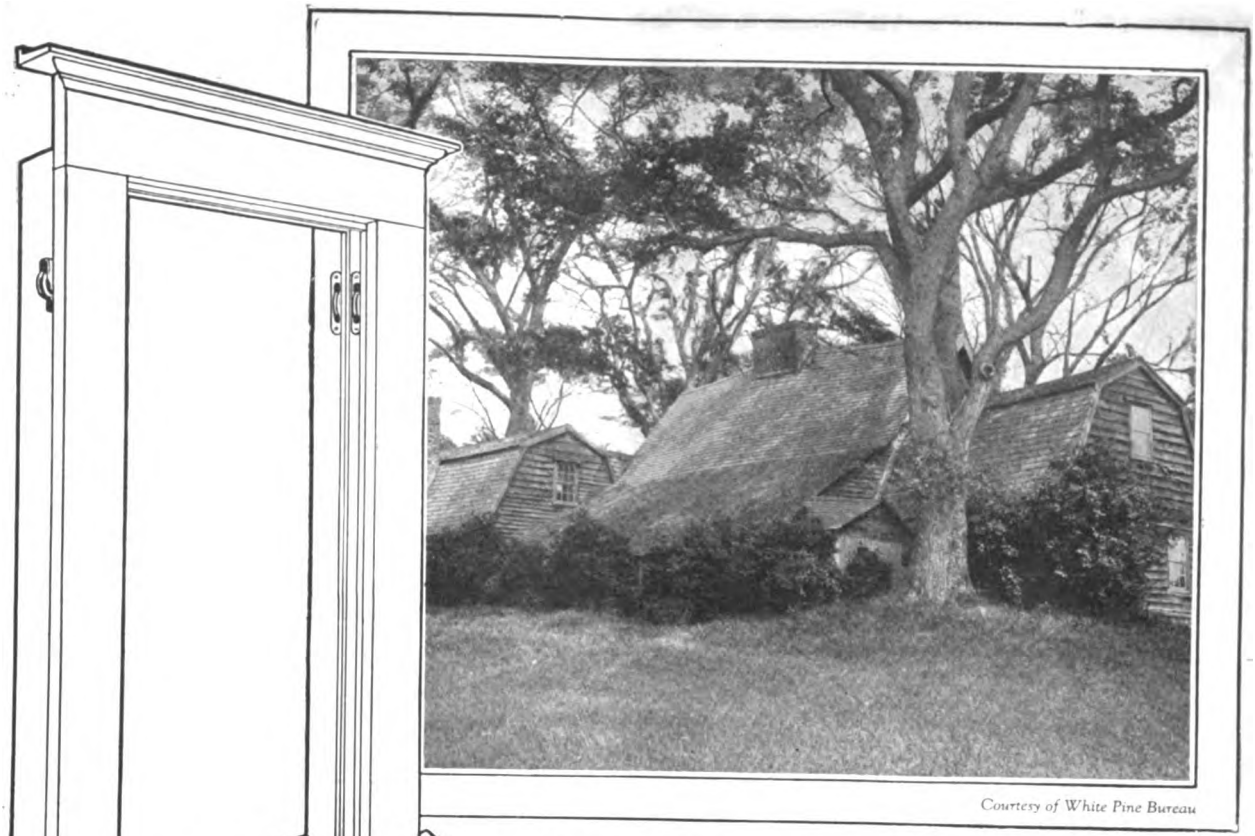
This is a check draft arrangement, coupled with the fire door and direct smoke damper, and with a chain attachment for regulation from upstairs.

Its purpose is to prevent escape of smoke and gas into the cellar when the fire door is open.

Opening the fire door **automatically** closes the check damper, and opens the direct outlet to chimney, making an inward draft at the fire door. Closing the door instantly readjusts the dampers to their original positions.

Simple and effective.

The simplicity of the Hess Furnace, and the impossibility of leakage from its welded seams commend it to home owners who appreciate comfort and a healthful atmosphere.



It burns anything. Saves all the heat.

Booklet (new edition) now ready.

Courtesy of White Pine Bureau

White Pine Defies Time and Weather

THE picturesque old house shown above was built in 1636 by Jonathan Fairbanks of Dedham, Massachusetts. It is the oldest house now standing in America. It is a strong testimonial to the weather resisting qualities of White Pine of which it is built.

White Pine has long life because it withstands warping, creeping, shrinking, swelling and rotting. Builders who know prefer White Pine for all out-of-door uses.

All exposed portions of Andersen Window and Door Frames are made of genuine White Pine. Andersen Frames are accurately made. Their White Pine construction enables them to resist time and weather and keeps them accurate for all time.

Simply by interchanging heights and widths Andersen dealers can make immediate delivery of 121 different sizes of frames from a small stock of only 11 standard sizes. That means less investment for the dealer and prompt delivery to the builder.

Each Andersen Standard Frame is shipped in two compact bundles, each weighing less than 20 pounds. The seven units of these two bundles can be nailed up in 10 minutes, forming a frame complete with pockets and pulleys in place.

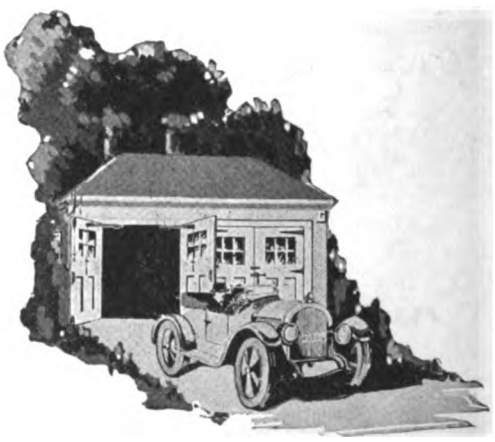
STANLEY

GARAGE HARDWARE

WHEN you erect a garage, you want every detail to be indicative of your judgment and experience as a builder. Regardless of its construction, a garage will never do you justice unless the hardware allows the doors to open and close freely.



The advantages of Stanley Garage Hardware, in a set, are many; everything is included —each item is of the proper strength, design and finish.

Another advantage is the sturdy type of Ball Bearing Hinge, included in the sets. The Ball Bearings eliminate wear on the joints and make for easy operation of the doors.

The majority of Stanley Garage Hardware sets include a Stanley Garage Door Holder, a very necessary piece of hardware for any garage. Its purpose is to hold the doors open against the wind, preventing them from being blown closed —damaging the automobile fenders and lamps.

Your most important reason for using Stanley Garage Hardware in sets for the garages you build, is because of the dependability and well known quality of the service it renders.

Have you received a copy of our new Garage Hardware Catalog? If not, write for E-6.

BUILDING AGE
AND
THE BUILDERS' JOURNAL

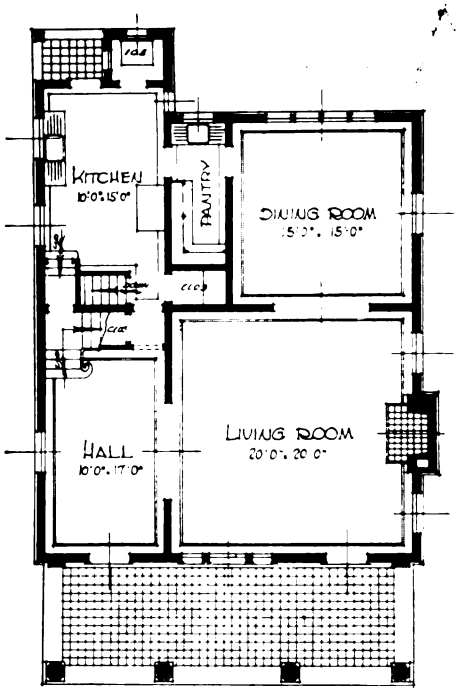
NEW YORK, JUNE, 1922

Southern Colonial Home Design

R. C. HUNTER & BRO., Architects

HERE tall columns lend dignity to this charming house design. The great two-story portico gives this house an unusual and imposing front of perfect symmetry. The columns are used to the best advantage, they are slender in proportion to their height, so as not to appear massive, they are well detailed and actually support a load as columns should.

The circular window in the pediment fits the space as no other form would and the pane division lends variety and interest.



In the first story the central window forms the main feature and this is balanced by the entrance door on one side and the door to the living room on the opposite side.

The entire front is purely Colonial in detail and is worthy of study.

As one enters the house from the cool porch into a comfortable hall, the stairway at once attracts; of easy proportions, properly placed and well designed, it is a true Colonial stairway.

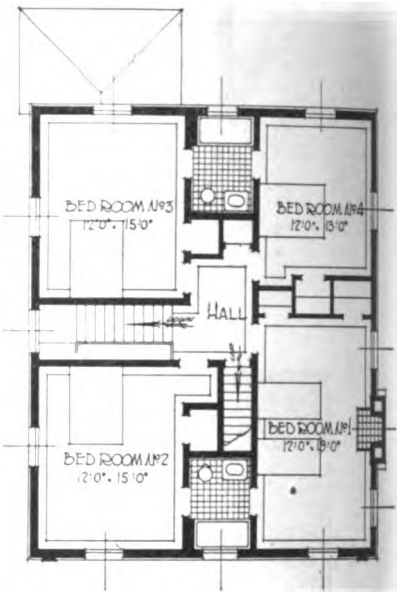
The living room is twenty feet square, it has a large open fireplace graced with pleasing mantel and it decorates admirably, as will be observed from the interior views.

Digitized by Google

FIRST FLOOR PLAN

The dining room has wood paneling done in a deep tone of ivory, while the bright colored Colonial paper above gives a cheerful contrast.

The plan arrangement of this nouse is as economical and practical as the exterior and interiors are artistic—a combination that approaches the ideal.



These things do not just happen; each and every detail has been worked out by the architects with great care.

Note how the stair arrangement eliminates the necessity of a service stair. The steps to the kitchen and the door on the landing give access to the second story without passing through main rooms.

The second floor plan is ideal. Four bed rooms, one in each corner, with cross ventilation and ample light. Two baths arranged so they serve the bed rooms privately, no passing through halls and past other rooms to reach the baths.

The bath tubs are tiled in on three sides, allowing showers to be installed with a curtain across the front of the tub. This takes the place of a separate shower stall.

The hall on the second floor is exactly in the center of the house (just where it should be), it provides wall space for the doors to the various rooms and linen closet and space for one chair at the head of the stairs, but that is all. The hall is not cramped, but there is not an inch of space that is not utilized to the utmost advantage.

SECOND FLOOR PLAN

This house is a good example of what can be done in the Colonial style without departing from a practical and economical plan.

This charming home was erected in Tenafly, New Jersey, for Mr. Walter H. Merritt from plans prepared by R. C. Hunter & Brother, Architects, of New York.

Design of Fireplaces

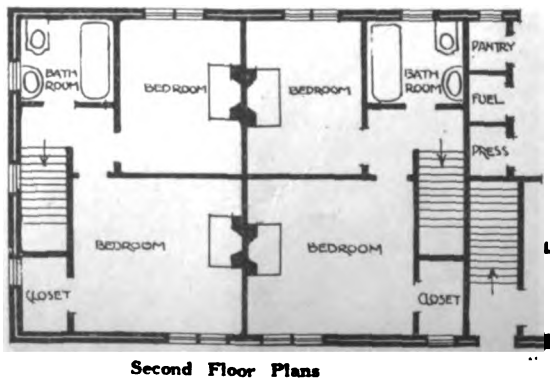
Modern English Design of Four Family House

Type of Houses Recently Erected by British Government

By JOHN Y. DUNLOP

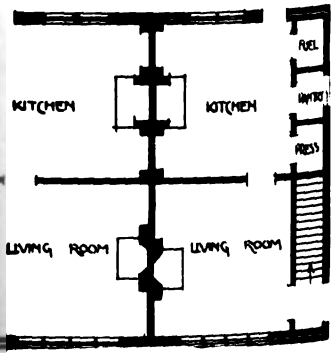
THERE is, at the present time, a great demand for all classes of material for the building of the small house in England and very often the choice of material is very much a matter of cost.

At one time architects used only to use brick in brick-making districts, and where sandstone was to be found there were nothing but stone houses, and not only that, but in districts where granite was quarried the area surrounding those quarries would have no end of granite houses. Now this order has changed, with the result that if one local authority gets a cheap offer for brick houses there is no end to inquiries for this class of fabric. Of course, all this is helping to bring down the cost of building.



We are having a great number of brick and stucco houses erected all over England for the reason that in many districts there are large coal fields, with the result that much of the refuse in mining is being made into building brick. This class of material makes quite a good building brick, but it lacks the finished appearance of clay brick, and for that reason is mostly used in house construction where the outer skin is to be covered with Portland Cement stucco.

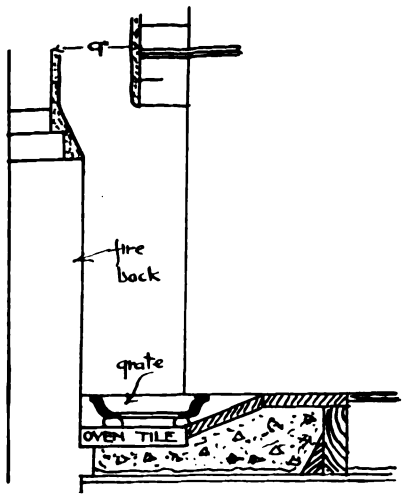
The house which is shown in the drawing is constructed partly in this way, while the lower story is built with an outer skin of pressed brick and an inner skin of common or blaze brick, as it is called in England. This house is built with hollow walls and at the junction of the stucco and the brickwork a moulded course is formed on the face of the wall. The advantage of this projecting course at this line is that it allows the lower outer skin of pressed brick to be built in the same line as the upper skin which is to receive the ornamental finish coat of stucco.



Without the moulding the top story wall would require to be kept back three-quarters of an inch to allow the stucco to finish flush with the pressed brick, which means that in carrying that out the top hollow space has to be curtailed or the upper wall has to be built three-quarters of an inch back from the face of the lower wall. The picture shows the pleasing effect of applying the stucco this way, the little projection giving a distinctive appearance that is decidedly pleasing.

The skins of the hollow walls are bound together with galvanized iron ties.

The houses, which are arranged with four rooms each, contain all the



Second Floor Plans

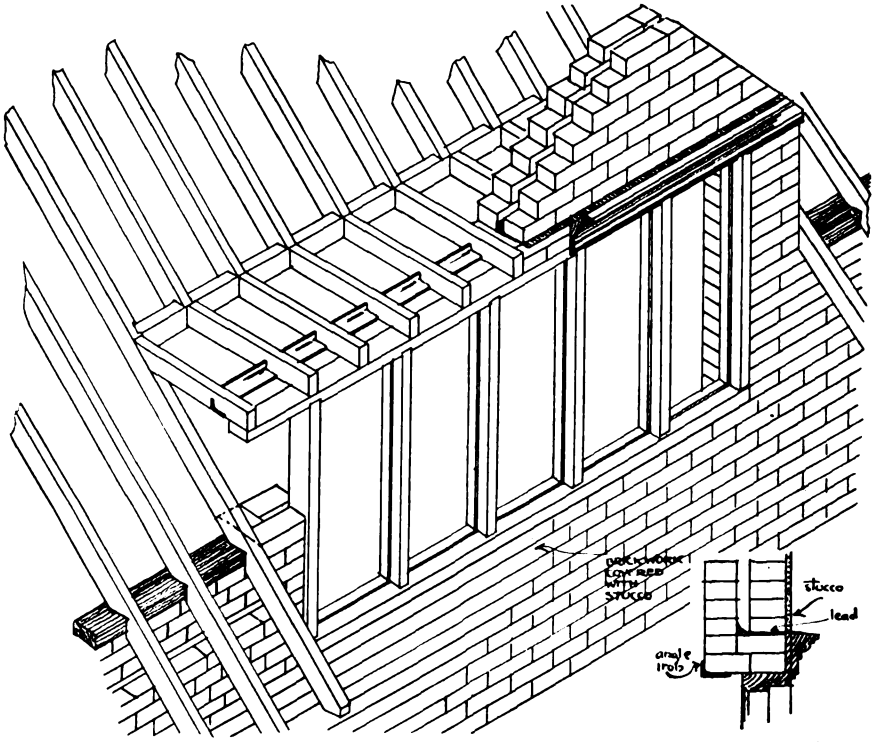
First Floor Plans

Digitized by Google

Section of Fireplace

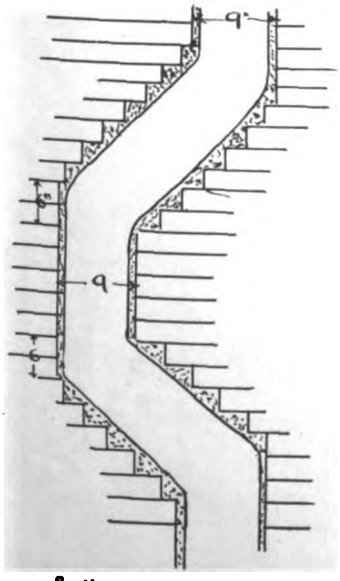
conveniences that are considered essential in England.

A sketch of the method of building the front gables is shown in which is indicated how the outer part of the wall is carried on the top of the window frame. The inner wall is built on the top of an angle iron beam which extends across from the brickwork on each side. This beam is also supported at the center by the partition which divides the two apartments and which is in line with the center of this gable.



To hide the edge of the party wall where it is built at this opening a concrete slab is formed in the inside of the middle window frame and in such a way as to allow the sash for this window to be made a fixture. The blank window is glazed with rough rolled plate in lattice panes to match the other windows.

The stair from the small entrance hall is in one flight, which is not the best arrangement; still, with very small houses and where space is at a premium it is often the best that can be done.



The fitments in the kitchen were very complete and one thing which strikes one as being an arrangement worth copying was that all shelving was set up with a one-inch space between their back edge and the wall. This is most easily done by fixing up continuous vertical grounds 3 inches by 1 inch to which the shelf brackets are screwed. This 1 inch space prevents the accumulation of dust, improves air circulation, and permits the shelves to be cleaned without smearing the walls.

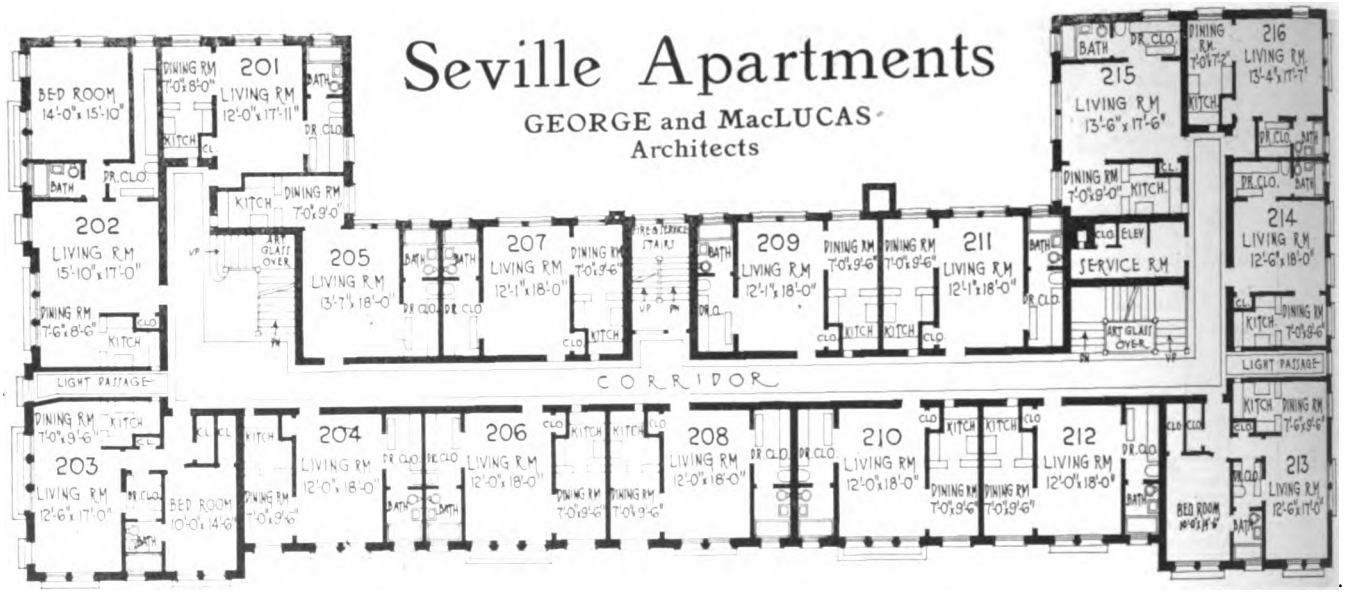
To insure a good draught each of these flues are built with one cripple, and to prevent the sloping parts from being contracted a two-course difference between the gathering points at the opposite sides of each bend was adopted.

The effective size of a small room is in this case much increased by the kerb or fender round the hearth being entirely dispensed with. The hearth at the outer tiles is set level with the floor, but the rear tiles sunk down a distance equal to the height of the grate bottom, an arrangement which is not only admirable for heating but achieves it with safety.

Detail of Dormer Framing Section

Section of Chimney Flue

Each apartment in these houses has a coal fire from which a 9-inch by 9-inch flue is carried up to the stack. The back of the fireplace as shown in the section is brought forward near the middle of the flue. This stepping back should always be kept on since it must be taken into consideration that these flues will require to be swept at some time and it is by keeping those courses down that the flue will be the normal size at that point.



FROM time to time we have published designs of "English" type houses and we therefore think that it will be of considerable interest to the readers of BUILDING AGE and THE BUILDERS' JOURNAL to show a photograph, plan and construction details of a real English dwelling of modern design. Each room is provided with an open fireplace for heating.

The layout of the rooms would hardly suit the requirements of the average American family, but it certainly is interesting to note what the people of other countries are building.—Editor.

Seville Apartments

GEORGE and MacLUCAS
Architects

MODERN apartments of small size are very popular with people who do not find it convenient to keep a large house, and quite a number of families who have a country house find it very desirable to keep a small apartment in the city, and it is to meet this demand that apartment houses like the one shown here are so deservedly popular.

The exterior of the building is of pleasing design along Spanish lines. It is built of light cream colored pressed brick with polychrome terra cotta ornaments, which give a decided artistic appearance to the structure; the whole appearance of the building being very striking and handsome.

There are sixteen apartments to each floor, or forty-eight in the whole building. All of the apartments are provided with in-a-door beds. The basement contains storage rooms and heating equipment.

The building, which is called "The Seville," was erected from plans drawn by George & MacLucas, and Fred M. Meiere was the general contractor. Freyn Bros. had charge of the plumbing, and the electrical work was installed by the Hatfield Electric Co.; all are of Indianapolis, Ind.

Uniting *the* Construction Industry

Progressive Aims of American Construction Council Now Being Formed
The Raising of Standards and Efficiency Its Object

By NOBLE FOSTER HOGGSON, of the Executive Board, Associated General Contractors of America
and E. J. RUSSELL of the Executive Committee, American Institute of Architects

FOR the first time in the history of American industrial development a great industry has united all its elements—manufacturers, labor, and the professional branches—in a great effort to raise the standards and efficiency of the industry and improve the service which it renders the public.

The nearest precedent is that furnished by the selection of Will H. Hays as arbiter of the motion picture industry, but the American Construction Council, on which the organization details are now being completed, goes much farther. It dips down into the industry and brings together for conference, for betterment of understanding and for common action the architects, the engineers, labor contractors, materials manufacturers and dealers, bankers and insurance men—all elements concerned with building work of any description and with the construction of public works, railroads, irrigation works, etc.

Organizing Meeting

It is stipulated that all the work of the Council must square with the public welfare and so dominant has this idea been in the preliminary conferences that Secretary of Commerce Hoover, seeing the benefits that will result, has taken the responsibility of presiding at the formal organizing meeting in Washington, D. C., June 19th and 20th, and Franklin D. Roosevelt, of New York, has agreed to accept the presidency. Every one interested is invited to attend. A descriptive pamphlet may be had by writing to 1053 Munsey Building, Washington, D. C.

The possibilities of the new organization are tremendous. If the reader were asked to tell what construction really is, the reply would probably be, "housing" or "plant construction and commercial building" or "highways and bridges, railroads and canals" or perhaps "terminals for railroads and ship traffic or irrigation and reclamation projects." Yet all of these are merely divisions or classifications of a single industry and should always be included in the thought of the whole.

Construction a Creator of Wealth

Instead of thinking of the building of houses as the individual expression of the fancy of the individual citzens, of the building of highways and railroads as merely the means of an industry we call transportation, of factory building and hydro-electric construction as isolated enterprises embarked in by isolated groups of individuals for private gain, we must think of construction as we do of agriculture, or of mining, or of manufacturing—as one of the great creators of permanent wealth, as one of the foundation stones in our civilization on which our progress is built.

Already indications of this are evident. Construction reports have become equal to crop reports as barometric indicators of the material prosperity of the country. On the their rise and fall depends the well being of millions of our people, the success of great enterprises, the future welfare of our citizens.

Construction a Basic Industry

The popular belief is that American industry is divided into four basic industries—(1) agriculture, (2) manufacture, (3) transportation and communication, (4) mining and forestry.

THE public demands that the industry square itself with the public interest by eliminating the minority that have brought it into ill-repute. The individual elements of the industry are aroused to the responsibility which it owes the public and to the opportunities for elimination both of duplicate association efforts and of wastes in construction operations.

Such a classification leaves out of consideration, however, what has been demonstrated after investigation to be the second most important industry in the country, namely construction. When considered from the standpoint of the yearly volume and money involved, this comes second only to agriculture and is among the first of all industries when expressed in terms of the labor.

Investigation has shown that the number of workers, who together with their families depend upon the construction industry for a livelihood totals approximately 11,000,000 persons. It was conservatively estimated that 24 per cent. of our annual capital accumulation and over 50 per cent. of our national savings are absorbed by this great industry every normal year.

Expenditures of Construction Workers

The support given to Agriculture and to Trade by the annual expenditures of this great number of persons is almost too apparent to need discussion.

Yet in this mighty industry each element has, with rare exceptions, acted by itself, looking after its own interest, neglectful generally of the rights of the other elements and, often indifferent to the rights of the public.

Lack of Popular Understanding

Since the war this lack of co-ordination, of actual understanding and of consideration of the service rendered the public has stood out more strongly than before. During the war it was necessary to postpone all but essential construction, leaving us at the close of 1919 with an enormous deferred volume of construction work. In 1920 we began to catch up, to fall back again in 1921; today we have a deferred total valued by students of the industry at $10,000,000,000. Of the housing shortage, an important part of this construction,

Digitized by Google

the general public is well aware. Yet the shortage exists in every line of construction. We have not enough office buildings or schools, railroads or highways, while sewerage, water-supply systems and paving are far behind present needs.

The Housing Shortage

This shortage has put great pressure on every branch of the industry and has forced it to study anew its relationship to the whole. Moreover, the public has lacked confidence in the fairness of building costs and this has added to the pressure put upon the industry. Not only has each of the elements been re-examining its position and responsibility but efforts at co-ordinated work have been made.

Preliminary Work

The National Federation of Construction Industries, a war-born organization, was continued after the Armistice in an effort to pull the industry together nationally and has achieved some excellent results. The Building Congresses, with notable successes at New York, Seattle and Portland, Ore., attacked the problem locally.

The National Board for Jurisdictional Awards representing labor, contractors, architects, and engineers, and the Joint Conferences of Engineers, Architects and Contractors on Estimating and on Standard Contracts have each tackled specific problems common to the whole industry and demonstrated the need as well as the practicability of cooperation

Launching a National Movement

The way has thus been well prepared for the great national movement now launched. Nearly every one of the 250 national associations in the industry has tested out its own work and learned from experience the large amount of duplicate effort and its inability to grapple effectively with the problems that extend beyond its special field. They are ready and eager to have these common problems taken over by an all-embracing organization so that there may be the elimination of duplication and more resultful work. They appreciate that the public demand will no longer wait and that only through a broad, virile and effective movement, dedicated to the improvement of the service which construction renders the community, states and nation can the industry gain public confidence.

ONE million people are actively engaged working on field construction and another million people are engaged in manufacturing construction materials in the United States. Truly the Construction Industry is a Big Industry — second only to agriculture.

Saving by Co-Ordination

Through co-ordinated action there is opportunity for tremendous waste elimination, assuring to the public more and better homes, public buildings, railroads, bridges, etc., for their construction expenditure.

It is these tremendous possibilities, in dedication to the public service and elimination of waste, that have fired imaginations of Mr. Hoover and Mr. Roosevelt and induced them to accept positions of leadership in the movement.

A Code of Building Ethics

While the organizers have a large program of work mapped out, efforts will be concentrated at the start on a few of the more outstanding problems. Chief among these is the establishment of a code of ethics that will be universally accepted in the industry. Due to a small minority the whole business of construction is, as Mr. Hoover expressed it recently in addressing the industry, "under a great cloud and the moral ethics of the business are challenged daily throughout the entire country." Mr. Hoover added these significant words:

"I am convinced that these things can never be cured by legislation or by jails. They can be cured by the resolute action of the vast majority of honest men who form the professions, and it has now become vital in the country's interests that this should be undertaken."

Spirit of the Work

The organizers consider this message from Mr. Hoover a charter for their work. It is in this spirit that the ethical work will be undertaken in order that the industry may stand square with the public and that all practices inimical to the public welfare may be eliminated.

Statistics are much needed so that the industry may operate intelligently. While there are partial statistics collected by many sources, they have not been brought together and interpreted in the light of all the facts.

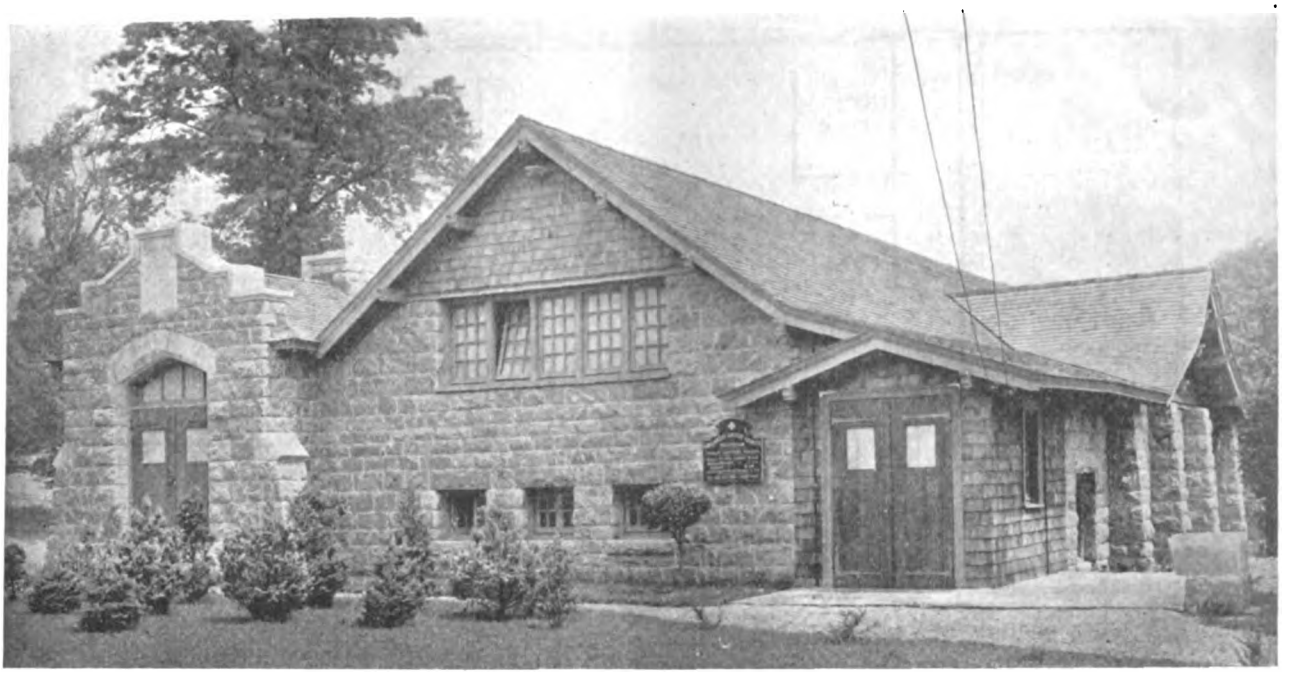
Apprentices for the Industry

Another great problem stands ready for effective handling. There is a shortage of building mechanics, and the labor organizations need help in establishing the necessary apprenticeship system. Mr. Hoover's department is making a national study of building codes, and when its work is completed there must be a nation-wide activity to carry the recommendation into effect—a type of activity which the new organization is designed to promote.

Publicity

In addition the program of immediate work embraces transportation, encouragement of local building shows, publicity directed at giving the public an adequate conception of the magnitude and work of the construction industry and studies of seasonal employment, with the initiation of efforts to level out the seasonal swings.

Voting Power



In its organization the cardinal feature of the Council lies in giving each group equal voting power. The ten groups agreed upon are: Architects, engineers, construction labor, general contractors, sub-contractors, materials and equipment manufacturers, materials and equipment dealers; bond, insurance and real estate interests; construction departments of public utilities, and the construction departments of federal, state and municipal governments.

Some of the associations engaged in the organization work have been the American Institute of Architects, the Federated American Engineering Societies, the Building Trades Department of the American Federation of Labor, the Associated General Contractors, the National Federation of Construction Industries, the National Association of Building Exchanges, the Building Trades Employers Association, the National Association of Real Estate Boards, besides a large number of associations of manufacturers.

Able Backing Assures Success

With this strong backing the organizers feel confident that the American Construction Council will quickly be able to play an important part in the industrial life of the nation. Work of great magnitude lies right at hand, crying for attention. The time is most propitious for action.

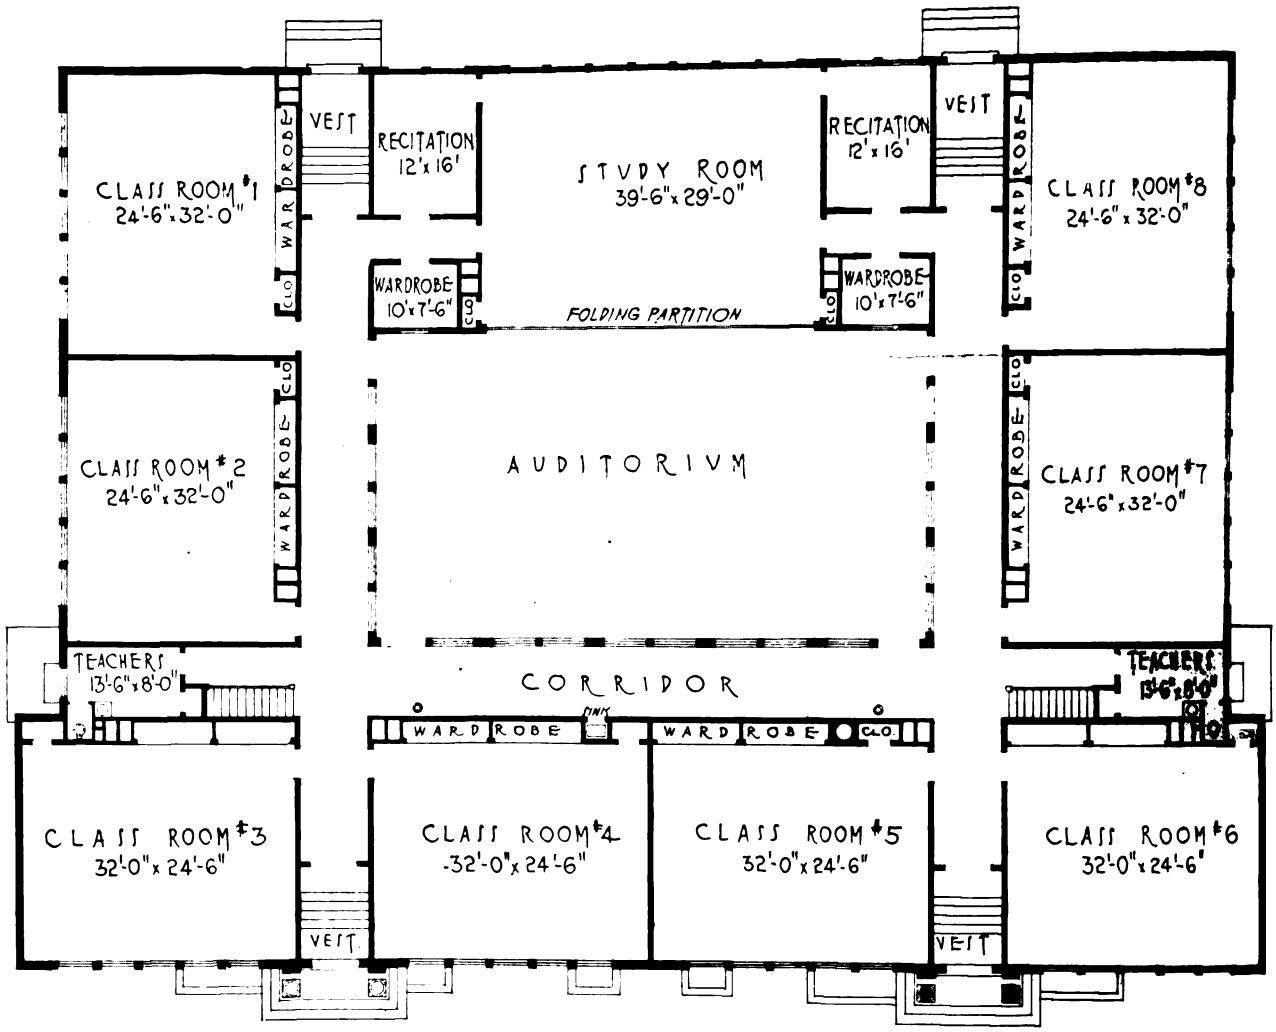
Interesting Stone Church Design

SELECTING a proper design for a church is not an easy matter for any congregation. They must always take in consideration future growth. Of course, where plenty of money is available quite an elaborate and handsome structure can be expected, but where there is a modest congregation, it is not expected that they will have a large structure.

The design shown here is that of the Larchmont Avenue Presbyterian Church located at Larchmont, New York. The principal part of this structure is of stone, laid on a concrete foundation.

It will be noted that some portions are of frame, covered with shingles, a considerable portion of the rear of the edifice is so constructed. This entire frame part together with the roof is considered temporary, as a completed stone structure is contemplated.

The two interior views show a simple but effective arrangement with quite a high ceiling. It will be noted that steps from the street level lead down to the church floor. The present church space will be occupied as a basement Sunday School room in the completed stone structure.



Too often we see a church that is started in this way, broken off with practically a flat temporary roof and it unfortunately remains as an eyesore in the community for a number of years. In this case, this feature has been very effectively taken care of and unless the design was studied carefully, one would think it a completed structure.

It is certainly a very interesting example of building craft. This church was designed by Messrs. Jallade, Lindsay & Warren, Architects, of New York.

Public School Wardrobes

Some Practical Methods of Construction for Modern Schools

By E. J. G. PHILLIPS

THE older public schools were usually built with small rooms adjoining the class rooms, which served as wardrobes. The wardrobes may have fulfilled the purpose of providing a place for the scholars' wraps and caps, but they have also been the scene of, and have become memorable because of the mischievous pranks carried on within their walls in spite of the teacher's watchfulness.

The public school wardrobe of today has been pretty well standardized by the school boards of the larger cities and though varying in detail, the general ideas are similar. Instead of being built as a separate room, public school wardrobes of the most approved types are built in the end of the class room, with a continuous series of doors along the entire front, opening into the class room. Several methods of hanging the doors are in use, some of which clear the entire wardrobe when doors are open, and in others, stationary and sliding doors alternate so that about half the front of the wardrobe is clear when doors are opened.

A selection of the type best adapted to the particular case, may be made from the three sets of plans and elevations showing doors opened and closed, which are presented herewith.

A wardrobe with four sliding and four stationary doors, is shown in Fig. 1. This belongs to the type in which half the front of the wardrobe can be opened. Adjoining the childrens' wardrobe, to the left at "A" is the teachers closet or locker. At the opposite end of the wardrobe, the ventilator shaft has openings directly connected with the wardrobe on each floor of the building.

Accommodations for about forty-six pupils can be provided in a wardrobe about sixteen feet wide with coat hooks arranged in three rows as detailed. A hat shelf, preferably of woven wire is located just above the top row of hooks. Two feet is a convenient depth for this type of wardrobe.

The two doors sliding to the left are connected by continuous steel bars "C" and "D" shown more clearly in the section Fig. 2. The two doors sliding to the right are similarly connected. Each door is supported by a door hanger located on the top of the door at the center.

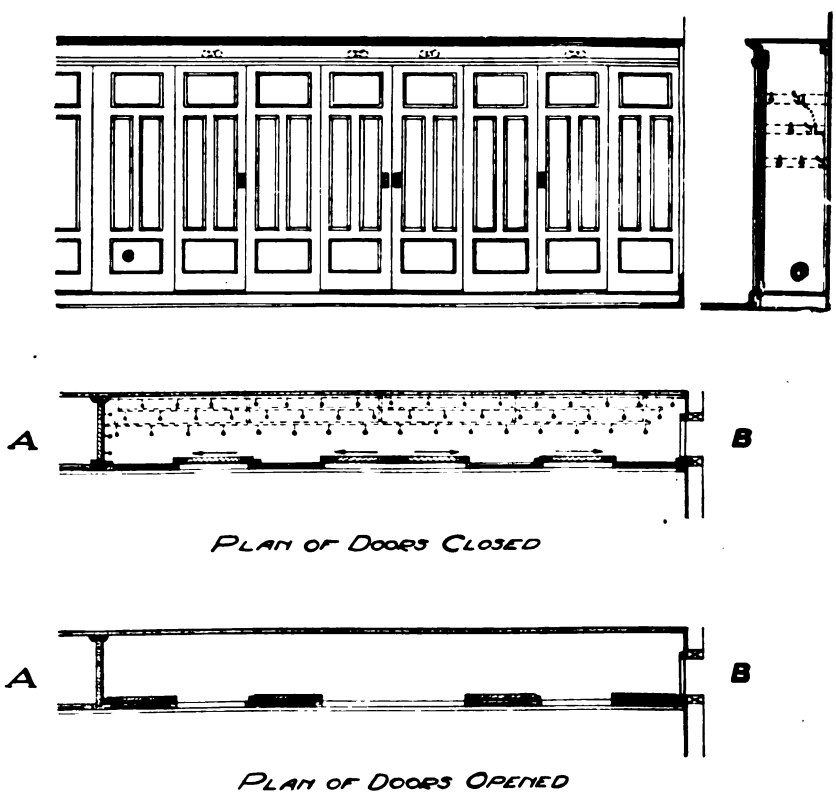

Fig. 1

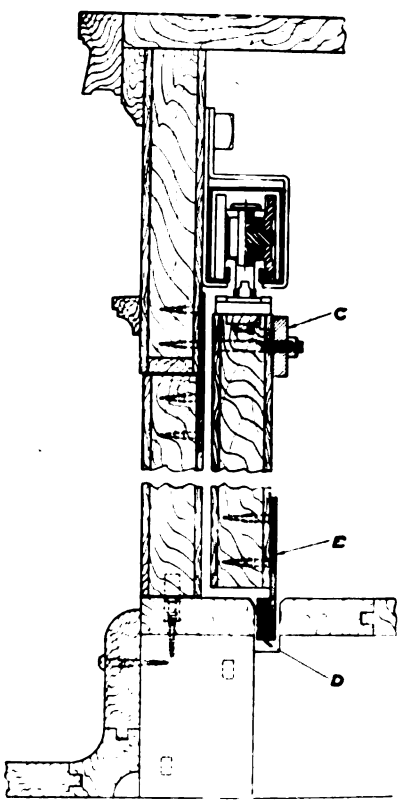

Fig. 2—Section of Door

Digitized by Google

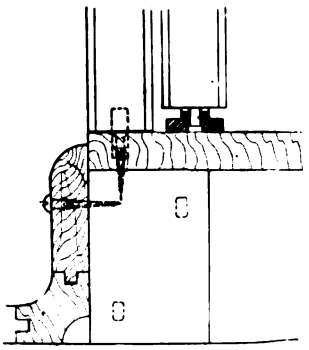

Fig. 3—Alternate Bottom Guide

The hangers are vertically adjustle so each door will be supported the hanger rather than through the eel bars. The purpose of the bars to keep the doors in line and to ake it possible to operate several ors simultaneously.

By taking a position at the center the wardrobe and moving one door the right and one to the left, the acher or monitor opens all of the ovable doors. The bar "D" opates in a groove in the floor to guide e doors and keep the bottom in ace. Plates "E" are as long as the ors are wide and serve to connect e doors with bar "D."

An alternate bottom guide is shown Fig. 3, here two double roller ides are used in the bottom of each or.

A wardrobe with four doors sliding in the same direction behind stanary panels, is shown in Fig. 4. he capacity and details of construcn is the same as the wardrobe own in Fig. 1, except that in this case, the attendant moves all of the doors at once from a position in front of the teacher's locker "F." The fourth sliding door from the teacher's locker, stands in front of the ventilator shaft "G" when open. The method of hanging is shown in the sectional drawing Fig. 5.

In all wardrobes of the type just described, the doors should be made narrow, not exceeding two feet in width. Wider doors make it inconvenient to reach the clothing which is hung behind the stationary panels.

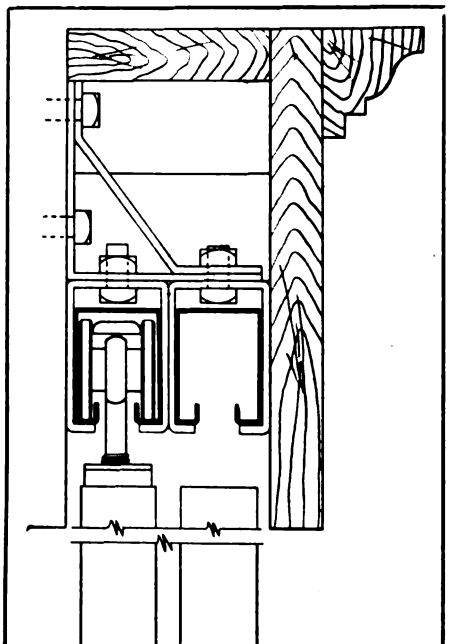

Fig. 7—Section with Double Track

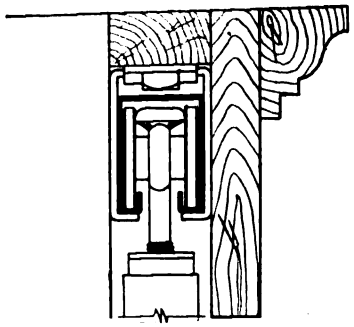

Fig. 5—Hanging of Door Tops

A different method of hanging the doors, by means of which the entire wardrobe is thrown open, is shown in Fig. 6. In this case only four doors are required, but their width is increased to about four feet.

A set of parallel door hanger tracks extend across the whole wardrobe as indicated in the plan. Each door is mounted on a pair of hangers and is usually operated independently, although the two doors which slide in the same direction, could be made to operate together if considered essential.

The vertical section Fig. 7 shows the method of hanging the track and also details the floor guides used at the bottom of the doors. The tracks are cased up in such a way as to be removable.

The upper panels of the doors used in plan Fig. 6 are frequently finished for use as blackboards, while the lower panels are of woven wire for ventilation purposes.

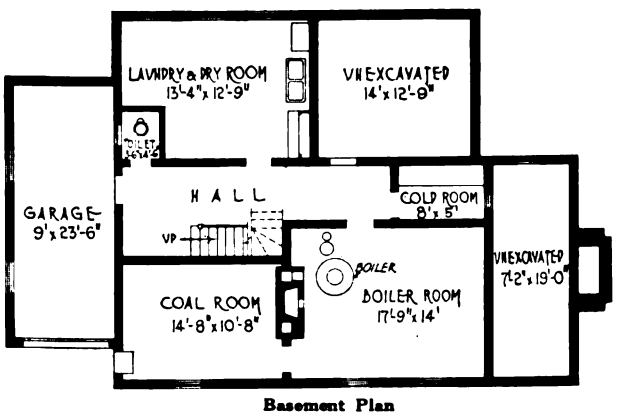
Bungalow with Basement Garage

VORSE, KRAETSCH & KRAETSCH, Architects

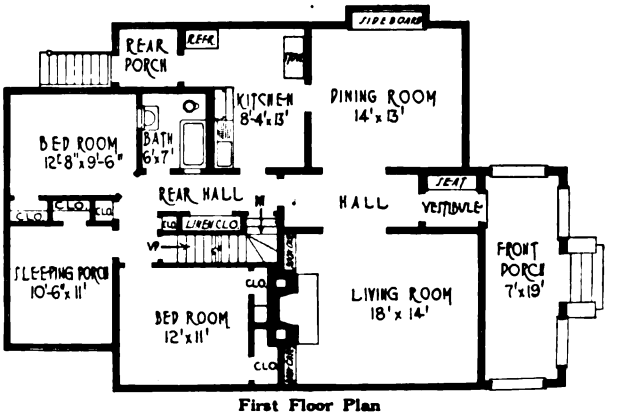
HERE is a very interesting example of a bungalow erected on a slightly sloping site. In this way, a driveway to the basement was conveniently made so that the garage could be placed directly underneath one portion of the house as will be noticed. Access to this garage is had from the interior by a convenient hall in the basement.

This house was built for Mr. Carl Weitz at Des Moines, Iowa, and is an interesting example of brick and stucco work.



For floors and ceilings over garages the best and most reliable construction is of course, reinforced concrete or some other type of incombustible fire-resistive floor. Where this is not used, the following is recommended:

Two-inch floor joists spaced on not less than 16-inch centers and properly bridged. Overhead flooring double, of 7/8-inch rough and finished floor boards with a layer of asbestos floor felt between. Ceiling of heavy metal lath and Portland cement or gypsum plaster not less than 3/4-inch thick. The metal lath to be attached to the joists by sixpenny nails driven nearly hole and heads turned over against the lath, also by strands of No. 8 annealed wire looped over each third joist engaging the lath at bottom of joist and twisted snugly to place. These loops to be spaced at intervals of 2 feet along the joists. The lath to be bent down 6 inches along the walls on all sides and securely attached to same.



For walls and partitions suitable construction can be had by using brick, hollow tile, concrete block or gypsum block 4 inches thick, or reinforced concrete 3 inches thick.

With frame construction, the walls should be of back-plastered Portland cement stucco on metal lath attached to wooden studs spaced on 16-inch centers with metal lath and 3/4-inch Portland cement or gypsum plaster on the inside surface.

Wire glass should be used in all windows and a solid metal covered door used between garage and hall.

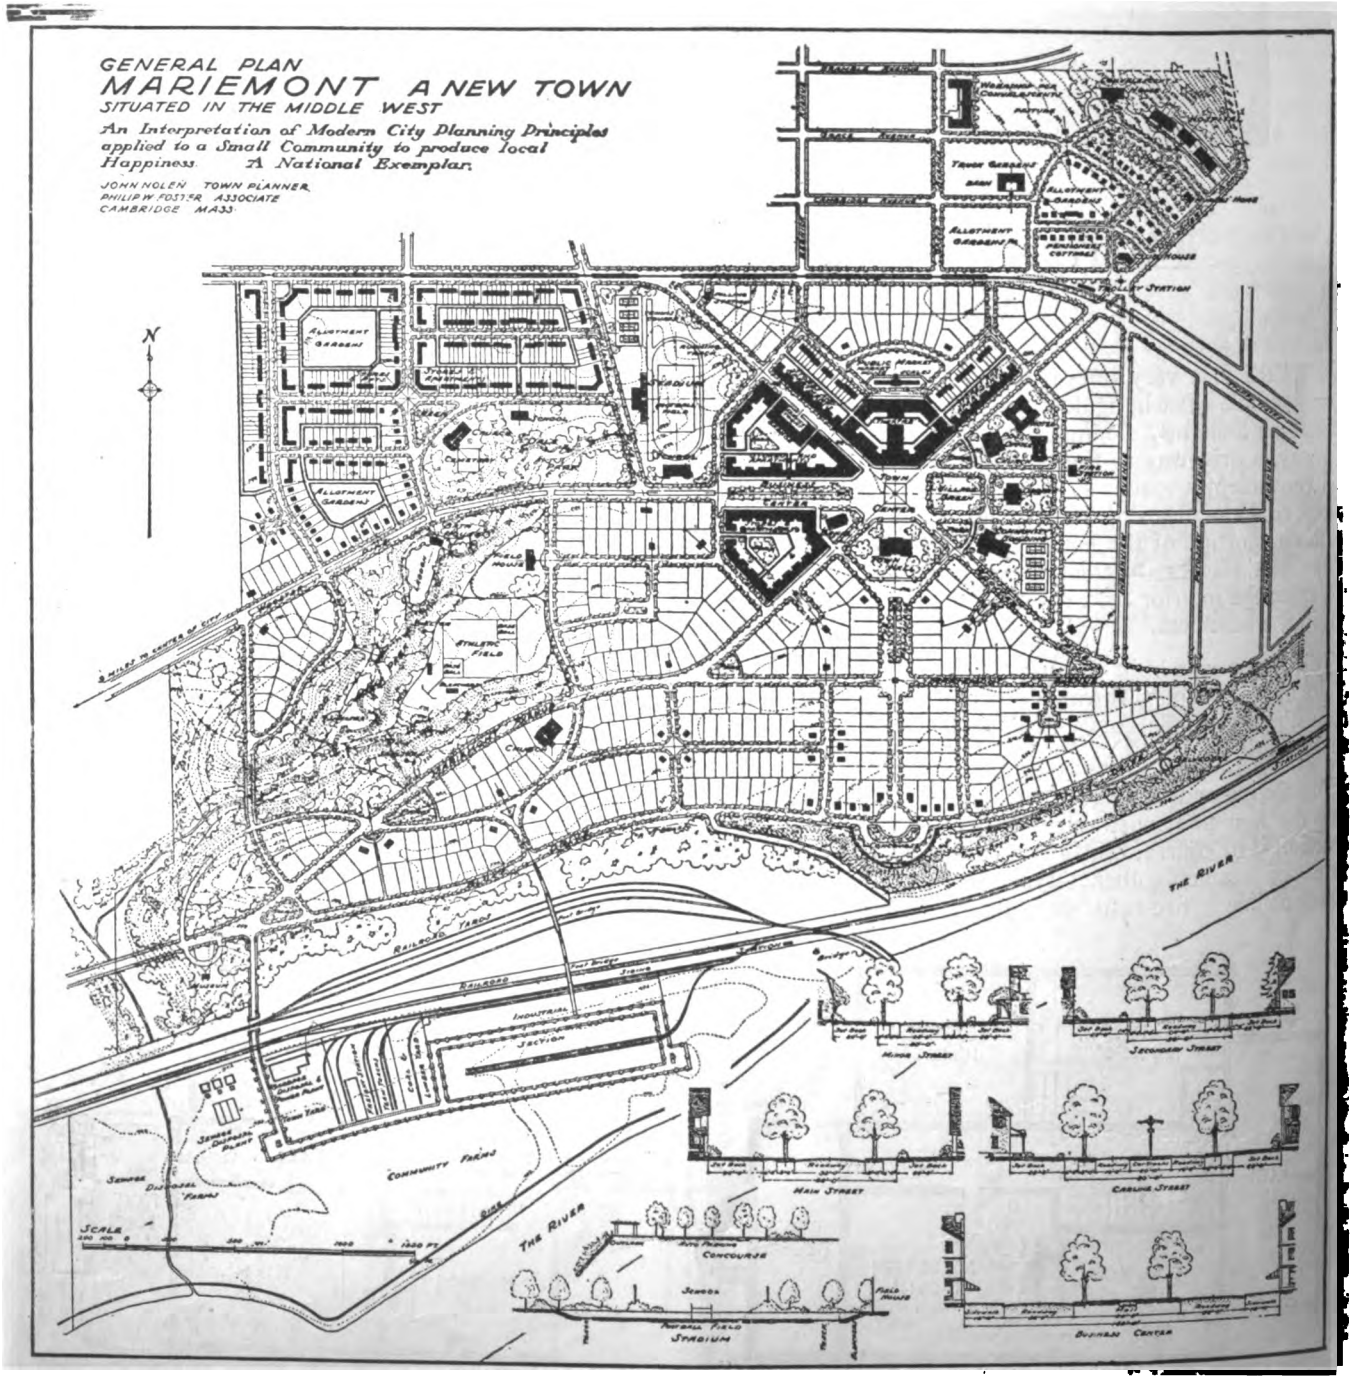
BUILDING A NEW TOWN



HERE is a plan for a new city to be developed as a suburb of Cincinnati. It is now a piece of farming land with certain natural advantages that make it an ideal location for such a project.

This undertaking is a philanthropic work of Mrs. Mary M. Emery, a wealthy resident of Cincinnati who desires to see good accommodations for wage owners in a model town.

Mariemont is named after Mrs. Emery and it will follow in general the plan of the English Garden City of Letchworth. It will however be put on a substantial business basis in accordance with American ideas. It is not a charitable scheme but a proposal that is intended as an example that it is hoped will be repeated in many places of the United States.

The Mariemont general plan as laid out, covers a tract of about 365 acres, it provides for a town with its village green and public buildings, stores, library, hospital, theatre, school sites, playgrounds and parks, and complete and attractive housing accommodations

Adequate provision will be made for the proper maintenance of the property as a complete town or suburb. Mariemont is being developed under the direction of John Nolen, Town Planner of Cambridge, Mass.

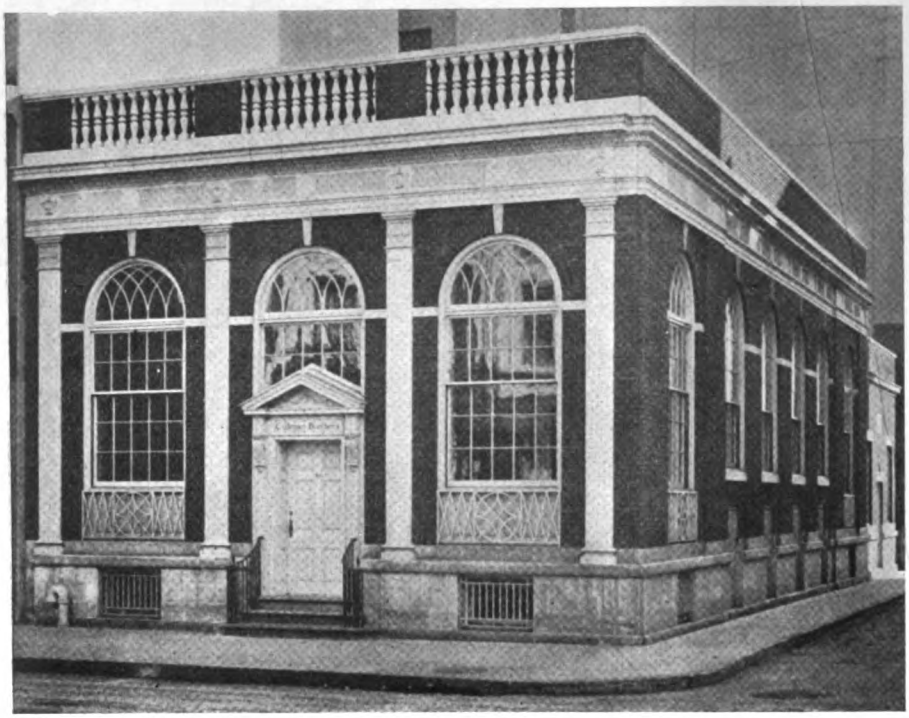
Modern Bank

IN the construction of banks nowadays more consideration is given to interior fittings, marble, hardwood and bronze being used in even the smallest banks. A handsome interior is as much of an asset to the bank as is a handsome exterior design.

The interesting design shown on this page is that of the State Bank of Belmond, Iowa, which was planned and erected by the Moorman Co. It is certainly a creditable example of bank architecture.



The erection of a dignified bank structure is usually followed by the erection of other commercial structures in its vicinity and the entire town benefits by such a progressive movement.

Bank Interiors of Marble, Bronze and Hardwood Are Dignified and Impressive.

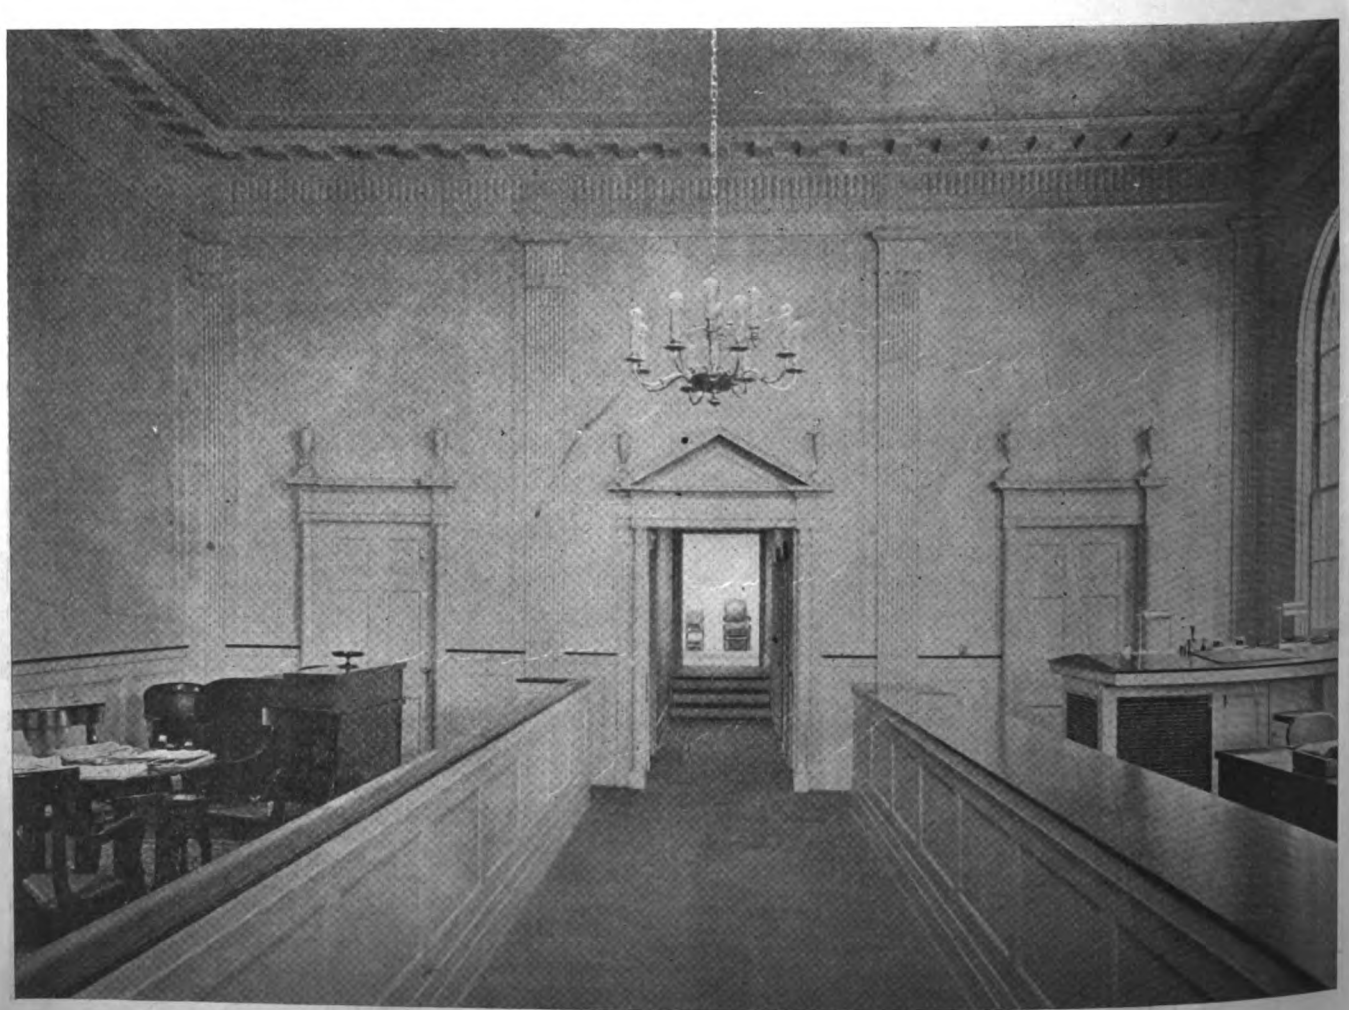
Modern Commercial Building

AYMAR EMBURY II. Architect



ONE hardly associates a tobacco warehouse with any idea of architectural beauty, but here is an interesting example of how a commercial building can have architectural merit.

This building is the office and warehouse of Collman Bros., tobacco dealers, located on Front Street, New York.

This is an interesting example of a modern office and warehouse building. Its architecture is strictly Colonial, both as to its exterior and interior.

There is no reason why our commercial buildings cannot be beautiful instead of ugly in their design and Mr. Embury has shown here what can be accomplished by careful planning.

The office interior is of special interest. It is finished in white and mahogany, and is a fine example of interior woodworking and ornamental plastering. The owners believe that men will do their best work in pleasant surroundings, and they certainly have provided them in this building.

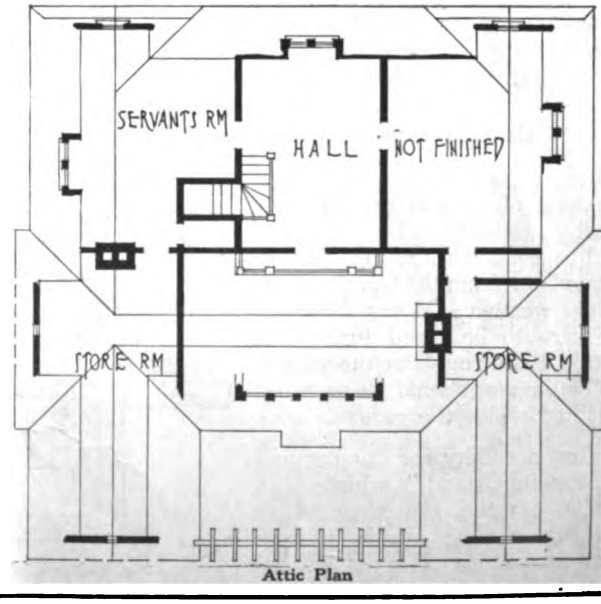
Stucco Bungalow Design

FOLSOM and STANTON, Architects



CHARMING indeed is the bungalow design shown on this page. It was built at Merchantville, N. J., for Mr. John Rowe from plans prepared by Folsom & Stanton, architects, of Philadelphia, and was built by the William A. Evans Co. some few years ago.

The building is of frame with stuccoed exterior, and a very interesting feature is the porch arrangement; here two gable ends form covered porches. The center porch is an open terrace with a pergola arch over the steps. This forms, as our picture shows, a very charming entrance when the June roses are in bloom.

From the terrace and porch one can enter either the dining room, living room or den. The living room is quite large in size, and its height extends up to the ridge; the large open fireplace has its chimney inside of the living room, and this forms a very interesting feature. A front dormer window leads up to the top part of the living room and affords excellent ventilation. A balcony on the opposite side is another very striking feature of this unique living room.

Special Plumbing and Lighting Requirements for the Modern Garage

By CHARLES L. HUBBARD, M. E.

WHILE in a general way the plumbing requirements are the same in a garage as in any other industrial building, there are certain conditions which require special treatment, among which may be mentioned washing and thawing devices, water heating and pressure tanks when city pressure is not available, and traps in connection with the floor drains for preventing gasoline from reaching the sewer.

Washing Equipment

In case of a small private garage, the washing of cars is usually done outside by means of a hose attached to the house sill cock, supplemented by warm water from the laundry heater in cold weather. When there are several cars to be cared for, which are also in use throughout the winter, special equipment should be provided for washing inside the garage.

The first necessity for this purpose is a "washing stand," which is a cement floor space, somewhat larger than a car, sloping gradually to a drain at the center. Next is an ample supply of warm water which may either be drawn into a pail or thrown from a hose under slight pressure.

Water may be heated in the same form of tank as for laundry work. and is best supplied with a steam coil connected with the heating system. If hot water is used for warming the building, an arrangement may be made for circulating hot water through the coil in the storage tank. In general, best results are to be obtained by bringing hot and cold water pipes to a mixing valve, with which a hose and nozzle are connected, as in this way any temperature desired is easily obtained.

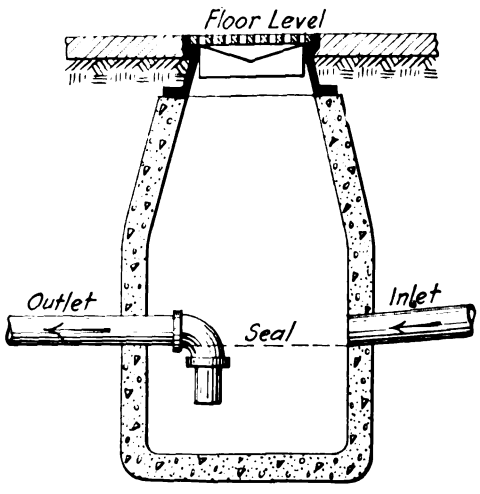

Fig. 4—Form of gasoline trap

A convenient hose arrangement for washing is shown in Fig. 1, consisting of a swivel connection at the ceiling to which a hose is attached, as indicated.

A typical water supply layout for a case where city pressure is not available is illustrated in Fig. 2, in which a pneumatic pressure tank B, and force pump driven by a gasoline engine are used. Hot water is furnished by tank A which contains a brass coil supplied with steam from the heating boiler.

Both hot and cold water are piped to a mixing valve on the main floor of the garage, from which connection is made with a swivel hose of the type shown in Fig. 1. These sketches are given as suggestions and may be modified or combined so as to adapt them to different conditions.

Digitized by Google

Although ice is commonly removed from a car by drenching with warm water, it is often convenient in a large city garage to have some means of doing this more rapidly and with less labor.

A convenient arrangement for doing this is shown in Fig. 3, and consists of a concrete pit, along the sides of which are steam pipes. The car is run over this for a short time until the ice is melted.

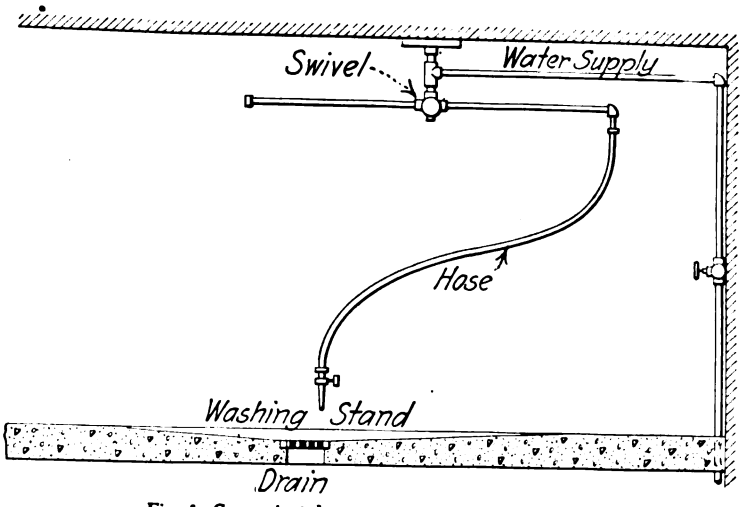

Fig. 1—Convenient hose arrangement for washing

Drainage

In arranging for the floor drainage of a garage particular care must be taken to prevent any gasoline from reaching the sewer, otherwise an explosive gas is likely to be formed which may find its way into the drains from other buildings and so cause serious damage under the right conditions. This may be prevented by the use of a special trap which seals the drain against the passage of gasoline.

A form which may be constructed upon the premises consisting of concrete, with a manhole frame and grating, is shown in Fig. 4. All of the floor drains from the garage should be brought into this, and the gasoline, being lighter than water, will float upon the surface and thus be evaporated while the water is drawn out from a point well below the surface. The size of the catch basin will vary in different localities, some cities requiring one of considerable size, say from 3 to 4 feet in diameter, and about 4 feet in depth, while in other cases one considerably smaller is acceptable. In the arrangement shown, the gasoline vapor passes back into the room through the grating and must be cared for by some of the methods of exhaust ventilation previously mentioned.

In some cases a vent pipe is carried from a point somewhat below the grating, with the idea that air will pass downward into the chamber through the grating, forcing the gasoline vapor out through the vent pipe.

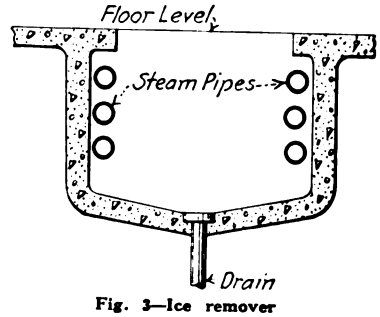

Fig. 3—Ice remover

As the vapor is heavier than air, the advantage of this seems somewhat doubtful, but it can at least do no harm.

Storage of Gasoline

This is usually taken care of at the present time by the various oil companies, who install the proper storage and pumping equipment.

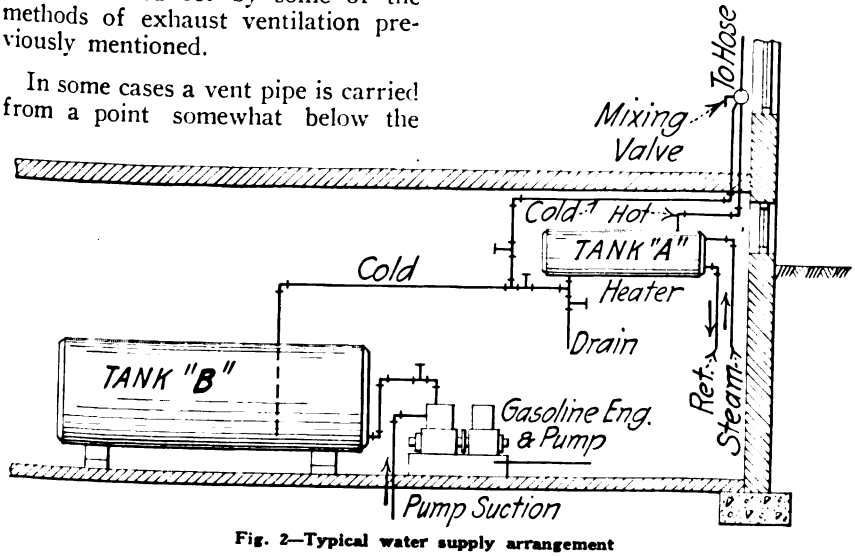

Fig. 2—Typical water supply arrangement

Tanks and pumps are usually placed out of doors both for safety and convenience. If, for any reason, it is necessary in a city to place them inside, the storage tanks should be buried in some cool part of the basement remote from boilers and steam pipes and provided with filling and vent pipes carried outside.

All work of this kind is subject to rules of the building departments and insurance companies and special data should be secured from them in any given locality before the work of installation is begun. In any case gasoline should never be stored above the floor level of a building, nor should the tanks ever be subjected to air pressure for purposes of raising them to a higher level, as with these arrangements there is always danger of flooding in case of carelessness or leaky valves. Hand pumps, especially designed for this purpose, form the only safe means of handling gasoline about the garage.

Lighting

It is evident from what has been said regarding the danger of gasoline vapor, that an electric bulb is the only safe means of lighting a garage, and this is usually available in the case of all buildings of any size.

For the small private garage in the country, all repair work should be done in the daytime and a flashlight or electric torch of good size be used around the car at night. A small automatic electric plant for lighting both the house and garage is one of the best arrangements for cases of this kind where it can be afforded.

Attractive Seven Room Home

Specially Designed for Readers of Building Age and The Builders' Journal

By R. C. HUNTER & BRO., Architects, New York

THE plans of this house show that it is modest in size. The first floor rooms are no larger than are required for their various uses, compatible with comfortable living; in fact, floor space has been reduced to effect economy, so that every foot of space is utilized, yet nothing is cramped or uncomfortable.

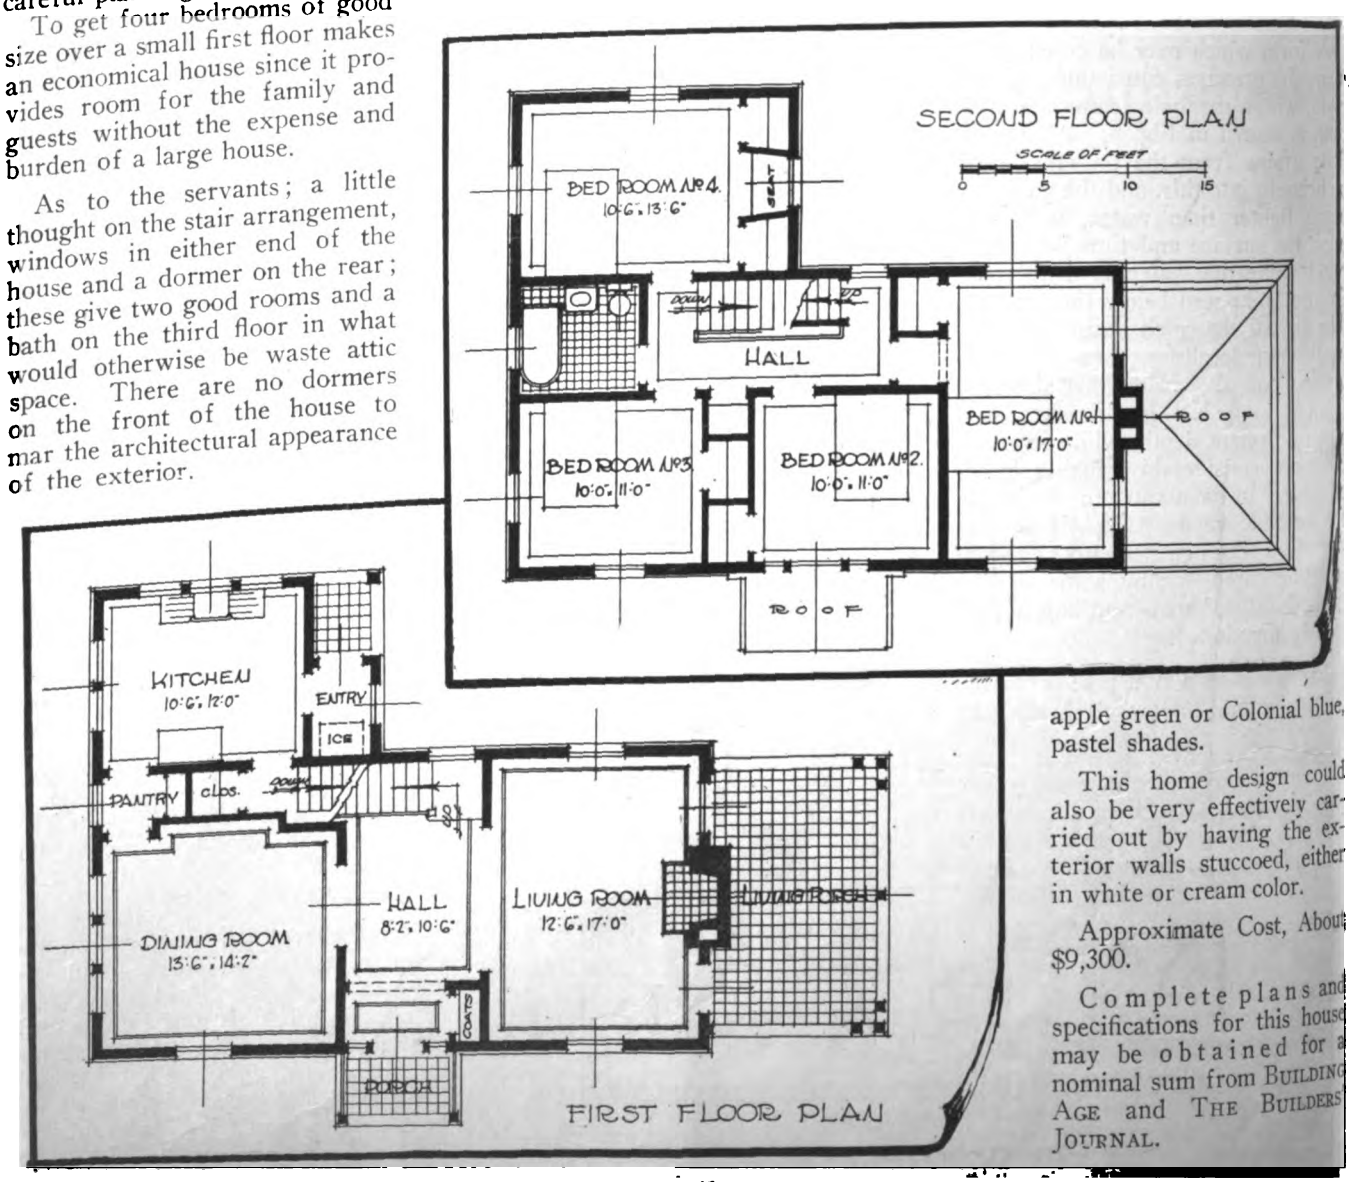
The architects have reduced the first floor area to a minimum; what happens to the second floor? The layout here is not disappointing; we find four bed rooms, a bath and ample closet space, the result of very careful planning.

To get four bedrooms of good size over a small first floor makes an economical house since it provides room for the family and guests without the expense and burden of a large house.

As to the servants; a little thought on the stair arrangement, windows in either end of the house and a dormer on the rear; these give two good rooms and a bath on the third floor in what would otherwise be waste attic space. There are no dormers on the front of the house to mar the architectural appearance of the exterior.

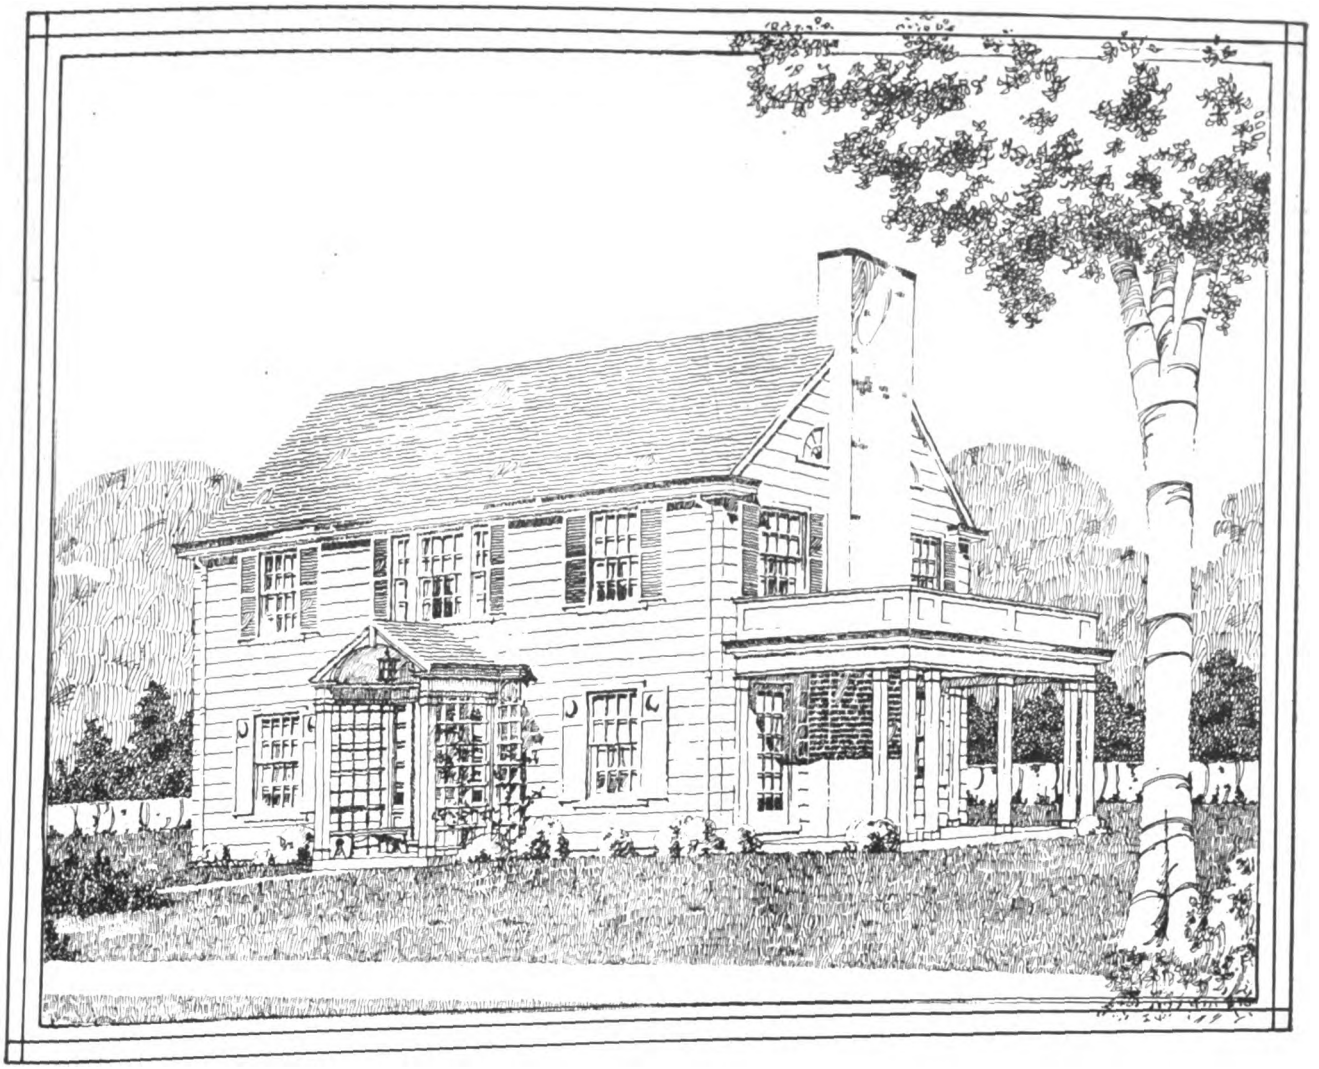
The perspective sketch shows an exterior of refined simplicity. The latticed entrance porch bids one a hearty welcome, while the triple window over the entrance relieves the front of any trace of monotony and gives excellent light in the center bed room.

A study of the plans at once shows that consideration has been given to the furnishing of the house. This is an important item for, often we find a large bed room with no place for the bed, owing to the entrance door having been improperly placed or a closet located in the wrong corner of the room. Or, again, we find a dining room where no provision has been made for the sideboard.



The time to overcome these defects is when the plans are drawn. An ounce of prevention is worth a pound of cure. Of what use is a room if it cannot be properly furnished? It certainly is not comfortable to live in.

This house is of frame construction, it has been designed for white shingles on the walls and a shingle roof stained dark. Shutters and blinds should be finished in either apple green or Colonial blue, pastel shades.



This home design could also be very effectively carried out by having the exterior walls stuccoed, either in white or cream color.

Approximate Cost, About $9,300.

Complete plans and specifications for this house may be obtained for a nominal sum from BUILDING AGE and THE BUILDERS' JOURNAL.

Quantity Survey *of* Attractive Seven Room Home

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protection, scaffolding and general equipment and supplies, have not been included.

Such items as are marked "Unit," are to be estimated in a lump sum, following requirements of plans and specifications.

EXCAVATION

(Excavation for pipe trenches not included)

Excavation for cellar	254 cu. yds.
Excavation for footings	17 cu. yds.
Excavation for areas	15 cu. yds.
Excavation for trench walls	13 cu. yds.
Excavation for leader drains and dry wells	16 cu. yds.
Backfilling around walls, etc.	43 cu. yds.

Leader drains and dry wells:

Field stone for dry wells	14 cu. yds.
4" salt glazed tile drain pipe	48 lin. ft.
4" elbows	8

MASONRY

Concrete work:

Concrete for cellar walls	920 cu. ft.
Concrete for footings	284 cu. ft.
Concrete for trench walls	175 cu. ft.
Concrete for area walls	211 cu. ft.
Cellar floor (3" concrete and 1" cement finish)	720 sq. ft.
Outside cellar steps (concrete cem. faced)	40 sq. ft.
Area bottoms (brick and sand)	32 sq. ft.
Porch floors (12" cinders, 3" conc. and 1" cement finish, colored and blocked off)	174 sq. ft.
Concrete forms	2300 sq. ft.
Pointing cellar window sills	18 lin. ft.

BRICK WORK

Common brick work for chimney (2.8M.)	140 cu. ft.
Face brick for hearth and jambs (or 105 brick)	15 sq. ft.
Fire brick for fireplace (or 75 brick)	15 sq. ft.
Face brick for porch borders (or 250 brick)	50 lin. ft.
8" x 12" T. C. flue lining	62 lin. ft.
3" bluestone chimney cap (2'0" x 3'8")	1 Unit

Digitized by Google

MASON'S IRON WORK

Fireplace damper (3'0" opg., with throat, etc.)	1 Unit
C. I. ash dump	1 Unit
C. I. cleanout door for ash pit (16"x12")	1 Unit
C. I. cleanout door for boiler flue (8"x8")	1 Unit
Thimble for boiler flue (9" dia.)	1 Unit

PLASTERING

Three coat patent plaster on wood lath, Gross	815 sq. yds.
(Net 660 sq. yds.)	
Keene's cement plaster on metal lath (servant's bath) Net	14 sq. yds.
Run cap	26 lin. ft.
G. I. corner beads	90 lin. ft.

TILE WORK

Tile work for bathrooms:	
Floor (1" hex. white)	36 sq. ft.
Wainscot (3"x6" white wall tile)	92 sq. ft.
6" sanitary base	18 lin. ft.
Moulded cap	24 lin. ft.

SHEET METAL WORK

Tin roof on living porch	198 sq. ft.
Tin flashing for roofs, etc.	64 lin. ft.
Tin flashing for column caps	12 caps
Tin flashing and counterflashing for chimney	8 lin. ft.
Tin gutter lining (20" wide)	95 lin. ft.
Tin valley lining (20" wide)	38 lin. ft.
4" half round hanging gutter (No. 24 gauge galv. iron)	6 lin. ft.
3" half round hanging gutter	10 lin. ft.
3" tin leaders	81 lin. ft.
2" tin leaders	20 lin. ft.
Bends for same	18
Gutter thimbles	9
3"x4" G. I. gas range vent	22 lin. ft.
Cap and thimble for same	1

CARPENTRY

Timber:
All No. 1 common stock, Hemlock, rough unless noted.

Cellar girders, 6"x10" spc. 1/18, 1/14, 1/12	220 F.B.M.
2"x3" nailer—84 lin ft.	42 F.B.M.
Sills—4"x6" 1/18, 4/14, 5/12, 1/10	288 F.B.M.
Posts—4"x6" 5/18, 2/10	220 F.B.M.

Valleys: 3"x8"—2/18	72 F.B.M.
Ridge: 2"x8"—2/14, 3/10	78 F.B.M.
Living porch rafters: 2"x6"—10/10—2"x8"—2/14	121 F.B.M.
Living porch ceiling beams: 2"x4"—13/10	87 F.B.M.
Plates: 4"x10"—1/16, 2/10	120 F.B.M.
Col. cores: 3"x4"—8/10	80 F.B.M.

CARPENTRY (Continued)

Entrance porch rafters: 2"x6"—5/10	50 F.B.M.
Ceiling beams: 2"x6" (cut to radius)—5/8	40 F.B.M.
Plates: 3"x8"—1/10	20 F.B.M.
Floor Bridging: 2"x2"—350 lin. ft.	117 F.B.M.
Cornice outlookers: 2"x2"—150 lin. ft.	50 F.B.M.
Cellar partitions (studs): 2"x4"—13/14	122 F.B.M.
Sheathing (7/8"x8" shiplap) no outs:	
Walls—to cover	2600 sq. ft.
Flat roofs—to cover	198 sq. ft.
Sheathing (waterproof)	2600 sq. ft.
Shingle lath—7/8"x3"	2950 lin. ft.
Grounds: 3/4"x2" surfaced one side	2000 lin. ft.
Sheathing for cellar partitions: 7/8"x8" shiplap—to cover	200 sq. ft.
Rough flooring (7/8"x8"shiplap): 1st and 2nd floors—to cover	1500 sq. ft.
Furring (7/8"x2")	200 lin. ft.
Shingle roofs (18" stained shingles): 13.2 squares	9100 shingles
Shingle sides (24" stained): 19.2 squares	6350 shingles

Exterior Finish

Watertable (7/8"x2" strip)	136 lin. ft.
Main cornice:	
7/8"x8" soffit	91 lin. ft.
7/8"x4" fascia	91 lin. ft.
7/8"x6" frieze	84 lin. ft.
5" crown mould	91 lin. ft.
3" bed mould	84 lin. ft.
Raking cornice: 5" mould	91 lin. ft.
Dormer cornice:	
7/8"x4" fascia	10 lin. ft.
7/8"x4" soffit	10 lin. ft.
5" crown mould	10 lin. ft.
2" bed mould	10 lin. ft.
Cellar Bulkhead:	
7/8"x3 1/4" M. & B. ceiling	54 sq. ft.
5/8"x7/8" cove	16 lin. ft.
Porch finish:	
Entrance porch:

Frames complete with sash, outside trim, etc. Sash 1 1/2" thick, glazed D. T.	
Cellar Windows (trim both sides):	
Single top hung casem. sash, 3'0"x2'6" 4 light	4
Mull. DH sash, each 2'6"x3'2"—12 light	1
First floor windows:	
Single D. H. sash, 3'4"x5'0", 16 light	4
Single D. H. sash, 2'10"x5'0", 16 light	1
Single D. H. sash, 2'6"x3'2", 12 light	2
Mull. D. H. sash, ea. 2'6"x3'2", 12 light	1
Triplet D. H. sash, ea. 2'6"x3'2", 12 light	2
Second floor windows:	
Single D. H. sash, 3'0"x4'6", 16 light	9
Single D. H. sash, 2'6"x3'2", 12 light	1
Single D. H. sash, 2'0"x4'6", 12 light	1
Triplet D. H. sash, center 3'0"x4'6", 16 light—ea. side 1'4"x4'6", 8 light	1
Third floor windows:	
Single D. H. sash, 2'6"x3'2", 12 light	1
Single D. H. sash, semi-circular head, 2'6"x4'0", 13 light	2
Single hinged quart. circular, 2'0"	2
Shutters (1 1/8" thick, solid paneled):	
3'0"x5'1" pr.	3 pr.
2'6"x3'3" pr.	5 pr.
2'10"x5'1" pr.	1 pr.
Blinds (1 1/8" thick, fixed louvres):	
3'0"x4'7" pr.	9 pr.
2'8"x4'7" pr.	1 pr.
2'0"x4'7" pr.	1 pr.
2'6"x3'2" pr.	1 pr.
Exterior door frames (1 3/4" thick, rabbeted) Complete with outside trim:	
Front entrance frame, door 3'0"x7'0" sidelight sash 1'0"x5'0" with panels below, ornamental trim, etc.	1 Unit
Frame for door to living porch, 2'10"x7'0"	1
Frame for rear entrance door, 2'8"x7'0".	1
Exterior doors (all to detail):	
Front entrance door, 3'0"x7'0"x1 3/4", 7 panel	1
Door to living porch, 2'10"x7'0"x1 3/4", glazed D. T.	1
Rear door, 2'8"x7'0"x1 3/4", glazed D. T	1
Finished Flooring:	
Living Room, Dining Room, Ent. Hall, plain sawed white oak, 13/16"x2 1/4", to cover	500 sq. ft.
Kitchen, Pantry, etc., No. 1 maple 13/16"x2 1/4", to cover	182 sq. ft.
Second story, No. 1 comb grain Y. P., 7/8"x2 1/4", to cover	645 sq. ft.
Third story, 7/8"x4" N. C. Pine, to cover	263 sq. ft.
Lining paper under floors	700 sq. ft.
Cement filled pipe cols. in cellar, 4" dia.x 7'6" long with caps and bases	6
Joist hangers (1/4"x2" W. I.):	
For 2"x10" beams	6
For 4"x10" beams	4
For 4"x8" beams	2

Interior Finish

Door trim (whitewood):	
7/8" jambs, 1/2" stops, 7/8"x4 1/2" moulded and mitered trim with wall moulding, Trim both sides.	
For doors, 2'6"x6'8"	8 sets
For doors 2'4"x6'8"	7 sets
For doors 2'4"x7'0"	1 set
For doors 2'4"x6'6"	4 sets
For doors 2'0"x6'8"	1 set
Trim for inside of exterior doors:	
Front entrance with sidelights, etc.	1 set
Rear entrance, 2'8"x7'0"	1 set
Door to living porch, 2'10"x7'0"	1 set
Trim for cellar doors (plain):	
2'8"x6'8"	1 set
2'6"x6'6"	1 set
Trimmed openings finished same as for doors:	
Opg., 5'0"x6'8"	2 sets
Trim for small door to plumbing pipes:	
1'6"x3'0"	1 set
Windows (whitewood):	
7/8"x41/2" moulded and mitered trim with wall moulding. 1/2" stops, 1 1/8" moulded stool. 7/8" moulded apron, 5/8"x7/8" cove under stool.	
For windows, single 3'4"x5'0"	4 sets
For windows, single, 2'10"x5'0"	1 set
For windows, single, 2'6"x3'2"	4 sets
For windows, mull., ea. 2'6"x3'2"	1 set
For windows, triplet, ea. 2'6"x3'2"	1 set
For windows, single, 3'0"x4'6"	9 sets
For windows, single, 2'0"x4'6"	1 set
For windows, triplet, center 3'0"x4'6" each side 1'4"x4'6"	1 set
For windows, single, 2'6"x4'0" curved head	2 sets
For windows, single, 2'0" quarter circle	2 sets
Base:	
7/8"x6 1/2", moulded	490 lin. ft.
7/8"x4", plain (closets)	120 lin. ft.
2" base mould	490 lin. ft.
1/2" quarter round floor moulding	620 lin. ft.
Picture moulding (7/8"x2 1/4")	400 lin. ft.
Mantel for living room	1 Unit
Seat for Bed Room No. 4	1 Unit
Interior doors:	
(2 cross panel birch veneer)	
Door 2'6"x6'8"x1 1/2"	8

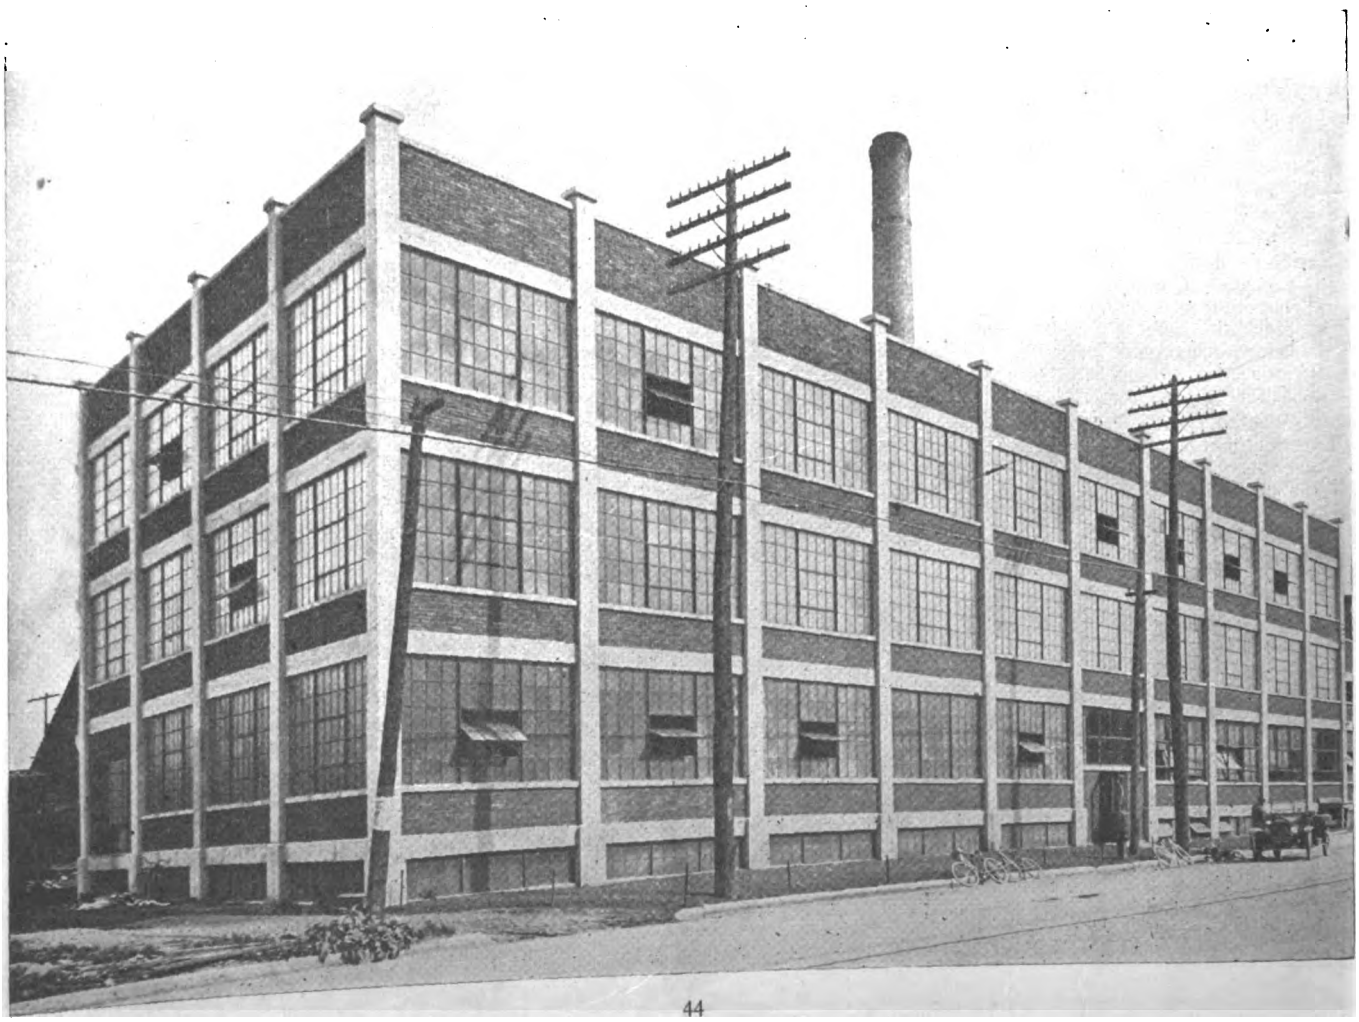
Industrial Buildings *of* Good Design



MODERN industrial buildings are being built more and more with the idea of securing good looking structures as well as having merely practical buildings.

Reinforced concrete enters largely into the construction of such buildings, the exposed concrete spandrels and columns can be made very attractive by intelligent design and good workmanship, and this can be combined with brick so as to secure a pleasing exterior design.

The smaller illustration shows the power house of the Wisconsin Public Service Company, located at Green Bay, Wisc. The lower illustration is that of the Larson Canning Company of the same city. Both these structures were designed and built by Ludolf M. Hansen Company of Green Bay, Wisc.

In other cases an entire brick exterior may be preferred and this can be relieved by some stone or cast concrete ornaments.

In a factory, a large amount of light is essential; therefore, practically the entire outer wall surface should be of glass. Of course in buildings of this sort, steel sash should be used exclusively as they have many advantages over wood sash and frames.

FINANCE and REAL ESTATE

Helpful Data for the Builder Who Builds to Sell

Mortgage Money Is Easier Now

IN a most comprehensive survey of the present real estate market and a forecast of the future, Charles F. Noyes, head of the firm of Charles F. Noyes Co., lays emphasis on the fact that mortgage money is decidedly easier and that the bona fide investor has at last returned to the market.

"The real estate business is exceptionally good in all its branches and never have we approached the usually dull Summer months with as much good business in sight," said Mr. Noyes.

"Mortgage money is very easy," continued Mr. Noyes, "and any good loan can be obtained at rates of from 5½ per cent to 6 per cent and a few good loans recently have been placed at 5 per cent. Five per cent money, however, is exceptional and security must be ultra-desirable.

"Business renting for the 1923 season is better than most advanced renting seasons. While rentals have dropped to stay dropped from the high point of war days, when office space commanded $4.00 to $5.00 per square foot, warehouse buildings 50 cents per square foot, and manufacturing lofts $1.00 per square foot, yet we all know that the old figures of prior to 1914 will not return.

"All leases now are being made on the basis of rentals that show a good income yield for the properties.

"Sales of real estate to investors now are being freely made, and a considerable amount of exchanging is being handled by the larger real estate offices.

"Money is plentiful and this is best emphasized by the fact that during the first three months of this year more than $5,000,000,000 in money has been in circulation, or an average of $51.25 per capita as against $35.05 per capita during the same period in 1914, and all of this money is eligible for investment. Not only is this great amount of money in circulation, but in 1920-1921 the aggregate resources of the national banks were nearly double those of 1914.

"The business man of large affairs finds himself at the end of the war period with odds and ends, and these with a little additional money he can convert into a substantial realty investment. This exchange movement, in my opinion, will grow and I predict that within six months one of the healthiest trading markets of my time will be in progress.

"The fact that real estate has proven itself to be the first one prime investment of all and is so regarded for the first time, even by men who formerly clung to Wall Street or bond investments, is accelerating this movement. The real estate market 'turned the corner' last January and now every month shows a steady and healthy gain, not only in volume of the aggregate amount over that of 1921.

WITH regard to the building situation throughout the country, S. W. Straus, of S. W. Straus & Co., says:

"As the season advances, increased activities prevail in all departments of construction, and there is substantial evidence that predictions made some time ago that the year 1922 would establish new building records, are being borne out. While there is an unprecedented amount of residential construction, there is activity in all other lines, including industrial plants.

"There is a firm and well sustained demand for building capital. Prices for all basic materials show tendencies to stiffen up as greater activities get under way. The labor situation, viewed from the standpoint of the entire country, is favorable, and wages are holding up well, due to a greater demand as well as a lessened supply as the result of a considerable exodus of workers from some of the building trades.

"Perhaps the most salutary phase of the situation lies in the effect which increased building activities is having on general business. An optimistic note is to be observed throughout the entire realm of business in this country, and evidences of returning prosperity will undoubtedly multiply with the upward trend of building operations. A new building is the symbol of progress because in its construction there is involved substantially every line of trade and industry as well as increased land values in the vicinity where it is built.

The present extensive building program now taking place may be viewed as the tangible manifestation of national progress and prosperity, and its continuation is bound to have a stimulating effect on all departments of business."

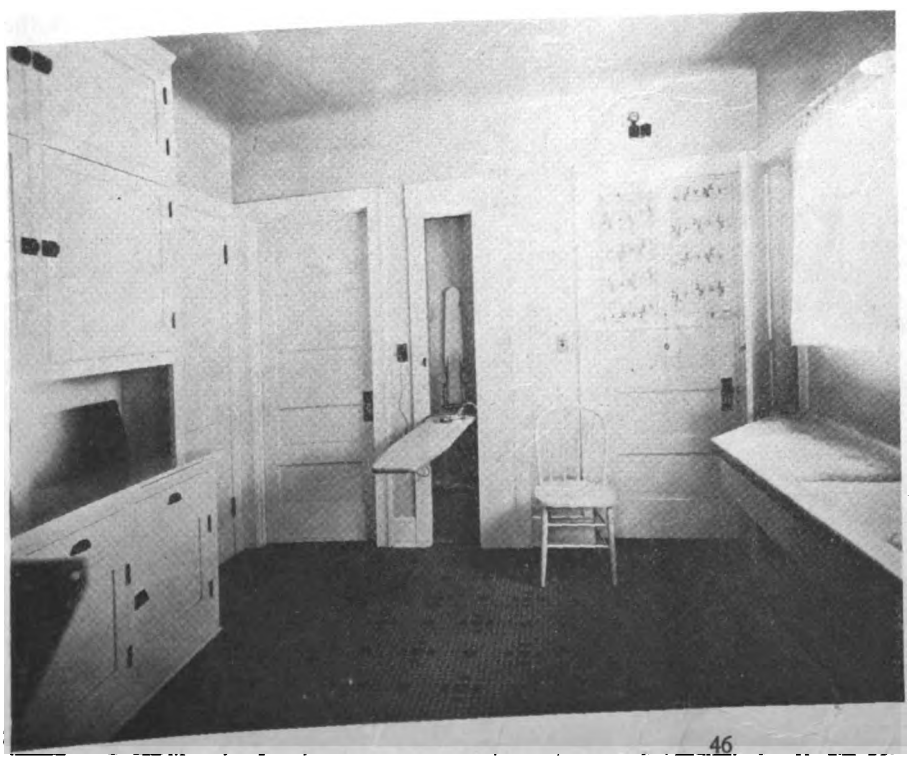
SHOPWORK and FURNITURE

Designs for the Finish Man



Kitchen Closets

THERE is one important point that a good housewife will insist upon and that is adequate kitchen closets.

The biggest hit a builder can make with his customers is to suggest a good array and variety of closets to be built in the kitchen. The two illustrations shown herewith are typical examples of good kitchen closet arrangements.

Notice in the cupboard arrangements, that the doors do not extend to the floor. This allows the first shelf to be about 6 inches above the floor level and in this little scheme many housekeepers find a decided advantage.

The proper hardware should be put on all doors and drawers. A mistake is often made in using a cheap variety, but this is a deplorable practice. There is nothing in the house that gets as much use and handling as the kitchen equipment and good hardware here will always be admired.

An ironing board closet is a very desirable adjunct to the modern kitchen. A convenient electric plug should be installed so that the electric iron is available.

In figuring out the closets to be installed, it is wise to mark down the different items of kitchen equipment that are to be kept out of sight and then make proper provisions for these various items. There should be proper space for brooms, mops, dusters, etc. The shelves should be arranged at different heights so as to accommodate tall bottles.

CARPENTRY

Good Practice in Frame Construction and Finish

How to Frame a Roof of Unequal Pitch

By RICHARD M. VAN GAASBEEK
School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

CONTINUING the problem from our May issue, we can now proceed to lay out the jack rafter on the long, common side. In our next article, we will show how to lay out the jack rafters on the short, common side.

The length of jack rafters No. 12, 13, 14 and 15, are determined in the same manner as the preceding common rafter No. 16, as they are a part of the length of it. Take the runs from the lay-out, figure 1, (printed in the May issue) measuring from facia line A to the center of the hip. The four rafters are shown developed on the side of a single rafter, figure 4. In practice these would be laid out separately and are laid out over one another, only to save space and to avoid repetition.

Press the fence firmly against the top edge of the stock to be used, using the same figures on the square as for the previous rafter and produce the facia line or first plumb line to the extreme right, A, figure 4. Slide the fence to the left and measure on a level line from facia line A, the run of rafter No. 12, 2¾", the run of rafter No. 13, 5½", the run of rafter No. 14, 8¼" and the run of rafter No. 15, 11", and produce plumb line C, figure 4. the extreme length of the rafter to the center line of the hip rafter.

From this length, deduct one-half the thickness of the hip, measured on the line of the jack rafter or one-half the diagonal thickness of the hip, C-D, figure 5, which is an enlarged section through W-W-figure 1, and produce plumb line D, figure 4. Square this line across the top edge of the rafter and locate the center.

To simplify picking up the bevel for the top cut, draw in a section of the hip and jack rafter, full size on the lay-out, figure 1, as shown in the section, figure 5.

Where the outside edge of the jack rafter intersects the outside edge of the hip rafter, square a line across at right angles to the center line un-

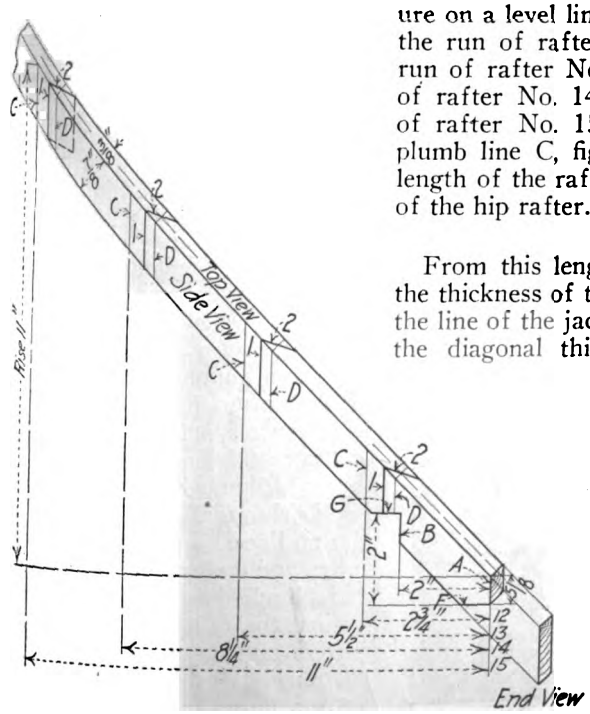

Fig. 4—Developed Length of Jack Rafters No. 12, 13, 14 and 15

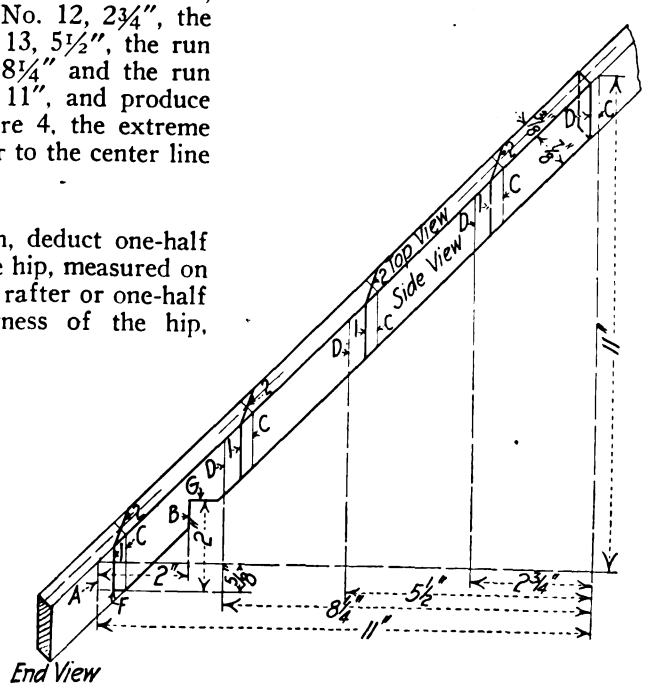

Fig. 6—Developed Length of Jack Rafters No. 17, 18, 19 and 20

Digitized by Google

til it intersects the center line as at I, figure 5.

To lay out the top, cut so that the jack rafters will fit against the side of the hip rafter at the proper angle, measure back on a level line from plumb line D, on the side of the rafter, figure 4, the distance D-1, figure 5, and produce plumb line 1, figure 4. Connect plumb line 1 through plumb line D on the center line as shown at 2, top view, figure 4. The lower end of the rafter is a duplicate of the long, common rafter. Measure in from facia line "A," measuring on a level line, 2", the width of the projection, locating wall line "B," Measure down on facia line A, from the top edge of the rafter, 5/8", the width if the facia, locating plancher level F. Measure up from plancher level F, measuring on plumb line, 2", locating plate level G. Cut on line A, for the facia, on line F, for the plancher level, on lines G and B for the birdsmouth and on bevel 2 on the top edge and plumb line 1 for the cheek cut against the hip rafter.

The length of jack rafters Nos. 17, 18, 19 and 20 are determined in the same manner as the preceding jack and common rafters, with the exception that the top and bottom cut are different. Take the runs from the lay-out, figure 1, measuirng from the center of the ridge to the center of the ridge, 3/16" and produce of the valley rafter.

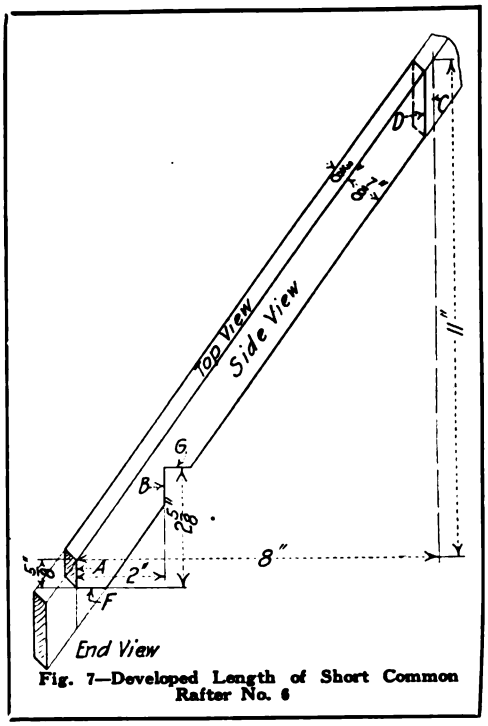

Fig. 7—Developed Length of Short Common Rafter No. 6

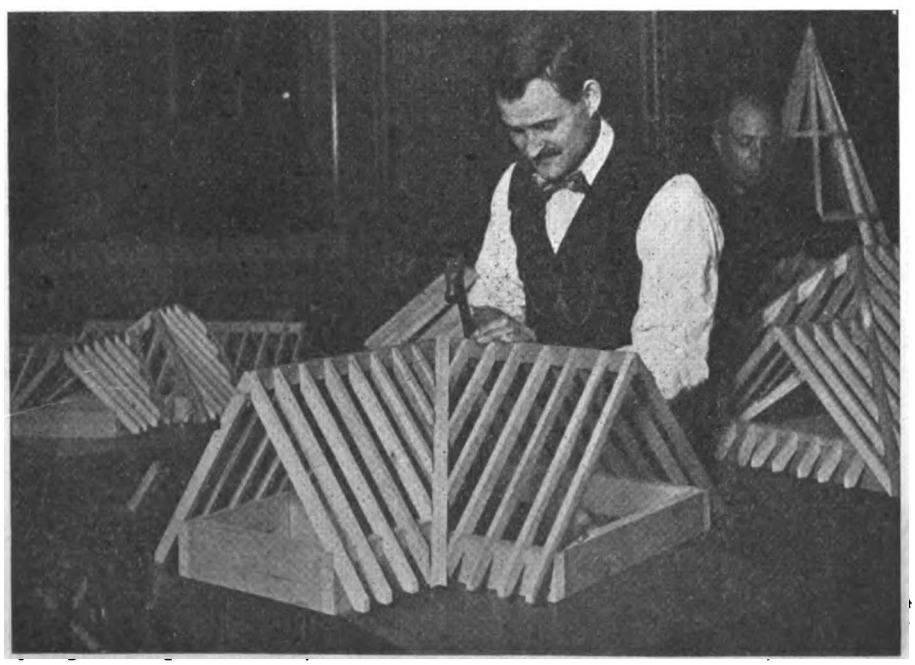
The four rafters are shown developed on the side of a single rafter, figure 6. In practice these would be laid out separately and are laid out over one another, only to save space and to avoid repetition.

Press the fence firmly against the top edge of the stock to be used and produce the first plumb line to the extreme right, "C," figure 6. Slide the fence to the left and measure on a level line the run of rafter No. 17, 11", the run of rafter No. 18, 8¼", the run of rafter No. 19, 5½" and the run of rafter No. 20, 2¾", and produce plumb line C, figure 6, the extreme length of the jack rafters to the center line of the ridge. From this length, deduct one-half the thick plumb line D, the cutting length of the rafter against the ridge.



The bottom end of all four rafters are beveled to make a fit against the side of the valley and jack rafter No. 17 also has a bearing on the plate so that the plancher level and birdsmouth must be laid out as for the common rafter.

To lay out the birds-mouth for rafter No. 17, measure in from plumb line, A, figure 6, measuring on a level line, 2", the width of the projection, locating wall line B. Measure down on plumb line A, from the top edge of the rafter, 5/8", the width of the facia, locating plancher level F. Measure up from plancher level F, 2", measuring on a plumb line, locating plate plate level G.

Plumb line A, represents the extreme length of the jack rafters to the center line of the valley rafter so that from this length deduct one-half the thickness of the valley, measured on the line of the jack rafter or one-half the diagonal thickness of the valley, C-D, figure 5, which is an enlarged section through W-W, figure 1, and produce plumb line D. Square this line across the top edge and locate the center.

The top cut for these rafters are the same as for the preceding jack rafter, as all rafters on the long common side of the hip and valley rafters are the same pitch.

To lay out the bottom, cut so that the jack rafters will fit against the side of the valley rafter at the proper angle, measure forward on a level line from plumb line D, on the side of the rafter, figure 6, the distance D-1, figure 5, and produce plumb line 1, figure 6. Connect plumb line 1, through plumb line D on the center line as shown at 2, top view, figure 6. Cut on line D, for the cut against the ridge, and on bevel 2 on the top edge and plumb line 1 for the cheek cut against the valley rafter, on all four rafters and on rafter No. 17, only, cut on line F, for the plancher level and on lines G and B for the birdsmouth.

Model of Roof with Unequal Pitches

Digitized by Google

To Lay Out Short Common Rafters

Before setting the fence and square the pitch, or rise in inches per foot must be determined, the run, a constant unit, 12″, remains unchanged. The run of short common rafter No. 6, measured on the lay-out, figure 1, measuring from the facia line to the center of the ridge is 8″. The total height from the top of the facia to the top of the ridge "C,' A-C' is 11″. This height is determined by the pitch of the long, common rafters as required by the specifications, which gives the total height of the roof. Thus, with the total rise 11″ and the total run 8″, find the rise in inches per foot. The formula or rule for finding this is:

$$\frac{\text{Rise in inches}}{\text{Run in feet}} = \text{Rise in inches per foot.}$$

Working this out as given in the problem we have:

$$\frac{132}{8} = 16\tfrac{1}{2} \text{ rise in inches per foot.}$$

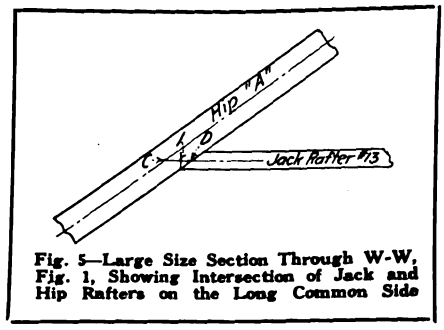


Fig. 5—Large Size Section Through W-W, Fig. 1, Showing Intersection of Jack and Hip Rafters on the Long Common Side

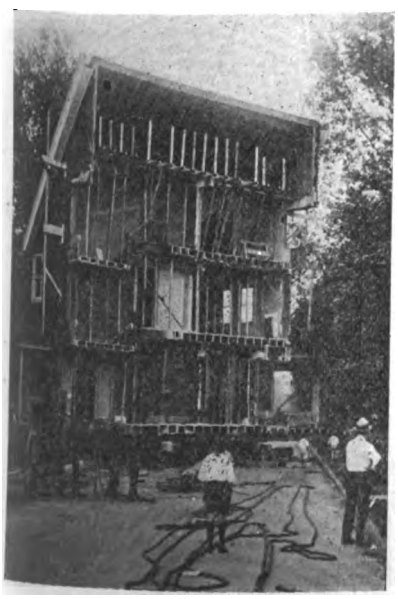

Set the fence and square at 16½″ rise on the blade and 12″ run on the tongue. Mark on the blade for all plumb cuts and on the tongue for all level cuts.

Press the fence firmly against the top edge of the stock to be used and produce the facia line or first plumb line to the extreme left, A, figure 7. Slide the fence to the right and measure on a level line from facia line, A, the run of the rafter 8″, and produce plumb line C, figure 7, the extreme length of the rafter to the center line of ridge "C." From this length, deduct one-half the thickness of the ridge, 3/16″, and produce plumb line "D," the cutting length of the rafter against the ridge.

To complete the lay-out of the lower end of the rafter, measure in from facia line, "A," measuring on a level line, 2″, the width of the projection, locating wall line "B". Measure down on facia line "A," from the top edge of the rafter, ⅝″, the width of the facia, locating plancher level "F." Measure up from plancher level "F," measuring on a plumb line, 2⅝″, (be sure to take this distance from the lay-out, figure 2, noticing that the short common rafters rest on plates M and O which are ⅝″ higher than plates J and L on which the long common rafters rest), locating plate level "G." Cut on line "A" for the facia, on line "F" for the plancher level, on lines "G" and "B" for the birdsmouth and on line "D" for the cut against the ridge.

Easy to Move by Cutting the House in Half

A VERY interesting moving of a house was successfully accomplished in Marlborough Street, Flatbush section of Brooklyn, N. Y., as the house was too wide to go through the streets the resourceful house mover solved the difficulty by "simply" cutting the house in half and moving the sections one at a time to their new location, where it was put on a new foundation and joined together as a complete house again. Note particularly how the unsupported ends of the joists were braced so as to prevent a collapse. The scaffold brackets were not removed, these were used for the planks on which the workmen stood while cutting the house in half.

The photograph, by Underwood and Underwood, shows the one section ready to be moved on its new site, the foundations being already built in place.

ANOTHER interesting example of a house moving job is shown in the second picture. Here a portion of the house is shown on the rollers and skids. Some overhead wires required cutting, and that is why the lineman is on the job.

This is half of a three story house that was moved at Newton, Mass.

The section shown here, weighing approximately forty tons, was moved along Commonwealth Avenue of that city.

The house was formerly located on Center Street and Commonwealth Avenue and was moved a distance of one-quarter mile from its original spot.

It is interesting to know how buildings of this sort are moved, a large building being cut in half to make two smaller structures.

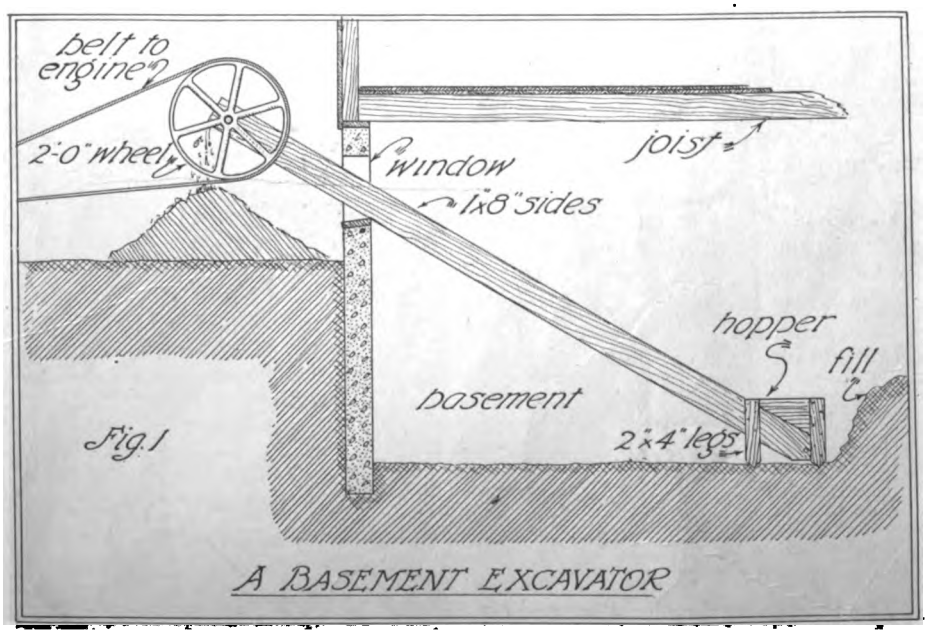
CONTRACTING EQUIPMENT

Reliable Information on Time and Labor Saving Devices

Basement Excavator



By DALE R. VAN HORN

THIS article describes the construction of a simple excavator of small size but large capacity which was once built primarily for the purpose of enlarging the basement under a house. It proved so effective, however, that it was eventually used by neighbors and finally fell into the hands of a contractor, who may be using it yet, or one like it, for all I know.

The writer had purchased a frame residence in the edge of a small country town. Though well built and modern, it did not have ample basement space. Less than half of the area covered had been dug out.

With the three or four small windows offering the only means of getting out the surplus earth, once it had been decided to enlarge the basement, unless a portion of the wall were removed, this step would be both expensive and risky. So the excavator or elevator was made.

Figure one shows a side elevation with a rather graphic pose. The elevator was made by using two one by eight-inch boards fourteen feet long for the side pieces and a twelve-inch plank for the bottom. Wood rollers, one at each end, took care of the belt or conveyor and a hopper at the lower end with removable sides, served as the inlet. A light iron wheel two feet in diameter was keyed to the upper roller and the one and a half horsepower engine belted to this. And it is a surprising fact that that little "one and a halfer" lifted the dirt as fast as two workmen inside could load it into the hopper. Of course, the earth thus removed was dumped just outside the window but that is as far as it would have been thrown, anyway. As the work progressed within, the conveyor was slipped over the window sill and the engine moved forward.

The other illustration shows most of the essential details though many of them can be altered to suit various conditions. There is the matter of the bottom. Instead of nailing the plank at the bottom edges of the boards it was placed one inch below the middle. In this way the conveyor belt is given room to clear the sill without scraping. The three inches left above the upper side of the belt is ample, anyway, for the earth being removed.

The plank was cut five inches shorter than the sides to allow room for the upper roller. The rollers in this case were cut from a roller on an old binder. Holes one-half inch in diameter were bored into each end and into these were driven squared rods to a tight fit. To one of these rods was keyed the pulley wheel. This was made secure by running a small bolt through both the roller and the rod so that there would be no chance of slipping.

The top of the chute was braced by a strip across the top as shown; and it would not be a bad idea to add two vertical two-inch strips at the ends of the chute through which to bore the holes for the bearings. In

Digitized by Google

this way the bearing surface will be increased from a scant inch to nearly three inches on each side.

In the case being cited blue denim one yard wide and folded twice, making three laps was used for the belt. It would probably be best to get light weight canvas or heavy duck, since this would be a little cheaper.

The belt, after being folded was sewed with coarse thread lengthwise on a sewing machine and the edges sewed several times. If I remember right, something like thirty seams were sewed into this belt.

The belt was cut somewhat longer than necessary and the ends turned back and these sewed down. Before it was placed, heavy galvanized strips, bent to the form shown were riveted at twelve-inch intervals along the stretch. They were eleven inches in width, rather than the full twelve, to prevent a possibility of their scraping along the sides of the chute.

These being fastened, the ends were cut to the proper length and the belt placed and lacing used to sew the ends together. The cloth stretched badly, and it was necessary to take up slack several times before the job was finished.

It would be a wise thing to provide an adjustable roller at the lower end so that the slack could be taken up with a wrench by turning two bolts.

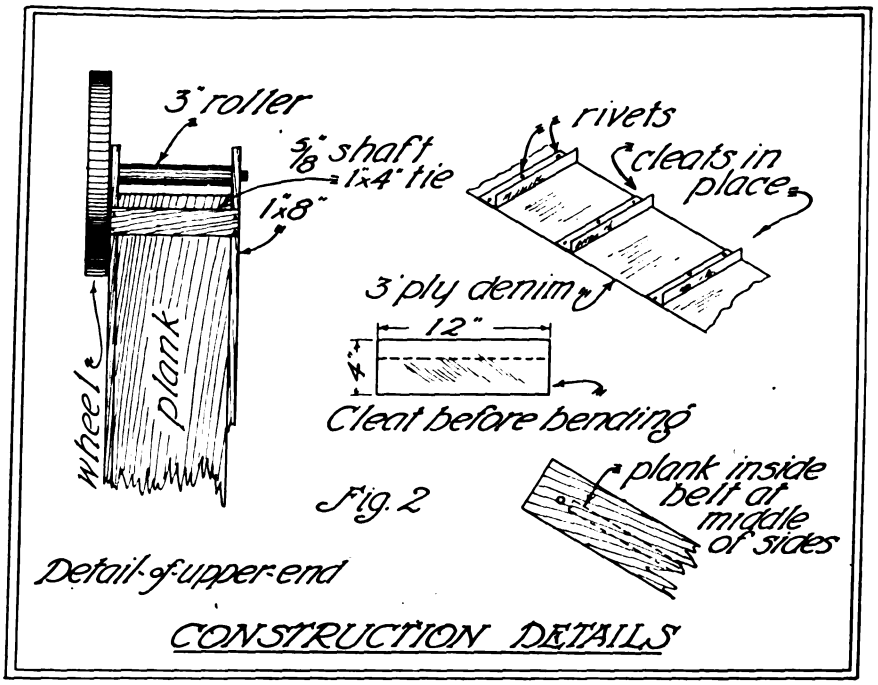


Fig. 2

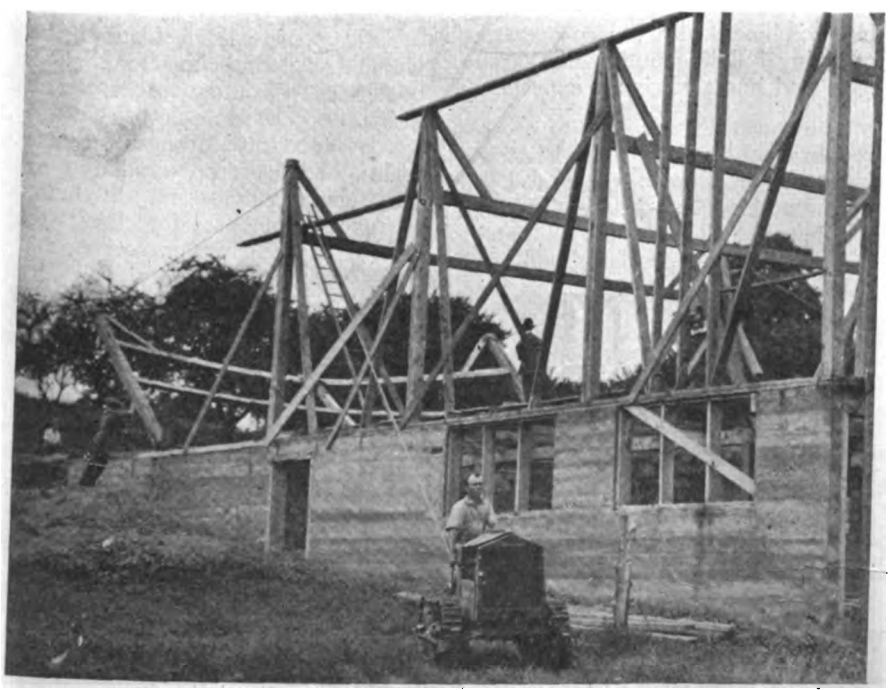


CONSTRUCTION DETAILS

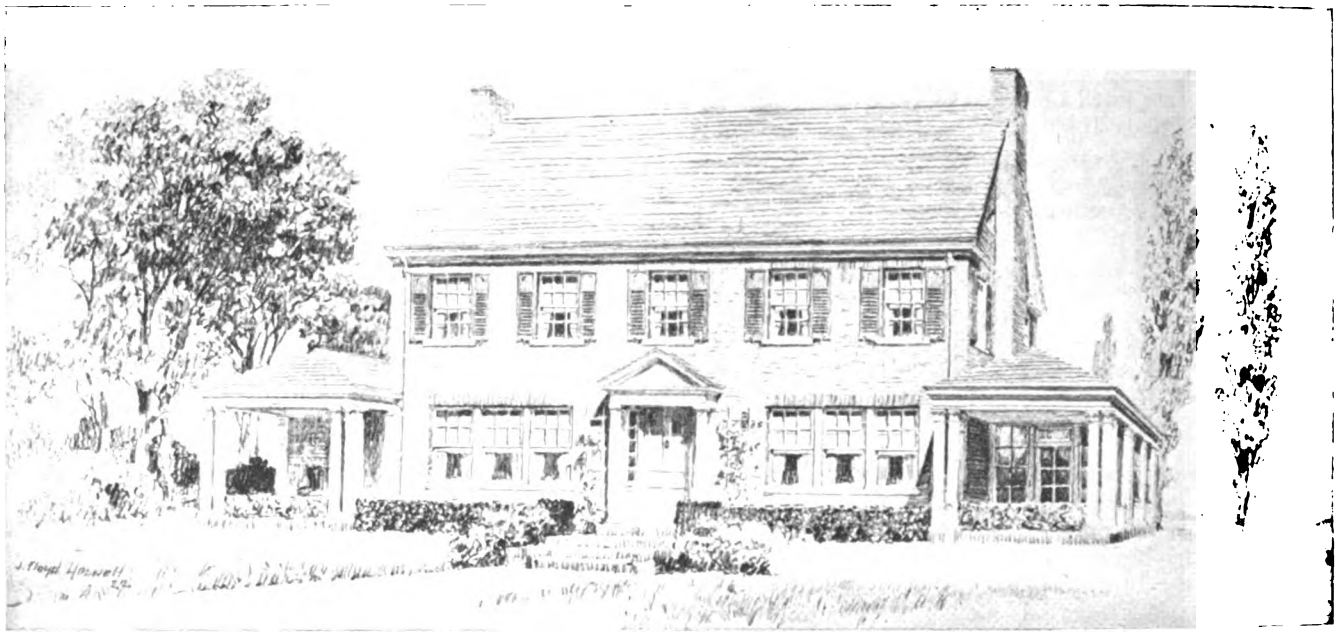
There was a little friction between the upper side of the bottom and the rivets holding the cleats in place, but they soon signed the treaty and no further trouble was experienced along that line.

Another thing which bothered a bit was the slipping of the belt on the upper pulley. This was natural since the surface of the roller was so small that wood to cloth was hardly sufficient. A little molasses fixed that.

Any one who had a little pluck and even less capital can outfit himself with one of these simple outfits and fare forth to a good job and good wages. For with it one man can do the work of three. By looking ahead to unusual jobs, certain parts can be made detachable so that as little time as possible will be lost in setting up.

Careful selection of the lumber used, especially for the sides, will prove worth while, too.

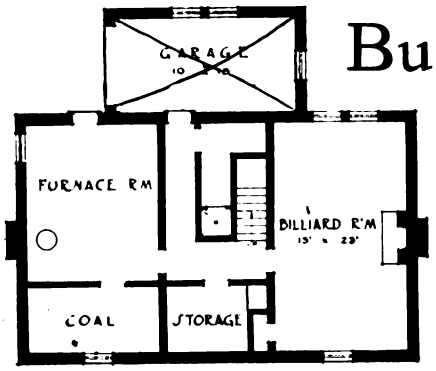
Tractor Use



RAISING the bents of a barn is always more or less of a job. Here is a picture of a simple method of accomplishing it without the aid of many men and horses.

A little tractor does the job. This shows a practical use for tractors in building operations and there are many such uses around any building construction of fair size.

The cost of operating a small tractor is not very much and it seems that in the near future a tractor will be just as valuable to the contractor as the motor truck.



Machinery is more and more taking the place of manual labor in building construction and this is another illustration of how it is working out.

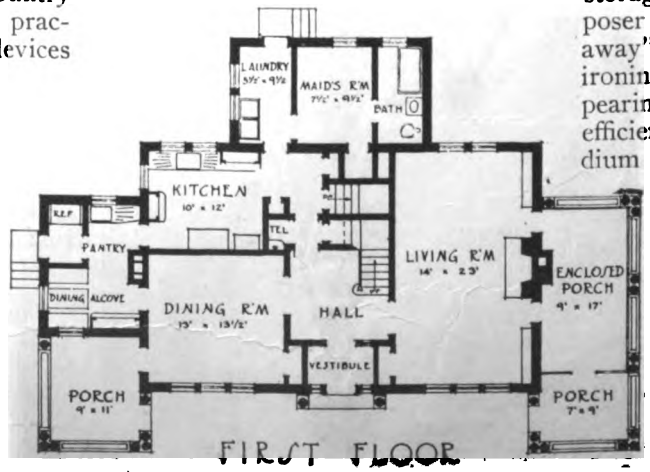
Building *the* Home Ideal

Interesting Model House Building Operation Incorporating Many Modern Features

CELLAR

SECOND FLOOR
2 ROOMS ON THIRD FLOOR

MALBA, Long Island, New York, is the scene of a novel building undertaking that is creating considerable interest among the builders in the vicinity and interested home builders.



The Malba Estates Corporation, the developers of the property, are erecting a model all-year country home that is to contain many practical, modern labor-saving devices and household appliances.

The project was conceived, and is being built for the purpose of showing prospective home builders the best and most desirable materials, equipment and fixtures for a modern home.

An attempt is being made to include every device and appliance that can be used, and the builders would be glad to hear of any item they have overlooked to include in their list and which is not covered with some other device in practically the same line.

This house represents the results of years' of experience in home building, combined with the co-operation of many building authorities, architects and home efficiency experts.

The construction will be of pressed red brick with common brick backing; copper shingle roof, and the beams and girders of the first floor will be of steel lumber.

Among the special features there will be: All built-in china closets, bookcases, window seats, hidden radiators, electric clothes washer, ironer, vacuum-cleaning system, ice-making refrigerator, ventilating system; patent kindler and ash chute in fireplace and lift for logs; cold storage room; package receivers; disposer for household waste; "Tuck-away" folding ladder; folding wall ironing-board, laundry chute; disappearing screens; safety hidden vault; efficiency kitchen, dining alcove, radium markers, bells and buzzers, speaking tube; closet with sliding hangers, raised floors, and door control lights; radio room and flower studio; patent coal chute and rotary ash receiver; copper sash cords, water filterer, thermostat heat regulator, phone closet; numerous other home innovations that will appeal to discriminating owners.

What the Editor Thinks

Threatening Building Prosperity

DURING the war, the word "profiteer" came into very general use against some certain unscrupulous individuals and corporations. That ugly word is being used quite freely today against some building supply dealers on account of their raising the price of some building commodities because of the demand for same.

In the city of New York the building industry has the greatest volume of work, on hand and under contemplation, known in its history, and the supply of bricks on hand is not enough to meet the demand.

Unfortunately, a rather near-sighted policy has grasped some brick supply men and they have boosted the price until it is quite a serious matter. A threat was made to import foreign brick by Samuel Untermyer at a recent meeting held in New York to investigate these unjust prices.

Now, American workmen and industry need every dollar that it is possible to earn and this is an un-American way of handling the situation.

The National Lumber Merchant in a recent issue also sensed this danger in its relation to the continued prosperity of the lumber dealer. They said:

"Lumber prices are rising rather rapidly these days, indicating that unless the 'brakes' are applied—somewhere and somehow—there will be another run-away market.

"The consuming public, the buyers—your buyers and every other retail lumber dealer's buyers—applied the brakes two years ago by simply refusing to buy. Will they do it again? That depends."

It is strictly up to the supply men to maintain a fair price for brick and other building commodities. If they do not, they will be the ones to suffer from a slackening up on the extensive building program which is now so well under way.

It must be remembered that when it no longer pays to build, building will not go forward.

You can only get business by selling your commodity at a fair and reasonable price. As soon as the gouging starts, the brakes are applied to the industry. Remember the goose that laid the golden egg—don't kill it.

Our Front Cover Design

DUTCH Colonial architecture is a popular type used for home construction and a very beautiful example is shown on our front cover this month.

As will be noted, the first story is of stucco, with the upper gable part and roof covered with wood shingle. The front entrance steps are of brick and the porch floor is cemented. A glassed in porch or sun parlor forms an interesting feature.

This house is located at Great Neck, Long Island, N. Y., and is the residence of Mr. M. Gaylord, and Messrs. Terrwilliger & Sohn of New York were the architects.

To build homes like this that fit so admirably in the landscape is a credit to the building industry.

Building Ideal Homes

IN different sections of this country the public's attention to home building is frequently secured by means of some houses that have been especially built for show purposes. These buildings are usually put up through the co-operation of the Local Builders Exchange or by some group of manufacturers, or the developers of a certain parcel of land.

Interesting examples of this are the numerous "homes electrical" which contain practically every electrical device to make house work easier.

Frequently a complete home is erected on some new development and the public invited to inspect a complete and newly furnished home, the furniture in the majority of these cases being obtained from local furniture dealers and house furnishing houses, and it is desirable publicity for all concerned.

A modern home is being built at Akron, Ohio, by the Builders Exchange of that city. This is rapidly nearing completion. It is an interesting example of builders getting together to spread the idea of better building.

Another interesting house is being erected at Malba, N. Y. This is described on another page of this issue. In an early issue we will have an article about an ideal home building erected in Baltimore and which was visited by over 30,000 people.

As these homes contain many desirable appliances they are very valuable as they tend to educate the public to the better things in construction and equipment of modern homes.

Show the people what a real house can contain and we will create a demand for better buildings.

Raising the Standard of Our Industry

ON another page we publish an interesting account of the formation of the American Construction Council. This is a big progressive step in advancing the interests of the construction industries and we certainly expect great things of it.

An industry of so much importance to the wealth of the country and the comfort of its inhabitants deserves a good deal of serious attention on the part of the general public. It will be part of the work of the American Construction Council to bring together different units of the construction industry so that they can better co-ordinate their efforts and methods of working so as to secure better and more economical results.

Another important point that the Council will be called upon to solve is the relations of labor to the employer and public. There must be some means of adjustment that is absolutely fair to all three parties and it is to be hoped that one of the earliest works undertaken by this new Council will be some method to eliminate disputes and strikes.

Every progressive member of the building industry will certainly lend his co-operation to this progressive movement.

PAINTING

Practical Points of Interest to the Builder

Finishing the Floors of the Smaller House

By A. ASHMUN KELLY

THERE are two ways that may be employed in finishing the floors of the average small or medium house. The floor most often painted is the floor of the kitchen, and where the wood is rather soft it is an ideal finish.

Some think paint the best for any kind of wood that may be laid on the kitchen floor. However, most people will want a hard pine flooring, and want this finished au natural, which means either oil rubbed in, or shellac, or liquid filler and varnish, or, not very likely, waxed. Wax will not do because it will not stand water or soap. But for any room where washing is not necessary, such as bedroom and hall, a waxed effect is good.

For a maple floor the first coat is of shellac, as oil will discolor this wood. After the shellac may come the wax. Or clear copal varnish, one or two coats, may follow the shellac, as varnish wears better.

The finishing of a hardwood floor —and by this is meant wood hard and soft—is not a difficult matter, any handy person may do it, but the re-doing of a soiled floor is something different, and then it requires an expert, to know just what is best to do. Wax soon discolors with wear, becomes dirty in spots, and must be removed and the part renewed with wax.

The proper care of a finished floor is also important, for even hard varnish will not stand all the abuse that sometimes is heaped upon a floor.

The varnish used should be that made particularly for a floor. It dries over night fit for walking on in the morning, yet it is sufficiently elastic not to ever crack.

As to the cost, there is no reason why the floor of a low cost house should not be as well finished as that of the mansion; the extra cost in the latter case comes from the scraping and smoothing, mostly, for which more may be paid than an average good floor will cost, including the laying.

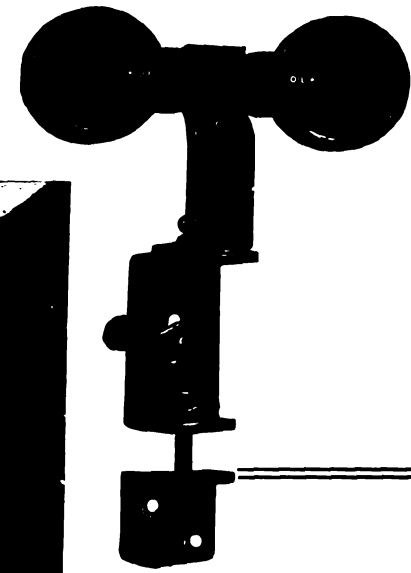
Floors require a great deal of attention to keep them in proper condition. The public expect floors when done to last for years, without giving them any care, and the painter is blamed for poor wearing qualities. They forget that iron, marble, or wood will wear down. That being the case, what can be expected from a shellac or varnish gum?

Be sure that the floor is scraped perfectly smooth before any finish is applied. And use only the very best of material if the job is to be a good one.

Some Paint Brush Hints

THIS is a criticism of a little item that appeared in the May number of THE BUILDING AGE. In the first place a real painter never lets his brush lie in the paint, as the article suggests. If he is done with it for a few moments he simply lays it across the paint pot. If done with it for the day, he wipes down the pot and removes all the paint he can by wiping it in the edge of the pot, then places it in water, either in a pot of water that will cover the bristles—and this is not the best way, either; or has a trough with water in it, and in which he places the brush, so that it cannot rest on the ends of its bristles, but on its side.

It is all right to bore a hole in the handle of a paint brush and suspend the brush thereby across the pot, in which there is water enough to cover the bristles only. That is a nice way, but it is seldom used.



No, no, you must not let the brush lie in the pot of paint, not for a moment. Nor is it ever done by a real painter. As to the pot of paint, if it is to stand over night, pour over its surface oil enough to cover it, or water will do as well. That will prevent the paint from skinning over.

A good paint brush costs money now, like evertything else, and it pays to take proper care of it. Keep it clean, don't let the paint dry in its butt, have a rag in pocket and keep brush handle and hands clean. Also wipe down the inside of the pot now and then while using the paint, and especially when done for the day, clean off the outside of the pot, and clean down the inside with the brush.

Remove surplus paint from brush by pressing it across the putty knife held over the paint pot.

An All Year Round Garage

Build a garage so that the doors are just as easy to open or close in the winter as in the summer time.

As a builder or as a home owner you know the dread of trying to open the garage door in the winter, especially when the doors are equipped with poor sets.

This can be overcome by the use of our No. 805 Sliding and Swinging National Garage Door Set. The features of this set are: Ease of operation; weather-tightness; adaptability and the small space required. As demonstrated by years of use, these features result in garage doors which work as freely and as easily as house doors, with just as little bother in their operation.

National Garage Sets safeguard the reputation of the builder.

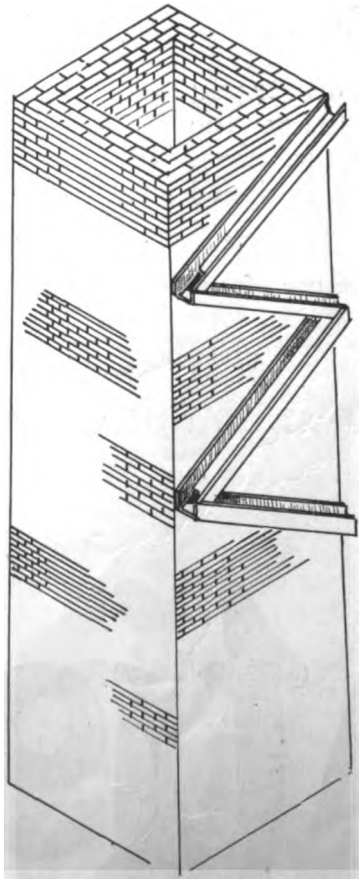
All readers are invited to discuss the questions and answers published.

Triangle Improvement for Detailing

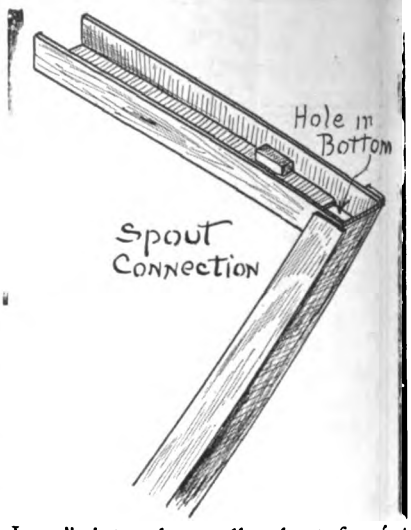
THE improved triangle shown herewith can be made by anyone from an ordinary triangle merely by four simple saw-cuts freeing the vertical side, thereby permitting its use in conjunc- with the balance of the triangle for deft work in detailing small complicated areas that invariably occur on large drawings while the tee-square blade need not be moved.

Incidentally, this improved triangle serves as two triangles, practically eliminating the need of another one and thus simplifying the draftsman's equipment. The drawings illustrate its construction and use. This idea will apply only to 45 degree triangles.

Guide lines are scratched on the celluloid surface and saw-cuts are carefully made with a fine saw as indicated.—**C. Nye.**



Razing a Chimney

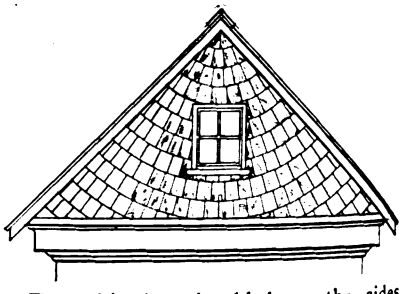


RECENTLY I used a method in razing an 80-foot high brick smoke stack that was new to me and I have near heard of it being used before and as it gave such good satisfaction I thought it would interest readers of BUILDING AGE AND THE BUILDERS' JOURNAL.

I used a spout put up in sections which were fastened to the sides of the stack. Each section had the proper slope to let the brick gently slide through same. At the lower end of each section there is a hole in the bottom through which the brick falls into the next lower section. The downward course of the brick is reversed as it passes from section to section thus controlling the velocity of same and when it arrives at the bottom it is not damaged by the force it strikes same.

I found this method very convenient and economical as the spout is always ready and just the right height to receive the brick, there being no time wasted waiting on the other fellow. As the chimney is taken down the sections of the spout are disconnected and lowered to the ground.

We went to and from the work through the flue. We first put "Put Logs" into the walls about five feet apart in height on which we placed our scaffolding boards.—**D. W. Daley.**



Circular Shingling

THE sketch shown herewith shows a rather novel and effective method of shingling the gables of frame houses so as to produce a circular effect.

Taking the mitre joints at the apex as a center and drive a nail at this point. With a string attached to this fixed center describe arcs at the proper distance apart.

The shingles should have the sides trimmed so that the joints will radiate or point to the nail center. This style of shingling may be done on the inverse curve or flowing effect may be had by cutting the bottoms of the shingles to irregular curves.

A good deal of ingenuity can be displayed in obtaining novel effects.

The principal point to be looked out for is to see that the distance is even between the different courses of shingles.—**Owen B. Maginnis.**

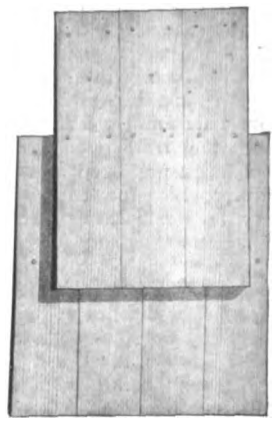
Residence—Highland Park, Illinois. Robert Seyfarth, Architect, Chicago. Exterior of Redwood Sawn Shingles.



Redwood Special Sawn Shingles

IN residence construction these new style sawn shingles give an appearance of wide clapboards—a style which is fast becoming a distinctive feature of the better class of new residences in the Middle West and the East.

Side walls of Redwood sawn shingles suggest careful specification of the highest grade materials—give an air of distinction to a house which makes it easier to sell.

Redwood Special Sawn Shingles are either 24 inches or 26 inches long, as desired. Both sizes are 5½ inches wide and ¾ inch thick at the butt. Laid 13 inches to the weather, they give the pleasing appearance shown in the illustration.

Made from clear, properly seasoned Redwood, these shingles do not warp. They take paint well and hold it indefinitely. Permeated with a *natural*, odorless preservative during the growth of the tree, Redwood lumber, shingles and millwork are protected against all forms of rot and decay. Their use for exterior construction gives greater permanence and value to any frame building.

Redwood Special Sawn Shingles

For the convenience of builders and architects, we have recently issued our "Construction Digest" and our "Engineering Digest" which either our New York or Chicago office will gladly forward, together with such other information on Redwood as you may request. Write for them.

Legal Department

HERE is a case where a builder took a contract to erect a building and complete it by a fixed date, writes a Canadian subscriber. "The work was not completed by the specified time as the contractor was disappointed in expectations in securing labor. Fine weather prevailing, it was agreed between the contractor and the building committee to open the building on a certain date, and completion was fixed for a week previous, with provision for $20 a day penalty for every day's delay after that. The weather having changed suddenly before that date, bringing snow and frost, the work was not completed at the time fixed. But the only work unfinished at the opening of the building was some outside trimmings, which did not affect use of the structure. Although it has been impossible to work outdoors for two months, the directors in charge want to enforce the penalty, although nothing has been lost to them through the building remaining unfinished. If they could be shown that a court would likely take a reasonable view and grant equitable relief they might give in."

Damages Chargeable Against Builder for Delay

We advise that the work be completed as speedily as is reasonably possible and that refusal to allow the $20 a day penalty be persisted in. We are confident that you will have no difficulty in establishing the proposition that the penalty is not assessable against you, although you may find it desirable to have local counsel assist you in effecting a settlement if the directors will not readily agree to a mutually satisfactory adjustment.

We believe that the Canadian law on this case will be found to be the same as the American law.

In the first place, if this provision for a daily penalty was an agreement not forming part of the original contract, it well may be doubted that it is valid. In that case it would certainly be necessary for the directors to establish some legal consideration for the provision. It is fundamental law that a promise to pay something which the promisor is not already bound to pay is not binding, unless supported by a consideration. And the existence of a consideration for a supplemental promise is not shown.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

But there is a stronger reason why the penalty appears to be non-assessable—there is no actual or substantial loss resulting from the delay in completing the exterior work.

Without attempting to explain a quite complicated legal doctrine, it should be sufficient to say that all English-speaking courts recognize the rule that where an agreement to pay a stated amount as damages for breach of an agreement calls for payment of an amount manifestly disproportionate to and greater than the actual loss, it will not be enforced.

"A provision in a building contract for liquidated damages, in case of a delay or other breach, unless the delay or breach is excused for reasons specified, is valid where the damages that may be suffered must be of an uncertain nature or amount. *But the damages so designated must not be obviously unconscionable or unreasonable.*" 9 Corpus Juris, 705.

"Because of the difficulty of ascertaining with certainty the damages arising from the failure to complete building and construction contracts within the stipulated time, the parties to such contracts frequently provide for the payment of a specified amount as damages for failure to perform the contract in time, and the courts will enforce such a provision, although the delay results from an honest mistake of judgment on the part of the architect. *Liquidated damages for delay, however, can be awarded only from the time the building should have been completed until the time the owner has gone into occupancy of it.* . . . A statute stipulating that, in case of part performance on the date stipulated, a penalty may be correspondingly reduced, is applicable only where the owner can have useful occupation of the portion completed.

"A provision for liquidated damages. . . . has reference only to *inexcusable delays.*" 9 Corpus Juris, 794-795.

At pages 739-742, 9 Corpus Juris, numerous cases—Canadian, as well as American—are cited showing that where a contractor has honestly attempted to complete his contract and the work has been so far completed that the owner has gone into possession of it, using it, there is a substantial performance of the contract, such as limits the owner's rights to the recovery of damages actually sustained through the contractor's failure to fully perform.

But, while as indicated, we are of the opinion that the builder in this case is not liable for the penalty mentioned, and not for more than actual damages, we feel that he was negligent in his own interest if he failed to insist on a clause giving him credit for all delays due to interruption by weather conditions, labor shortage, etc. Such a clause would completely exclude any claim whatever on the part of the owner for such delays as are mentioned.

ORDINANCES which unjustly discriminate against the use of particular kinds of building materials or methods of construction will not be sustained by the courts.

Power of Municipalties to Limit Construction Methods

One of the latest authoritative coure decisions on this important subject was handed down by the Illinois Supreme Court in the case of McCray vs. City of Chicago, 126 Northwestern Re-

I Buy Varnish from.....

"Made to Walk on"

Johnson's Floor Varnish dries dust-free in two hours and hard over night. It imparts a beautiful, high lustre—has good body—will give long wear—is absolutely water-proof—and will stand all reasonable tests.

Johnson's Floor Varnish is tough, elastic and durable. It gives a beautiful high gloss which will not chip, check, mar, blister or scratch white. Is very pale in color so can be used on the lightest floors and linoleum. Splendid for furniture, woodwork and trim of all kinds. May be rubbed if desired.

Free to Contractors

We will gladly send you a pint of Johnson's Floor Varnish, all charges prepaid, if you will test it in comparison with the brand you are at present using. Write us on your business letterhead—there is no obligation whatever attached to this offer.

JOHNSON'S FLOOR VARNISH

Digitized by Google

porter, 557. The court annuls an ordinance of the defendant city containing provisions that in all buildings of ordinary construction wood lath shall not be more than 1½ inches wide, shall be nailed to each stud, joist or bearing with not less than a three-penny fine 16-guage nail; lath to have joints broken with not over seven lath to a break; lath to be spaced not less than one-fourth of an inch apart, and to be covered with at least two coats of plaster, making the lath and plaster finish to at least seven eighths of an inch in thickness.

The court recognizes that an ordinance regulating building will be sustained as being valid if it has any reasonable tendency to promote the public health or safety, but adds:

"To justify the public authorities in interfering with the rights and privileges of the owners of property, as provided by the ordinance here in question, 'it must appear: First, that the interests of the public generally, as distinguished from those of a particular class, require such interference; and, second, that the means are reasonably necessary for the accomplishment of the purpose, and not unduly oppressive upon individuals. The Legislature may not, under the guise of protecting the public interests, arbitrarily interfere with private business, or impose unusual and unnecessary restrictions upon lawful occupations. In other words, its determination as to what is a proper exercise of its police powers is not final or conclusive, but is subject to the supervision of the courts.' [Quoting from a decision of the United States Supreme Court.] . . .

"Appellants charge that this ordinance, requiring wood lath and plaster in all buildings of a certain kind, tends to create a monopoly, because there are other materials equally safe that secure the same results. . . .

"The validity of the ordinance here in question must be determined by its operation and effect with respect to its exclusion of the use of Preferred Bestwall three-eighths of an inch thick, and not by the desirability of preventing the use of Beaverboard, Sackettboard, or any other of the numerous paper or wall boards less than three-eighths of an inch thick, regardless of how desirable or undesirable any of those boards may be. The proper way to reach the evil is to regulate the use of wall boards and not to suppress their use. . . .

"We believe the ordinance in question is unjust and oppressive in its discrmination as to the material to be used for the partitions and ceilings of the rooms in ordinary dwelling houses. This being so, it must be held that these provisions of the ordinance are void, and should have been so declared by the trial court."

Inefficient Labor Under Cost Plus Contracts

EXTREMELY important is the decision handed down by the Arkansas Supreme Court in the case of Buckeye Cotton Oil Co. vs. Kaucher, Hodges & Co., 238 Southwestern Reporter, 1. It deals with the responsibility of a contractor for increased building cost to the owner due to inefficient labor employed.

Defendants contracted to erect for plaintiff a reinforced concrete building near Little Rock "for a compensation equal to 8 per cent of the actual construction cost." They guaranteed that the cost should not exceed $76,463, subject to this condition:

"This guaranty is made during existing conditions and does not apply should the work be interfered with or cost increased by any act of government or any unforeseen elements or acts of God."

The building cost more than $20,000 more than the estimated cost, and the owner sued to compel the contractors to reimburse it for the excess cost. The defense interposed was that the increased cost resulted from changed conditions respecting prices of labor and material and inefficiency of labor.

The court upholds the defense so far as concerns increased cost of labor based on increased wage scales, but not as to increased cost due to mere inefficiency of labor employed. Referring to the terms of the guaranty above mentioned, the court says:

"What the language means is that, if there was any increase in the cost of the building aside from those causes stated in the exception, appellants should be responsible for it under their guaranty. Now, the language of the exception does not, we think, include any estimated increased cost by reason of the inefficiency of labor. The increased cost of labor and materials was easily ascertainable and was within the contemplation of the parties at the time the contract was entered into.

"It was their manifest intention to exempt appellants' liability on account of increased cost of the building from those causes. But the question of the inefficiency of labor is a thing so vague that it could not have been within the contemplation of the parties that an estimate should be taken of the degree of inefficiency of labor during the construction of the building.

"In fact, that was one of the things appellants undertook to do and were paid to do in selecting the right kind of labor, and there is no proof in this case which would justify the finding that they could not have done that so as to reduce to a minimum in degree the inefficiency of labor.

Statement of the Ownership, Management, Circulation, Etc., Required by the Act of Congress of August 24, 1912.

Of Building Age and The Builders' Journal, published monthly at New York, N. Y., for April 1, 1922.
State of New York } ss.:
County of New York }

Before me, a Commissioner of Deeds, in and for the State and County aforesaid, personally appeared C. G. Peker, who, having been duly sworn according to law, deposes and says that he is the editor of the BUILDING AGE AND THE BUILDERS' JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—Building Age Publishing Corporation, 912-920 Broadway, New York City.

Editor—C. G. Peker, 912-920 Broadway, New York City.

Managing Editor—C. G. Peker, 912-920 Broadway, New York City.

Business Manager — David Meyers, 912-920 Broadway, New York City.

2. That the owners are:

Building Age Publishing Corporation, 912-920 Broadway, New York City.

That the stockholders owning or holding one per cent. or more of the total stock of Building Age Publishing Corporation are as follows:

B. A. & C. P. Holding Corporation, 1 Madison Avenue, New York City.

3. That the stockholders owning or holding one per cent. or more of the total stock of B. A. & C. P. Holding Corporation are as follows:

Frank Meyers, 912-920 Broadway, New York City; David Meyers, 912-920 Broadway, New York City; W. H. Parsons, 912-920 Broadway, New York City; W. A. Bardgett, 912-920 Broadway, New York City; M. & S. Meyers, 1 Madison Avenue, New York City; George Meyers, 1196 First Avenue, New York City; Michael Miller, 794 St. Nicholas avenue, New York City; S. Cowen, 20 East 97th street, New York City; David L. Short, Columbia avenue and Hancock street, Philadelphia, Pa.; G. Friedman, 627 Broadway, New York City; A. Cowen & Son, 34 West 25th street, New York City; John J. Robbins, 276 Fifth avenue, New York City.

4. That the known bondholders, mortgagees, and other security holders owning one per cent. or more of total amount of bonds, mortgages or other securities are:

Architectural and Building Press, 243 West 39th street, New York City.

5. That the two paragraphs next above, giving the names of the owners, stockholders and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than so stated by him.

CHARLES G. PEKER, Editor.

Sworn to and subscribed before me this 21st day of March, 1922.

[Seal] SADYE BLUMENFELD,
Commissioner of Deeds,
New York City, No. 23028.

KEYSTONE COPPER STEEL

Copper, the *Anti-Toxin for* Sheet Metal Rust!

COPPER—properly proportioned, puts into sheet steel a new measure of endurance and resistance to rust that cannot be attained without its help. It makes a new metal of steel.

KEYSTONE COPPER STEEL

Soft and ductile of itself, copper is the martial music that adds the grit of fight wherever rust threatens. It is steel's most effective ammunition. Use it for longer wear and greater permanence.

Use Apollo-Keystone Galvanized. Shall we send new Weight Cards and Apollo Calendar?

For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use Keystone quality Galvanized Sheets and Roofing Tin Plates. Time and weather prove it best for both builder and owner. Sold by leading metal merchants. Look for the added Keystone.

Write for booklets describing Keystone Copper Steel Sheets, Formed Products, and Terne Plates.

News, Notes and Comment

Production of Stone in 1921

ABOUT 62,400,000 short tons of stone was quarried in the United States in 1921, according to the United States Geological Survey, Department of the Interior. This is more than 20 per cent. less than the production in 1920. The estimated value of this stone is $92,500,000, a decrease of 30 per cent. as compared with 1920.

Producers all over the country stated that both wages and prices had been reduced, and nearly all reported a decrease in the cost of production. High freight rates are said to have contributed largely to the general depression in the industry.

Building stone was in but little demand, and the returns at hand indicate a decrease in output of about 25 per cent. The output of monumental stone, which has shown practically no diminution during the last five years, apparently decreased more than 45 per cent. Paving blocks were in great demand, and increases were shown in the sales of curbing and flagging, facts that indicate a revival in street work in cities and towns. The campaign begun for the betterment of suburban and country roads caused an increase of nearly 8 per cent. in the output of crushed stone. Depression in the metal-smelting industry was reflected in a decrease of more than 50 per cent. in stone sold for fluxing and for use as refractory material. Decreases were noted also in the demand for agricultural limestone, and for stone used by alkali works, sugar refineries, paper mills, and in other manufacturing establishments throughout the United States.

Production of Gypsum in 1921

ACCORDING to conservative estimates made by the United States Geological Survey from the incomplete returns available April 1 the quantity of gypsum mined in the United States in 1921 was approximately 2,870,000 short tons, as compared with 3,129,142 tons in 1920. The combined value of the crude and calcined gypsum sold was approximately $20,820,000, as compared with $24,533,065 in 1920.

Book Reviews

Hendrick's Commercial Register of the United States: This 1922 edition contains 2,166 pages; published by S. C. Hendricks Co., Inc., 70 Fifth Avenue, New York City. Price $12.50.

The 30th annual edition, 1922, has just been published of this useful directory of the engineering, hardware, mining, chemical, architectural and building and other industries.

It contains a list of manufacturers, jobbers, purchasing agents, architects, etc., and will prove a very valuable reference book to any buyer.

* * *

The Electric Range Hand Book, 4th edition: This is a 122-page book; published by the Society for Electrical Development, 522 Fifth Avenue New York City. Price $3.00 per copy.

This book is on the installation and handling of the electric range. It contains very valuable information for the electrician as well as for the builder who contemplates putting an electric range in the kitchen of up-to-date apartments and private residences.

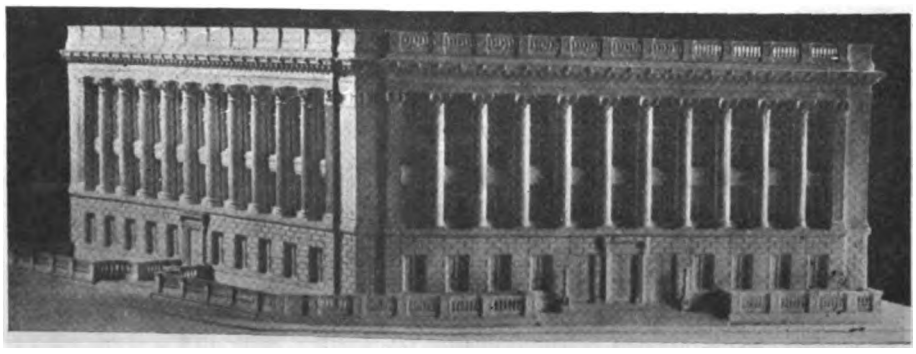
Hand Book of Standard Details by Charles H. Hughes: This is a cloth bound book of 312 pages; published by D. Appleton & Co., New York. Price $6.00.

This book contains convenient forms, tables and formulas of standard details useful in designing. It is intended more for mechanical engineers, but will be especially useful to contractors and draftsmen.

* * *

Concrete, Its Manufacture and Use. Published by the Koehring Co., Milwaukee, Wis. 207 pages; cloth bound.

This is a practical reference book on the practical handling of concrete published by one of our largest manufacturers of concrete machinery. It is in no sense a catalogue but a practical treatise on the best methods of handling concrete and equipment. A nominal charge is made for a copy of the book.



New Building of U. S. Chamber of Commerce

ON May 17th the corner-stone was laid for the new building to house the Chamber of Commerce of the United States. This building is being erected on Lafayette Square, Washington, D. C., on the site of Daniel Webster's old home. The building is estimated to cost $1,500,000.

The illustration shown herewith is a photograph of the model of the proposed building. In its architecture it follows the general lines of the recent public buildings erected in the Capital.

As is probably known to most of our readers, a comprehensive plan is being followed out to make Washington a City Beautiful.

Now Ready for Distribution to Contractors

"COPPER ROOFING"

A Manual of Up-to-Date Practise in the Erection of Copper Roofs, Copper Flashings, Copper Gutters, Copper Leaders, etc.

PROVIDING for the contractor a convenient reference to the latest and best practise in the application of Copper in the roofing and roof-drainage uses of the Everlasting Metal, "Copper Roofing" fills a long-felt need.

Proper methods for the erection of Copper are given. There are a number of full-page illustrations showing the Copper roof applied to various types of buildings. And, wherever it has been thought helpful, the text has been illustrated with figures.

Included are sample specifications covering roofing, flashings, valleys, gutters, leaders, skylights, cornices, etc., and a choice of methods for treating the Copper roof to secure an immediate coloring.

We are anxious that every architect, engineer and contractor interested shall have a copy of "Copper Roofing," and will send a copy promptly on request. There is of course no charge.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

Working Drawings Available to You

This home was designed for a private owner by one of the best residence architects in America.

Sometime ago we published a view of it in one of our books and it attracted so much favorable attention that we had hundreds of requests from all over the country for details and plans.

At last we have prevailed upon the architect to grant us the right of supplying complete working drawings and specifications. These working drawings are exceptionally complete and contain many full size details which make them unusually valuable and different from the ordinary.

Hiawatha's Cost Appeals to Buyers

This home can be built of Brick (solid masonry) for as low as from $9,000 to $13,000 depending upon location and the character of equipment and finish.

After you see the plans in circular No. 705 you should be able to determine the approximate cost of this popular home in your locality. With the complete plans—working drawings—and specifications, which are yours at a nominal price, you can estimate exactly what it will cost to build this home.

Costs Even Less With Ideal Wall

When this home was first built the Ideal Brick Hollow Wall was unknown. Its recent development makes possible the building of this Brick home for even less than the above figures. With the Ideal wall you obtain all the advantages of solid masonry construction at a saving of ⅓ in cost.

The Ideal Wall is thoroughly described in "Brick, How to Build and Estimate"—a 72-page manual of vital information for contractors and builders. It contains 30 tables, 9 full page detail drawings and other information which proves of wonderful assistance in estimating costs quickly and accurately. Only 25 cents postpaid.

The Hiawatha is one of a wide variety of Brick house designs shown in that fascinating volume, "Brick for the Average Man's Home." Here you will find all kinds of homes illustrated and described, together with much helpful information which will prove of great value in interesting prospective home owners, thus helping you to land jobs. The nominal price of $1.00 is to cover printing and distribution costs only.

$1.25 brings both books. Address The Common Brick Industry of America, 2129 Cleveland Discount Building, Cleveland. O.

The Hiawatha

A House You Can Sell Quickly and Profitably

This home is so good looking, practical and economical that it appeals to every one. It is declared by experts to be the finest of its class in America.

Think what a ready market you'd have for such a home if you built it. Think of its greater sales value—its better profit possibilities.

You can now secure complete plans and specifications for this remarkable brick home. Send for free circular No. 705 showing alternate floor plans and giving complete details.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

Review of the Building Situation

BUILDING statistics for April just published by F. W. Dodge & Co. show that the volume of contracts awarded are the highest ever recorded. The previous high record was for the month of July, 1919, the total for that month having been $317,698,000, compared with a total of $353,161,900 in April, 1922.

April's figures represented an increase of 20% over the March and an increase of 60% over that of April, 1921.

The first four months of this year have showed a total figure that is just under a billion dollars and is 65% greater than the total for the first four months of last year.

There has been comparatively very little activity in the building of industrial plants since the close of the war, and it is certainly a good healthy sign of the business revival that the contracts awarded for industrial buildings in April total $24,311,700.

A curious fact that we notice here is that the Middle West district which has been rather inactive, is now spending a large sum for industrial buildings.

Residential building, of course, still continues to lead, amounting, in April, to $132,477,800 or 37% of the month's totals.

Business buildings amounting to $58,711,100 is an increase of 17% over that of the March figure and this is also a very good sign of business revival. A good deal of money is being spent on schools and public works.

In the New England District, the total is 60% ahead of March and two and one-half times that of April, 1921.

In the New York District, comprising New York State and Northern New Jersey, the April total was 30% greater than the March figure and two and one-quarter times that of April, 1921!

In the Middle Atlantic States comprising Eastern Pennsylvania, Southern New Jersey and South to South Carolina, the amount is 9% over that of March and is 72% more than that of last year.

Of the total of $132,477,800 to be spent for residential construction, $87,501,700 or nearly two-thirds is under erection in the New England, New York and Middle Atlantic Districts. This shows that the greatest activity in the building of residences is still concentrated in the Northeastern section of our country.

In the city of New York alone, there is now under construction residential buildings which will have room for 50,000 apartments and before the year is over, it is expected that 50,000 more apartments will be provided for.

These figures are exclusive of the one- and two-family houses in New York, of which a great number are being built.

Record of April, 1922. Building Contracts Awarded

BUILDING MATERIALS

GUMLASTIC—The Best Protective Roof Coating on the Market

It toughens and callouses with age. It will not dry out, peel or crack. It is a scientific combination of pure asbestos, gums, waterproof lacquer, and non-volatile oils. It is unaffected by the severest cold or most intense heat—fireproof and rotproof.

Contractors can make big profits coating leaky roofs with Gumlastic roof coating. A gallon covers from 50 to 75 square feet. It is a perfect coating for burlap, canvas, tar and gravel, concrete, felt, iron, tin and steel roofs. You can save your customers money by coating their roofs with Gumlastic.

YOUR REPUTATION

as a contractor, builder or dealer is in every square of roofing you sell, or every roof you lay. You are selling your customers *permanent shelter*—backed by your guarantee of honest materials and good workmanship.

That is why you rightly demand from the manufacturer the same quality of materials and skill in workmanship, as a guarantee of durability and lasting beauty for all roofs.

OUR REPUTATION

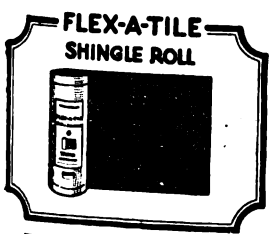
is behind every piece of Flex-a-Tile Roofing we manufacture.

The fact that The Richardson Company builds Flex-a-Tile "from the ground up"—operating its own felt mills, its own asphalt refineries, its own slate quarries—guarantees uniformly perfect materials.

The fact that The Richardson Company has specialized in the manufacture of fine roofing felt since 1868 guarantees uniformly skilled workmanship.

And the fact that The Richardson Company is thoroughly fertilizing its market through advertising assures recognition of the merits of Flex-a-Tile on the part of the building public.

For re-roofing over old shingles or for new construction; for smooth or slate surfaces; for large roofs or small—there is a Richardson Product, with the Richardson reputation behind it, designed to fit every roofing requirement.



Write us for any further information you may require.

Address Dept. T

The Richardson Company
Lockland, Cincinnati, Ohio

The extra thickness of these shingles adds to the beauty of a roof, as well as to its permanence. Yet they cost less than a third more than standard asphalt shingles.

Each roll of Flex-a-Tile Shingle Roll Roofing contains 108 square feet, which covers 100 square feet of roof, and allows a two inch lap. Nails, cement and complete instructions with each roll.

RICHARDSON Product

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 68*

Koehring Company, Milwaukee, Wis.
38. *Concrete—Its Manufacture and Use.* Book. 4½ x 7 in. Illustrated. 207 pp. Comprehensive discussion from the practical standpoint of concrete.
Lehigh Portland Cement Co., Allentown, Pa.
40. *The Expense-Proof Farm.* Book of 96 pp. Illustrated. Showing methods of constructing various buildings, fence posts, water troughs, etc., used about the farm.

CHAINS
Bridgeport Chain Co., Bridgeport, Conn.
29. *Catalog No.* 14. Contains 64 pp. Illustrated, of different chains that can be used in all parts of building construction.

CLAMPS
James L. Taylor Mfg. Co., Poughkeepsie, N. Y.

COLUMN AND BEAM COVERING
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
39. *32-page booklet,* 8½ x 11. Pyrobar Tile.

COLUMNS
Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
233. *Catalog No. D-47.* 48 pages, illustrated. 7¼x10 in. Illustrating the Koll's Patent Lock-Joint Wood Columns.

CONCRETE APPLIANCES
Universal Cement Mould Co., No. Milwaukee, Wis.
41. *Illustrated Folder* describing mold for building hollow concrete walls for homes, garages, barns, silos, etc.
Van Guilder Double Wall Co., 77 South Avenue, Rochester, N. Y.
42. *A Catalog* describing the Van Guilder system of portable forms for the building of hollow concrete walls on the thermos bottle idea for the erection of homes, ice houses, barns, silos, etc. Walls are dry, as there is continuous air space around entire building.

CONCRETE MACHINERY
A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
43. *Descriptive Illustrated Circular* of Magic Concrete Mixer.
The American Cement Machine Co., Inc., Keokuk, Iowa.
Badger Concrete Mixer Co., Majestic Bldg., Milwaukee, Wis.
Concrete Equipment Co., 535 Ottawa Street, Holland, Mich.
Concrete Block Machine & Mold Co., 114 S. 2nd Street, St. Louis, Mo.
253. *Catalogue No.* 38. Describes Building Block Machines. It is a 40-page book, 6 x 10 in.
254. *Catalogue No.* 5. This is a new catalogue describing the Adjustable Steel Culvert Forms. 8-page book 6 x 10 in.
255. *Catalogue No.* 11. This is a new catalogue describing the new Steel Burial Vault Molds. It is 8 pages, 6 x 10 in.
C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
Ideal Concrete Machinery Co., 1334 Monmouth Street, Cincinnati, Ohio.
Jaeger Machine Co., 216 Dublin Avenue, Columbus, Ohio.
Koehring Co., Milwaukee, Wis.
46. *Koehring Construction Mixers.* Booklet. 7¼ x 10½ in. Illustrated. 96 pp. Complete information on construction type concrete mixers.
47. *Koehring Dandie Mixer.* Booklet. 6 x 9 in. Illustrated. 24 pp. Illustrating and describing Koehring line of Dandie light mixers.
Little Whirlwind Mixer Co., 438 Gould Street, La Crosse, Wis.
Republic Iron Works, Box 602, Tecumseh, Mich.
Standard Scale & Supply Co., 1631 Liberty Avenue, Pittsburgh, Pa.

CONCRETE MARBLE
Art Stone Co., Waynesboro, Pa.
45. *Descriptive Circulars* with illustrations of different marbles in colors. Sent free to any interested party.

CONSTRUCTION, FIREPROOF
National Fire Proofing Co., 250 Federal St., Pittsburgh, Pa.
226. *Standard Fire Proofing Bulletin* 171. 8½ x 11 in. 32 pp. Illustrated. A treatise on fireproof floor construction.
National Pressed Steel Co., Massilon, Ohio.
United States Gypsum Company, 205 West Monroe St., Chicago, Ill.
48. *Pyrobar Gypsum Tile.* Booklet. 8½ x 11 in. 32 pp. Illustrated. Detail and specifications for fireproof partitions.
49. *Bulletins,* 8½ x 11 in. Containing details and specifications for Pyrobar voids for use with reinforced concrete joist floor construction; Pyrobar roof tile; and monolithic gypsum floors and roofs.

CONTRACT AND ESTIMATE BLANKS
L. Fink & Sons Printing Co., Laurel Springs, N. J.
166. *Catalog and Samples* of contract sheets, estimate blanks, job tickets, time sheets, wage receipts, etc., with prices.

DAMPERS AND ASH DUMPS (Fireplace)
The Danley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.
Stover Mfg. & Engine Co., 747 Lake Street, Freeport, Ill.

DAMP-PROOFING
Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
Certright Metal Roofing Co., Philadelphia, Pa.
Illinois Zinc Co., 280 Broadway, New York.
National Sheet Metal Roofing Co., 339 Grand Street, Jersey City, N. J.
Rocbond Co., Van Wert, Ohio.
F. C. Sheldon Slate Co., Granville, N. Y.

DOOR CHECKS
Park Manufacturing Co., Worcester, Mass.
50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
247. BOCA steel sash. (E-22). A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½x11 in.
Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.
Hess Warming & Ventilating Co., 1201 Tacoma Bldg., Chicago, Ill.
Henry Hope & Sons, 103 Park Ave., New York.
51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¼ x 18½ in. 32 pp.
Truscon Steel Company, Youngstown, Ohio.
52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.
53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill. 8½ x 11 in.

DOOR AND WINDOW FRAMES
Andersen Lumber Company, South Stillwater, Minn.
55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¾ x 10¾, 24 pages.
56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.

DRAFTING MATERIALS
A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
Keuffel & Esser Co., Hoboken, N. J.
Peerless Blue Print Co., 347 Fifth Avenue, New York City.
Warren-Knight Company, 136 No. 12th Street, Philadelphia, Pa.

DUMBWAITERS
Kimball Bros. Co., 1106 Ninth Street, Council Bluff, Iowa.
Sedgwick Machine Works, 156 W. 15th Street, New York.
57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

ELEVATORS
Kimball Brothers Company, Council Bluffs, Iowa.
58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.
Richards-Wilcox Mfg. Co., Aurora, Ill.
59. *"Ideal" Elevator Door Equipment.* Catalog showing elevator door hangers for one, two and three speed doors, also doors in pairs and combination swing and slide doors. Door closers and checks. 24 pp. Ill. 8½ x 11 in.
Sedgwick Machine Works, 156 West 15th Street, New York.

FACTORY EQUIPMENT
The Edwards Mfg. Co., Cincinnati, Ohio.
60. *Edwards' Steel Equipment.* Illustrated catalog. Showing steel lockers and shelving for factories, offices, stores, schools and hospitals, together with illustrations and description of "Edmanco" steel office furniture and filing cabinets. Size 8 x 11 in. 32 pp.

FIREPLACES AND MANTELS
Apex Fireplace Co., Urbana, Ill.
Stover Mfg. & Engine Co., 747 Lake Street, Freeport, Ill.
Strait & Richards, Inc., Newark, N. J.
62. *Catalog* describing fireplaces, electric and gas logs, heating supplies, heaters, etc.

FLOOR HARDENERS
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
61. *Agatex and Its Performances.* Booklet. 8½ x 11 in. Describes the methods of hardening concrete floors by the application of a chemical which forms a new surface as hard as agate.

FLOORING, LUMBER
The Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
63. *The Perfect Floor.* Tells how to lay, finish and care for Oak Flooring. 16 pp. 14 Illus. 5½ x 7¾ in.
Oak Flooring Manufacturers Association, 1014 Ashland Block, Chicago, Ill.
64. *Modern Oak Floors.* Booklet. 6½ x 9¼. 24 pp. Illustrated. A general book that tells the complete story on Oak Flooring.
65. *Oak Flooring, How and When to Use It.* Booklet. 3½ x 6¼ in. 16 pp. Illustrated. A small, technical book showing the general rules, standard thickness and widths, how to lay, finish and care for oak floors.
Pacific Lumber Co., 2070 McCormick Bldg., Chicago, Ill.
United States Gypsum Company, 205 W. Monroe Street, Chicago Ill.
66. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins, 8½ x 11. Pyrofill.
Wood Mosaic Co., New Albany, Ind.
227. *Catalogue* of wood-carpet, strips, plain and ornamental parquetry, tongue and groove flooring in natural wood colors.

FLOORING, COMPOSITION
Everlasbestos Flooring Co., Rochester, N. Y.
National Kellastone Co., 155 East Superior Street, Chicago, Ill.

FLOOR SURFACING
Amer. Floor Surfacing Machine Co., 521 So. St. Clair Street, Toledo, Ohio.
Wayvell Chappell & Co., 137 No. Jackson Street, Waukegan, Ill.
M. L. Schleuter, 223 W. Illinois Street, Chicago, Ill.

FLOOR VOIDS FOR USE IN CONCRETE
United States Gypsum Company, 205 W. Monroe Street, Chicago, Ill.
67. *Loose-leaf Bulletins.* 8½ x 11. Pyrobar Gypsum Floor Tile.

Sheetrock Stands Every Test

Some wallboards may have one good feature — some, another. Sheetrock effectively combines all the qualities you want in a dependable wall and ceiling material.

Both in new construction and in remodeling and repairs, Sheetrock makes an attractive, high grade job of which you can always be proud.

Sheetrock Goes Up Fast. It comes in thick, rigid sheets all ready for nailing to the joists and studding. It is cut with a common saw and is quickly fitted to form.

It Stops Fire. Being made from gypsum rock, Sheetrock will not burn. It has been tested for fire-resistiveness and approved by the Underwriters' Laboratories, Inc.

Sheetrock Won't Warp. It will not shrink, warp or buckle. It remains firm and flat year after year. Sheetrock can be decorated with wallpaper, paint or panels.

Keeps Rooms Comfortable. As the gypsum rock from which it is made is an efficient non-conductor of heat and cold, Sheetrock helps keep rooms comfortable the year 'round. Sheetrock also deadens sound.

Sheetrock Is Economical. Because it is low in first cost and will outlast the building in which it is erected, and because of the savings it effects in construction labor, Sheetrock provides smooth, solid walls at a minimum cost.

Ask for a sample of Sheetrock and a plan which will help you line up the Sheetrock jobs that exist in your locality. Don't put it off. Fill in and mail the attached coupon today!

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

86. *Syracuse Pipeless Booklet.* 4½ x 8 in. 12 pp. Illustrated. General Booklet giving sizes and capacities.
87. *Valves, Syphons and Traps.* A series of pamphlets to enclose in envelopes, describing the well known Thermostatic Return Line Valves and other heating equipment specialties made by this company.
Sill Stove Works, Rochester, N. Y.
Strait & Richards, Inc., Newark, N. J.
88. *Catalog* describing fireplaces, electric and gas logs, heaters, etc.

HOISTS—See Elevators
American Saw Mill Machinery Co., Hackettstown, N. J.
89. *Bulletin No.* 10 describing several kinds of builders' hoists.
C., H., and E. Mfg. Co., Milwaukee, Wis.
90. *Bulletin No.* 3. Hoists and Mortar Mixers.

HOLLOW TILE
Fiske & Company, Boston, Mass.
National Fire Proofing Co., Pittsburgh, Pa.

INCINERATORS—See Garbage Destroyers

INSULATION
Bishopric Mfg. Company, 103 Este Avenue, Cincinnati, Ohio.
92. *Homes Built on the Wisdom of Ages.* Catalog. 6 x 9 in. 48 pp. Illustrated. Describing the use of Bishopric Stucco-Board and Bishopric Sheathing Board.
Brown Co., Portland, Me.
93. Send for samples of "Bermico" Sheathing paper—different weights for all purposes of insulation.
Samuel Cabot, Inc., 141 Milk St., Boston, Mass.
249. Cabot's Quilt. Catalog containing drawings and description.
United States Mineral Wool Co., 280 Madison Avenue, New York, N. Y.
94. *The Uses of Mineral Wool in Architecture.* Illustrated booklet. Properties of insulation against heat, frost, sound, and as a fire-proofing, with section drawings and specifications for use. It gives rule for estimate and cost. Size 5¼ x 6¾ in. 24 pp

JOISTS AND STUDS, PRESSED STEEL
General Fireproofing Co., Youngstown, Ohio.
National Pressed Steel Co., Massillon, Ohio.
96. *Descriptive 4-page folder* on metal lumber for building construction.
Truscon Steel Company, Youngstown, Ohio.
95. *Truscon Steel Joists.* Catalog. 8½ x 11 in. 24 pp. Illustrated. Information on Pressed Steel Beams and Joists for light occupancy buildings. Tables, specifications and views of installations.

LATH, METAL AND REINFORCING
Buffalo Wire Works Co., Inc., 446 Terrace, Buffalo, N. Y.
250. Write for Booklet 61-F on wire lathing.
General Fireproofing Co., Youngstown, Ohio.
97. *Catalog* describes Herringbone Rigid Metal Lath, how it is applied and used, with detailed drawings, specifications, etc. 32 pp.
National Pressed Steel Co., Massillon, Ohio.
Truscon Steel Co., Youngstown, Ohio.
99. *Hy-Rib and Metal Lath.* 18th Edition. Catalog. 8½ x 11 in. 64 pp. Illustrated. Gives properties of laths, specifications, special uses and views of installations.

LEVELS
A. S. Alee Co., 513 Olive Street, St. Louis, Mo.
L. Beckman Co., 1004 Jackson Street, Toledo, Ohio.
Keuffel & Esser Co., Hoboken, N. J.
Warren-Knight Company, 136 North 12th St., Philadelphia, Pa.
100. *"Sterling" Levels and Transits.* 32 pp. illustrated catalog. Description, specifications and structural advantages required in modern practice for establishing lines, levels, angles, etc. Vest Pocket Manual of adjustments.
David White Co., 907 Chestnut Street, Milwaukee, Wis.

LIGHTING
American Three-Way Prism Co., 1307 South 55 Court, Cicero, Ill.
98. *Descriptive Circular* on the use of prisms for directing light to dark corners.

LIGHTNING RODS
E. G. Washburne Co., 207 Fulton Street, New York.
232. *Descriptive Catalogue in Colors.* Showing different designs of weather vanes, lightning rods, ventilators, etc.

LIGHTING SPECIALTIES
I. P. Frink, Inc., 24th Street and 10th Avenue, New York, N. Y.
250. *Lighting Service for Hospitals.* A booklet illustrated with photographs and drawings, showing the types of lights for use in hospitals, as operating table reflectors, linolite and multilite concentrators, ward reflectors, bed lights and microscopic reflectors, giving sizes and dimensions, explaining their particular fitness for special uses. Size 7 x 10 in. 12 pp.
251. *Frink Reflectors and Lighting Specialties for Stores.* Catalog No. 424. A catalog containing a description of the Frink Lighting System for Stores; the Synthetic System of Window Illumination; and a number of appliances to produce the most effective lighting of displayed objects. 20 pp. Illustrated. 8 x 11 in.
252. *Frink Lighting Service for Banks and Insurance Companies.* Reflectors. Catalog No. 425. A very interesting treatise on the lighting of offices; with details of illustrations and description of lamps and reflectors. Contains a list covering several pages, of banks using Frink Desk and Screen Fixtures. 30 pp. Illustrated. 8¼ x 11 in.

LUMBER
Arkansas Soft Pine Bureau, 802 Boyle Building, Little Rock, Ark.
101. *Arkansas Soft Pine Handbook.* Catalog. 8½ x 11¼ in. 62 pp. Illustrated. Concise, technical information regarding physical character, uses, and including Grading Rules and Standard Molding Designs.
102. *The Home You Long For.* Booklet. 8¼ x 11 in. 32 pp. Illustrated. Folio intended for the layman. Contains 18 homes by Robert Sayfarth, Architect, Chicago. Of general interest to architects, but does not contain technical information.
Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
104. *The Post Everlasting.* Booklet. 10½ x 7½ in. 32 pp. Illustrated. Information regarding creosoted yellow pine fence posts, barn poles, paving blocks, etc.
228. *Poles That Resist Decay.* Booklet. 9¾ x 4 in. 16 pp. Illustrated. Poles for telegraph, telephone, high power transmission lines.

Safely from Ridge to Ground

The **roof** catches the rain or snow, but it is the valleys, gutters and leaders that carry the rain or melted snow to the ground.

If valleys or gutters **leak,** due to rust or corrosion, decorations and furnishings are at the mercy of the elements, **no matter if the roof proper is in perfect condition!**

If Valleys and Gutters Are

TARGET-AND-ARROW ROOFING TIN

(*Prior to 1905 called Taylor's "Old Style"*)

decorations and furnishings are absolutely safe, for TARGET-AND-ARROW is made to **last,** and while its first cost is slightly more than ordinary roofing tin, it will save many, many times the original investment by preventing costly damage to the favorite furniture and fittings.

Send for "THE ACHILLES HEELS OF A BUILDING," a graphic chart showing where gutters, valleys, flashings and other vital spots occur in the roof of a building and explaining how and why "Target-and-Arrow" assures permanent protection to these important places.

N. & G. TAYLOR COMPANY
304 CHESTNUT ST. PHILADELPHIA, PA.

Ripolin Co., The, Cleveland, Ohio.

256. *Ripolin Specification Book,* 8x10¼ in., 12 pp. Complete architectural specifications and general instructions for the application of Ripolin, the original Holland Enamel Paint. Directions for the proper finishing of wood, metal, plaster, concrete, brick and other surfaces, both interior and exterior, are included in this Specification Book.

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.

131. *Spread the Sunshine Inside.* Booklet. 5 x 8 in. 24 pp. Describes methods for light saving by the application of light reflecting enamels to interior walls of factories.

PARTITION STEEL

Empire Steel Partition Co., College Point, Long Island, N. Y.

PARTITION SYSTEM

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels with special clip, ready for plastering.

PARTITION TILE

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PLASTER—(Interior)

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

PLASTER BOARD

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PERGOLAS

Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.

235. *Album No. 33.* 7½x10½ in. 42 pages of illustrated literature regarding the various types of Pergolas.

PLASTER, INTERIOR

National Kellastone Co., 155 East Superior Street, Chicago, Ill.

PLUMBING SUPPLIES

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

Hess Warming & Ventilating Co., 1205D Tacoma Building, Chicago, Ill.

136. *Hess Sanitary Steel Medicine Cabinets.* Booklet. 4 x 6 in. 16 pp. Illustrated.

B. Karol & Sons Co. 806 So. Kedzie Avenue, Chicago, Ill.

Trenton Potteries Co., Trenton, N. J.

257. *Our New Catalog Shows These Details.* If our new Catalog R is not on your desk, by all means send for a copy. Architects who have seen it quite generally pronounce it the most completely comprehensive catalog of plumbing fixtures in their experience. Not only are complete specifications given, but the detail drawings are invaluable in showing exactly how and when a certain type should be used.

PUMPS

C. H. & E. Mfg. Co., Milwaukee, Wis.

251. Bulletin No. 2. Pumps.

The F. E. Myers & Bro. Co., Ashland, Ohio.

137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.

138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinders and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illustrated.

REFRIGERATION

McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.

ROOF DECKS

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

ROOFING MATERIALS

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.

American Sheet & Tin Plate Company, Pittsburgh, Pa.

140. *"Better Buildings."* Catalog. 8½ x 11. 32 pp. Describing Corrugated and Formed Sheet Steel Roofing and Siding Products—Black, Painted and Galvanized; together with directions for application of various patterns of Sheet Steel Roofing in various types of construction.

112. *Copper—Its Effect Upon Steel for Roofing Tin.* Catalog 8½ x 11 in. 28 pp. Illustrated. Describes the merits of high grade roofing tin plates and the advantages of the copper-steel alloy.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

141. *Specifications and Price List.* Descriptive booklet. Details of Ambler Asbestos Cement Roofing Slates, "Century" Asbestos Shingles and Asbestos Corrugated Sheathings. Tables and drawings. Size 6 x 9 in. 44 pp.

142. *Ambler Asbestos Corrugated Roofing.* Catalog gives complete data for specifying, drawings, methods of application, tables, etc. Size 8½ x 11 in. 20 pp.

Wm. L. Barrell Co., of N. Y., Inc., 50 Leonard Street, New York.

143. *Prepared Canvas for Roofing.* Samples can be obtained on application. A canvas for every use.

John Boyle & Co., Inc., 112-114 Duane Street, New York, N. Y.

145. *Boyle's Bayonne Roof and Deck Cloth.* List B 93. A prepared roofing canvas guaranteed waterproof for decks and the roofs and floors of piazzas, sun-parlors, sleeping porches, etc.

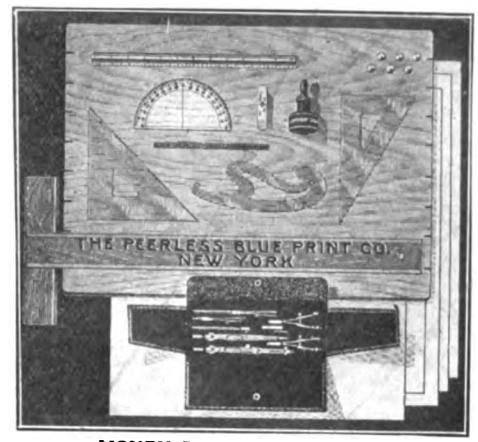
Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt



A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

341-347 Fifth Avenue, New York

Mr. Architect—

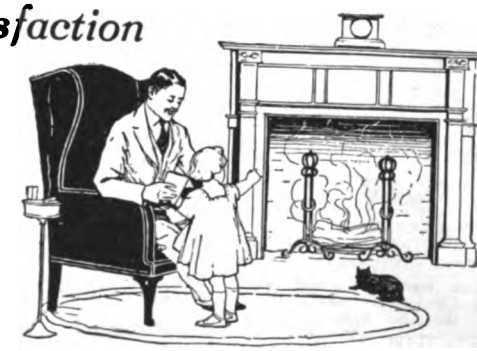
What about the attic space?

Is it used to advantage or is it allowed to go to waste because you have not been able to provide the necessary space in the room below?

If so

You should know more about The Bessler Movable Stairway—the logical solution to this problem.

The Bessler has been thoroughly tested by hundreds of users under all sorts of conditions.



It has merit—strength, ease of operation, appearance and convenience.

Shouldn't you really have our catalogue giving sizes of stairs, opening widths, ceiling heights, prices, etc.? You owe it to yourself to keep posted on this "modern way up"—The Bessler Movable Stairway. Write for your copy of our catalog today.

Fireside Satisfaction

and what it calls for

IT calls for an easy chair, a pipe, and a book; for a hearth rug and pussy cat; for a tiny daughter who begs for a story. It calls for a fire that really burns—a bright, clean, warm, smokeless blaze that needs little attention or fuel.

Make sure about the fire with a Donley Damper. The other details will arrange themselves, if you are right in this fundamental feature.

American "Jewel" Bench Planer

American "Variety" Tilting-Table Saw Bench

American "Universal" Saw Bench

American "Triumph" Planer, Matcher and Moulder

"Furnishes All Necessary Mill Work"

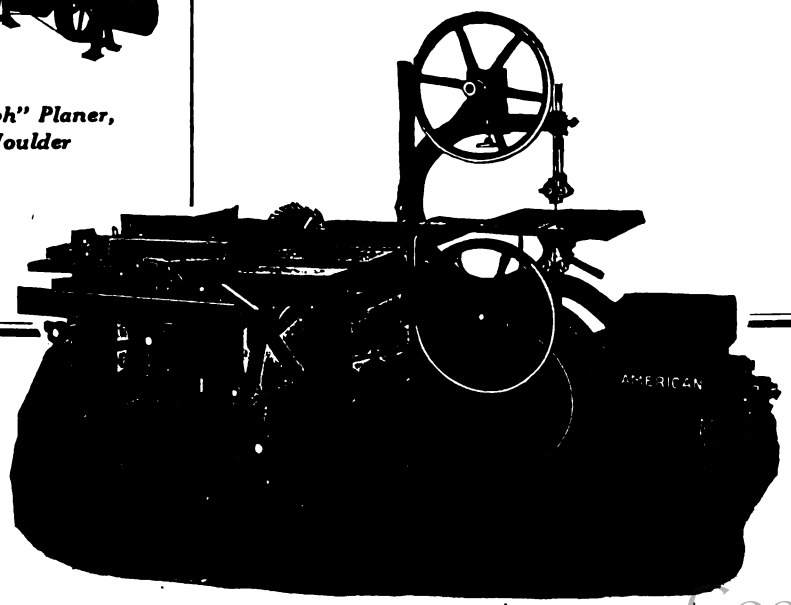
THAT is what Frederick Skon, a carpenter and builder of Jersey City, N. J., says about the American Contractors' Variety Woodworker.

His letter is as follows:

> "The Contractors' Variety Woodworker has proven very satisfactory in my shop. I cannot say what department the machine has proven most useful in, as the rip-saw, cross-cut saw, jointer and mortiser are in constant use by two men in my shop. I think it is sufficient recommendation for the machine to say it furnishes me with all necessary mill work."

Hundreds of contractors, builders and carpenters, the country over voice the same enthusiasm, on the all around utility of the "American" Contractors' Variety Woodworker.

Put an "American" in your shop and from the start it will prove a dividend paying investment in time and labor saved and volume of work turned out.



Write for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of woodworking machinery.

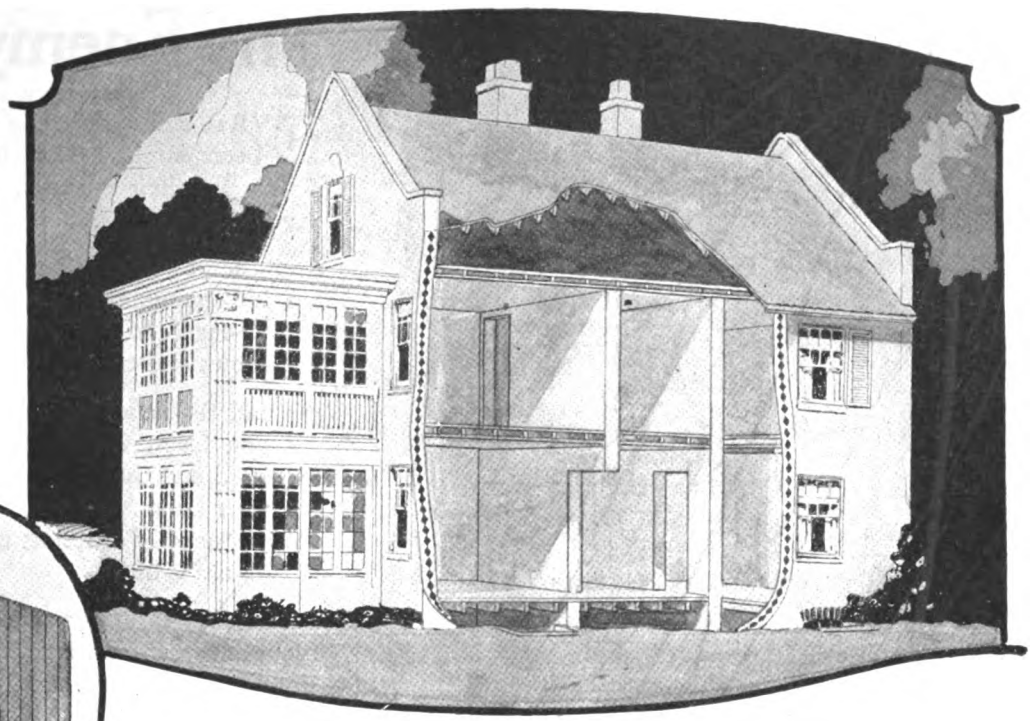
How Many Possible Buyers Get Your Catalogues?



The manufacturers whose catalogues are listed in "Selected List of Manufacturers' Literature" are getting results—that is why they continue to describe their catalogues in this list.

You can get similar results. Insert a brief description of the catalogues you issue and you will note a ready response from Builders, Contractors and Architects who are always eager to learn of new products or new uses for old products.

The cost is nominal—only $5 per listing per month.

What makes a refrigerator independent of the weather? Dead air space. See how this principle is used in Hollow Tile.

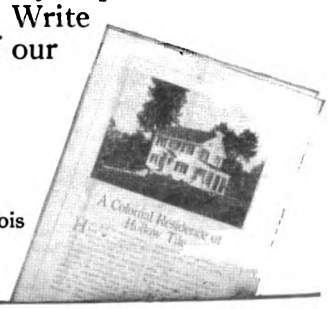
Take a Hint from the Ice Box

Read Why Some Houses Are Cool and
Comfortable in Summer

Swing open the refrigerator door to get a glass of milk or something—how cold it is!

That's due to dead air space.

Dead air space permits neither heat nor cold to pass. The scorching rays of the summer sun cannot filter through the dead air space in Hollow Tile.



Sell your customers the comfort of coolness as well as a house. Show them how Hollow Tile keeps the home cooler in summer and warmer in winter—saving coal.

Here is a fine point to close a sale—this extra convenience without additional cost.

Build with Hollow Tile—fireproof, weatherproof and strong. When you show how it costs only 5 per cent more than wood—Man, the job is yours! Write for free plan folders. Take advantage of our complete plan service.

Complete plans and specifications of many types of houses, farm buildings and garages are ready for you at the Hollow Building Tile Association.

THE MOST ECONOMICAL FORM OF PERMANENT CONSTRUCTION

Digitized by Google

ISOMETRIC DRAWING
Showing steel joist floor construction.

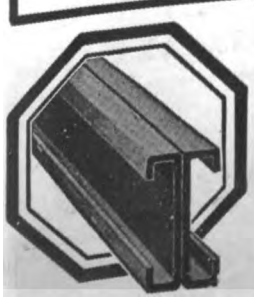
The panels above show the effect of basement fires on a wood floor as compared with a Steel Joist Floor. Lower panel shows Steel Joist Floor detail. Over 2,000 dwelling fires occurred every week last year. Most of them started in basements.

The Enemy Within

EVER since life came upon earth there has been enmity. Man has his enemies. Animals have their enemies. Birds, trees, fish—all have their enemies.

And that building that shelters you and yours has its enemy, too. It ever lurks within that home, eager to devour it together with your loved ones and treasured possessions.

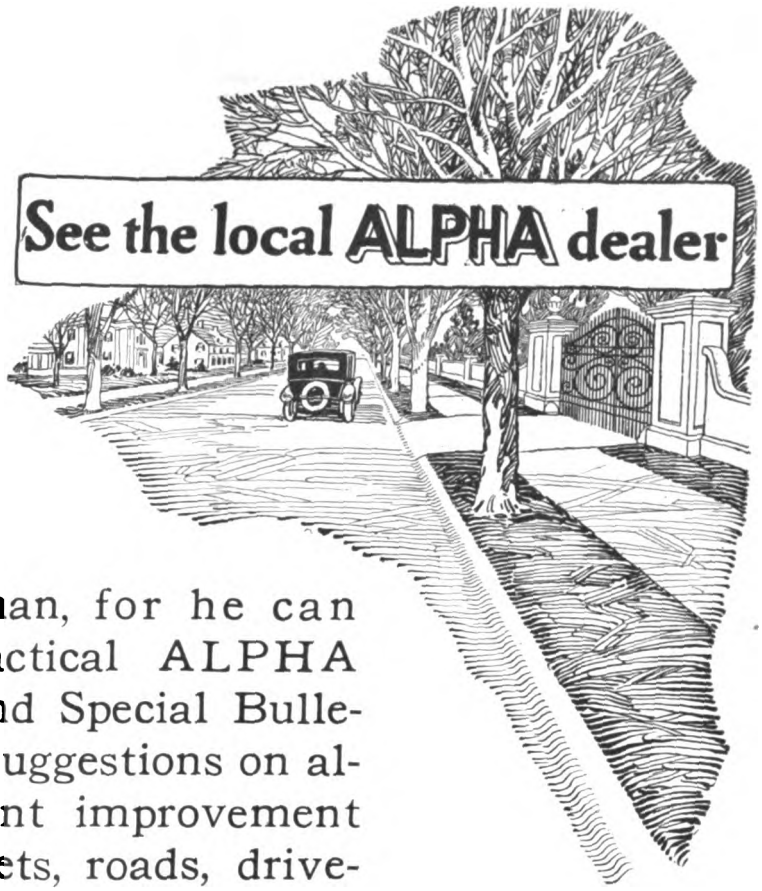
We call that enemy **FIRE**. You dread it. And yet you foster it. You build with inflammable materials and thus place food in its path throughout your home. When it attacks you, you fight it. It's usually a losing game. Don't fight fire out—build it out.



Perhaps you, like many others, have always thought firesafe construction too costly for homes. You approved it for office buildings, theatres, etc., but you felt that you couldn't afford it. That may have been true in years gone by. But it's not true today.

Basement walls are fireproof. But if you cover your basement with a wood-beam floor you encourage the home's destruction. Build a Firesafe First Floor over those fireproof basement walls and cut off from the livable sections of your home the fire hazards located in the cellar.

The cost of this simple construction is little more than common wood-beam floor construction. National Steel Joists are as light as wood beams and as easily handled. Many millions of square feet of floor space have been built with these steel joists in dwellings, schools, office buildings, apartments, etc. Stocks of National Steel Joists are carried by most structural steel companies throughout the country.



Send us a pencil sketch or picture of the residence, store or other building you are planning and blueprint layout, list of materials, estimate, etc., will be furnished without charge. We have a pamphlet for contractors giving safe loading tables and details. Shall we mail you one?

Contractors and Dealers Should Help Each Other

Poor dealers make a poor town. A poor town doesn't build. It can't.

Strong dealers make a strong town. A strong town does build.. And keeps on growing.

Strengthen your dealers and you strengthen your town. Strengthen your town and you strengthen yourself. It's simple. Hard sense. Good business.

Your dealer carries supplies and always can help you—at once—in a pinch.

Your dealer knows you and can give you a line of credit. Without credit no business man can get very far.

And finally, your live dealer is your best salesman. He is constantly getting tips. He has to turn them over to you because he can't use them himself. And if he turns his tips over to you, the least you can do is to turn your business over to him.

We urge all contractors to buy through their dealers. Because a growing dealer means a growing town. And a growing town means a steadily increasing building program. And since we are in the building business we believe in a real building program for all.

That's why we have adopted the policy of selling to building material dealers exclusively.

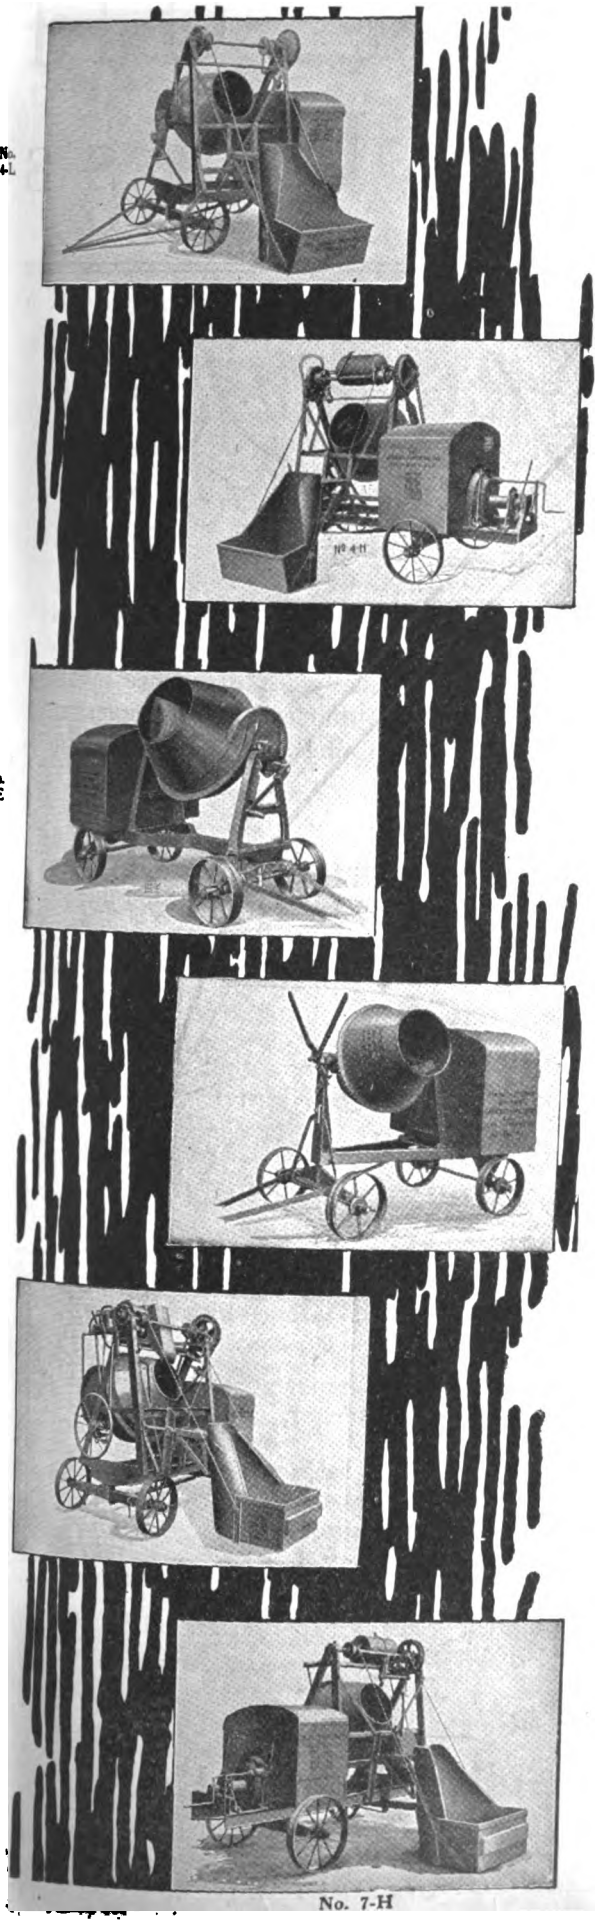
Expansion and Contraction Shorn of Power

WHEN KELLASTONE stucco powder and the magnesium chloride mixing fluid are combined, the setting reaction results in a chemical crystallization absorbing a majority of the moisture content, thereby eliminating rapid evaporation and consequent high porosity. Accordingly, Kellastone stucco coatings are exceedingly dense, thereby effectively and permanently repelling the entry of moisture. By repulsing the attacks of the most active agency of expansion and also because magnesite by nature is dormant to expansion and contraction, cracking and deterioration caused by these destructive elements and so frequently present in ordinary stucco walls, may be completely avoided by specifying ***Genuine Kellastone.***



KELLASTONE Super Plaster for interior walls is built on principles differing radically from any other plastic product. It is fibrous and very light, thereby possessing great volume and spreading capacity. It attains six hundred pounds per square inch tensile strength in thirty days, No plaster in existence can approach its flexibility and water will not damage it. It is highly plastic —works as easy as gypsum—and may be applied over any construction surface.

Many architects and builders have expressed appreciation for the interesting KELLASTONE publications, copies of which we shall be pleased to send upon request.

Jaeger
A MIX A MINUTE

When You Think of JAEGER *Think of "Tilting-Drum"*

EVERY one of the 18 Jaeger mixer outfits is a tilting-drum machine. This line not only gives you the widest possible choice of mixers—it gives you a mixer that has definitely proven its superiority over any non-tilting type mixer made.

Consider this fact: Of the 50,000 mixers used in this country more than 25,000 are tilting-drum machines. **And of this 25,000, more than half are Jaegers!** Remember that there are but two concerns putting out a standard tilting-drum mixer compared to a host of concerns making other types—and you'll agree that the tilting-drum is the most popular type mixer made.

The Jaeger Tilting-Drum gives you a quicker mix. It takes but 5 seconds to tilt the drum and completely discharge a batch—half the time that it takes to dump a batch from a non-tilting mixer where the concrete is mechanically dipped out.

You get **a more thorough mix.** The scientific shape of the bowl and placing of the paddles insure that.

You get simpler construction. This means less wear, less upkeep—**lower depreciation. The depreciation of a Jaeger is 20% to 30% lower than on any other mixer made!**

Speed of mix, thoroughness of mix, low cost of operation—these are the features that insure low-cost concrete and bigger profits.

Our new catalog and list of lower prices will interest you. Send in the coupon today!

Just Off the Press

Beautiful Homes of Moderate Cost

A book of 100 pages, large size, 9"x12", printed on heavy paper, illustrating the work of architects known nationally for excellence in design of houses of moderate cost—practical, economical. Handsome front cover design, in 3 colors.

Here is a plan book which is entirely different from existing plan books. Every design, whether it is of the simple frame dwelling or the larger residence has been designed so as to secure beauty and convenience.

Builders and contractors can use "Beautiful Homes of Moderate Cost" **to create more business.** Just show this book to your prospects and let them pick out the home they like best. Every home illustrated in this book will be a credit to the community where it is built and the builder.

The designs include bungalows, one-family and two-family houses; frame, brick, hollow tile, stone, stucco and combination of these materials.

Complete Blue Print Plans, ¼" Scale, and Specifications for each design are available at small cost.

The book also shows Garages, Pergolas, Garden Furniture, Gates and Fences, Kitchen Arrangements, desirable Built-in Features, and articles on Financing, Carrying Charges, Landscaping, Wiring, Furnishing, Decorating, House Building Materials, Roofing, Heating, Plumbing, etc.

A book of exceeding importance to every prospective home owner, and, consequently, just the book for every builder, draftsman, lumber dealer, real estate operator, and mortgage and building loan organizations.

Published to complete our service to the industry and so priced very nominally—$1.00 the copy, heavy paper covers; $1.50 in cloth covers.

OAK FLOORS
(For Everlasting Economy)

All Kinds of Buildings

Whether you build cottage or coliseum, warehouse, factory or post office, Oak meets every test of modern flooring.

No flooring is more beautiful, more sanitary, more durable, more easily cleaned, more susceptible of fine finish.

Oak Floors increase selling and renting value. Note constant mention of "Oak Floors" in "For Sale and Rent" columns of newspapers.

All Types of Floors

It may now be assumed that the *modern home* will have Oak Floors. But where a "high duty floor" is required, the *durability* of Oak makes it the logical choice. No. 2 Common Oak Flooring, formerly called "Factory Oak Flooring," is now the cheapest hardwood obtainable, being 25% under any other hardwood.

Cases are on record where this flooring has stood up for over 40 years in a machine shop where heavy, vibrating machinery was in daily use.

All Stains and Finishes

The adaptability of Oak Flooring to take any desired stain or finish clinches the arguments in its favor, as the builder may take it for granted that Oak may be finished in any desired color.

Oak Floors Over Old Floors

On remodelling jobs the special ⅜ thickness for overlaying old, worn floors, at small cost, should be borne in mind.

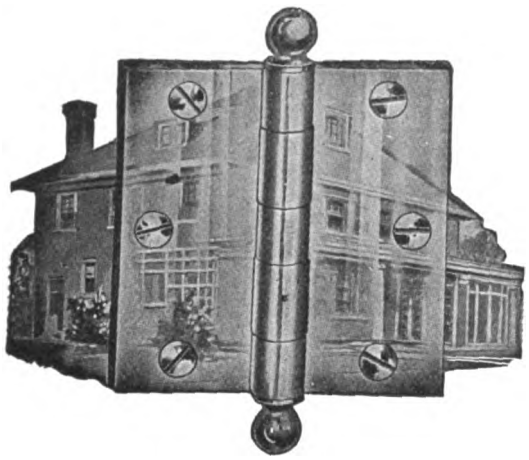
KNAPE & VOGT Garment Carriers

There Is One for Every Closet in Every Home



KNAPE & VOGT Garment Carriers are made in all lengths from 12 to 60 inches. They will fit any and all closets in old homes and transform disorderly clothes racks into modern garment cases.

In new homes—or homes about to be built, as much as 15 per cent in construction costs is saved when Knape & Vogt Garment Carriers are planned for in advance, because this modern system permits smaller, space-saving closets, which reduce the overall dimensions of the building without reducing the size of the rooms. And yet these smaller closets will hold more clothing, create order, cleanliness and lengthen the life of the garments. Architects and builders who do not know the Knape & Vogt Garment Carrier System are not giving their clients the benefit of the latest developments in home conveniences.

Write for prices and details of simple installation.

Why Kelsey Health Heat Is Ideal for the Home

Warm Fresh Air

Plenty of pure warm air for every room in the house, regardless of the direction of the wind or severity of the weather. The positive cap sends an extra supply to the room that is hard to heat.

Circulation

The warm air is delivered not only in large volumes, but at high velocity, insuring proper circulation.

Ventilation

The exhausted air is removed through vents at the floor line.

Humidity

The automatic humidifier supplies the proper amount of moisture for health and comfort.

Convenience

No radiators occupying space that should be used for furniture.

Economy

The Kelsey Warm Air Generator extracts more heat from a ton of coal than any other system. This can easily be proved by records of actual performance.

Our Engineering Department will furnish detailed plans and specifications, insuring satisfactory installation.

Let us send you descriptive Booklet No. 5.

Here's the Window Contractors Are Buying!

and here's why—

If you had your choice between this trim Fenestra Steel Basement Window, with its can't warp or stick features insuring easy operation, its additional daylight and ventilation, its permanence, its fire resistance and many other advantages, or—

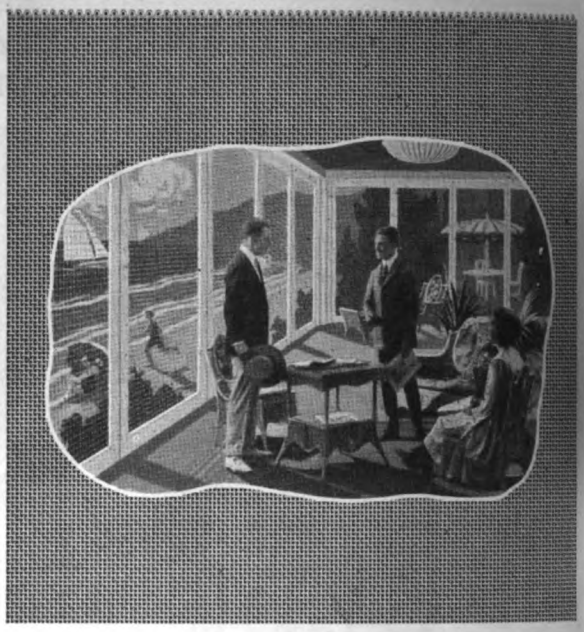
A cumbersome, warping, sticking, rotting, and daylight obstructing wood window —If you had your choice—*at the same cost*—which one would you buy?

Thousands of new home owners have and are deciding in favor of Fenestra. There is really no comparison between this highly improved type of window construction, and the old-fashioned inflammable wood window.

No Bracing

Fenestra Steel Basement Windows will stand upright without bracing. The channel section at the sill set firmly in a bed of mortar, keeps the window in position while the wall is laid around it.

There are no extra frames to make—no planing or fitting of sash—hardware already attached—and the complete window comes painted with one priming coat.



Your Building Supply Dealer Has Them

or can procure them for you. Fenestra Steel Basement Windows come in four standard sizes that work out satisfactory with brick, concrete block, concrete, or field stone. You can get them the day you are ready to install—no waiting.

Get a copy of our booklet, "More Daylight in Your Basement" which shows installation details together with other information which you can use to advantage in talking to your customers.

Where Porches Mean Money

HOMES advertised for sale, or rent, which have a screened porch are in more popular demand.

When you talk porch screens—and now is the time to make them—recommend portable panels which lock together and close in the open sides of the porch.

We Assist You

To assist you in pointing out to your prospect the simplicity of construction and installation of screened porches, we have prepared a Blue Print of a Porch Plan which we will send free for the asking.

Now Is the Time to Make Them

Screened porches are money-makers for you. Due to its metallic coating, a special process exclusive with us, PEARL is longer lasting, hence most economical, besides being the most sanitary and beautiful.

Insure your workmanship and customer loyalty by specifying PEARL and make sure of getting the genuine by looking for our round red tag on each roll and the two copper wires in the selvage—our permanent mark of identification.

Call on your local dealer or write direct for samples and literature if you're interested in screen material.

Address Dept. "C"

The Gilbert & Bennett Mfg. Co.

New York Georgetown, Conn. Chicago Kansas City

PEARL is made in Regular Grade (12x13 mesh) and 14, 16, 18, 20, 24 and 30 mesh; also Extra Heavy Grade (14 mesh only)

Want A Warm House?

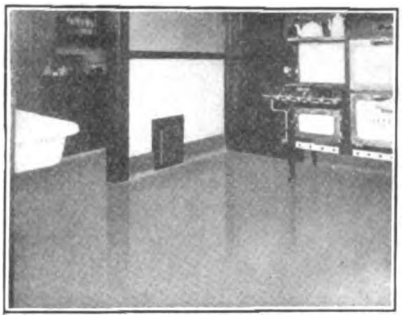
Investigate This Splendid Furnace and the Reduced Prices!

THE bleaker the weather, the more you enjoy a glow of warmth as you enter the front door. And the bleaker the weather, the more people appreciate the N. P. Sterling Furnace. For it heats every room in the house with a current of genial warmth. It doesn't burn a lot of coal; it is of modern, efficient design, built of good materials, with fine care. Two pipes flank the furnace. They draw the cool air down out of the rooms, and make way for the warmth that rises from the big fire-pot. It isn't a lot of work to install a Sterling; there is just one pipe and one register.

N. P. Sterling Furnace

The One Register Furnace

HERE is a furnace that is built to last. There is not a cheap feature about it. Everything that goes into its making is the best to be had. For instance, just look at the grates—the big water chamber (moist air is best to live in)—see the way the joints are made so you can't get a bit of ash dust or coal gas or wood smoke in the house. It's a fuel saver, too. Actual tests show that it gives out more heat from less fuel than any other furnace. It's a quality proposition thru and thru, built to give real service.



Before you install any heating plant, be sure to investigate the N. P. at the reduced prices.

MAKE MONEY LAYING

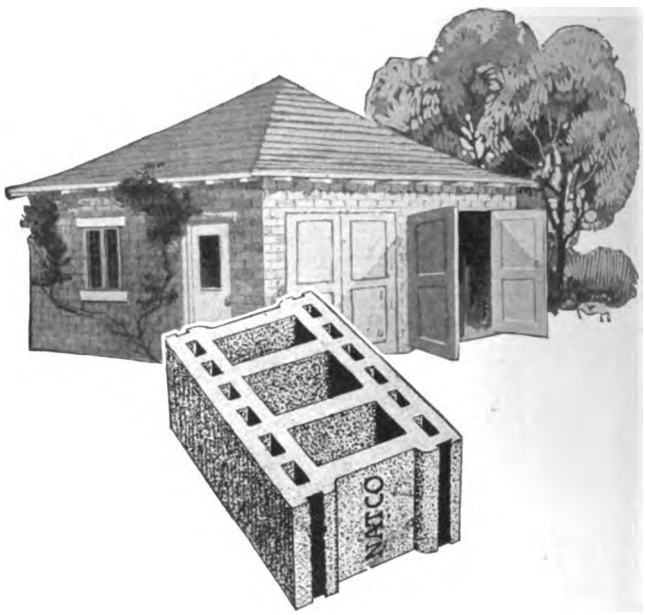
Everlasbestos Flooring

THE COMPOSITION OF HIGHEST QUALITY

THIS superior sanitary composition pleases everyone—owner, architect and builder.

It is easily laid by anyone who can use a trowel, bonds with any foundation, hardens in 24 hours. Superior formula and materials, and perfection of method for mixing and laying have produced a composition which is entirely dependable.

Its surface is seamless and dustless and takes a fine finish. Colors—Royal Red, Golden Buff or Natural Gray. It wears for years without noticeable depreciation. Owners recommend it to their friends.



Everlasbestos is in great demand for kitchens, bathrooms and other floors in homes, and is widely used in factory lavatories, restaurants and offices, also in stores, schools, hospitals, etc.

Everlasbestos is nationally advertised as a better sanitary composition, and always lives up to its advertising. Mason contractors find it produces profitable business, easy to sell, inexpensive to lay, and always satisfactory.

R. A. LONG BUILDING Lumbermen since 1875 KANSAS CITY, MO.

Level and Plumb With Your Own Instrument

$5.00

BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Aloe Convertible Level and Transit Combined

FREE Write for this Book

BE A BIGGER BUILDER

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

Write for Free Book

Our free book—"Be A Bigger Builder"—tells you how to increase your income—how to get the profitable jobs and become a bigger man in your community. Write for this book today.

Stocks in All Large Cities for Prompt Delivery

Any trial or comparison you wish to make will convince you that the REPUBLIC line represents the greatest mixer values to be found. Lower price is not effected by cheaper construction, but by concentrating on a few sizes and building in large quantities, which enables great manufacturing economies, and by operating on a small margin of profit.

The REPUBLIC "THREE" is a small light mixer for the small builder, and cheap enough to enable anyone to own it. The REPUBLIC "SIX" is a medium size outfit, and the REPUBLIC "TEN" a compact, sack size machine. These lasting, durable mixers will do your work with the least trouble and expense and at minimum cost for operating and moving. GET CATALOG AND PRICES FROM YOUR NEAREST STOCK.

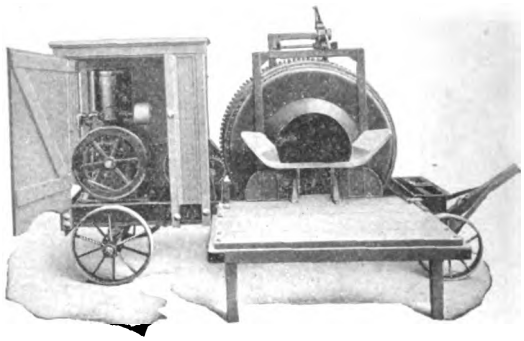
These ends are worthless

but you pay for them

In figuring the estimates on your next job, segregate the following scaffolding and shoring costs:



Cost of waste from sawed timbers.
Cost of labor for cutting timbers.
Cost of boards and nails used for splicing the timbers.
70% of cost of labor in erecting, and
90% of cost of taking timbers down and cleaning of nails.

The above costs can be absolutely eliminated by using Schenk Timber Clamps. Let us tell you how. Write us today.

GRANVILLE, N. Y.

The **FIRMNESS, DURABILITY** and **ATTRACTIVENESS** of **AMERICAN BRAND SCREEN WIRE CLOTH** will appeal at once to the architect, home builder, or screen manufacturer who desires to give maximum Fly Screen satisfaction.

AMERICAN BRONZE: This grade is made of best hard drawn wire 90% copper, 10% non-corrosive alloy, principally zinc. **BRONZE** should last as long as the house in most sections.

Avoid copper substitutes as these are too soft.

GALVANOID: This grade is heavily electro - zincked after weaving, then varnished. It is the recognized leader in its field—the best grade of zincked cloth made.

We also make
PAINTED, GALVANIZED, COPPER, KOPNIK, MONEL
and many special grades of wire cloth. Samples and descriptive literature sent upon application.
Order from your Hardware Jobber or Dealer. If he cannot furnish, advise us, and we will see that you are supplied.

One of the

Apex Fireplace Dampers

Operates Like a Transom Sash

Nothing to Interfere with Face Design

Especially Adaptable When Facing Is Placed After Plastering Is Done

The vertical rod is adjustable to all conditions, and different margins from Lintel to Mantel Shelf.

The end of rod can be concealed if necessary or above shelf.

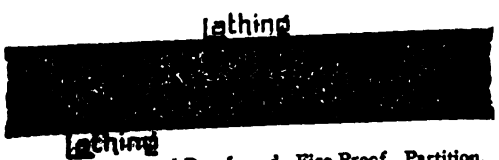
A real damper at a low price, and a set of working drawings to go with it.

APEX FIREPLACE CO.

URBANA, ILL.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building



Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

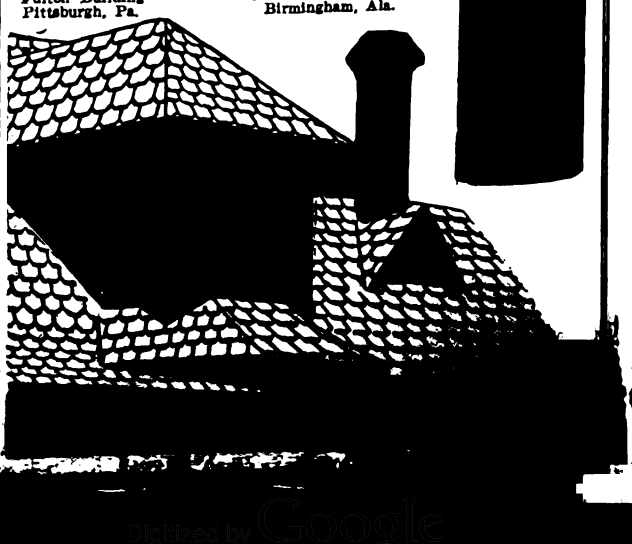
280 Madison Avenue, New York
[Cor. 40th Street]

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

In-Lade

Design Roofing

Meets the big demand for a roofing that combines distinctive appearance with permanence.



It is easy to apply and may be laid over wood shingles, keeping the house warm in winter and cool in summer.

Send for samples to show your customers. In-Lade roofing will help you build up your roofing business. It is made in rolls of red, green and white. Approved by the National Board of Underwriters "Class C."

CompoBoard

(TRADEMARK)
The Wood Core Wall Board

Takes ANY form of Decoration

This wall board has the extra strength and rigidity needed to resist the "pull" of wall paper, burlap, canvas and other popular wall coverings. Can also be painted or tinted.

Does not require panel strips. Compo-Board Filler is especially prepared to fill the joints and nail heads.

Makes Permanent Walls and Ceilings that will not crack, crumble, warp, shrink or buckle. Compo-Board withstands hard knocks and keeps out the dampness, cold, heat and sound.

This strong, wood core wall board insures greater satisfaction to your customers and more profit to you. Write for sample and interesting booklet.

Consider Re-Sale Value When You Build

If there is any single construction feature in a house that makes it easier to sell or rent it's the Kernerator—the modern system for disposing of household waste and refuse. Though under present real estate conditions this factor may not seem so vital, it is important to the far-sighted home-owner who considers a house as a marketable investment. The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse —rags, sweepings, wilted flowers, broken crockery, tin cans, garbage—**without cost,** for no commercial fuel is required. Non-combustibles are dried and sterilized and later dropped into the ash-pit for removal.

Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, Sweet's 1921 Catalog.

"ALL GOOD THINGS ARE THREE"

1. Mack Ejector. "A ventilator that uses its head," always operative, utilizing low velocity wind pressure. Inverted bronze bushing in steel bearing and individual balancing, assure silent ease of motion and positively prevent down-draft. Substantially built and all edges are wired.

2. Airomatic. The ventilator without a storm band, yet absolutely weather and down-draft proof. Note generous openings. Ventilates in any wind, straight across, up or down. Rigidity assured. All edges are wired.

3. The Perfecto. A combined damper-lock, regulator and indicator. Regulates and controls incoming tempered air and exhaust of vitiated air. Locks that control. Indicates position of the damper, and designates rooms to which ducts are directed. Made of stamped steel, any desired finish.

ALL THREE ARE GOOD

The Stark Sheet Metal Works Co.

REX and SECOND STS., S. E. CANTON, OHIO

Architects Ebling, Magnuson & Klinert, N. Y. C. used "CREO-DIPT" 16-inch Moss Green Stained Shingles on roof and 18-inch Dixie White Wide Exposure on sides for true Colonial White effect.

ACTUAL economy values as well as artistry are deciding factors in selecting side walls and roof materials.

"CREO-DIPT" Stained Shingles have quality the open market does not afford. Only the best grade of shingles are used, cut from sound timber. While market grading permits a large percentage of flat grained shingles, only vertical grained shingles are worthy of the "CREO-DIPT" process; preserving each shingle with creosote stain in color desired that will not wash or fade. The result is a roof and side wall material that can not rot or curl.

If you are going to build or remodel, write for portfolio of Fifty Large Photographs of homes by Leading Architects. Sample Colors on Wood. Ask about 24-in. "Dixie White" side walls; also about "CREO-DIPT" Thatch Roofs.

"CREO-DIPT" Stained Shingles

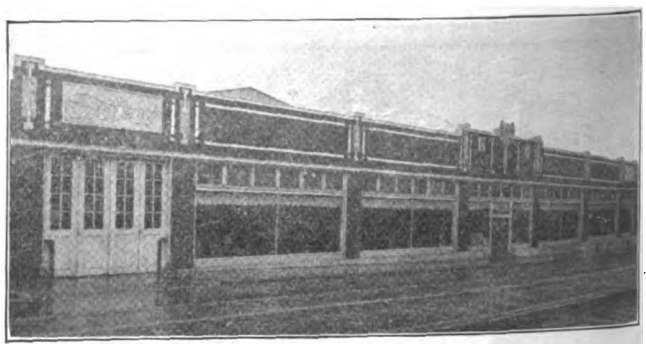
New Tape Hook Makes Pullman Sash Balance

The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.



Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

FORSTNER Labor Saving AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.

Box frames unnecessary

Mortises cut at mill reduce cost of installing. They counterbalance sashes at any given point and outwear ordinary weights and cords. Unaffected by atmospheric conditions.

Cheapest method for modernizing old windows, as alterations in sashes and frames are not necessary. Sashes should be weighed before ordering.

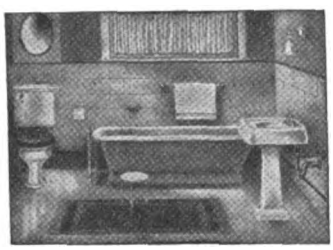
Contractor-Agents Wanted

YOU MAY BE FOLLOWING a trade already or perhaps looking for a new one. Whichever it may be, install Allmetal Weatherstrip and have a real income.

We have a proposition to offer good live men that will put them on the road to success—$5,000 per year income is common among weatherstrip men.



Buildings are well under way now. They will soon be ready for the weatherstrip contractor. Just as soon as you get the new ones equipped, start after the old ones. Owners of old buildings are easy to sell. They are tired of big coal bills, draughty windows, dirty floors, etc.

It costs you nothing to enter the Weatherstrip business. We co-operate with you to land sales.

As for our selling plan

BE A FLOOR SURFACING CONTRACTOR

MAKE $5,000 to $15,000 OR MORE—YEARLY

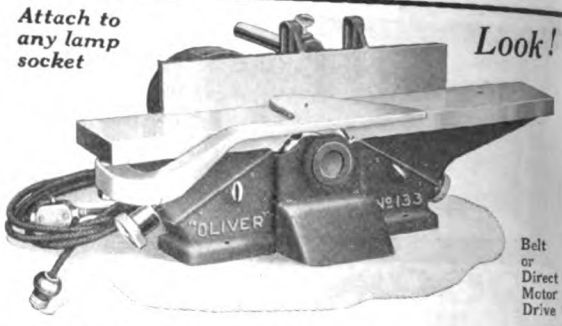
New, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

SPRING BUILDING BOOM IS HERE

Building is starting all over the country. There are innumerable opportunities for those equipped to handle work of floor surfacing. The American Universal Machine is essential to hustlers. Get in on the ground floor—get the machine now. It will earn more than the original investment in this busy season.

Resurfacing Old Floors

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need resurfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect.



Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

NEW ENGLAND COLONIAL STYLE

Illustrating the symmetry and statelinessof New England town houses of the period when Colonial architecture was at its height. This is another of the 17 architectural styles illustrated and discussed in "Good Houses," a book for home-builders interested in good design, efficient planning and thorough construction. "Good Houses" interprets these architectural styles which are the foundation of American building traditions, and which are adaptable to wood construction today. Send for your copy today.

Illustrating Good and Bad Bearing Post Footings

IF bearing posts under the girders in the basement of a house settle unduly the effect is apparent throughout the house. Cracks appear on plastered walls; doors become troublesome; floors become uneven. The bearing posts support a considerable amount of the weight of the house. Obviously they must be well supported or "rooted."

The footing shown on the right is too small in all its dimensions and is limited in its bearing power by its shape as well. Note how the post is set down into the concrete, a material which is always somewhat damp, thus needlessly subjecting the post to decay.

The greater sustaining power of the footing on the left is evident at a glance. Note its generous dimensions, its flat bearing surface, and note, too, how it extends above the cellar floor line, thus keeping the bearing post off the damp floor.

The success of concrete footings is dependent, too, upon the use of good materials in the right proportions, properly mixed.

Bearing post footings are just one of the many vital points in successful house building discussed in the booklet —"The High Cost of Cheap Construction," sent free on request to prospective home builders.

(This is the Weyerhaeuser Home-Building advertisement appearing in National magazines for June.)

What Will You Say About Your New Home Three Years From Now?

ASK any one of the better class of building contractors why so many people are dissatisfied with their houses a few years after they are built. He will tell you poor construction.

Constant repair bills, excessive heating costs and the endless annoyances that so often rob home-owners of the satisfaction they are entitled to, are the results of construction short cuts—mistaken for economy—behind plastered walls, beneath the floors and even under the very foundations of many houses that are being built today of all materials.

Yet at no greater cost than the prices that are being paid for compromise houses, the application of the right principles of building construction can make your house a substantial, economical, satisfactory home.

THE key to successful house building lies in right materials properly applied.

Lumber for house building is of the same good quality as ever. Developments in manufacture are constantly improving it.

Good workmen and the better class of contractors still want to do an honest job; in fact they have been preaching the value of right construction in house building for years.

But conditions, largely beyond their control, today are forcing legitimate contractors—the men who know good materials and how to use them, who understand fire-stopping and other modern construction practices, and who see house construction in terms of durability and efficiency — to bid against construction practices that every honest craftsman condemns.

That is why we say, go to a legitimate contractor—one who takes pride in his craft and would rather deliver a good job at a fair profit than a poor job at an unfair profit.

You will find these men more and more using lumber of the Weyerhaeuser standard of quality—trade-marked with the manufacturer's pledge of personal responsibility.

IN "The High Cost of Cheap Construction," a book which will be mailed you on request, you will find the essentials of good construction necessary to successful house building; the basis for judging the manner in which your house is built; and the means of making the lumber you use in the construction of your house of even greater service. Ask also for "Good Houses."

Weyerhaeuser Forest Products are distributed through the established trade channels (to contractors and home builders through the retail lumber yards) by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

EACH *year you will find an increasing number of retail lumber dealers recommending Weyerhaeuser lumber for house building—men who know the relation to correct building practice of properly dried lumber, of uniform grades and of the kinds best suited to your needs.*

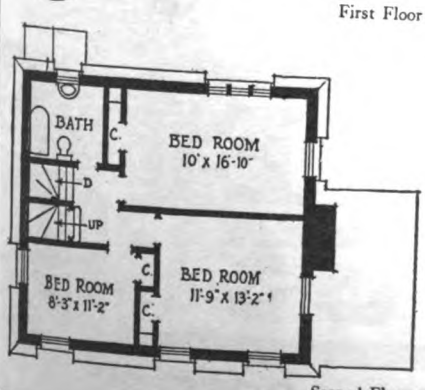
Build from A·F·B·A PLANS



The architect's sketch of Design 127 as it appeared in "The Home of Beauty"

—and a photograph of this design as built at River Forest, Illinois.

First Floor

Second Floor

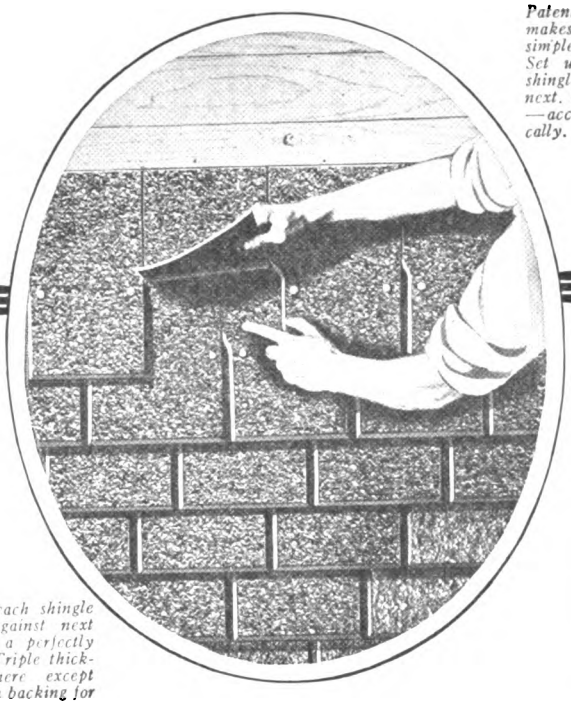
FACE brick houses are sound investments. Their permanence saves appreciably in upkeep and depreciation—the value is stable. The beautiful shades of face brick, together with mortar joints and bonds, offer boundless possibilities for creating artistic effects. Build Face Brick homes — they sell better, and afford greater satisfaction.

Send for These Helpful Books

"The Home of Beauty": A 72-page book presenting floor plans and perspectives of fifty designs, by competent architects, for a wide variety of practical and artistic homes. Complete working drawings obtainable for every house at a nominal cost. Per copy, 50c.

"Face Brick Bungalows and Small House Plans": Four separate booklets featuring 3-4, 5, 6, and 7-8 room designs respectively. A unique presentation of the designs with reverse plans for each exterior and a choice of 2 exteriors for each plan affords 184 house arrangements. Per copy, 25c—set of four booklets, $1.00.

"Manual of Face Brick Construction": A complete, illustrated treatise on all phases of face brick work, explaining methods and presenting data essential to every builder. Supplemented with 31 house designs for which working plans are available at small cost. Per copy, $1.00.



"The Story of Brick": A 60-page booklet handsomely illustrated, covering the whole subject of face brick, its history, structural merits and architectural possibilities. This is an effective contractor's "Sales Manual" that will help sell your services. Sent free.

Top half of each shingle fits snugly against next one, forming a perfectly sealed roof. Triple thickness everywhere except at slots. Firm backing for each shingle.

Patented shoulder device makes correct application simple. No guesswork. Set upper half of each shingle flush against the next. Spacing done quickly—accurately—automatically.

How Self-Spacing Shingles Make a Better Roof

BETTER protection because of extra thickness and perfect sealing. (See illustrations above.)

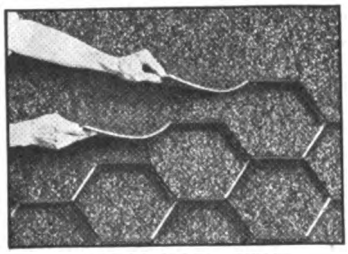
Better wear, because when laid according to instructions, Vulcanite Self-Spacing Shingles form a triple-thick roof except at the slots. Triple wear—triple life—triple service.

Better application, and easier, because it's absolutely automatic. You can't go wrong.

Better looking, because even spacing, uniform slots, and unusual thickness give neat, handsome job.

The Vulcanite line includes *a better roofing for every possible need*—shingles, rolls, ornamental effects and built-up roofings for every conceivable use. Also roofing cement and roofing paint.

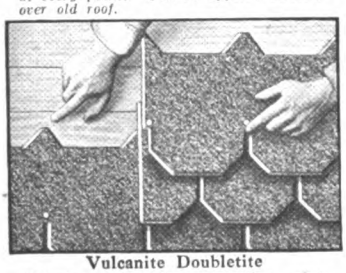
Quick deliveries—low freight rates to all points. Factories at Albany, N. Y.; Franklin, Ohio; Anderson, Ind.; Chicago, Kansas City and San Francisco. Also conveniently located warehouses.



Ask our nearest office for samples and Vulcanite sales plan. At your request we will gladly have one of our many roofing experts call and explain the Vulcanite line in detail.

THE VULCANITE ROOFING COMPANY

(Roofing Division of The Beaver Board Companies)



Administrative Offices—Buffalo, N. Y.; Ottawa, Ont., Canada; London, England.
District Sales Offices—Albany, N. Y.; Buffalo, N. Y.; Cincinnati, Ohio; Chicago, Ill.; Kansas City, Mo., and San Francisco, Calif.

Two Other Vulcanite Patented Shingles

Vulcanite Hexagon Slab

Patented design assures proper application. Considerably wider than ordinary slab shingle, insuring double thickness at every point. Can be applied directly over old roof.

Vulcanite Doubletite

Patented triangular projection gives double thickness all over. Triple thickness at vital points. High quality—handsome appearance—automatic spacing—12 inches wide—medium priced.

"The Prettiest House in Town"

This charming house of English architecture was erected by D. J. Peterson Lumber Co., of Toledo, Ohio, for Mr. J. H. Peterson of Ottawa Hills, near Toledo.

It was the intention of the builders to make it in every way a model house. The best equipment of national reputation was selected throughout. The house was thrown open to the public as an exhibit.

The English casement windows were much admired. Some ten thousand people examined them, noting especially the convenience of control and handsome appearance of the

Win-Dor

Trade Mark

CASEMENT ADJUSTERS

The Win-Dor Casement Adjuster, invented by Mr. Robert C. Spencer, F. A. I. A., and perfected by six years' experience and improvement, makes the casement window as convenient as it is picturesque, and as economical as it is luxurious.

The fly screen is set inside the window, concealing almost completely the Adjuster but not interfering with its operation. The screen need not be lifted; the Adjuster locks automatically.

Win-Dor Casement Adjusters are made to attach to the surface of the sill or to be countersunk flush with the sill. They are made in brass or bronze metal, or in galvanized finish, which can be easily painted to match woodwork.

The few parts, strength and efficiency of the Win-Dor Adjuster, together with its simplicity and inconspicuousness, make it the most satisfactory article of hardware conceivable for the purpose.

Built with National Steel Joists
Chas. W. Bates, Architect
The Carmichael Co.
General Contractors

National Steel Joists in place in Cynwyd Public School, near Philadelphia

Build School Floors Firesafe With Steel Joists

You have, no doubt, built many buildings with National Steel Joist firesafe floors, including stores, garages, homes, office buildings, theatres, apartments, hospitals, etc. How about schools? How many times have you secured the advantage which this modern type of economical firesafe floor construction affords your bids on school structures?

Prominent architects and contractors nearly everywhere now consider National Steel Joist firesafe floors and roofs the standard construction for school buildings. The cost is low—lower than that of any other type of recognized firesafe designs. And remember, the dead weight of these floors averages only 40 pounds to the square foot. That means half the weight in materials to buy, handle, erect and on which transportation must be paid.

National Steel Joist firesafe floors can be quickly erected. There is no time and money lost in building and tearing down wood forms, as in concrete construction. The work of all trades on the job is perfectly synchronized. And the sound-proof qualities of National Steel Joist floors is also of great importance in school construction.

There are stocks of National Steel Joists not far away—more than likely in your city. The joists are delivered to the job cut to meet the plans. And it's surprising how easily Steel Joist floors are embodied in plans. If you have yet your first Steel Joist job to plan or erect, you had better let us send you full information now. You'll be asked about this modern type of economical firesafe floor construction soon.

Architect M. H. Westoff,
Springfield, Mass.

Houses or Homes?

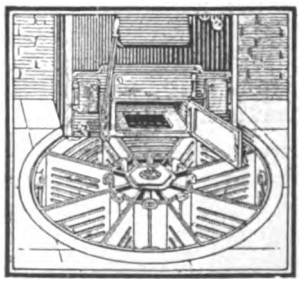
There's a deal of difference between houses—just houses, built to sell, and houses that are built to be homes.

The difference comes in the care and forethought given to details that go to make the whole house habitable and useful. Builders, today, meeting the demand for such homes, are equipping them with every device that makes the care of the house easier; the whole house more useful.

The Sharp Rotary Ash Receiver

will help in a multitude of ways to make the homes you build more comfortable, more useful. It stores ashes out of sight in a dust-tight, fireproof compartment where they stay, forgotten till finally disposed of.

There are no ash cans to litter up the cellar; no grimy ash dust to sift through the house. Dusting upstairs is reduced to a minimum. Downstairs, the cellar, attractive and free from ash cans and dust, offers space that invites use as a laundry, or even a comfortable card or billiard room.



We have just prepared an interesting booklet about "The Cellar as Clean as the Rest of the House." It shows just how the receiver is installed and how it simplifies the care of the furnace. There are also photographs of many homes where the Sharp Rotary Ash Receiver has banished furnace drudgery forever.

Write for your copy TODAY.

Contractors and builders: send for Specification book, prices and discounts.

The cellar as clean as the rest of the house.

The Sharp Rotary Ash Receiver consists of a set of five, eight or twelve cans mounted on a revolving steel frame, installed in a concrete pit, under the ash pit of any size or style heating plant. There's nothing to get out of order.

Sharp Rotary Ash Receiver Corporation

Use PLATE Glass ©

Makes all the difference in the world

HOUSES of the better kind use plate glass in the windows as a matter of course. From inside or outside, plate glass windows impress the observer with a fine sense of perfect architectural finish.

Plate glass makes all the difference in the world. Ordinary glass cannot compare with it in artistic effect. The true surface of plate glass, with its perfect reflections, is inviting and restful-looking, and a promise of an elegant interior. There are no humps and hollows, no wavy lines or accidental swirls, no distorted shadows that wave and wiggle and annoy the eye.

Plate glass is the proper glass for a well-planned home, office building or hotel. It lifts a house out of the ordinary.

Inside of the house, too, there are dozens of uses for plate glass to make the home more livable, rentable or salable—plate glass shelves in the bathroom and kitchen, full-length plate glass mirrors in closet doors, plate glass doors for vestibules, plate glass push-plates for swinging doors. All these details can be installed at little cost, and in some cases the cost is less than other materials.

Like the Pyramids —built to LAST

"Red Cross" Furnaces

"RED CROSS" AJAX, BERMUDA and EMPIRE Furnaces offer to the builder and home owner every desirable feature in a furnace for the modern home, school, church, store or other building.

Substantially constructed of a better grade of iron —these sturdy furnaces are **built to LAST.** Well designed—"RED CROSS" Furnaces show their superiority at a glance. They are easy to operate, economical of fuel, and produce more heat than any other furnace made.

"Red Cross" Ranges

"Red Cross" WELCOME, POPULAR and PRIZE Ranges represent the highest attainable standard in range construction. Beautifully nickeled and enameled in pleasing colors—they are an adornment to the most elaborately equipped modern kitchen. Coal and gas combinations, or either alone. All are famous as perfect bakers.

"Red Cross" Ranges are strongly built—to LAST—and many embellishments add to their attractiveness. "Red Cross" conveniences — gas water heater; hot water reservoir; high warming closets; elevated baking and broiling ovens; white enameled splasher and doors; roomy oven, etc. — make a strong appeal to the modern housewife.

Distributors Wanted

In territory where "Red Cross" products are not at present being sold, we desire to add distributors.

Sixty years of experience in manufacturing furnaces and ranges as well as they can be made, and an extensive advertising campaign, stand back of the "Red Cross" Line. Red Cross Furnaces and Ranges sell rapidly and completely satisfy.

RED CROSS is the most profitable line to handle.

WRITE for Price List of "Red Cross" Furnaces, Stoves and Ranges, illustrated in color; also Plan Sheet, on which our engineers will recommend correct installation without charge.

-the Big Butt Shingle

Winthrop
Tapered Asphalt Shingles

The problem of finding a satisfactory roofing material for this apartment building was complicated by the many types of design incorporated in the one roof.

Winthrop Tapered Asphalt Shingles were selected because of their adaptability. They are flexible and can be curved to follow the lines of the roof and they will not curl or warp. They are thick where thickness is needed to combat the weather and resist fire. They are long lasting—some Winthrop roofs having been laid for over fifteen years and still giving perfect service.

Winthrops have all the desirable features of the best asphalt shingles—plus the taper.

Winthrops are manufactured in five big factories conveniently located for prompt deliveries.

Dealers: Write for full information on our generous merchandising plan and learn how you can become an exclusive Winthrop dealer in your territory.

Contractors: Write for information on what others have done for themselves by laying Winthrop Roofs. The details will interest you.

Architects: Get the Winthrop Specification Sheets. They will fit your files.

Bud Haskins—Metal Worker

Bud was in the Fifth Division. He worked metal there—up through, what he called not too clearly, the "Oregon Forest." But what he lacked on spelling, and confused as he was about the geography of the darned thing—he'd learned how to land a hand-grenade just where it'd do the most good.

And he came back.

And got his old job with Ernest Carlson, Roofing & Contracting.

And the Boss had a new roof he was pushing for all he was worth—a zinc roof made by a concern, the Boss said, out in Peru, Illinois.

Bud had learned enough geography to realize that map makers had no sense of proportion—putting Oregon in a woods in France, and Peru in a town in Illinois. He was glad he was a roofer instead of a geographer, and let it go at that.

Bud had covered many a job with corrugated zinc—roof and side walls, too, before the whistle blew for France. But these shingles were all new to him, and it was a zinc shingle job he tackled the first time he donned his overalls.

Nail it on with the nails provided—overlap the second shingle on the first, and the nails all covered—and there's a place all marked showing how far down the butt end of the next row of shingles goes, and no nails showing.

"Great stuff," said Bud. "Folks don't know it, but wasps, bees, mosquitoes, and flies'll have no helluva a time huntin' out a hole in this here roof to get through into the attic and make life miserable. And where can the ice catch ahold, and tear things loose—or the rain leak through and rot and warp things, and get 'em all out of shape? And just look at that slick little stunt for expansion and contraction that people know so little about, but that keep goin' on all the time with the weather changes. Some roof, I'll say. Like the Marines at Chateau Tearry—it'll stop anything."

Before tackling your next roofing or re-roofing job, you really ought to see this zinc shingle. Bud's right—it'll stop anything, and never need a cent of up-keep.

Put an Illinois Zinc Shingle roof on your next contract. You will never see it wear out because it will outwear the building on which you put it. But this first zinc roof of yours will immediately develop new business for you just as it has with everyone else. Send for detailed information today.

Economy In Good Roofing
—FLEX-A-TILE—

Flex-a-Tile combines all that a builder demands of a roof—durability, beauty, economy.

Richardson reputation and long experience in the manufacture of fine felt answer the question of durability. For FELT is the FIRST requirement in prepared roofing; and since 1868 The Richardson Company has specialized in the manufacture of superior felt.

Genuine slate from Richardson's own quarries answers the question of appearance. There is no handsomer roofing color than the cool, rich green of Flex-a-Tile, which harmonizes with any surroundings, and which mellows still more with age. Flex-a-Tile comes, too, in a deep red, in blue black or in a weathered brown.

Richardson manufacturing and distribution methods answer the important question of economy. Flex-a-Tile is moderately priced at the outset because it is made "from the ground up" in Richardson factories; because quantity production cuts costs; and because it is easily laid, over old shingles or new sheathing.

RICHARDSON *Product*

But the real economy of Flex-a-Tile comes from its wearing qualities. Its backbone of Richardson felt makes it tough and durable; while perfect saturation and double-coating with natural asphalt seal this inner strength between water-proof layers.

From such roofing, in the final analysis, come the real profits of any contractor, builder or dealer. In Flex-a-Tile you are selling roofing satisfaction—permanent shelter—on any type of building.

Flex-a-Tile is manufactured in the form of individual shingles, giant shingles, shingle roll and many other styles. There is, in short, a Flex-a-Tile House-Top for every building requirement—each backed by the Richardson reputation.

Write for booklets giving complete information regarding Richardson Products.

What Would You Do?

East Dining Room of Hotel Knickerbocker Before the Building Was Remodeled Into an Office Building.

Would you install anything but brass pipe over this room?

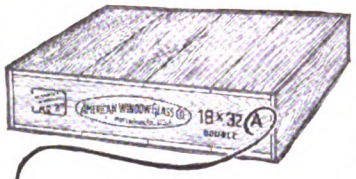
"Bridgeport" BRASS TRADE MARK CO. U.S.A.

Would you risk using a pipe that could not be counted on for more than 5 years—at the most 10 years?

Would you chance a leak in a room decorated so magnificently?

In the Knickerbocker Hotel the main distribution was in the second floor. It extended over this wonderful east dining room—now no more.

All the pipe was Plumrite Brass. It was installed in 1902 and about 19 years later when the building was remodeled for office service this pipe was as good as new.



Don't put a time limit on your reputation—use Plumrite Brass Pipe. It has proven its worth.

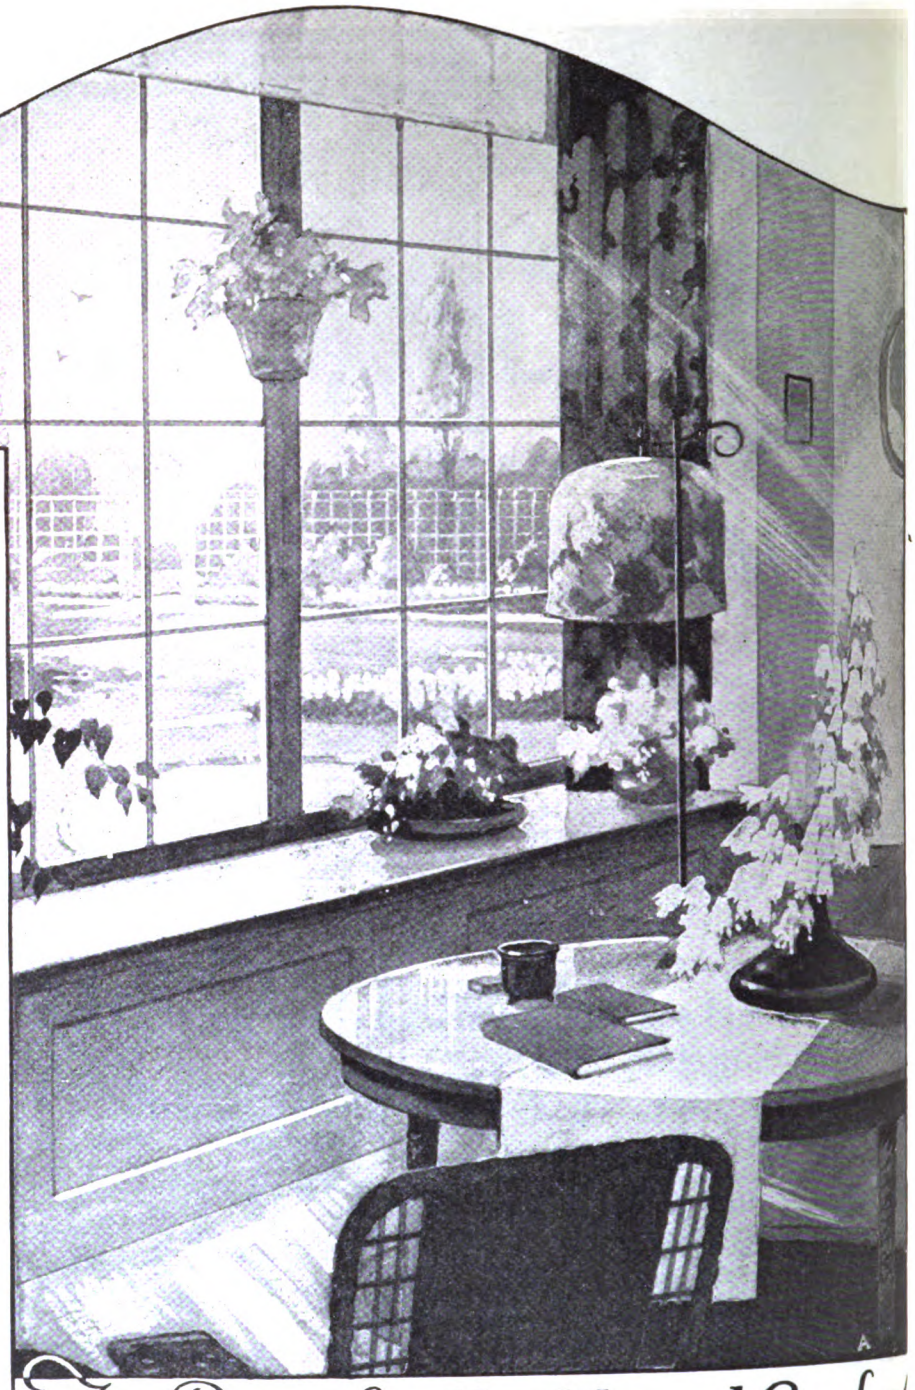
Window Glass Grading Depends on Standards



FIRST, second and third quality are relative terms which depend on the standards used in grading.

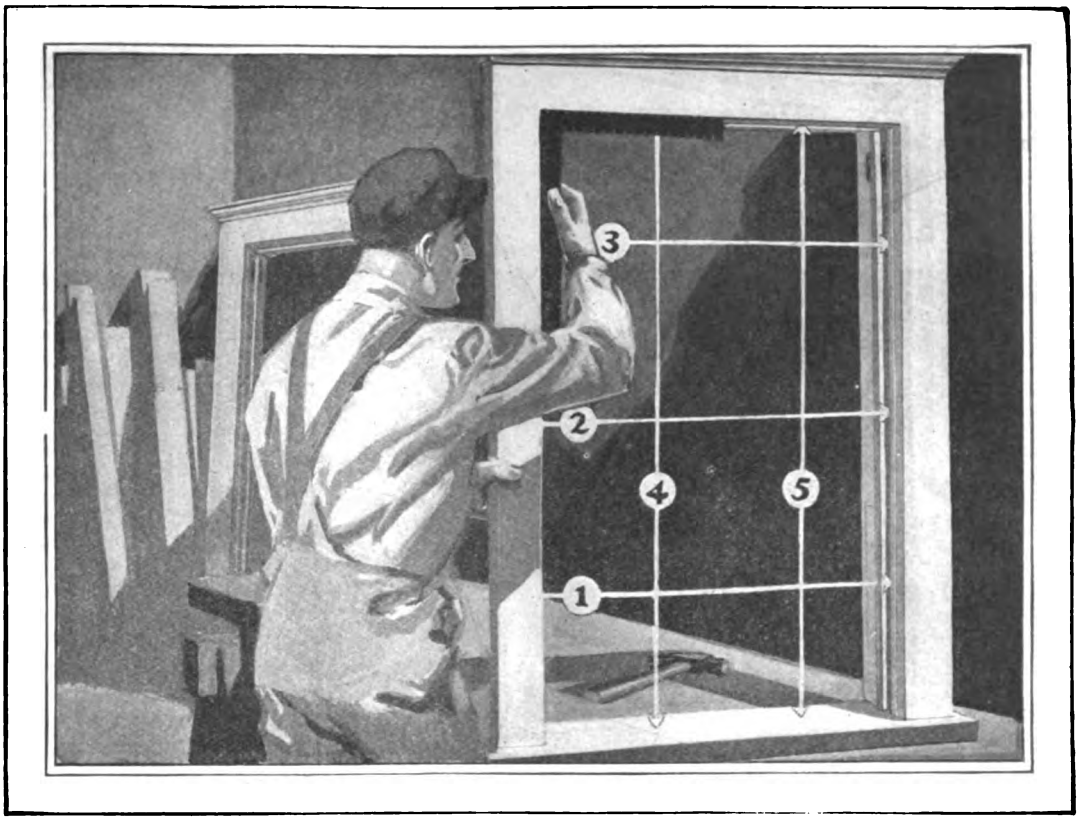
The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

When buying glazed sash by grade, make sure that American Window Glass Co. Product is used. This assures you the finest glass obtainable in that grade.

"Let in the sunlight"

The Room for Health and Comfort



IN EVERY home there is one room which breathes health and comfort, a real atmosphere of home. It will always be found to be the room with generous windows where the sunlight has free access. In this room the whole family loves to linger.

Rooms such as this add value to a house. When you build, whether for comfort or for speculation, give the windows careful thought. It pays to make them large and clear—and to have plenty of them.

Andersen Frames Are Accurately Built

THE Andersen Lumber Company makes nothing but standard White Pine window and door frames.

Thousands of parts are run through a machine set to an exact size. That makes each piece an exact duplicate of all others. The assembled parts form a tight-fitting frame that absolutely excludes weather. There's no tinkering or fitting when assembling Andersen Frames. They fit.

All exposed portions of Andersen Frames are of genuine White Pine. White Pine withstands warping, shrinking, swelling and rotting. Builders prefer it because it remains accurate despite age and weather. That White Pine construction keeps Andersen Frames accurate for all time.

By simply interchanging heights and widths, dealers can supply immediately 121 different sizes of Andersen Window Frames from a stock of only 11 standard sizes.

The seven units of an Andersen Standard Window Frame are shipped in two compact bundles. Each bundle is plainly marked. The seven units can be nailed up in ten minutes, forming a frame complete with pockets and pulleys in place.

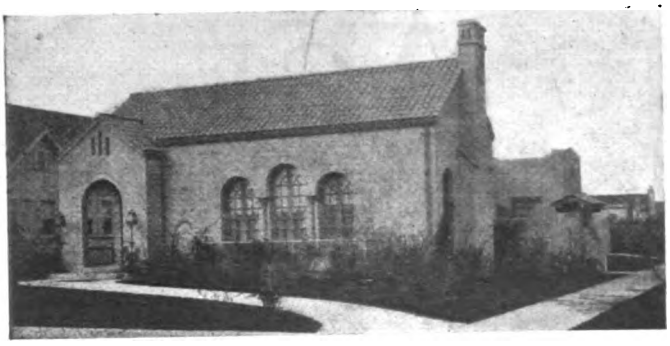
Modern Bungalow Types

Attractive Small Homes Being Erected by Progressive Builders in a Pleasing Variety of Design and Color

NOT so many years ago a bungalow was considered merely a sort of shack. Gradually the idea has grown and during the past twenty years the exterior designs have constantly improved in appearance. Many of the bungalows that are being erected today have behind them the best architectural thought. All types of architecture seem to have been drawn upon to obtain the pleasing results that are today so apparent in practically every locality.

The bungalow idea, as is well known, originated in India. Here in the United States its use is steadily growing in popularity owing to its convenience; in most cases it is simply a well appointed apartment contained in a house by itself, and this feature endears it to the woman who likes an apartment but wants a private house.

The bungalow design shown above is an adaption from the Spanish. The rough cast stucco gives an artistic finish that is entirely in harmony with the lines of the building and the roof of Spanish tile gives a touch of red to the structure. The building is severely plain in design which serves as a background for its outstanding features—an ornamental doorway in which Spanish detail has been faithfully carried out.



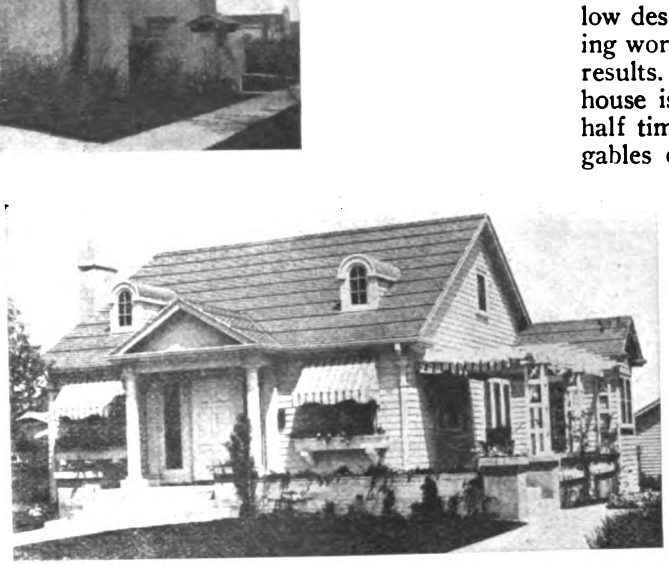
In a building of this sort, we naturally expect a patio and of course this has been included and the entrance to it will be noticed on the left hand side of the picture.

Iron guard rails are placed at each window for ornamental effect only. In a great many Spanish buildings, the windows are entirely barred all the way up and an iron entrance gate is usually used. The Spanish citizen seems to have an idea that his "casa" is liable to be attacked and he takes all means possible of barring out intruders. The American spirit, however, is better expressed in our omitting all sorts of such barrier on our homes for fear that it would look inhospitable. The American idea seems to be "The latch string is out, come on in—you are welcome."

Next to the Spanish style, the Italian seems to have been drawn on quite a good deal for ideas for bungalow builders. Its architecture lends itself very readily to artistic results when properly handled. Italy, however, does not abound in one-story houses, they seem to have the go-up-stairs' habit.

Both in the Spanish and Italian houses stone stairways seem to be the rule, while in our American houses wood is the favorite. The Italian and Spaniard, when he is pre-

Digitized by Google



Suggesting the Italian Style Villa

vented by the expense from using the marble that he likes so much for his interior work, has his walls plastered or stuccoed and this is painted and veined to represent some marble.

The idea of using stone for staircases has emigrated to the Western Hemisphere quite a good deal in Spanish-speaking countries. In Cuba white marble seems to be the favorite material for staircases; even the handrails being frequently made of polished marble and this, too, in some of the cheaper dwelling houses.

While we like to have Italian and Spanish style bungalows, we do not follow the interior arrangements of these countries, in that, we seem to be all American in our idea of what is comfort.

The New England Colonial Styles Suggested This

Just No Style But Homey and Comfortable

The Colonial architecture of our New England ancestors has been drawn on quite freely for ideas to be used in creating new bungalow designs. The plain gable roofs with perhaps a few dormers, delicate columns and well-proportioned doors give grace combined with the substantial appearance to designs modelled after this interesting phase of American architecture.

A very interesting example modelled after New England Colonial lines is shown herewith. One of the other illustrations shows a two-family or rather twin bungalow with a New England Colonial influence in its make-up that is quite pleasing.

The Dutch Colonial style of bungalow follows the lines of the old houses that were built around Philadelphia by some of the earlier settlers. A hooded entrance is usually the distinctive feature and in the design shown herewith this has been retained, the brick steps and shingled exterior with the solid shutters on the front windows are all details borrowed from this popular form of our domestic architecture. The Dutch Colonial style has been followed to quite an extent, some even have the gambrel roof effect so common in Eastern Pennsylvania.

The English style house has been drawn on quite a good deal for bungalow designs, half timbered effects being worked in the gables with pleasing results. Usually the main part of the house is of stucco or brick with the half timbered and stucco effect in the gables only, in other cases, the half timbered effect is carried out throughout. In other words, some of the old houses of England have served as models for many successful bungalows.

Many bungalows having a pleasing exterior cannot be classed as of any particular style of architecture. One of these designs is shown here; it has just a little touch of English influence in the front gable but that is all; the balance of the house is typically modern American. It has made use of a number of materials—there are concrete block foundation, cobblestone chimney, or brick walls and stuccoed. While there is no real architecture in this, the result seems to meet with popular favor, as quite a number of such houses have been built.

The flat prairies of our midwest states have suggested a horizontal line treatment for buildings, wide overhangs seem to be the rule, the effect being of a wide brimmed hat. Many bungalows situated in our midwest states have been patterned after this style of architecture and an interesting bungalow example is shown in this article. This is a stuccoed design and it has been worked out in a very creditable shape. It certainly suggests and typifies the flatness of

A Mixture of French and Colonial Lends Beauty

Digitized by Google

the prairies that gave birth to its design.

Switzerland has not been overlooked in the selection of bungalow designs, as its famous chalets have served as models for many attractive designs, especially those located on hillsides as this style gives the opportunity for using field stone, balconies, hooded windows, etc. Of course, to get the best effect, the ground should be treated in Alpine fashion, a number of evergreens being planted among rocks and the front entrance should be reached preferably by a winding path bordered with rock.

The exterior of many bungalows follow no style of nameable architecture, still they present a very attractive appearance due to the skillful work of the designer.

Bungalow design has had more thought given to it than one would think, and the results of this earnest work are becoming manifest in the number of very pleasing examples recently erected. Perhaps making various combinations of the sort will develop into a sort of hybrid design that will be typically American.

The Prairie Style Horizontal Roof Lines Predominating Feature

Various kinds of building materials can be successfully used for the exterior of bungalows. Drop siding, bevel siding, vertical boarding and shingles are forms of wood covering that lend themselves very readily to many artistic designs, whether used singly or in combination with some other material.

Stuccoed bungalows are quite common. They can either have a wood frame or be of hollow tile, concrete or common brick construction. Brick and stone are also used to quite an extent. The concrete block, however, has been used with poor success owing to the fact that people who have been using this to quite an extent simply use it for economy's sake and not with the idea of getting any beauty. Some very attractive looking designs, however, are capable of being worked out by the use of cement block. So far it has been a case of not knowing how to use the material on hand.

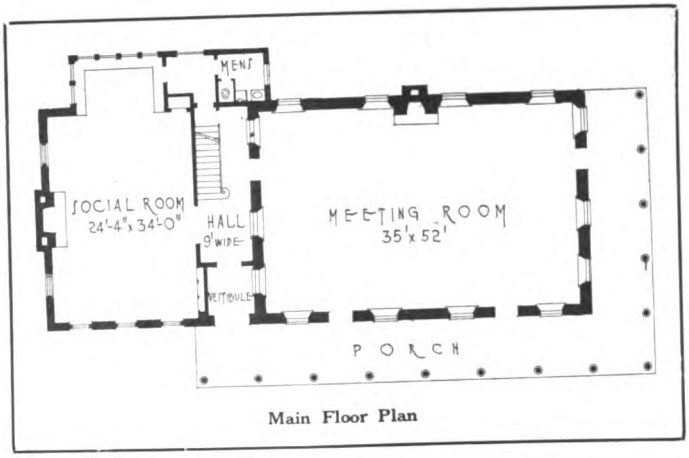
Modeled After the Dutch Colonial Homes of Pennsylvania

Twin Bungalows Can Be Made Quite Attractive

The use of metal is also coming into vogue both for roofs and siding of bungalows and the chances are that in the not remote future, many buildings with metal exteriors will be erected. Many very desirable designs can be worked out and no doubt some bungalows will evolve something that is artistic in metal siding without having the metal try to imitate some other material. True beauty in the use of any material lies in the fact that it should not appear in disguise.

Particular attention is now being paid to the roof. The different materials now on the market enable one to obtain a beautiful roof at but small expense by the means of various acids, stains and paints and many artistic roof effects are obtainable at a remarkably small cost. The roofing materials themselves can also be had in various forms, and color so that practically any design in the way of a roof can be carried out.

The use of color on roofs is receiving more attention, the mottled effect is very pleasing on certain styles of houses and this is very easily produced by use of different stains or different shades of material.



The floor arrangement of modern bungalows has also been the subject of much careful thought, and in a future article the different usual and unusal types will be described.

A Pleasing Adaptation of the Swiss Chalet

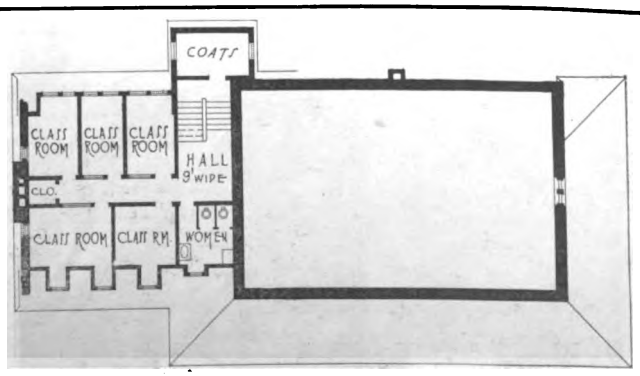
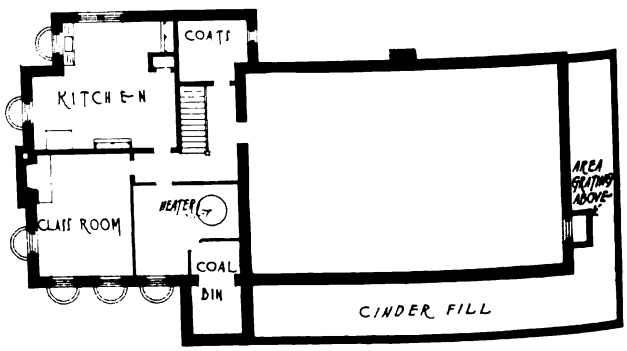
Friends Meeting House

Main Floor Plan



HEACOCK and HOKANSON, Architects



CHURCHES vary in their architectural treatment. Here is something a little different in the way of a house of worship. It is the School Lane Meeting House of the Society of Friends, located in Germantown, Philadelphia, Pa.

The larger portion of this building, used as the meeting room, was an old building of the mid-Victorian age, very similar to the railroad type of freight stations that were erected in those days.

The building was remodeled and a wing added to the left. The roof was extended so as to come down to form the porch, which is a distinctive feature of the present edifice. The building is of brick with plaster finish on the exterior. The contractors were Frederick Elvidge & Son of Philadelphia. Heacock & Hokanson of Philadelphia were the architects for the remodeling of this building.

ORGANIZATION *of the* AMERICAN CONSTRUCTION COUNCIL

IN OPENING the organization meeting of the American Construction Council at the Washington Hotel, Washington, D. C., June 19th, Secretary of Commerce Herbert Hoover stated that "If we would stem the tide tending to refer every little need and complaint to government, action to meet these demands must arise from within industry itself." He declared that in thus bringing all representatives of the construction industry together to see if such a council can be organized the most important step in the history of industry was being taken.

Among the subjects suggested by Secretary Hoover for the consideration of the Council were standardization of grades, inspection of, and simplification of dimensions of construction materials, the collection of statistics, the encouragement of home building, zoning, proper building codes, seasonal and intermittent employment, jurisdictional disputes, apprenticeship, vocational training and in general the elimination of unnecessary speculation and the better functioning of industry in regard to our national needs.

Aims and Purposes

A warning against "an intense stratification of the various economic interests in our national life" which lead to selfish aims and purposes was voiced by Willis H. Booth, vice-president of the Guaranty Trust Company of New York, in following Secretary Hoover. If the public confidence is to be gained the aims and purposes of the Council must square and comport itself entirely with the best public judgment, he said. He denied proposing an impractical altruism which was not consistent with actual facts, but declared such a basis was "an enlightened kind of selfishness which will take us further because it is more nearly right." Illustrating his point he went on to say: "If we can surround the construction industry with a feeling of stability we immediately add to its ability to secure credit." This feeling of stability, he stated, was based on the confidence which the public gave to the industry.

Two hundred representatives of every element of the industry were in attendance at the meeting, including architects, engineers, general contractors, sub-contractors, labor, manufacturers, dealers, bankers, insurance and bond interests, public utility corporations, state, federal, county and municipal construction departments.

Aid from Supply Dealers

M. T. Bannigan, president of the National Building Supply Dealers Association, said: "We went to war to prove that might did not necessarily make right. We are organizing this Council to establish the principle that the good of any element of the construction industry depends upon the good of every component part of the industry."

Architects' Co-operation

Henry H. Kendall, past president of the American Institute of Architects, stated that the architects were happy to be among those who are participating in the organization of the Council.

Public Utilities

William McClellan of New York, representing public utilities construction said: "The extreme difficulties encountered in construction as compared with other industrial problems, makes an organization such as this an inevitable factor. When a manufacturer gets an order he puts it through a factory with an organized force and system well established. Construction on the other hand necessitates in the very nature of things that those engaging in it have even to clear the ground, create their plant and organize their forces before they can begin to build. And on the next contract, they must do it all over again.

View of the Insurance Interests

Ralph F. Proctor, of the Maryland Casualty Company of Baltimore, representing insurance and bonding companies, said: "Although the Bible says 'He that is surety for a stranger shall smart for it, and he that hateth suretyship is sure,' we would welcome a better understanding by our clients of our business and its problems. It is with enthusiasm, therefore, that we join in the work of the American Construction Council, and you may be assured of our hearty co-operation in coordinating and building the construction industry."

Proper Co-ordination

The importance of coordination was emphasized by Frederick L. Cranford of New York, vice-president of the Associated General Contractors of America, who said: "For forty years American business has been passing through a transformation from individualistic to collective and cooperative activity, but the co-operation so far developed in construction has been the effort of the members of a unit of the industry, and they have counted the successful though often antagonistic to the interests of the industry, so that while individually we were important, our cooperative efforts have proved ineffective.

The Part of Labor

A very significant stand was taken by labor engaged in building trades when the organized building trades endorsed the American Construction Council and voted unanimously to affiliate with the Council at their recent convention in Cincinnati.

"We believe that the Council can be a most potential factor in the stabilization of the industry we serve," said John Donlin, head of the Building Trades Department, American Federation of Labor, "and we hope that all the elements of the industry will affiliate."

He stated that the Council should be a fact-finding agency to determine rights and wrongs, and to serve to eliminate wrongs inflicted by a few in each element of the industry. It was his opinion that the Council should establish and maintain local conference committees in all cities, these being necessary for local guidance to hold the confidence of the public, to avoid strikes, lockouts, and to protect the industry against uneconomic abuses.

Digitized by Google

Manufacturers' Viewpoint

James A. Emery, counsel for the National Manufacturers Association, who followed Mr. Hoover in presiding at the meeting, said that this was an opportunity to set up in an unusual way, self-government in the construction industry, a self-government which can speak for itself and act with intelligent vision, and accept for one of its important duties the cleaning up of the industry from the inside when it is in need of this. "It has," he said, "its own function, its own authority, and as I see it can make itself a self-reformative body without any regulatory power of the government. It can be self-governed or it will be governed by the people by their elected officials."

Highway Interests Helping

Thomas R. MacDonald, chief of the Bureau of Public Roads, emphasized the relationship of the highway industry with the whole construction industry.

Engineering Interests

In speaking for the engineers, Mr. Calvert Townley of the Westinghouse Electric and Manufacturing Company of New York said:

"A movement to coordinate with the object of performing better public service is distinctly a move in the right direction."

Election of Officers

Franklin D. Roosevelt, formerly Assistant Secretary of the Navy, was formally elected President of the American Construction Council, and John B. Larner, vice president of the American Bankers Association, was elected treasurer. General R. C. Marshall is Chairman of the Temporary Operating Committee.

Owing to illness Mr. Roosevelt was unable to be present, but sent a letter which was read; certain portions of this letter we print in a box as it outlines his aims.

Executive Board

The Executive Board of the Council is composed of men prominent in their respective fields. Amongst the groups represented are Architects; Engineers; General Contractors; Sub-Contractors; Labor; Material and Equipment Manufacturers and Dealers; Financial, Bonding and Insurance; Public Utilities; Federal, State, County and Municipal Construction Departments; and Federated Associations.

During the two days' session two hundred representatives of these interests carefully considered what can and ought to be done to put the construction industry as a whole on a higher plane and to determine ways and means of working together to that end.

Practical Work Outlined

The immediate program of action suggested for the new Council as a result of these deliberations include:

> THERE is absolutely no doubt that the construction industry must do something constructive. I refer not to abuses of power in the past, by this, that or the other individual or local organization; I speak of the fact that an immense sum of money, energy and happiness on the part of the American people can be saved if the existing waste is eliminated.
>
> In my judgment the American Construction Council must be broad enough to include every element, and it must be strong enough to strike at any individual or association of individuals which fails to live up to certain simple standards of ethics in business dealings. It may be felt by some that there would be danger through the limitation of freedom of action of the individual, but it must be remembered that the public as a whole are concerned in the efficiency, honesty and honor of all the groups constituting the construction industry. It goes without saying that if the members of the construction industry are unable to keep their own house in order, an exasperated public will some day regulate their house for them.
>
> FRANKLIN D. ROOSEVELT.

The formation of a code of ethics acceptable to the whole industry and to the public.

The gathering of adequate statistics from all sources and resulting interpretation having all the facts.

The reduction of the national shortage of building trades mechanics and the establishment of the necessary apprenticeship system.

Co-operation in establishing uniform building codes throughout the country.

Co-operation with the railroads in expediting the revision of existing freight rates on construction materials. The establishing and strengthening of local organizations throughout the country to bring about the co-operation of all elements in conformity with the principles of the Council.

The mitigation of the evils of seasonal employment and trade migration of labor.

The encouragement of local building shows.

Simplification, standardization and elimination of waste.

Education of the public to the distribution of its construction and maintenance requirements more evenly throughout the year.

The promotion of health and safety of workmen.

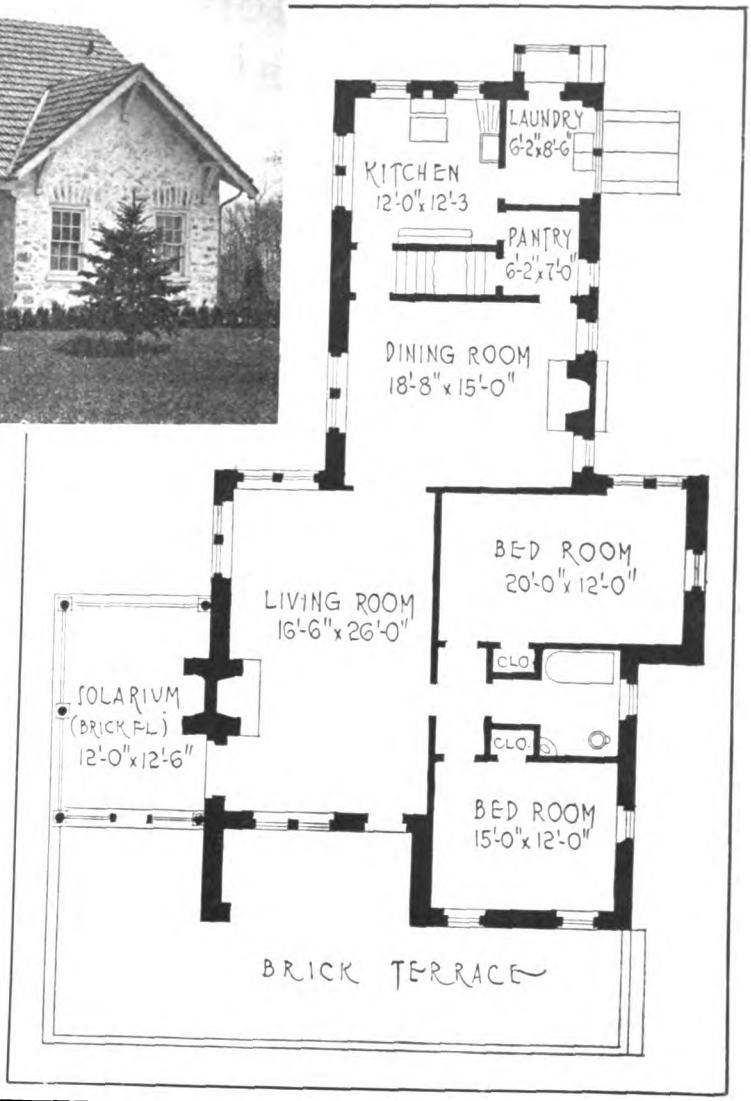
The reduction of loss of life and waste of construction materials from preventable fires.

The study of old buildings in order to establish superior methods of construction.

The education of the public as to the necessity and economy of properly maintaining existing structures.

About a Code of Practice

Mr. Walter Gordon Merritt, attorney in New York City, in presiding at the meeting of the Council emphasized the need of the co-operative action that the Council will bring about.



"The evils of the construction industry," he said, "are the evils of organizations, not the evils of individuals. Those evils have come about because of the selfish aims of the individual organization. The need is to restrain these selfish aims, and to have each group lay down a code of practice which must pass the judgment and be in accord with the rules and principles of the American Construction Council."

In stressing the necessity to work hand in hand with labor, he said that the organized labor movement is big enough to meet with and discuss its own problems with any of its critics.

"If we all meet and reason together," he continued, "we shall think, feel, and act together. The relation at the present time between employers and employees in the building trades, is one of periodic armistice. This Council must work out a plan of common counsel and joint action.

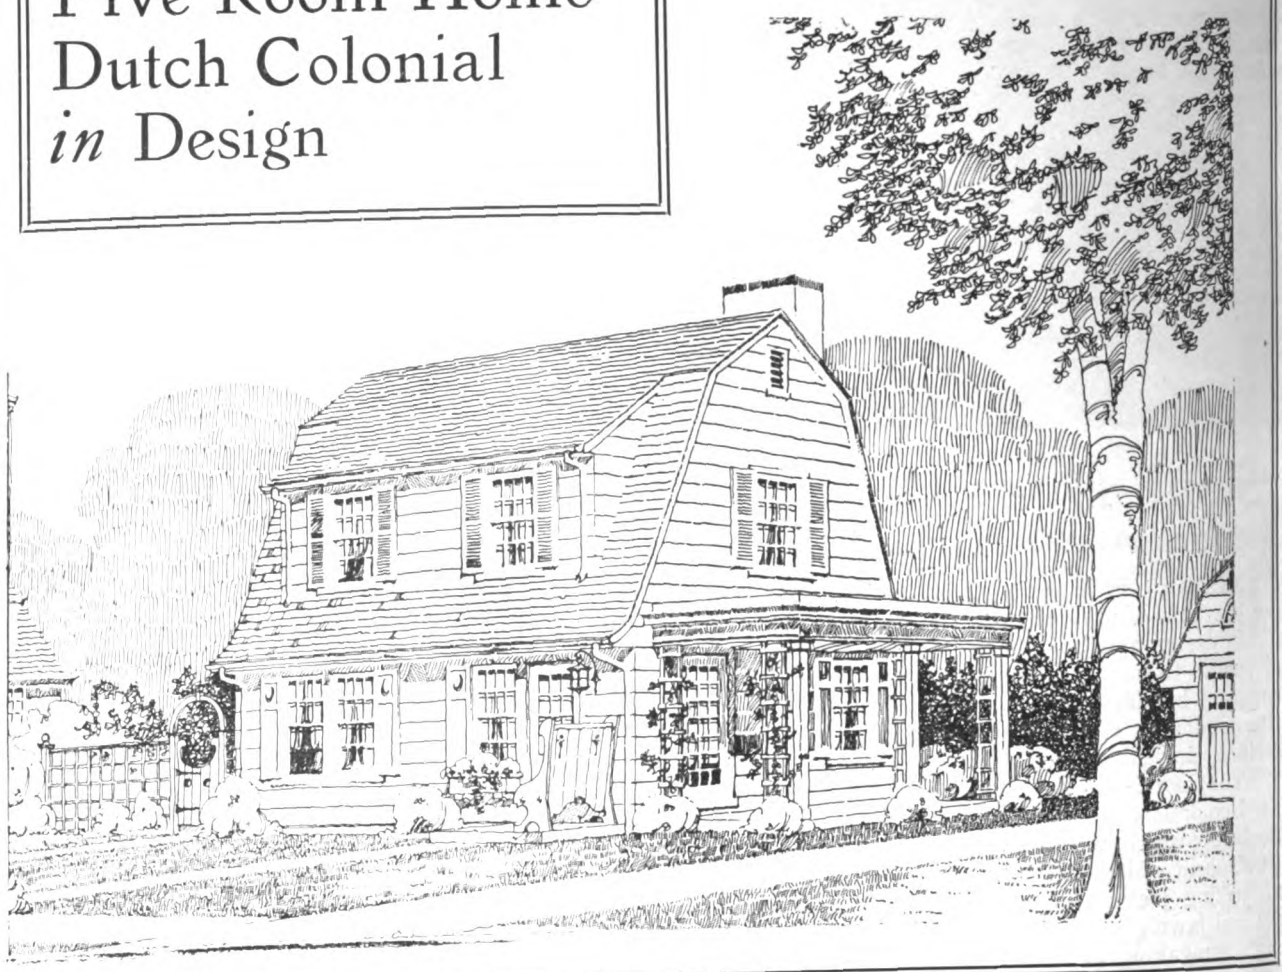
Stone Bungalow

NEWTON FLOUNDERS, Architect

HERE is a very interesting type of bungalow built of native stone. It is dignified in design and has a certain charm that will appeal to many. It is an interesting example of builders' work.

The flat dormer on front being placed to one side, is an unusual break that is a little different. The roof is covered with clay tile and its red color is quite a contrast to the gray stone below which, with its wide mortar joints pointed up in white, makes a very interesting and striking picture in its setting of green trees and lawn.



This bungalow was built for Dr. W. T. Werntz at Rose Tree, Upper Providence Township, Delaware County, Pa., and overlooks the famous Rose Tree Fox Hunting Club's premises. The builder was James B. Flounders of Media, Pa.

The Rear of the Bungalow is an Interesting Study of Roof Lines

Five Room Home Dutch Colonial *in* Design

HERE is a charming little house that can be built for about $5,500 and one that will provide a real home that is within the means of most everyone.

Inexpensive to build, and it requires but little housework, a good cozy home to be proud of; a possession that will certainly give more lasting satisfaction than a bunch of rent receipts.

The architects have worked out a very simple and economical plan and have combined with it an attractive Dutch Colonial exterior. Most houses of this very modest size look like "packing boxes" for want of proper roof treatment. This little cottage will hold its own among the most pretentious.

The rooms are comfortable, livable rooms and not mere nooks. As one enters the front door the house appears large; the fireplace, stairs and bookcase all count in the scheme, yet the arrangement is most economical. The stairs are very compact.

The two nice bedrooms are much larger than one would expect to find; they have cross ventilation and good closets. The bath is well arranged and there is not an inch of waste space. Note that the only hall in the entire house (halls are of little value as living spaces) is the very small pass at the second floor. This is what makes this house a big one in everything but cost. The laundry, heater, etc., are in the cellar.

Specially Designed for
BUILDING AGE
and
THE BUILDERS' JOURNAL
by R. C. HUNTER & BRO.
Architects **New York**

The complete working plans and specifications of this house may be obtained for a nominal sum from BUILDING AGE AND THE BUILDERS' JOURNAL.

Before you build, consider the location of your lot in relation to the kind of a building you wish to erect. It is a poor business plan to put an expensive building in a cheap location or a cheap house in an expensive, restricted neighborhood.

If you do not make the mistake of wanting too much in the way of a house, you will find that you can save money by owning our own home and you will get a good deal more pleasure out of life.

There is a satisfaction in owning a piece of real estate and a home of one's own. One takes a certain pride in keeping up the appearance of a home and grounds; things do not have that neglected appearance.

Quantity Survey

of Five Room Home Shown on Preceding Page

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

SUCH items as clearing site, temporary work and protection, scaffolding and general equipment and supplies, have not been included. Such items as are marked "Unit" are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	148 cu. yds.
Excavation for footings	11 cu. yds.
Excavation for areas	4 cu. yds.
Excavation for trench walls	11 cu. yds.
Excavation for leader drains and dry wells	10 cu. yds.
Backfilling around walls, etc.	31 cu. yds.
Leader drains and dry wells—	
Field stone for dry wells	8 cu. yds.
4 in. salt glazed tile drain pipe	30 lin. ft.
4 in. elbows	5

Masonry

CONCRETE WORK

Concrete for cellar walls	615 cu. ft.
Concrete for footings	142 cu. ft.
Concrete for trench walls	150 cu. ft.
Concrete for area walls	84 cu. ft.
Cellar floor. (3 in. concrete and 1 in. cement finish)	425 sq. ft.
Area Bottoms (brick and sand)	20 sq. ft.
floors (12 in. cinders, 3 in. conc. and 1 in. cement finish, colored and blocked off)	205 sq. ft.
Concrete forms	1800 sq. ft.
Pointing cellar window sills	14 lin. ft.

Plastering

Three coat Patent Plaster on metal lath. Gross (Net 360 sq. yds.)	420 sq. yds.
G. I. Corner beads	72 lin. ft.

Tile Work

Tile work for bath rooms—	
Floor, (1 in. hex, white)	42 sq. ft.
Wainscot (3 in. x 6 in. white wall tile)	104 sq. ft.
6 in. sanitary base	26 lin. ft.
Moulded cap	26 lin. ft.

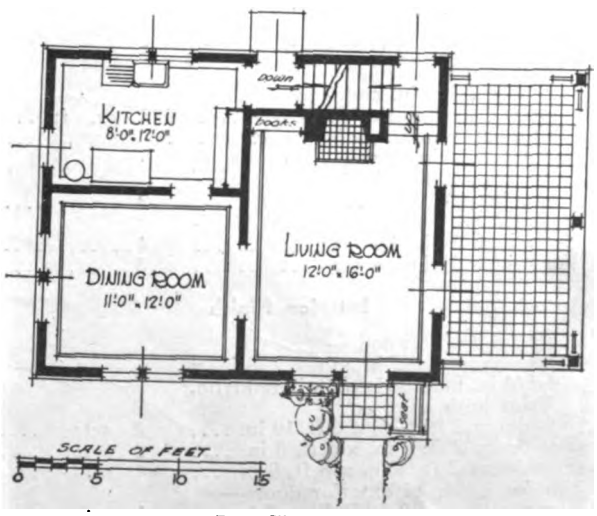
Brick Work

Common brickwork for chimney (or 3.2 M.)	160 cu. ft.
Face brick for hearth and jambs (or 84 brick)	12 sq. ft.
Fire brick for fireplace (75 brick)	15 sq. ft.
8 in. x 12 in. T. C. flue lining	54 lin. ft.
3 in. bluestone chimney cap (1 ft. 10 in. x 2 ft. 8 in.	1 Unit

Mason's Iron Work

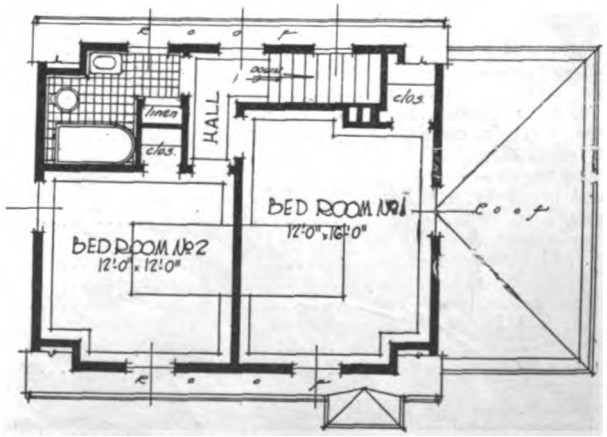
Fireplace damper (2 ft. 6 in. opg., with throat, etc.)	1 Unit
C. I. ash dump	1 Unit
C. I. cleanout door for ash pit (16 in. x 12 in.)	1 Unit
C. I. cleanout door for boiler flue (8 in. x 8 in.)	1 Unit
Thimble for boiler flue (8 in. dia.)	1 Unit

Sheet Metal Work



Tin roof on porches	220 sq. ft.
Tin flashing for roofs, etc.	105 lin. ft.
Tin flashing for column caps	3 caps
Tin flashing and counterflashing for chimney	14 lin. ft.
4 in. half-round hanging gutter (No. 24 gauge galv. iron)	91 lin. ft.
3 in. Tin leaders	74 lin. ft.
Bends for same	18
Gutter thimbles	9
3 in. x 4 in. G. I. gas range vent	20 lin. ft.
Cap and thimble for same	1

Carpentry



TIMBER

All No. 1. common stock, hemlock, rough unless noted.

Cellar girders, 6 in. x 10 in. spc. 1/12, 1/8,	100 F. B. M.
2 in. x 3 in. nailer—~~40 lin.~~ ft.	20 F. B. M.

General Conditions

Add for permits, fees for water and sewer connections, etc., insurance and general overhead charges. Allow for general work not listed, such as grading, planting, etc. Include sub-bids: Hardware and applying same, painting and decorating, plumbing and gas fitting, heating, electric work.

Information about Building and Housing

FOR several years there has been developing a feeling that some agency of the Federal Government should interest itself in building and housing. The Congress of the United States made an appropriation for such activities for the year 1921-1922. The act appropriating the funds says, among other things: "That as much of this sum as necessary shall be used to collect and disseminate such scientific, practical, and statistical information as may be procured, showing or tending to show approved methods in building, planning, and construction, standardization, and adaptability of structural units, including building materials, and codes, economy in the manufacture and utilization of building materials and supplies, and such other matters as may tend to encourage, improve, and cheapen construction and housing."

Accordingly, Secretary Hoover created in the Department of Commerce the Division of Building and Housing, which co-operates with all groups interested in housing and construction, such as architects, builders, building material producers and dealers, building trades labor, contractors, builders' exchanges, realtors, building and loan associations, building inspectors, city officials, and others.

The Division has helped local communities in successfully solving their housing problems. It collects and publishes monthly prices of twenty-four items of building materials as paid by contractors in different cities. It also makes reports on building activity, such as building permits and contracts awarded, and on general building and housing conditions in the country.

Mr. Hoover has appointed two main committees which co-operate with the Division of Building and Housing. The Advisory Committee on Building Codes, with a subcommittee on Plumbing, is drafting minimum code requirements for building construction. The Advisory Committee on Zoning is making studies of state enabling acts and zoning ordinances. Its reports should be of distinct aid to communities interested in the promotion of the public welfare and the protection of property values.

Depreciation of Buildings

THE Chamber of Commerce of the United States is conducting an investigation to determine the rate of depreciation of various structures, machinery, etc.

For frame buildings used in mercantile pursuits a 5 per cent. depreciation per annum was considered a fair average. Brick buildings are figured at 2½ per cent. and concrete buildings at 2 per cent. Motor truck depreciation was figured at 22.2 per cent. and other delivery equipment at 15 per cent., while wagons and other horse-drawn vehicles averaged 4.3 per cent.

The committee's work will tend to bring out some very valuable information that will be useful to every contractor and BUILDING AGE AND THE BUILDER'S JOURNAL will publish this matter as soon as definite figures are available. Data of this kind will be valuable, when one is figuring up the income tax returns, etc.

In the case of brick dwellings, a large fire insurance company figures this depreciation at 2 per cent. per annum for a period of 25 years. After that it is considered that the old building has a permanent value of 50 per cent. of its replacement cost.

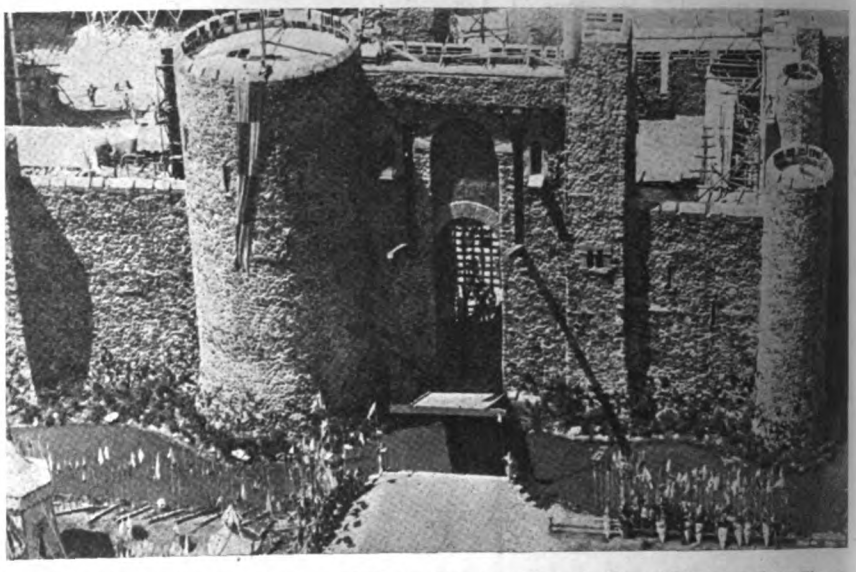
The Movies Call for Aid



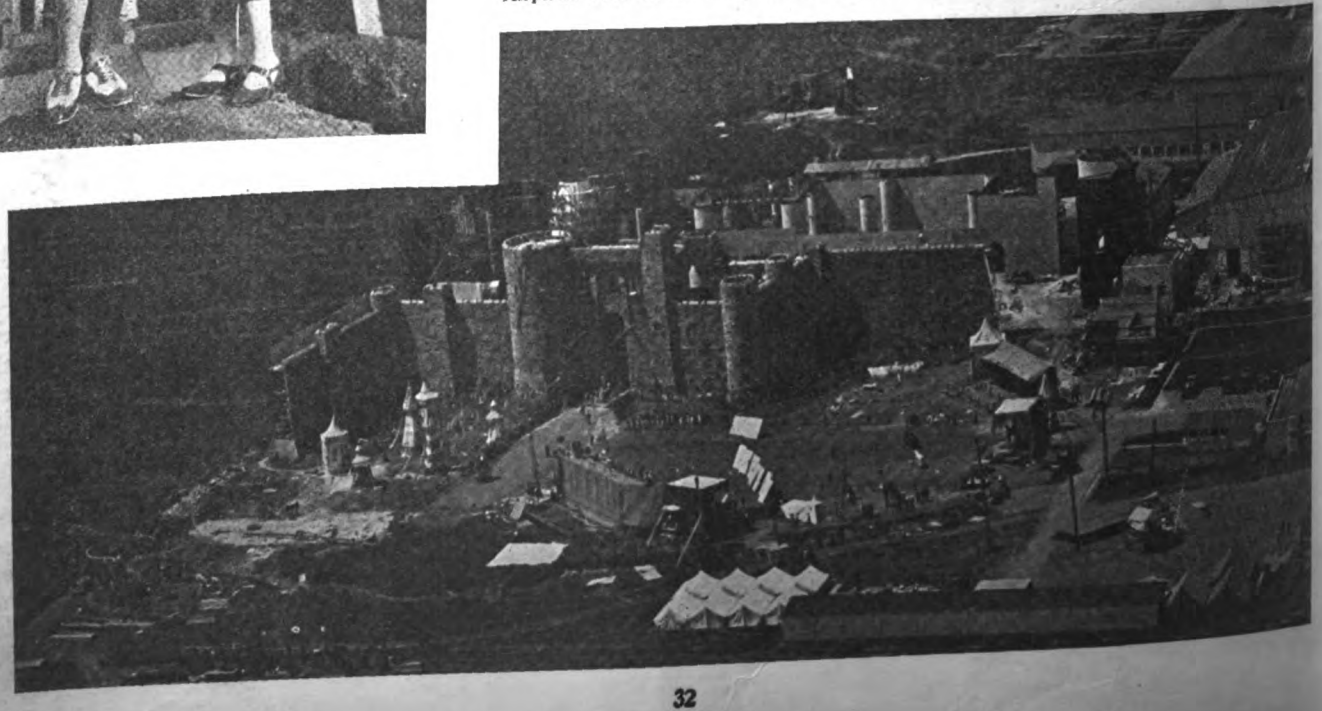
Remarkable Construction Work

BUILDING construction on rather an elaborate scale was necessary in the preparation of the "sets" for the new movie production Robin Hood that Douglas Fairbanks is now preparing. The pictures shown here of the construction work for the complicated "scenery" cannot fail to be of considerable interest to everyone in the building industry.

The principal scenes are laid in and around an old Norman Castle of the Twelfth Century. Any student of architecture who has read about these ancient castles will remember that they are built of stone, many feet thick, and were of enormous size. A castle in the old days was both the town and fortress and for its protection from marauders it was surrounded by a moat.

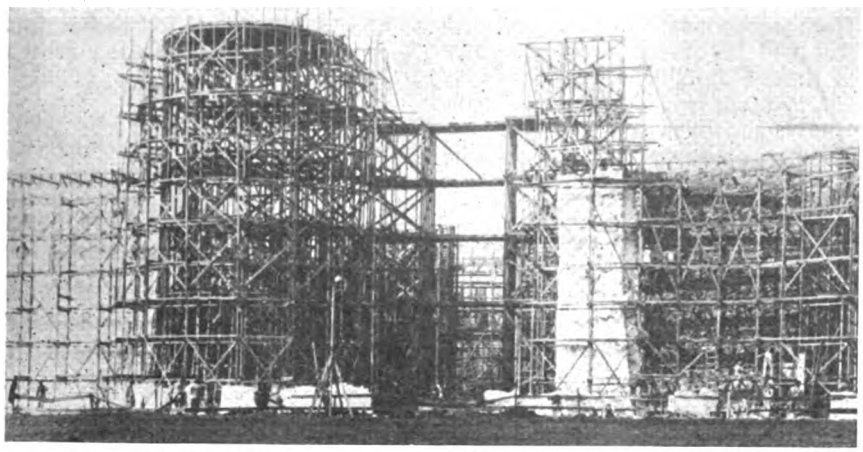
There was usually only one entrance and this was reached by a draw bridge and further protected by a huge iron gate or "portcullis," as it was called, which was raised or lowered at will. It must be remembered that these had to be worked by man power as it was before the days of gun powder, steam or gasoline, and when we view some of the construction that some of the old timers did, we really have to marvel at the wonderful results that they secured with practically no equipment. Today modern building construction makes use of many different mechanical principles and technical processes.

To obtain the right atmosphere as a background for the actors in a production such as this movie of Robin



Practical Portcullis, Drawbridge and Moat. Compare Gigantic Size of Towers and the Players.

Mary Gives Doug a Few Suggestions About Building Construction



Airplane View of the Large Motion Picture Set Built for Douglas Fairbanks in "Robin Hood"

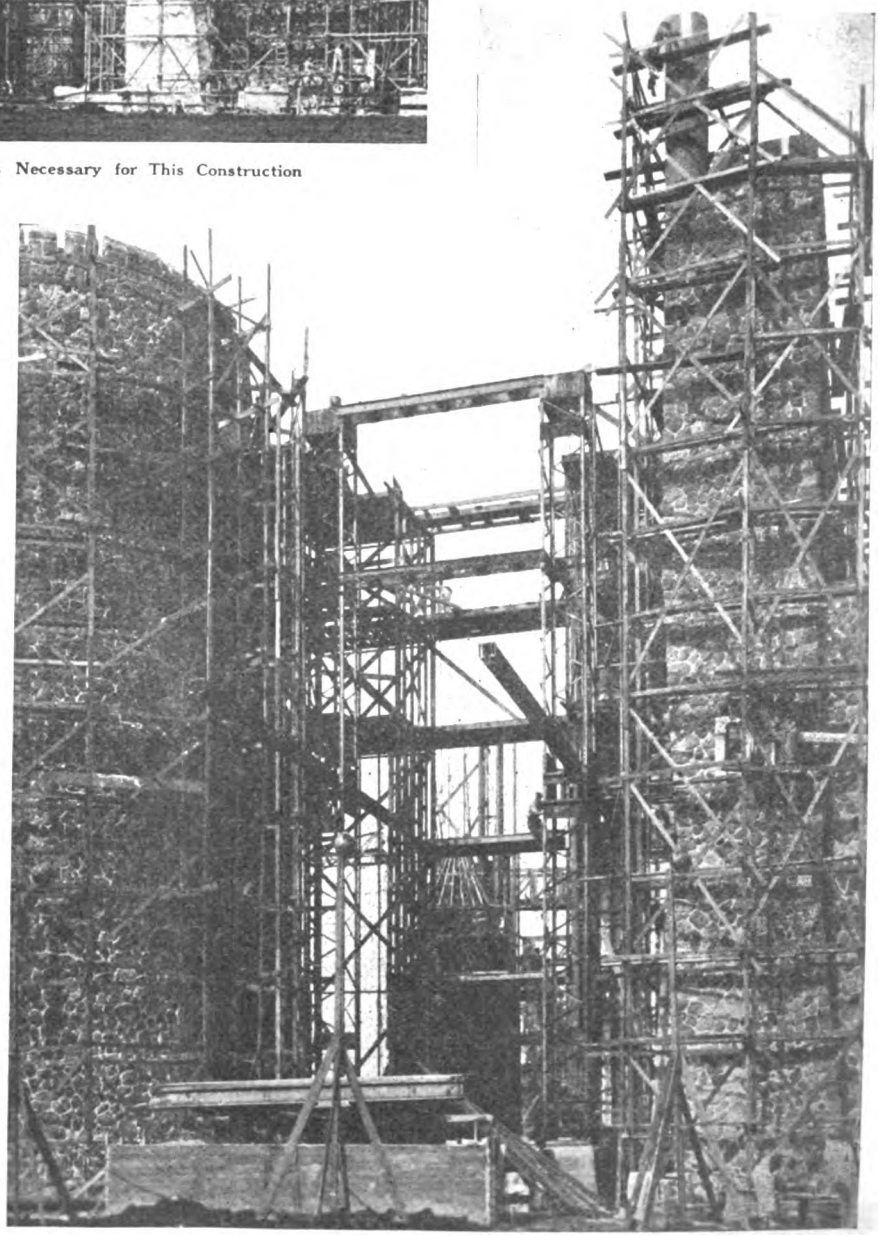
on the Building Industry

for Large Moving Picture Set

Some Remarkable Scaffolding Was Necessary for This Construction

Hood, many structures have to be erected. The old castle shown in these pictures is of considerable size and many difficulties had to be overcome in its erection. Of course, being for temporary use only, it is not of stone construction, but was built of a wood and steel frame-work and covered with sectional pieces of stucco work fashioned so as to resemble stone.

This castle is 620 feet long and in parts 310 feet high, and is composed of 8 towers with the usual curtain building between. The ground area covered is over 2½ acres in extent. In its construction 400 workmen were employed and the lumber if laid out in board feet would cover 20 acres of ground, or if placed end to end, it would span a distance of over 400 miles!



A carload of 30 tons of nails were used in its construction, together with 250 tons of plaster, 1,500 bags of cement, 178,000 square feet of wall board and stucco lath and 25,000 lbs. of fibre was used in the plaster. The actual construction work was accomplished in about 12 weeks, although many months were used in preparation.

One interior scene is taken in the great hall of the castle; this is a room larger than the concourse of the Pennsylvania Station in New York City, which is considered the largest room in the world. The banquet hall in this movie castle, however, has no roof, being open for the proper lighting of the picture.

One of our interesting pictures shows the construction of the castle walls. An idea of their height can be had from the number of divisions in the scaffolding compared with the height of the workmen. As an interesting example of scaffolding, this picture will be of great interest to builders.

This hole in the wall, filled with scaffolding, was later closed by a drawbridge built especially for the movies. It is made of structural steel and over it will ride Douglas Fair-

Close-Up View Showing the Use of Steel for the Drawbridge Support

Digitized by Google

banks bound for the Holy Land with Richard the Lion Hearted and his horde of Crusaders.

The bridge is an innovation, for it is said to represent the first use of structural steel in motion picture construction. Perhaps it predicts the building of skyscrapers of steel and stone especially for the movies. The old Norman castle of which the bridge is a part, is said to be the largest set of its kind ever built for the moving picture camera.

In the good old days the drawbridge and counterbalance beams were made of heavy oak timber and the raising of portcullis and drawbridge was accomplished by man power. Of course, a counterbalance was used, but even then it required the muscle power of a good many men to work these protecting doors. In this modern movie castle the old-time methods would of course be too slow and cumbersome so a 24 horse power electric drum hoist operates the drawbridge and it is simply worked by the director pushing a button! What would Robin Hood and any of his band have thought of such a contrivance in those jolly old days?

Builders can learn quite a good deal from an examination of these pictures that will be of considerable interest to them. Building is bound to play an important part in the movies of the future, and likewise the movies will also play an important part for building construction.

The gathering of historical facts is by no means a small job, but when Doug. and Mary are spending about a cool half million on a super-production as they are on Robin Hood, it is certain that proper search would be made back into history for the right material to present a truthful portrayal of the buildings, furniture, clothes and customs used at the time.

Doug. has gathered about him experts in every line. First of all he secured the services of specialists in research work, men who are considered the foremost authorities on history during the twelfth century. Dr. Woods, considered the best informed authority on this period in the country, heads this work at the Fairbanks Studios.

It was necessary for Dr. Woods and his assistants to search through no less than one hundred and forty-six books for material in order that this great picture might be an exact portrayal of Mediæval England during the 12th Century.

It is readily seen that time, money and real brains were necessary when Fairbanks made up his mind to do Robin Hood.

Door Opener *for* Garage

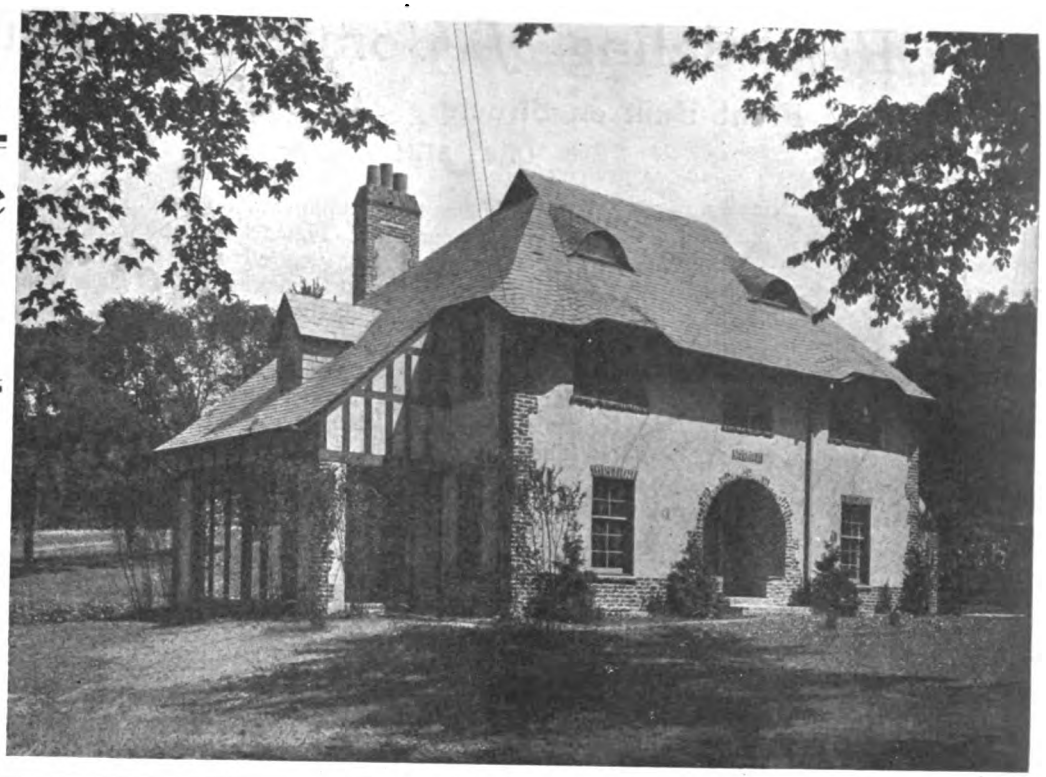
OPERATING the garage door without getting out of the car is an advantage that every car owner will appreciate.

Here is a picture of how the scheme has been worked out in quite an elaborate private garage, but the same scheme can be applied to the modest one-car garage of the ordinary type.

The scheme is very simple and any builder can work out the details to fit any particular case.

An idea of this sort can be worked by having a chain attached to the door and have it slide over two pulleys. It will work on one or two sliding doors, also on swinging doors.

The alert builder who will use an innovation like this will be the man that will get the reputation for being up-to-date in his calling.



The picture shown here is that of the garage attached to the residence of Mr. Claire Briggs, located at New Rochelle, N. Y. This is a large private dwelling in old English style, a combination of stone, brick and stucco with half timbered effects.

The garage door carries out the old English idea in all its details. It is an interesting example of some of the building problems that contractors meet in their everyday work.

The House on our Cover

ARTHUR LOOMIS HARMON
Architect

UNUSUAL in its exterior treatment is the house shown above, also on our front cover this month. The design is a little different from the great majority of houses that are now being erected. Some of the old houses of England suggested the treatment that the architect has so happily evolved in this design.

This house has been built of brick. The portions that are stuccoed have been depressed about an inch so that the finished stucco and visible brick-work are in the same plane. A garage is included in the house proper. It is carried out in the same style and corresponds with the piazza; English half timbered work at these two portions gives a very pleasing contrast with the main portion of the house.

The roof lines are rather distinctive; it is simply a hipped roof, but the treatment at the dormers and the hooded portions over the windows give the distinctive touches that make the house original in its design.

The garage does not appear so from the street as it looks like a portion of the house. It is entered from the rear as the plan shows: there is no direct entrance from the house, which is really a desirable feature, but there is a convenient rear entrance from the pantry, which is covered over, affording suitable shelter in bad weather.

This house was built for Mr. Harvey W. Bell, New York, from plans prepared by Arthur Loomis Harmon, architect, of New York. The builder was Mr. Ernest Beherens, of Irvington, N. Y.

The room arrangement is rather novel; all rooms being readily reached from the hall, both up and down stairs. Two bathrooms are located on the second floor and a very desirable feature is that they can be reached from the hall. In some houses bathrooms can only be reached from the bedrooms and this feature is sometimes very undesirable when visitors call.

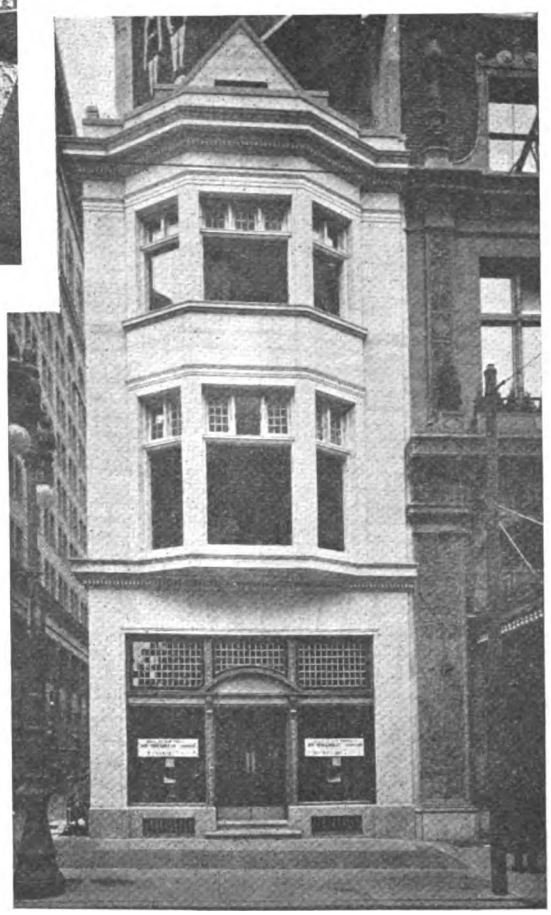
Remodeling *of* Commercial Building

Modern Front Built on Structure That Projected Beyond Building Line

C. A. ZIEGLER, Architect



IN the old days different cities had building lines, stoop lines or area lines. All sorts and manners of projections extended beyond the building line. There was no firm or fast rule or regulation of what should not be done beyond the line and within the area line. Years ago this condition existed in practically all large cities, and bay windows, etc., all encroached beyond the building line.

In recent years, a large hotel was built in Philadelphia, adjoining one of these old buildings hat projected beyond its building line. The brick wall at the side of the hotel projected about five feet beyond the hotel front and to prevent this from being an eyesore, it was faced with limestone. When litigation for the removal of the encroaching portion of this building was settled, the old front had to be removed. Of course, it could have gone back pretty near in the self-same shape, but as the building was on the prominent corner of Philadelphia at 132 Chestnut St., it was advisable from a financial point to make a high class looking job while they were at it.

Through the efforts of the architect, Mr. C. A. Zeigler, a very interesting and artistic remodelling job was done. The new front is built of limestone on a polished granite base.

The idea of the bay window is a novel one in a commercial structure. The small casement sash used for the transom, provides means for ventilation. The large windows are of plate glass. The store front is of cast iron, artistically painted in bronze-like effect. Above the plate glass show windows and entrance doors prismatic glass transoms are used.

Remodeling of buildings that have outlived their original usefulness offers a profitable field of work for contractors

Remodeling buildings that have outlived their original usefulness offers a very profitable field for securing business for the building contractors. By making certain alterations in buildings they can again be turned into a profit maker and for this reason it would pay to do so.

In every city and town there are a number of such buildings. Perhaps an old dwelling can be altered and converted into a store; if it is set back a distance the store can be built in front of it with an entrance to one side leading into the old structure. In other classes of buildings the fronts only need to be altered. In some structures, especially on city streets, it is necessary to do a good deal of shoring to support the super-structure while a new store arrangement is built underneath.

Frequently the old floor is a few feet above sidewalk level, while the modern store demands a floor level not higher than one step; in fact, in the more progressive stores, no steps are used at all but just enough incline to drain the rain towards the street.

When a floor has to be dropped as mentioned in the above case, a new foundation wall may be built on each side at the required height for the new level. The joists are then cut and the entire floor lowered to the new position.

In cases where a cellar does not exist and the foundations go down only 3 or 4 feet, a high cellar can be made without much expense by building a retaining wall inside of the old foundation. This only takes off a few square feet from the cellar floor, but it saves a good deal of expense for underpinning if the original foundation wall is to be deepened.

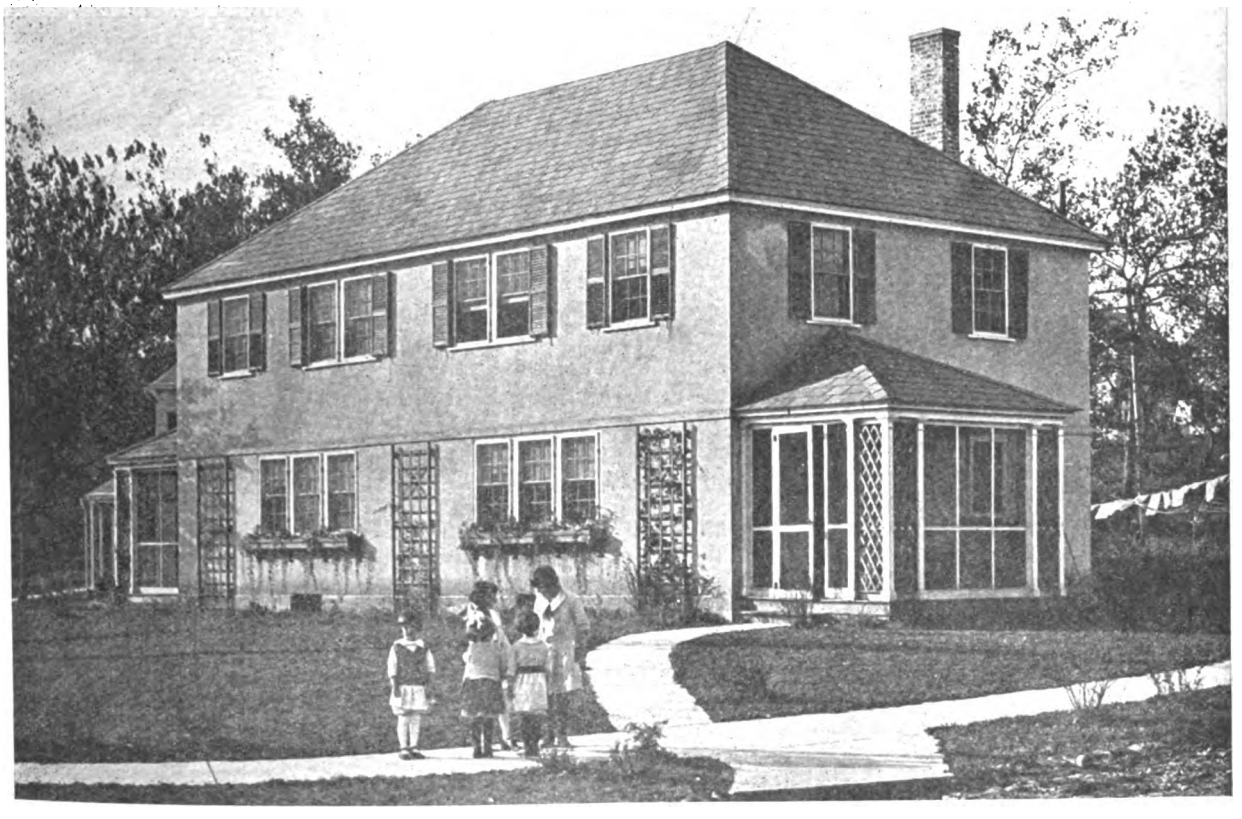
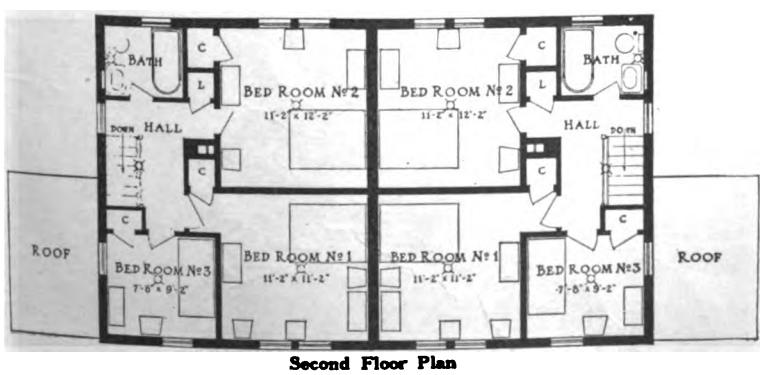
Twin House Design



MURPHY & DANA, Architects



THERE is a certain economy in building a twin house besides improving the exterior appearance, as a more pretentious appearing building is the result.

The interesting example shown here is of frame construction covered with stucco. The lattice treatment adds just the ornamental touch to relieve the plainness.

First Floor Plan

Second Floor Plan

The belt cross carrried around above the first story windows and in line with the porch roof forms an interesting dividing line between the two stories.

Each house contains six rooms, very conveniently laid out, proper attention having been given to secure adequate room for the necessary furniture.

This interesting house was one of a number built at New Britain, Conn.

ATTRACTING

How a Progressi
Successfu

Flashlight View of the Crowd Waiting for Admission at Night

HOME owning interest can be capitalized to a wonderful degree by the speculative builder. The idea of having a sample house completely furnished is not a new one, but it can be carried in such a complete manner so that it will result in some very valuable advertising.

Successful salesmen in the building line know the psychological effect that a crowd has on the man and woman who really want a home. They mingle with the crowd, viewing the different rooms and hearing with rapt attention all the nice remarks about how the rooms are furnished and laid out, and they hear many suggestions from this or that one as to how they would have had it, if they would own it. Sales under these conditions are made under the best possible conditions. The speculative builder is here in the same position as any other merchant with goods to sell.

A fine piece of furniture displayed in a junk shop would not command so good a price as if properly displayed in a furniture store window where its beautiy would be enhanced by a suitable background.

Usually builders have only their services to sell, but quite often they will build a house for speculative purposes so as to make extra money on the side. Frequently this leads to building on rather a large scale, and it is interesting to know how some successful builders in this line have sold their product.

A most remarkable example of the model house idea was recently used in Baltimore very cleverly by Mr. George R. Morris. There it was successful as advertising is evidenced by the fact that over 27,000 people visited this furnished house! During the inspection period is was open both day and night, and needless to say this great number of people talking about it, was worth a great deal of money and as all of the buildings erected were successfully disposed of the publicity certainly was good advertising.

Mr. Morris some years ago bought a tract of land which had formerly been part of an old homestead on the outskirts of Baltimore. He divided this into streets, put in sewers, sidewalks, curbs, etc., and erected quite a number of different homes and called the place "University Homes."

Several of the different buildings in this group were described in our

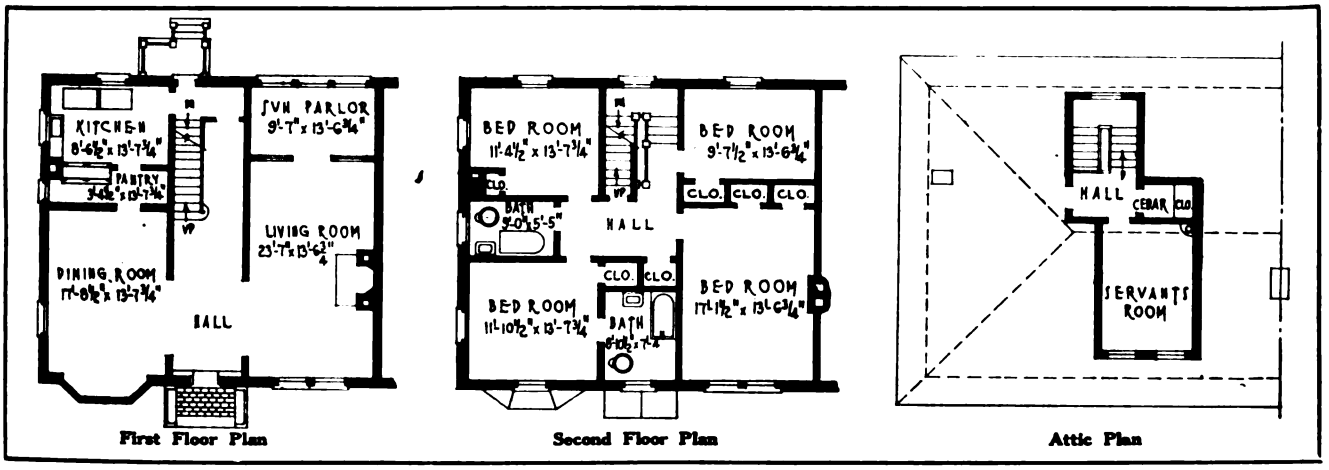
THE CROWD



altimore Builder
old Houses

May issue. It is a community development, different in many respects from anything ever attempted in Baltimore or for that matter anywhere else in the country, and the successful methods employed to profitably and quickly dispose of these houses will give many a good idea to our readers.

Mr. Morris was an architect who branched out into the speculative building business and he has made a big success of it; this home development is the result of his years of experience in designing and operating apartment houses as well as building a great many individual homes. By close contact with his customers he learned just what the majority of the

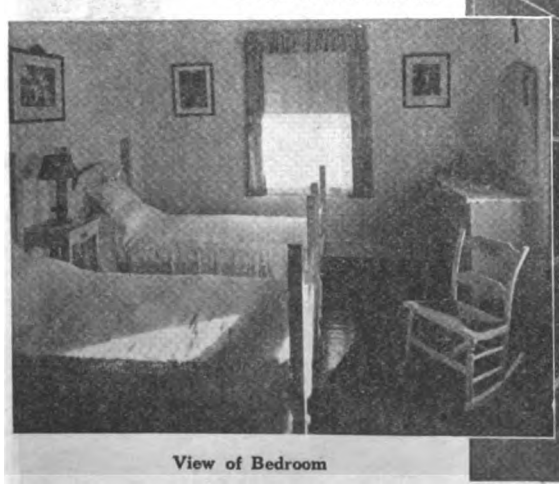
View of the Kitchen

Sambo the Cook of More Than Little Size Sure Finds the Kernarator a Great Invention for Disposing of the Garbage

people wanted in the way of a desirable home at a moderate expenditure.

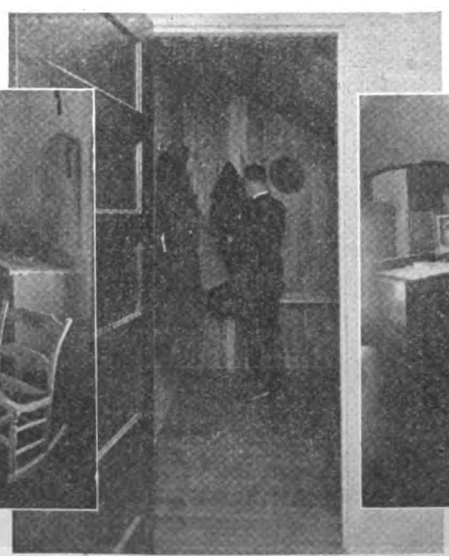
We present herewith a very interesting group of pictures of one of the houses in "University Homes" that was fitted up as a model house. This was one side of a twin house, as for economy's sake the houses were built semi-detached.

A very interesting picture is the flashlight taken one night, showing the crowds waiting for admission to view the interior. Some small advertisements were inserted in the local daily papers in the real estate section calling attention to the fact that an ideally furnished model house was open free for inspection to anyone who might call. On some days the crowds were so great that they had to form in line to wait for admission.



With the cooperation of different firms in Baltimore, the house was completely decorated and furnished so that it had an absolute home-like appearance. In some model houses, handsome furniture and rugs are all placed down in a certain artificial way, and with a prominent tag on each, and this, while attractive enough, chills the homelike effect. No such eyesores appeared in the model house of Mr. Morris's. Instead, an attractive, well printed 32-page booklet, size 5½" by 8", was presented to each visitor. This booklet had a title, "The Ideally Furnished Home." It contained a picture of the house and a short description of the development. Then came an itemized list of each room, listing every article of furniture, etc., and from whose establishment it came. A visitor could go about each room and a look at the booklet would tell them just exactly where each piece of furniture, linen cloth, etc., could be had.

In furnishing up the house, the home touch was always brought out strong. Little toilet articles were on the dressers in the bedrooms, and clothes were hung in the closets. The idea was to create the impression that it was a real livable house. It was just the human touch that was needed and many a lesson on successfully selling houses can be learned from this.



The booklet contained a number of advertisements of different firms who furnished material and furniture for the house and the money derived from this source paid for the cost of the interesting booklet. Every copy went into the hands of an interested party and it was a successful example of cooperative work throughout.

We also present with the pictures a plan of the floor arrangements. This plan shows the opposite side of the twin house, both are identically the same, except reversed.

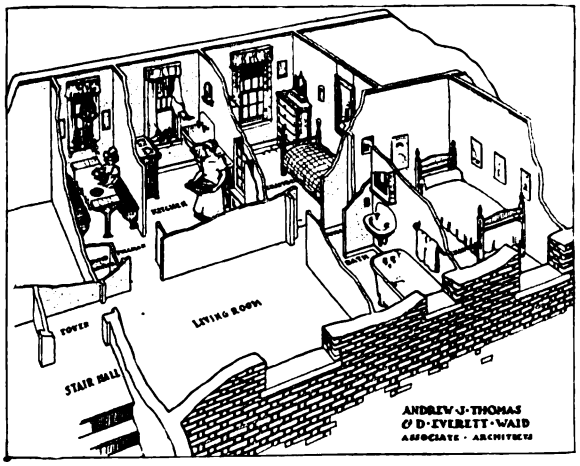
MODERN APARTMENT BUILDINGS

The Start of the Metropolitan Life Insurance Company's $100,000,000 Building Project



WORK has commenced on four groups of apartment houses in the Astoria section of the City of New York in the huge home building program of the Metropolitan Life Insurance Company.

Mr. Walter Stabler, the company's comptroller, informs us that the contract is for total guaranteed cost not to exceed $6,500,000. This includes the contractor's fee of $5,000 a house and the architect's fee. Mr. Stabler declared he expected the cost would be less than the maximum amount and any reduction over charges would go to reduce the rents. In any event, even if the full $6,500,000 is spent the rental will be $9 a room.

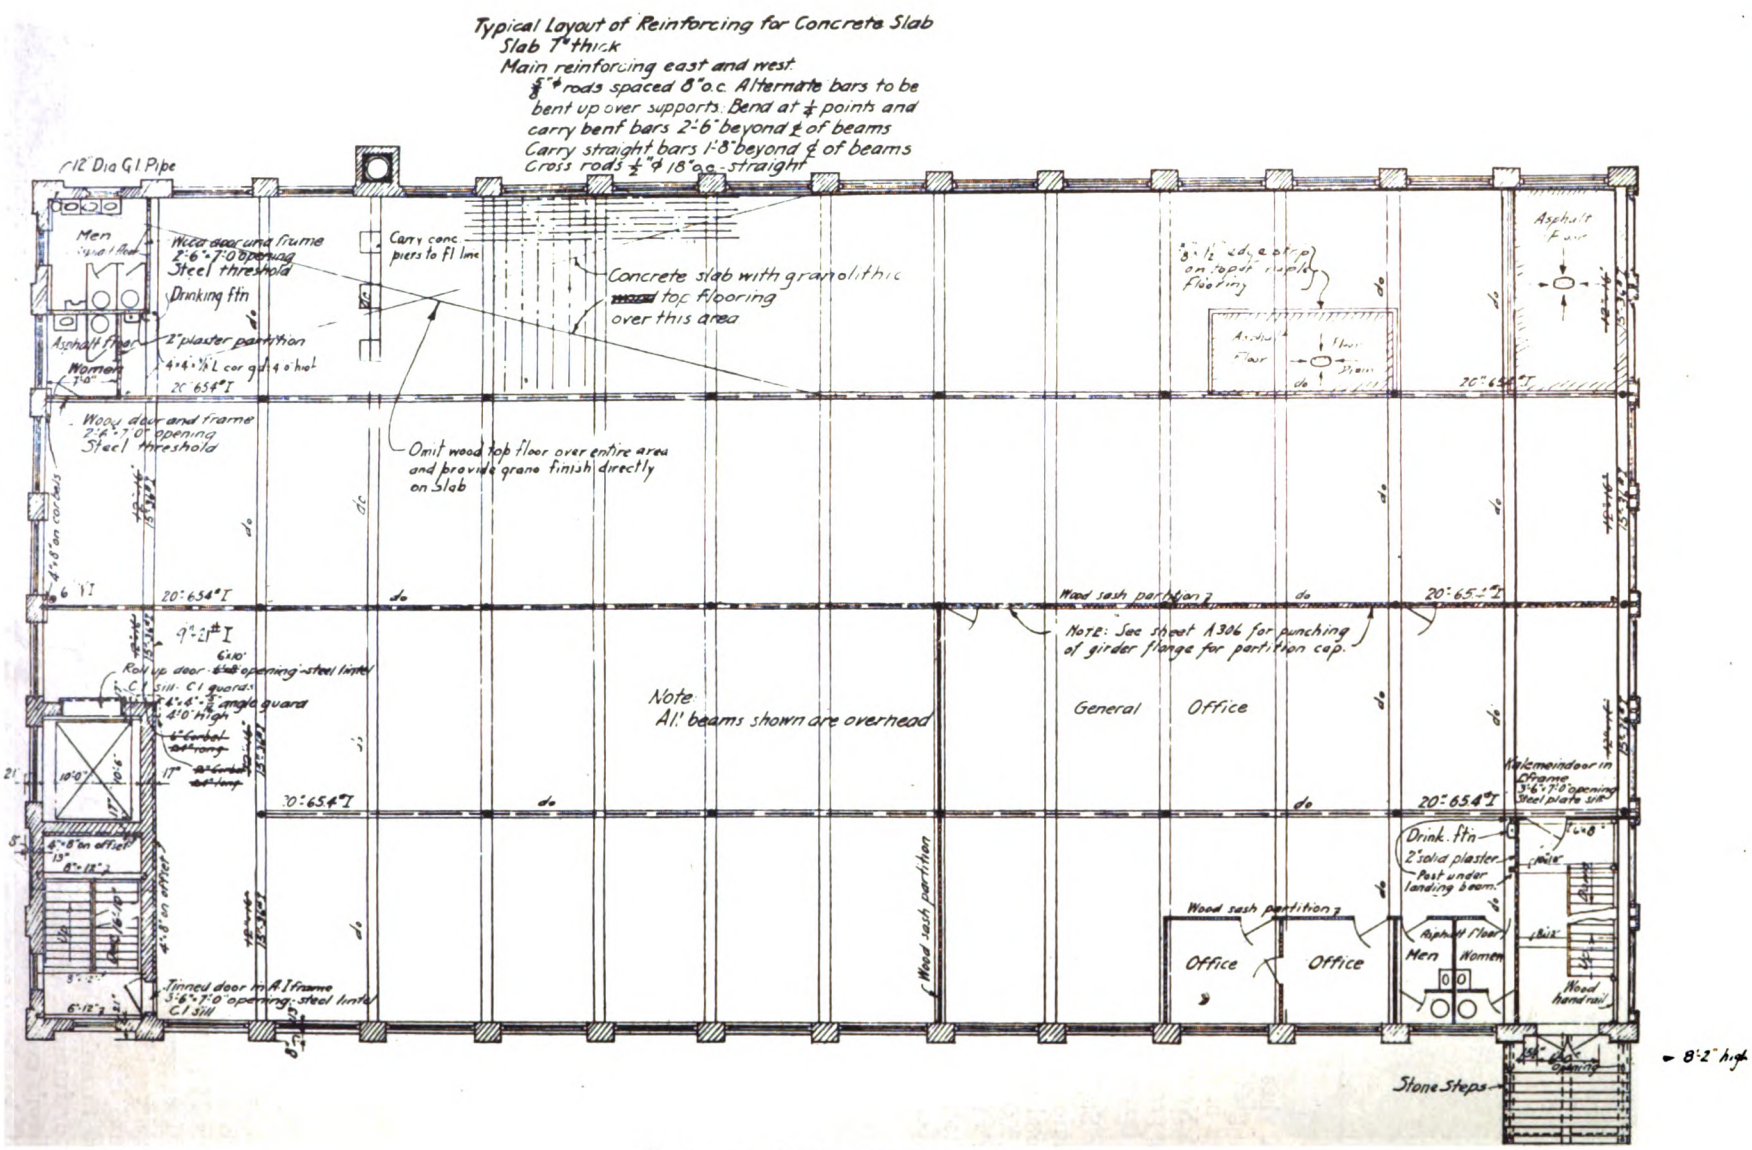
In announcing the completion of plans and the award of contracts, the Metropolitan Company calls attention to the fact that the earnest co-operation of labor and the large scale reproduction of the unit house will enable the company to rent the houses at not more than $9 a room, as specified in the law, and cover operating expenses, return 6 per cent. interest on the investment, and amortization.

Mr. Andrew J. Thomas is the architect for these model apartment houses and Mr. Stabler, who has charge of this huge project for his company, is enthusiastic about the plans and gives Mr. Thomas considerable praise for creating a model plan. Mr. Stabler said: "His vision, his initiative and his untiring efforts have combined to make these buildings a model for future development. The Metropolitan's own architect, D. Everett Waid, has been associated with Mr. Thomas in a consulting capacity, but the ideas, the plans, are all those of Mr. Thomas."

Pictures accompanying the description of the new houses show the architectural beauty of the exterior block, the pleasant parked courts and the extensive use of the "Pullman"—an eating nook separate from the kitchen and not encroaching upon the functions of the living room, the old style dining room having been eliminated from the majority of the apartments, more convenience in less space.

What may not seem so obvious from a glance at the architectural drawings, but of even more significance, is the fact that the buildings occupy only 50 per cent. of the land area. In other words, half the space on the block—which is 600 feet long and 200 feet wide—is open. The Tenement House Law demands that only 30 per cent. of the area be unoccupied.

Another feature in which Mr. Thomas's plans are far more generous than the requirements of the law pertains to the size of the rooms. Every room is far in excess of the minimum specifications of the law, as is the general block development.



Apartments are four, five, and six rooms, Mr. Thomas being able to break away from the three-room plan, which he declares is "definitely below the American standard of living," only after long study. Every apartment will have at least two bedrooms—assuring the privacy which a civilized home life demands—a living room and a kitchen. Some will have additional bedrooms and dining rooms.

The four-room apartments will be equipped with the "Pullman," a cozy corner with a stationary table and benches on either side. A window looking out upon the street or the parked courts gives light.

Every one of the 8,250 rooms will look upon a street or court. Between the two rows of houses forming each block will run a great interior garden thirty-six feet wide and 600 feet long. This central park will be seeded and planted with shrubs and flowers in accordance with the principles of good landscape gardening that will accord with the design of the houses.

Within each individual house, which will be built in the form of a U, will be a large garden, 40 feet wide by 154 feet long. These gardens will intersect the central court. At a third opening are the passageways every 100 feet between buildings. All these courts and passages bring outside light and fresh air into the buildings.

Future Extension and Use Considered in Modern Factory Design

By SAMUEL B. LINCOLN

FACTORY buildings, like other structures, sometimes serve entirely different uses than what they were originally planned and built for. To build a structure that can be used for only one thing is apt to cause quite a financial loss should there be a change in the industry for which it was erected. Builders should have this in mind when they are submitting designs or called in consultation with the owner of a proposed factory or any other commercial project.

Everyone is familiar with the changes in certain business streets that have occurred in a number of our large cities.

In this connection the design of the modern brick factory building presented in this issue will be of considerable interest, as there are several very unusual features about this design.

After occupying rented quarters for a number of years, the Shambow Shuttle Co. of Woonsocket, R. I., had constructed during the past year an entirely new plant to house their business and to enable them to give better service to their customers.

Work was started in July, 1919, and the new plant was substantially completed so that moving into the same was completed about January 1, 1922.

In the first place, the owners decided that, since Woonsocket was a rapidly growing worsted center, it would be good business foresight to construct so that should they at any time wish to move their shuttle business away from Woonsocket, the building could be readily converted into a worsted spinning mill.

This thought has been kept in mind both in the design and construction, with the result that while this is a very fine shuttle factory it also could be converted with practically no expense into a good worsted mill.

Unusually complete provisions have been made for future expansion of the building in either of two directions. The building is constructed at present to a height of three stories and has been arranged for the future addition of two more stories. One temporary end has been built into the building so that at some later date the building may be practically doubled in length on the ground available and now owned by the Shambow Shuttle Co.

For this reason the entrance has been placed to what is practically one end of the building; in the completed structure, as contemplated, this main entrance will be in the center and will then give a well balanced appearance to the entire structure.

The temporary frame enclosure on the one end can be easily torn away when the addition is built and roofed over, but the appearance of the existing structure is complete.

Lockwood, Greene & Company of Boston were the engineers and the general contractor was the Eastern Construction Co. of Woonsocket, R. I.

Designs of this type of building are of interest especially at the present time, as there has been a considerable increase in the number of industrial buildings in demand. During the month of May, twenty-three million dollars worth of contracts were let for various industrial buildings. This is a very gratifying sign of the times, and indicates that the business revival is now going forward throughout our country.

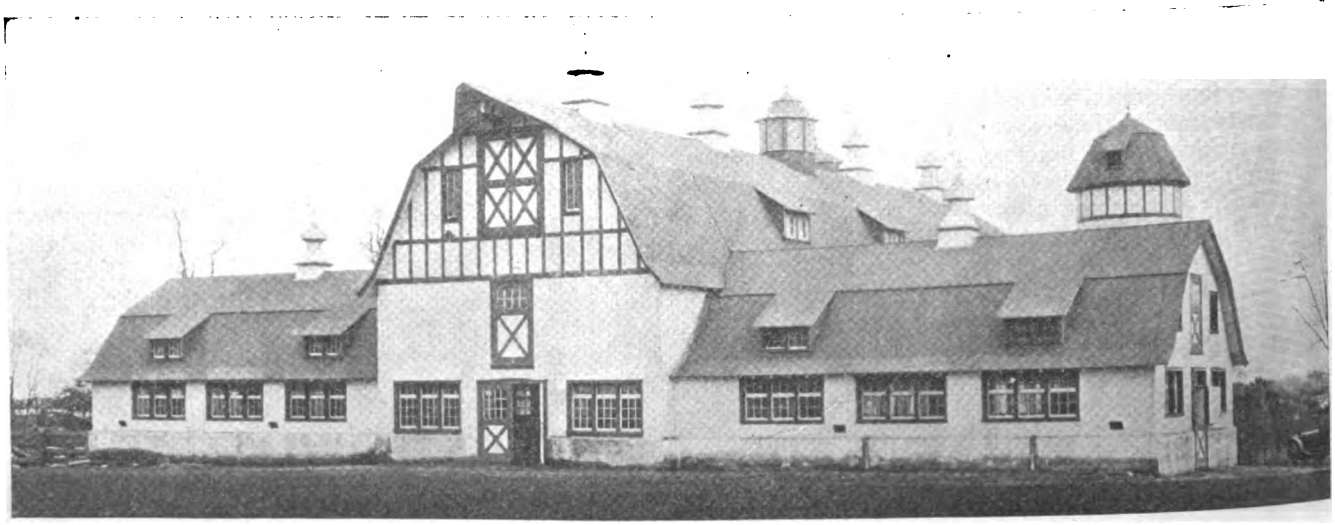
Modern Good Looking Barns Replace the Ugly Type

A Little Ornament Judiciously Placed Transforms an Otherwise Plain Structure Into One of Beauty

FARM improvements are steadily developing. The old time farmer of fifty years ago would certainly marvel if he could visit one of the up-to-date farms and see all the modern conveniences and the attractive looking buildings.



The dreadful monotony has been dispelled by the automobile and the wireless phone. Farm homes now contain many modern improvements so as to give the women folks, also the men folks, all the advantages that the city dweller enjoys. More attention is being paid to the beauty of the buildings. Of course, it is necessary that they be well constructed so as to serve their purpose, but little thought has been given in the past to make them good to look at. It will therefore be of interest to our readers to examine the three pictures shown herewith, of the large dairy barn belonging to Mr. J. T. Towner and built at Torresdale, Pa.

This is a large stucco covered barn which is well lighted, and the windows placed so as to obtain a pleasing architectural effect. The doors with crossed timbering in the panels form interesting details of the completed structure. The large hay door is similarly treated. In the ordinary type of barn this is usually an ugly looking construction. Here it is pleasing.

Besides the practical metal ventilators, the central one has been covered with an ornamental tower with louvres, this adding a good deal to the appearance of the barn.

The large gable end and silo tops have been effectively handled by means of half timbered work.

CONTRACTING EQUIPMENT

Reliable Information on Time and Labor Saving Devices

Economical Operation *of* Hoist

FOR four years we have been using a 6 H.P. gasoline engine with a platform hoist, and have found it by far the best, quickest and most economical method of hoisting material for building construction work," says Mr. Peter Guthy, Jr., of Peter Guthy, Inc., 852 Monroe St., Brooklyn, N. Y.

Since its purchase our outfit has worked on several large buildings, besides different jobs of smaller size. It worked for about 4 weeks on the Brooklyn Hebrew Home, for 6 months on the Riviera Theater building, and for 2½ months on the church of the Seventh Day Adventists. At present it is operating on a building which we are constructing for the J. H. Meyer Company at Howard and Dumont Avenues, Brooklyn.

On these jobs the outfit was used for hoisting brick, concrete, terra cotta blocks, beams, stone and lumber. The concrete is mixed in a mixer on the ground and dumped into a barrow, which is then wheeled onto the hoisting platform and raised by the engine. At the top the barrow is wheeled off by a workman who handles all material from the hoist. Only one man is needed here.

When hoisting lumber, the outfit works only at intervals because of the large amount of sawing required. On a brick hoisting job, however, it has to work steady all day long, and easily keeps a gang of 20 men busy laying bricks. Of course only half of these man are bricklayers, the other half being helpers. The outfit hoists an average of 15,000 bricks a day in addition to barrows of mortar as needed.

ANALYSIS OF OPERATION

Units handled daily, 15M brick.
Period covered, 1 day.
Hours operated, 8.
Estimated life, 6 years.

Investment and Depreciation	
Cost of outfit (including freight)	$586.92
Cost of additional equipment	.....
Total depreciation yearly	97.82
Depreciation prorated for daily period	.65
Fixed Expense	
Average interest at 7%	$23.97
Maintenance and repairs on engine	60.00
Maintenance and repairs on outfit (new cable)	9.56
Total yearly fixed expense	$93.53
Expense prorated for daily period	.62
Variable Expense	
Fuel cost, 2½ gals. @ 27c	$ .68
Lubricating oil, .14 gals. @ 50c	.07
Total for daily period	$ .75
Labor Cost	
Operator ($7 per day)	$7.00
Helper ($7 per day)	7.00
Total for daily period	$14.00
Summary	
Depreciation	$ .65
Fixed expense	.62
Variable expense	.75
Labor	14.00
Total cost daily expense.	$16.02
Total cost per M brick	$1.07

Since our first outfit is still in operation after 4 years' use, we believe it is good for at least 6 pears in all, and are depreciating it on that basis.

On the average job the engine uses 15 gallons of gasoline in 6 days, or 2½ gallons a day, and an average of about .14 of a gallon of oil per day.

It must be kept in mind that these costs include the full time of two men. The operator at the bottom of the hoist not only tends to the engine —which really requires very little attention—but also loads the platform with the barrow and other materials, and operates the hoist. The helper at the top of the hoist unloads it and delivers the material around the building as needed. The wages of these men amount to $14 a day, or ⅞ of the entire operating cost, leaving only $2.02 per day as the actual cost for depreciation, repairs, fuel, etc., for the equipment. Two men are required on almost any hoisting outfit; but with the Novo they can give practically all their time to handling the material.

On these hoisting jobs it would be possible to use horse power or hand power, but both are too slow and expensive. We use the outfit on jobs up to 6 stories in height; but we have never tried horses except for one-story buildings, and have not used hand hoists at all.

On account of the satisfactory performance of our first hoisting outfit, consisting of a Novo engine, we purchased another one a short time ago. The original had been in operation four years and needed an overhaul, so we thought it advisable to purchase another one. The new equipment has proved as satisfactory as the original.

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

Estimating Materials *for* Masonry Work *and* Concrete Construction

By I. P. HICKS

SINCE many materials are now bought and sold by the ton (2,000 lbs.) and by the 100 lbs. instead of by the cubic yard and the cubic foot, it becomes necessary to have a basis for quantities by the ton and by the 100 pounds.

As many parts of concrete and cement construction are figured by the cubic yard, cubic foot and square foot of surface for given thicknesses, there is much need of a ready method to determine the weight and quantities of material required for such work.

To meet this demand we have arranged the following data, which will enable the contractor to readily determine the quantities of material required for the different kinds of work as described. In the mixtures of materials, Portland cement is figured 100 lbs. per cubic foot; sand, 100 lbs.; broken stone, average size 1 inch diameter, 88 lbs. In the mixing of materials the quantities are to be taken by volume unless otherwise stated. In most cases the mixing of materials is by volume, but in the estimating for buying, it is often necessary to know the weight of the materials in order to purchase the correct quantities.

Quantities of Materials for One Cubic Yard of Concrete

Mixture Proportions	Sacks Cement	Sand Tons	Stone Tons
1 : 2 : 3	6 33	0.63	0.95
1 : 2 : 4	5.50	0.54	1.08
1 : 2½ : 5	4.50	0.56	1.11
1 : 3 : 5	4.20	0.63	1.05

Material Required to Lay 100 8"x8"x16" Cement Blocks Using 1 to 3 Portland Cement Mortar

Portland cement, 1.75 sacks; screened sand 600 lbs. Cement blocks required per cubic foot of wall, 1.68. Cement blocks can also be figured 1⅛ blocks per square of the surface measurement for an eight inch wall. A wall faced with 4" 8" x 16" blocks can be figured by the same method, 1⅛ blocks per square foot of the surface to be faced.

Materials Required for 100 Square Feet Cement Floor—Base Coat

Thickness Inches	Mixture Proportions	Sacks Cement	Sand Tons	Stone Tons
2"	1:2:3	4.00	0.38	0.58
2"	1:2:4	3.25	0.34	0.67
2"	1:3:5	2.60	0.39	0.65
2½"	1:2:3	5.00	0.47	0.73
2½"	1:2:4	4.16	0.42	0.83
2½"	1:3:5	3.25	0.49	0.81
3"	1:2:3	5.83	0.58	0.88
3"	1:2:4	5.00	0.50	1.00
3"	1:3:5	4.20	0.60	0.98
3½"	1:2:3	6.76	0.68	1.02
3½"	1:2:4	5.80	0.58	1.16
3½"	1:3:5	4.50	0.68	1.13

Mortar Colors per 1,000 Brick Approximate

Red, windsor, terra cotta, amber, seal, fern, green and salmon, 50 to 75 lbs.

Buff, brown, colonial drab and French grey, 40 to 60 lbs. Black 30 to 60 lbs.

Materials Required for 100 Square Feet Cement Floor—Finish Coat

Thickness Inches	Mixture Proportions	Cement Sacks	Sand Tons
½"	1 to 1	3.40	0.12
¾"	1 to 1	5.12	0.18
1"	1 to 1	6.80	0.24
½"	1 to 1½	2.72	0.14
¾"	1 to 1½	4.08	0.21
1"	1 to 1½	5.44	0.28
½"	1 to 2	2.24	0.16
¾"	1 to 2	3.36	0.24
1"	1 to 2	4.48	0.32
½"	1 to 3	1.57	0.24
¾"	1 to 3	2.00	0.36
1"	1 to 3	3.14	0.48

Magnesite Stucco Materials for 100 Square Yards

Thickness	Stucco, pounds	Chloride solution
Scratch coat, ¼"	1,600	56 gallons
Finish coat, ¼"	1,600	56 "
Dash rock	1,000	

Cement Stucco Materials for 100 Square Yards

Mixture Proportions	Thickness	Sacks Cement	Sand tons
1 to 2	½"	20	2.00
1 to 2	¾"	30	3.00
1 to 3	½"	16	2.16
1 to 3	¾"	24	3.24
		Dash rock	0.50

Materials for 100 Square Yards Plastering—U S G Hardwall Plaster

Materials	On wood lath	On metal lath	On Sacket plaster Brd.	On brick and tile walls
Sacks plaster	10 to 11	16 to 18	8 to 9	14 to 16
Sand pounds	2,700 to 3,000	3,300 to 4,500	2,300 to 2,500	3,800 to 4,000

For the white coat, 1 barrel of lump lime or 5 sacks of hydrated lime, and 100 lbs. of finish plaster.

4-foot lath 1,500, 32-inch lath, 2,000 will be required for each 100 square yards. Lath nails required 8 lbs.

Material to Lay 1,000 Brick ⅜" Mortar Joint

Mortar 1 part lime putty and 2 parts sand. 1¾ barrels lump lime and 1,500 lbs. sand.

Mortar 1 part lime putty and 2½ parts sand. 1⅜ barrels lime and 1,500 lbs. sand.

Hydrated lime mortar, 1 part hydrated lime and 2 parts sand. 6½ sacks hydrated lime and 1,500 lbs. sand.

Hydrated lime mortar, 1 part hydrated lime and 2½ parts sand. 5¾ sacks hydrated lime and 1,500 lbs. sand.

Lime, sand and cement mortar, 1 barrel lump lime, 1 sack Portland cement and 1,500 lbs. sand.

Or, 4 sacks hydrated lime, 1 sack Portland cement and 1,500 lbs. sand.

Cement mortar, 1 to 3 Portland cement. Portland cement 5 sacks, sand 1,500 pounds.

Approximate Weight of Masonry Building Materials

	Pounds
Sand per cubic foot	100
Gravel per cubic foot	100
Crushed rock per cubic foot	88
Portland cement per cubic foot	100
A sack of cement weighs	94
Usually figured 1 cubic foot	
Lump lime per barrel	180
Hydrated lime per cubic foot	40
Hydrated lime per sack	50
Hard wall plaster per sack	100
Stucco plaster per sack	100
Common brick per cubic foot	125
Press brick per cubic foot	150
Limestone and marbles per cu. ft.	168
Granite	170
Sandstone	151
Bluestone	160
Quartz	165

Weight of Masonry

Concrete per cubic foot	140
Common brick work	120 to 130
Press brick work	140
Granite and limestone rubble	154
Sandstone rubble	145
Mortar, hardened	103
Plaster, square yard on wood lath	27 to 33

Materials Required to Lay up 1,000 Pieces Hollow Tile

One part Portland cement with 20% hydrated lime added and 3 parts sand.

Size of tile	Thickness of wall	Sacks of cement	Tons of sand	Lime Or Dry hydrated lbs.	lump lime cubic feet	required to make putty lbs.

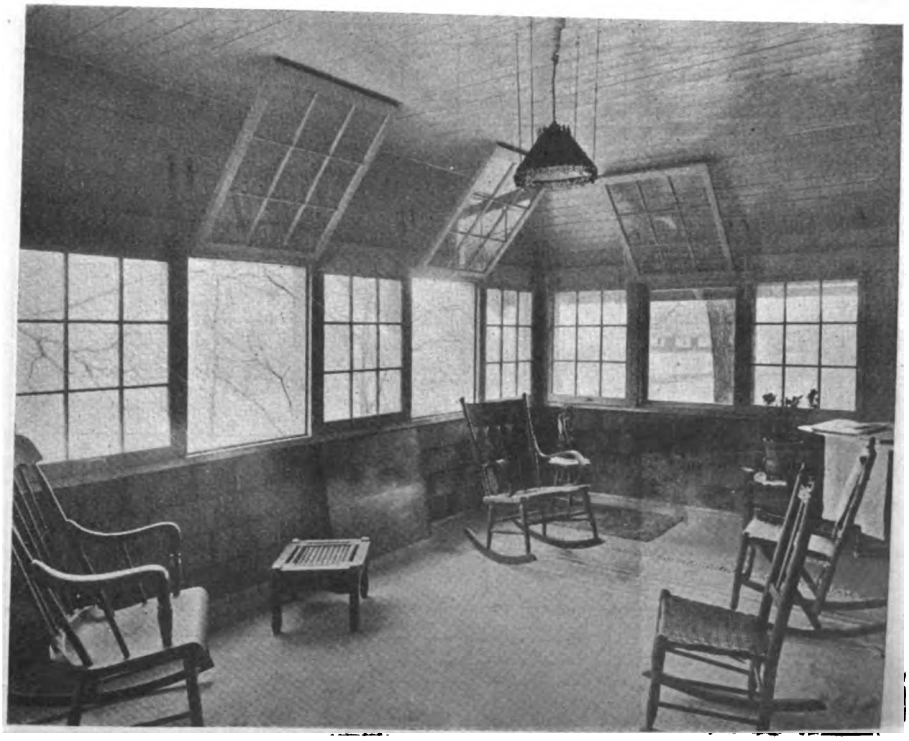
Novel Method *of* Hanging Sash



New Use for Spring Sash Balances

SLEEPING porch windows should be fixed in a manner so that the full opening can be had. A means must be found where the sash can be rapidly and easily closed and opened.

A heavy wind usually awakens the sleeper and the closing of the windows on the windy side of course prevents this annoyance. The same is true of a rain storm; this is why it is desirable to have an easily operated sash.

The picture shown herewith is the scheme of an ingenious home owner who had the sash hinged on top and counter-balanced by ordinary spring sash balances. The idea of using the spring sash balances in this position will be new to most of our readers, but in this case it has worked out very successfully.

This ingenious method was used by one of our subscribers, Mr. William H. Force, Jr., on his own residence at Madison, N. J.

CARPENTRY

Good Practice in Frame Construction and Finish

How to Frame a Roof of Unequal Pitch

By RICHARD M. VAN GAASBEEK

School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

CONTINUING the problem from our June issue, we will now proceed to lay out the jack rafters on the short common side. The length of the jack rafters Nos. 1, 2, 3, 4 and 5 are determined in the same manner as the preceding common rafter No. 6, for they are a part of the length of it. Take the runs from the layout, figure 1, measuring from the facia line to the center of the hip rafter. The five rafters are shown developed on the side of a single rafter, figure 8.

In practice these would be laid out separately and are laid out over one another on the drawings, only to save space and to avoid repetition.

Press the fence firmly against the top edge of the stock to be used, using the same figures on the square as for the previous rafter and produce the facia line or first plumb line to the extreme left, A, figure 8. Slide the fence to the right and measure on a level line from facia line A, the run of rafter No. 1, 1 7/16 inches, the run of rafter No. 2, 2 7/8 inches, the run of rafter No. 3, 4 5/16 inches, the run of rafter No. 4, 5 3/4 inches and the run of rafter No. 5, 7 3/16 inches, and produce plumb line C, figure 8, the extreme length of the rafter to the center line of the hip rafter.

From this length deduct one-half the thickness of the hip, measured on the line of the jack rafter, one-half the diagonal thickness of the hip, C-D, figure 9, which is an enlarged section through U-U, figure 1, and produce plumb line D. Square this line across the top edge of the rafter and locate the center as shown in the figure.

To simplify picking up the bevel for the top cut, draw in a section of the hip and jack rafter, full size on the layout, (figure 1 shown in May issue) as shown in the section, figure 9. Where the outside edge of the jack rafter intersects the outside edge of the hip rafter, square a line across at right angles to the center line until it intersects the center line as at I, figure 8.

To lay out the top cut so that the jack rafters will fit against the side of the hip rafter at the proper angle, measure back on a level line from plumb line D, on the side of the rafter, figure 8, the distance D-1, figure 9, and produce plumb line 1, figure 8. Connect plumb line 1 through plumb line D on the center line as shown at 2, top view, figure 8. The lower end of the rafter is, of course, an exact duplicate of the short common rafter.

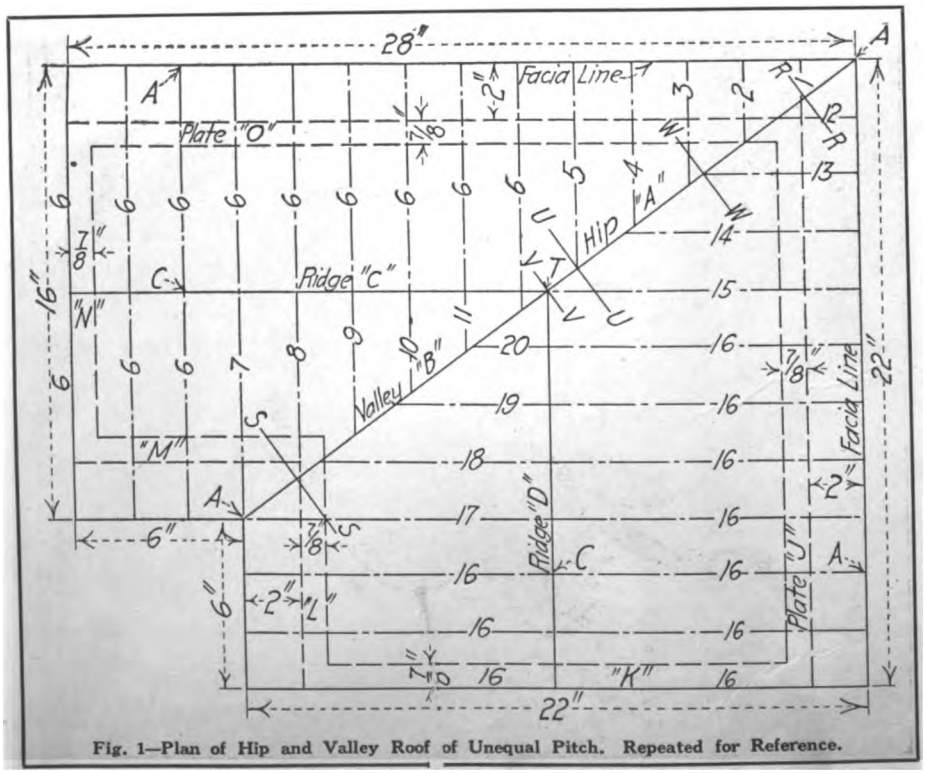

Fig. 1—Plan of Hip and Valley Roof of Unequal Pitch. Repeated for Reference.

Digitized by Google

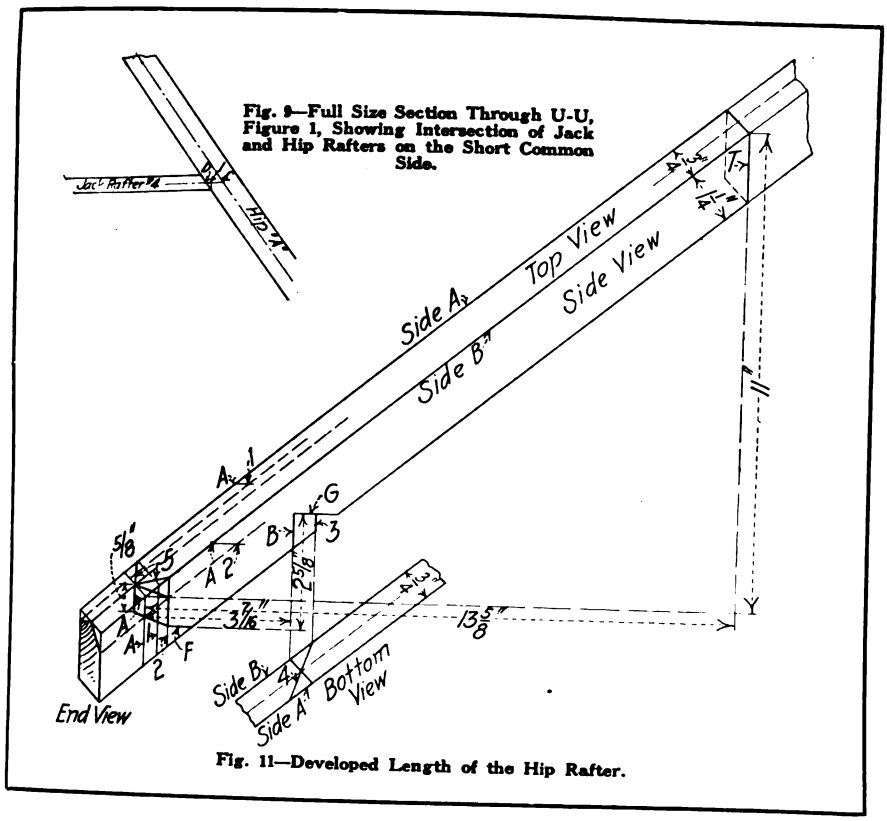

Fig. 9—Full Size Section Through U-U, Figure 1, Showing Intersection of Jack and Hip Rafters on the Short Common Side.

Fig. 11—Developed Length of the Hip Rafter.

Measure in from facia line A, measuring on a level line, 2 inches, the width of the projection, locating wall line B. Measure down on facia line A, from the top edge of the rafter, 5/8 inch, the width of the facia, locating plancher level F.

Measure up from plancher level F, measuring on a plumb line 2 5/8 inches, locating plate level G. Cut on line A, for the facia. On line F for the plancher level. On lines G and B for the birdsmouth. On bevel 2 on the top edge and plumb line 1 for the cheek cut against the hip rafter.

The length of jack rafters Nos. 7, 8, 9, 10 and 11 are determined in the same manner as the preceding jack and common rafters, with the exception that the top and bottom cuts are different. Take the runs from the layout, figure 1, May issue, measuring from the center of the ridge to the center of the valley rafter. The four rafters are shown developed on the side of a single rafter, figure 10.

In practice these would be laid out separately and are laid out over one another only to save space and to avoid repetition. Press the fence firmly against the top edge of the stock to be used and produce the first plumb line to the extreme left, C, figure 10. Slide the fence to the right and measure on a level line the run of rafter No. 7, 8 inches, the run of rafter No. 8, 6½ inches, the run of rafter No. 9, 5 1/16 inches, the run of rafter No. 10, 3 5/8 inches and the run of rafter No. 11, 2 3/16 inches, and produce plumb line C, figure 10, the extreme length of the jack rafters to the center line of the ridge. From this length deduct one-half the thickness of the ridge, 3/16 inch and produce plumb line B, the cutting length of rafter against ridge.

The bottom of all five rafters are beveled to make a fit against the side of the valley and jack rafters No. 7 and 8 also have a bearing on the plate so that the plancher level and birdsmouth must be laid out as for the common rafter on rafter No. 7 and the birdsmouth only for rafter No. 8.

To lay out the birdsmouth for rafters No. 7 and 8, measure in from plumb line A, figure 10, measuring on a level line, 2 inches, the width of the projection, locating wall line B. Measure down on plumb line A, from the top edge of the rafter 5/8 inch, the width of the facia, locating the plancher level F. Measure up from plancher level F, 2 5/8 inches, measuring on a plumb line, locating plate level G. Plumb line A represents the extreme length of the jack rafters to the center line of the valley rafter, so that from this length deduct one-half the thickness of the valley, measured on the line of the jack rafters or one-half the diagonal thickness of the valley, C-D, figure 9, which is an enlarged section through U-U, figure 1, and produce plumb line D, figure 10. Square this line across the top edge and locate the center. The bottom cut for these rafters is the same as for the preceding jack rafters, as all rafters on the

(*Continued on page 66*)

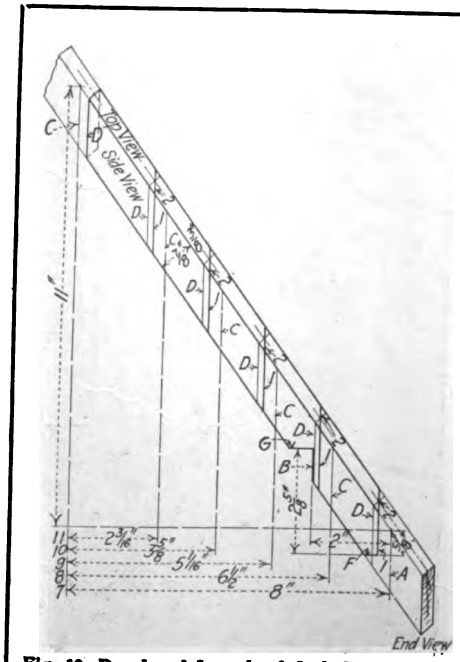

Fig. 10—Developed Length of Jack Rafters Nos. 7, 8, 9, 10, and 11.

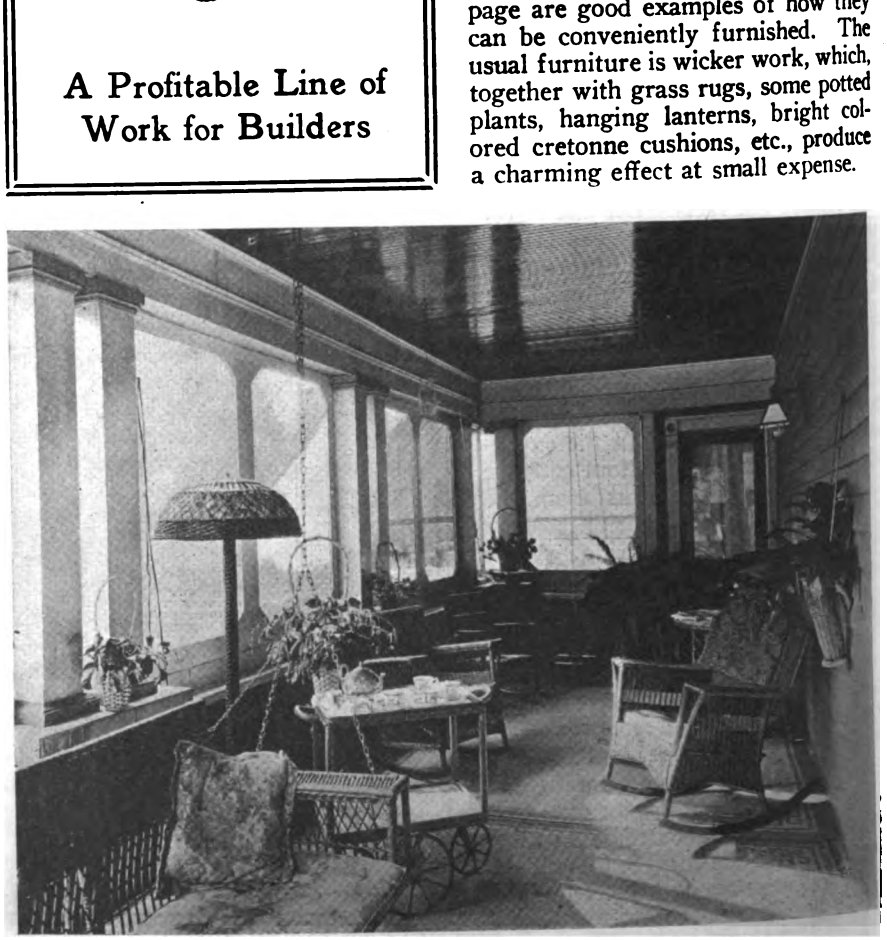
Screening the Living Porch

A Profitable Line of Work for Builders

FLIES and mosquitoes are the two pests that it is most desirable to keep out of the house and now-a-days when our porches are really outdoor living rooms, it is also necessary that they be screened.

There are two forms of porches in common use. One with the solid rail and the other the open rail. The one is termed a closed porch and the other an open porch. In making frames for a closed porch, it is only necessary for the screens to fit the opening. Now, the common method of doing this is to make it in sections that are easily handled. Sometimes, however, a pleasing treatment can be given to the screens themselves by having them of different widths. For instance, take an 8-foot space, it would look good to have this divided with a 4-foot screen section in the center and two 2-foot sections on either side.

To enhance the appearance, certain sections or the whole screen can be divided in small sections by muntins, the same as a sash is divided. There is really no reason why a screen should be in one or two divisions except that it is habit. A better architectural effect can be secured by dividing as we have mentioned.



For open porches, particular care should be taken so as to have the division bars at the same height of the top rail; frequently this is not done and the result is that it has an awkward looking appearance, and this can be so easily avoided.

In some cases the screens are put on the outside of the porch column and rail. This, however, does not give a pleasing appearance, as there is no finish to the top of the screen. Another method is to put them inside, and this seems to give the best results. Where there is no rail, screens are frequently put in a line with the center of the columns and the screen frames at the side cut to fit the form of the column. This method is a little harder to do than just the plain screen frame, but it produces a good effect, both inside as well as out.

Enough thought has not been given to the subject of designs for screens on porches and this is the reason we see so many ugly contrivances to keep out our flying and biting pests.

Screens can be conveniently hung on the special hardware that is now obtainable for the purpose. Should it be necessary, however, to have the frames screwed in place, it is always a wise precaution to grease the screws before inserting, as it makes withdrawal easier in the Fall. The use of brass screws would eliminate trouble of this sort.

The two porches shown on this page are good examples of how they can be conveniently furnished. The usual furniture is wicker work, which, together with grass rugs, some potted plants, hanging lanterns, bright colored cretonne cushions, etc., produce a charming effect at small expense.

What the Editor Thinks

New Code for Smaller Buildings

WE have been favored with an advance copy of the tentative draft of the proposed national building code for small houses that will be recommended by the Building Code Committee, Division of Building and Housing, United States Department of Commerce.

The committee has certainly done its work well. Thoroughness is reflected in practically every paragraph that they have prepared. Particular attention has been paid to describing construction details that will prevent the spread of fire; much space has been devoted to this subject, but no space is devoted to such other factors that are as equally important for the comfort of the inhabitants of our houses.

Of course, it is generally up to the architect or the builder to see that the house is properly designed, but would it not be a good idea to give some specific minimum requirements for space on stairways, etc.? Unfortunately there are many houses with too scant headroom at the stairway and one has to bend or dodge or bump one's head, usually the latter!

For every person that suffers from a fire in a dwelling, there are at least several thousand that suffer from wrongly planned details. Would it not be an excellent plan to combine some definite limits of construction sizes, etc., in the code? Of course, this is only a suggestion.

There are many such details that need attention that mean so much for the comfort and health of the occupants that it seems to us that these are also important points that should receive consideration in a code as well as protection from fire.

Practically all codes specify that water closet compartments should be adequately ventilated, but what code specifies that kitchens should be ventilated and lighted?

When builders can do what they want, irrespective of restraint, we can expect the building monstrosities that we have had to put up with for so many years.

Progressive builders know the value of proper restriction in a building code and live up to them, but it is the Bolsheviki element in the industry that needs restraint. Putting in the law what they should do is a good way of educating them to better construction methods.

Brick and Concrete Supplanting Stone

BUILDING stone is being used less than formerly in construction, according to figures just published by United States Geological Survey.

It was not so many years ago that practically all sills and lintels of our masonry buildings were of cut stone; today this has largely given away to brick and cast concrete.

The cement and brick manufacturers have been persistent advertisers in the construction papers, while it is but seldom that one sees anything regarding building stone.

Now, stone has its uses and is very desirable in its proper place; it adds an ornamental touch to some forms of construction and it is unfortunate that the stone industry has been so backward in making its product known and obtainable.

Mis-Information About Building

MANY articles are appearing in our newspapers and popular magazines regarding the building of homes and it is an unfortunate fact that a good deal of erroneous information is being spread about.

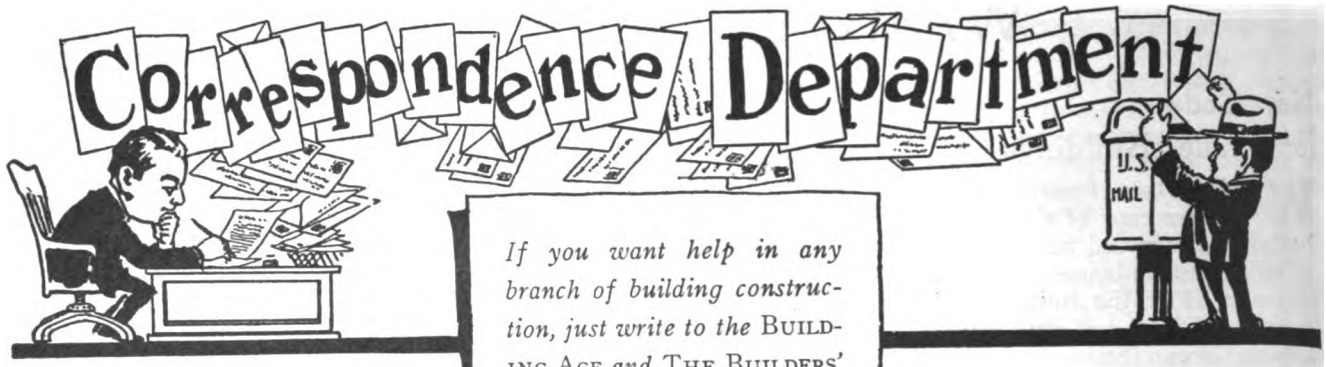
In some cases we read that concrete houses are damp and in some others that brick is a poor material to be used and others that frame buildings should be avoided; other cases that wood shingles make a fire trap of a building; that no building is fit to live in unless it is absolutely fireproof. Some writers state that we should build a house with large rooms, others to have them small and compact, etc., etc.

It is no wonder then that the ordinary individual who desires to build a house has rather a confused and hazy idea of just what he should have.

The best way for the builder to handle a client of this sort is to be able to give him all the desired information regarding different building materials and house arrangements. This information can be readily secured by builders from the literature of the different manufacturers and associations.

The builder should have on hand a good reference library of information of this sort. He will find it of considerable value when talking to a prospective home builder as he will be able to give correct and reliable information regarding any point inquired about.

Home Improvements Paid by Installments



MANY people have purchased pianos, phonographs, clothes, houses, etc., by the partial payment plan. It is a scheme that fits into our modern living conditions. Why cannot builders go one step further in this regard by selling home improvements by the same method of payment?

There is many a family who have a good house, but some modern improvement is lacking. To make this alteration or repair costs quite a good sum of money and is beyond the owner at the present. For instance, if a man desires a porch enclosed to make a sun parlor, the total cost will probably run say to $300 or $400, but not having the money on hand, he hesitates to order it. He is without a desirable improvement and some builders and carpenters are out of a paying job because the scheme cannot be financed.

Here is something to discuss at the meeting of your Builders' Exchange. There are a lot of good jobs to be created if some scheme to finance them is provided.

Many lines of business have been developed to quite a large extent by the installment plan of payment and there is no reason why the same method cannot be used by builders to secure some very desirable business.

If you want help in any branch of building construction, just write to the BUILDING AGE *and* THE BUILDERS' JOURNAL *Correspondence Department. We will be glad to answer all your questions without charge.*

All readers are invited to discuss the questions and answers published.

Improved Stormtight Cellar Sash

SOME time ago I read a question in BUILDING AGE & THE BUILDERS' JOURNAL in reference to cellar windows being hung or hinged at the bottom, and how to make them stormtight.

I send you herewith the sectional drawing showing in detail how this can be accomplished and it has the advantage of being very easily made.

The arrangement of the bottom rail is the secret of its efficiency. Any water that might work up by capillary action would drop off at the quarter circle space. The other details are self-explanatory.—**J. S. Adrianzen.**

Stone and Concrete Difficult to Flash

WIDE copings or other places are occasionally encountered where a metal covering or a flash is required and no material is found wide enough.

This necessitates the material being used lengthwise and a provision must be made for securing the side seams. This may be done by drilling or making wedge holes with a chisel where needed. These holes may be run full of liquid solder, to which cleats may be soldered for holding the sheet material.

The sides or rather end of the flash, may be fastened by drilling holes with a slight downward slant into which wood plugs are made to wedge.

Several notches may be cut into the back end of these wood plugs; run a little hot lead into the holes and drive the plug into it immediately, then it will be ready to receive the nail which can be driven through the metal flashing into the plug to hold it secure.

For flashing fire walls of concrete, and the front of same, when sheet metal roofing is used, holes may be drilled in the concrete, and treated as already described, for the purpose of nailing wooden strips over the formed up edge of the top flashing metal. The plugs need not be so numerous when the top edge is coated with the following mixture:

To Oxide of Iron, add and thoroughly mix coal tar until it is a comparatively dry mass, then add boiled linseed oil until it is of the consistency of glaziers putty. This mixture will never dry hard and will carry a film on the outside that is impervious to water.—**L. S. Bonbrake.**

Ladder Scaffolds for Roof Work

A VERY simple workable scaffold for repairing pitched roofs up to a slope of 50 degrees can be made by taking or making a ladder of 2" x 3" with 2" or 3" x 1" rungs spaced 10 inches apart and nailing two 1" x 4" cleats across the back edges as seen in the attached sketch. Three temporary wire nails are driven through these cleats into the shingles, tar

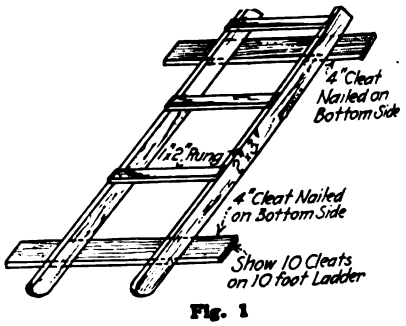

Fig. 1

paper or any other penetratable material with which the roofs may be covered. If there is a gutter projecting above the roof surface, the foot or bottom end of the ladder may be set in its trough to prevent its slipping down but the cleats are a safer method and safety ought to be the first consideration always.

Pieces of bagging or old carpet should be tied around the bottom ends of the

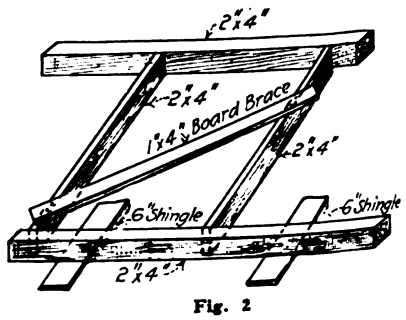

Fig. 2

ladder's side to avoid cutting of gutter troughs or be rounded as shown in Fig. 1.

When moving along or across any roof the nails are pulled out with a claw hammer and the holes plugged up, then the ladder is easily pushed or turned over as needed.

Digitized by Google

In rubber or other special roof coverings, the holes are filled with roofing cement or when putting shingles on a new house or relaying, reshingling or re-roofing an old house, many good mechanics shingle in their scaffolds which is simply done by nailing the butt ends of strong wide shingles about the second or third course up from the bottom end above the gutter, spacing them about 4 feet apart, as shown in Fig. 2. These may be used 4 or 6 feet between each or as far as a man can reach when shingling and are strong enough to safely carry two men and three bundles of shingles of 250 each; the butts of the shingles project below the level line of each course on which they occur; the 2 or 3 inches of the thickness of the 2 x 4 joists which form the footholds or scaffolds and these are sawed off to the butt course as the roof is being cleaned on completion of the job.

Sometimes if there be short pieces of joists or timbers available struts or uprights are employed spaced 4 feet apart and about 4 feet in length in the way also indicated in this figure and braced diagonally by reversed board braces to prevent sliding or side movement. It doesn't pay, however, to saw long joists or studding especially for this purpose although the pieces can be afterwards utilized for bridging or bracing in partitions.

Finally all scaffold and foothold joists and planks must or ought to be of good, sound, straight grained spruce timber free from large knots, cross or short grained.

It is a mistake and one is taking a risk in using Hemlock for scaffolding of any kind whatsoever either for uprights or horizontal pieces, so let us protect ourselves while at work by working safely.—**Owen B. Maginnis.**

California Chalet

BUILDING AGE & THE BUILDERS' JOURNAL fills the bill all right. Although I am a long distance from New York, each issue is eagerly looked for, as it contains some useful information that I can use in my daily work.

In some of my reclamation work out here, I have occasion to design a good many houses and I am sending you a little sketch of a bungalow after the Swiss Chalet Style. The floor plan is a very convenient layout. The exterior walls were built of concrete block. A large reinforced lintel is used over the front porch opening. The rear porch was framed above with a wood gable.

I feel sure this will interest some of your readers.—**Frank Johnston.**

HAVE you ever used any machinery or device which has saved you time and money?

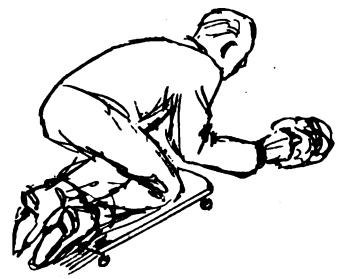
Have you ever invented any way of doing a piece of work quicker?

If you have BUILDING AGE and BUILDERS' JOURNAL wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

Address The Editor, BUILDING AGE and BUILDERS' JOURNAL 920 Broadway, New York City.

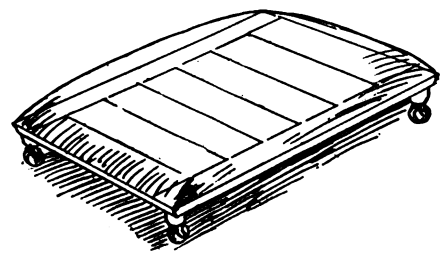
Leveling Without a Level



IT often happens that leveling is to be done, when there is no transit or spirit level obtainable. In this case, good and fairly accurate work can be done with a makeshift apparatus consisting of a vessel of water and an improvised float.

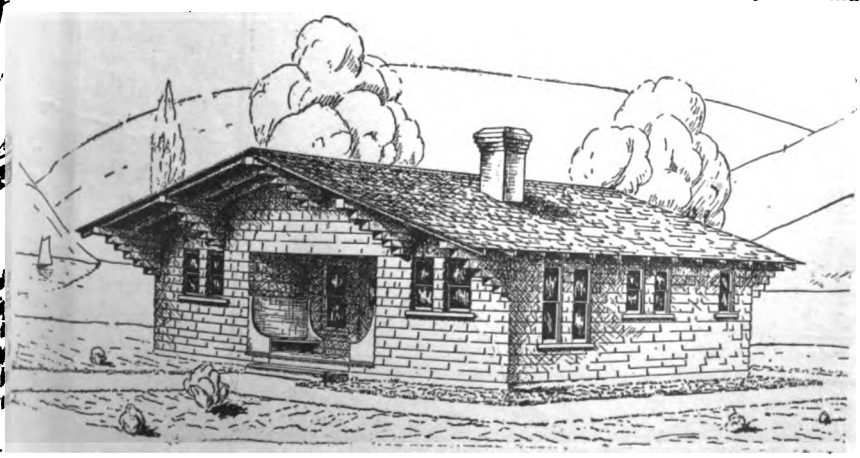
Secure a small slab of wood eight inches in length and three or four inches wide that is free from knots and as nearly uniform in weight as possible and erect two thin wood sticks, mast fashion, one at each end, and in the same relative position. Into one stick screw a small screw eye so that the opening faces the other stick and into the top of this drive a small pin or needle.

This is then made accurate by driving the pin down until the distance from the bottom of the block to the top of the pin is the same as the distance from the bottom of the block to the center of the opening in the head of the screw eye.

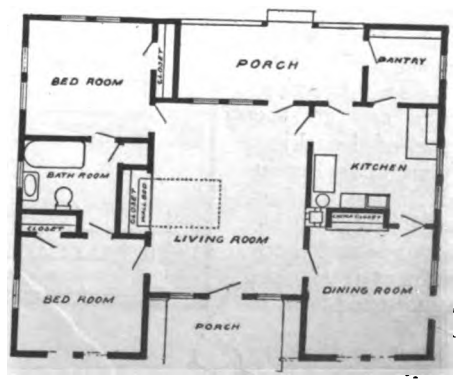


The leveling process is then carried out by sighting over the head of the pin through the center of the screw eye to the point in question.

This crude device will readily show relative points over uneven ground, and it may even be used for leveling foundations, etc., and will save the expense of hiring an engineer in a number of cases.—**Dale R. Van Horn.**



Floor Work Knee Rest



THE drawings presented herewith illustrate a valuable knee rest that saves the knees, clothes and time and permits work in comfort.

It facilitates a workman moving about without rising while engaged in various floor work, such as scrubbing, oiling, parquet laying, etc.

It is simply constructed of light wooden boards, padded and mounted on four small rubber-tired casters.—**C. Nye.**

CONCRETE

Form Work-Reinforcing Methods Monolithic and Block Construction

Casting a Well Curb

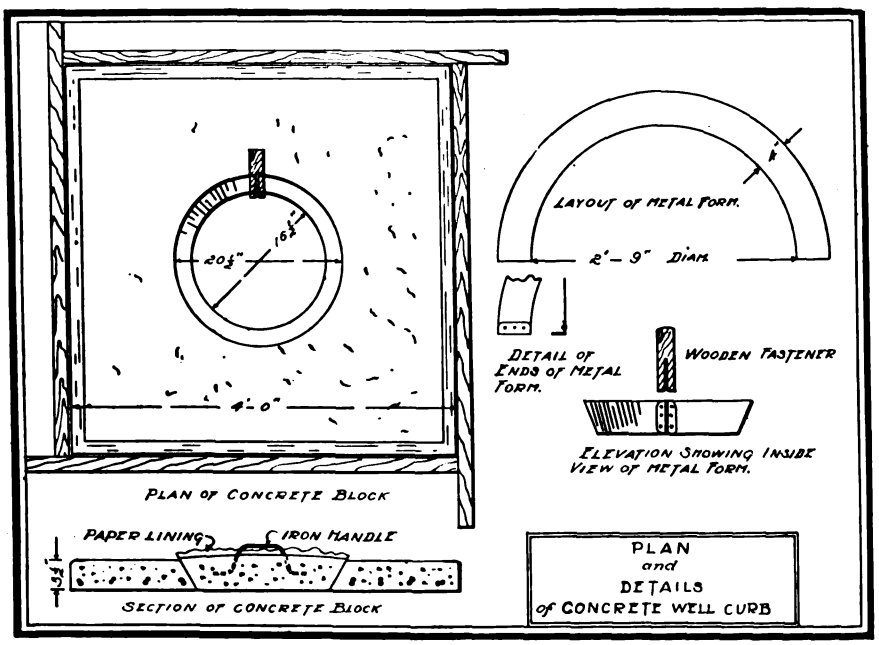
By LAWRENCE S. KEIR

THE carpenter contractor, especially in rural districts, is often called upon to do small mason jobs; covers for well, cesspools, etc., being one of the numerous things he is called upon to make. The accompanying drawings show an easy method of casting a concrete cover for a well. Such a cover can be used for many purposes and made of a shape and size to suit conditions.

The stone is cast on the ground or on a bed of sand. In either case, a space a little larger than the proposed stone and as near as possible to where the stone is to be made use of, is leveled off and packed solid and smooth and then covered with a layer of heavy paper, and cast on this.

The outside form is of short pieces of 2″ x 4″, cut square at one end. The pieces are set on edge and held together at each corner by two 10-penny wire nails driven through the side of one piece into the squared end of another. Any surplus length of 2″ x 4″ is allowed to run by and these projecting ends add to the ease of knocking form apart again after the stone has set. After the form is nailed together it is set square and level in its place and held there by earth or sand packed against the outside.

The manhole form shown is easily made and if kept clean will last a long while. It is made of fairly heavy sheet metal but of a gauge that can be easily cut with the tin snips.



First cut out a half circle as shown in the layout drawing. Then at each end of the half circle rivet on a piece of the same kind of material that has been cut and bent to form an angle as shown by the small detail below

Having the angle piece in place, spring the curved piece carefully and evenly until it forms an even ring with the angle pieces on the inside. A piece of wood having a wide saw kerf at one end, is slid down over the projecting wings of the angle pieces and holds the mould in shape.

In casting the stone set the metal mould where required. Fill in the body of the block and as soon as the concrete has set enough to hold its shape, remove the metal form by slipping the wooden fastener off. Then the edges of the manhole thus formed are lined with strips of building paper cut wide enough to extend a little way above the top of the stone. Now pour in the concrete that is to form the cover, leveling it off at a point about 1/8″ above the rest of the block. The handle is then set.

When the concrete has set hard the cover can be lifted out, the paper removed and the cover will fit back neatly in its place. A corresponding arrow mark put on cover and main block while the concrete is soft, will assist in finding where the block fits best

Four lengths of two-strand fence wire placed parallel with each other on all sides of the block and lapping over at the corners does very nicely for reinforcing but anything available at the time can be used instead. The reinforcing is of course placed well near slab bottom.

Use the Three Doors as Easily as One

Set No. 806 includes:
Latch No. 27
Swivel Hanger
Braced Rail, 6 Feet
T. P. Butts—4½ Pair, 4x4" Jap.
Chain Bolt No. 820
Foot Bolt No. 830
Pull No. 5
1 Pair No. 40 Padlock Eyes.
All necessary bolts and screws.

ON Sunday morning when you go to the garage to tune up the car must you open all the doors or do you enter by a special door built in the side? Neither is necessary.

When you use the National Sliding and Swinging Garage Door Set No. 806 you will find that you can use one door without disturbing the other two or use all three doors with as much ease as one.

This garage door set permits doors to slide and swing and fold instantly. Nothing to bind—nothing to jam. Heavy doors can thus be made to open as easily as a house door. And when open they allow a maximum passage space in the garage entrance.

Builders—In designing garages specify and use National Garage Door Sets. This insures you against dissatisfaction on the part of your clients.

Our catalog on Garage Hardware illustrates our various models and shows plans and photographs of completed garages. Shall we send you a copy?

Legal Department

IN a suit to recover damages for injury to a carpenter claimed to have been due to negligence of the defendant, by whom he was employed to remodel a grain elevator, the Michigan Supreme Court lately said (Norris v. Elmdale Elevator Company, 185 Northwestern Reporter, 696):

Measuring Value of Loss of Carpenter's Earning Power

"A question is raised respecting damages for impairment of earning capacity. Plaintiff's damages in this regard should be measured by his impairment of earning capacity of his usual employment. . . . As bearing upon that question, evidence might be received of subsequent earnings in the same or other employment, and of changes in wages and conditions of labor. . . . The rule is stated in 17 C. J. 898:

"'The difference in the actual earnings of plaintiff before and after the injury does not constitute the measure; hence the amount which plaintiff is capable of earning, and not that which he has actually earned, since the injury is to be taken for the purpose of comparison with his previous earnings as showing the diminution of earning capacity.'"

A NEW JERSEY builder, but not licensed architect, asks concerning his right to recover compensation under the following stated circumstances:

Builder's Right To Recover for Plans Used

He verbally agreed with a lot owner to draw plans for a building to cost between $17,000 and $18,000, and consisting of two stores and six rooms on the first floor and four rooms and five rooms on the second floor.

When these plans were completed, he directed that the builder change them so as to provide for two four-room apartments on the second floor. After this change was made, he directed a further change to provide a janitor's apartment in the basement. Then he had this apartment cut out.

On these changes being made, the builder was directed to make the blue prints and file them. The builder agreed that no charge would be made for the plans should he refuse to build the structure for the estimated amount.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

The day after the plans were filed with the city the owner sold the lot, and now declines to pay the builder for his plans, stating that since he did not build he was not liable for the plans.

On the facts we are of the opinion that the builder has a valid claim for the reasonable value of his services in preparing and filing the plans, etc.

That he was not a certified architect makes no difference, for while the New Jersey statutes in general forbid unlicensed persons to engage in the business of preparing plans, etc., it is distinctly provided that the act shall not be construed to prohibit any person from acting as designer of any building to be constructed by himself or his employees.

Of course, if it had been provided that the builder's rights to compensation were to be contingent on the owner actually proceeding with construction of the building, there would have been no right to compensation. But under the circumstances stated, we do not believe that the builder would have difficulty in establishing in court his right to reasonable pay for services.

In the case of Graves vs. Hunt, 8 New York State Reports 308, it was decided that where the owner refused to permit a builder to carry out a contract for the construction of a building, the value of the builder's services in drawing the plans was a recoverable element of damage.

I BUILT a house and the owner was to get the money from the Building Association and make four payments on the job, but failed to do so. I finished the job without delay and there was $84 worth of extras, for which I was holding written orders The lawyer, owner and association asked me to sign a release of liens, so that the owner could get the money to pay me, but the association would not pay the $84 for extras. The owner and attorney then promised that if I would sign the release of liens they would guarantee payment of the balance within two weeks. At the end of two weeks I received a check for $46 and a note saying that they would not pay any more as I had signed a release of liens, and he [the owner?] considered this a receipt in full, and that it was all he intended to pay for extra work. What are my rights?—G.L.F., Pa.

Effect of Release of Liens

Answer—For the benefit of G.L.F. and other readers of THE BUILDING AGE, we make this suggestion before proceeding to answer this query: When a builder or architect is willing to forego his right to a lien for work or services furnished, on the strength of a personal guaranty of payment, the guaranty should be reduced to writing. Proper procedure in the case above mentioned would have been for the release of liens to have expressly recited on its face that, in consideration of Bill Lawyer and John Owner personally guaranteeing payment of $84 covering extras, any right to a lien on that account was waived. At the same time Bill Lawyer and John Owner should have signed some such writing as this: "In consideration of G.L.F.—— foregoing right to lien for $84 extra work performed in building the undersigned John Owner's house, we personally guarantee payment to G.L.F.—— of that amount on or before ——, 1921."

But, even as matters now stand, nothing appears to relieve the owner from liability from any balance actually due under the contract for extras. It is absurd to say that a mere release of

Residence in Country Club District, Kansas City, Mo. Redwood Siding, painted white. Built by the J. C. Nichols Investment Co. Edward W. Tanner, Architect.

Residence and Garage at Belmont, Mass. Redwood Siding, painted white. Built by George Almgren. George Reid, Architect.

Residence at Des Moines, Iowa. Redwood 8-inch Colonial Siding, painted white.

Residence at Highland Park, Ill. Redwood Special Sawn Shingles, painted white. Robert Seyfarth, Architect.

Homes of Redwood from Missouri to Massachusetts

REDWOOD'S resistance to rot and its consequent lower annual cost for repairs and repainting give the builder the strongest selling point. For every unit and part of the exterior of a frame house you can secure T P L Co. Redwood lumber and milled products to meet all requirements of design and construction,

During the growth of Redwood every fibre is permeated with a *natural*, odorless preservative which permanently protects it against all forms of rot and decay.

Containing no pitch or other highly inflammable resinous compounds, Redwood is slow burning—reduces the fire hazard wherever used. A uniform cell structure free from pitch or other substances give Redwood a remarkably good painting surface.

The high proportion of clear lumber, its soft texture and good wood-working qualities keep waste at a minimum when you use Redwood.

You may be surprised to know that the price of Redwood compares favorably with the prices asked for wood that cannot compare with Redwood in resistance to rot, high percentage of clear lumber and for freedom from warping, swelling and shrinking.

Use these selling points and you will find that using Redwood you can get better prices.

Redwood should be specified for

Exterior Construction

Including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish

Natural, stained or painted wood block floors.

Industrial Uses

Tanks and vats for water, chemicals and oil—factory roofs and gutters—wood block flooring.

Wood Specialties

Such as—Caskets and burial boxes—incubators and ice-cream cabinets—cigar and candy boxes—furniture manufacturing, etc.

Railroad Uses

Such as—Railroad ties and tunnel timbers—signal wire conduits and water tanks—car siding and roofing.

Farm and Dairy Uses

Such as—Silos, tanks and troughs—hog feeders and implement sheds—wood block floors, etc.

liens releases the personal liability of the owner for any balance actually due. But, of course, it would be open to the owner to show that the builder is not entitled to more than the $46 already paid for extras. On the other hand, if there is a balance actually due, as the builder claims, there is no bar to his obtaining judgment for the amount. And it is probable that under the laws of Pennsylvania, the same as under the laws of many other states, the judgment can be recorded in such way as to constitute a lien against any real estate the owner may own subject to prior encumbrance including the building association's mortgage. The "release of liens" is probably so worded as to mean merely that the right to a mechanic's lien was waived. If so, this would not preclude creation of a judgment lien. But it may not be necessary to attempt to enforce judgment against the owner's real property. If he is a man of some means it may be that his bank account can be reached by garnishment. In any event, if he refuses to pay, much must be left to the builder's attorney employed to enforce the payment of the balance due.

Assuming that the attorney did not commit his guaranty of payment of the balance due for extras to writing, we do not believe that he can be held under the Pennsylvania statutes. There is a law in that state that promise to answer for another's debt in excess of $19.99 is not enforceable unless in writing.

When are Building Restrictions Violated?

I OWN a house and lot in a city. There is a convenant in my deed which says that no house shall be placed nearer than fifty feet from the front line of the lot. The main front wall of my house is just 50 feet from the front line of the lot, but I find that the eaves of the house extend a foot over the 50-foot line. Am I violating this restriction?

"If I am violating the restriction, can I collect the cost of moving the house back from the man who sold it to me, as the covenant is a part of the deed? If my house complies with the restriction, can I compel the other house owners on the block who are bound by the restriction to move their houses back to the 50-foot line? My next neighbor has built a house that extends 15 feet in front of mine and completely cuts off my view on that side."—H. H., South Carolina.

Under the facts stated, we do not believe that legal redress can be had against you as for violating the building restriction mentioned.

In the first place, it is very doubtful that you have violated the legal spirit of the restriction. It seems to fall within the liberal legal principles stated as follows in a comparatively recent and authoritative summary of the law of this particular angle of building restrictions:

"Conditions and restrictions regulating the distance at which buildings shall be placed from streets, or, as they are commonly known, building line restrictions, must be construed according to the fair meaning of their language. . . The purpose of a building line restriction is to prevent the encroachment of *substantial parts* of buildings erected upon property. Hence there are quite numerous authorities holding that such a restriction is not violated by an extension over the line of steps leading to the building [citing New Jersey and California cases], or by bay windows [citing Pennsylvania and Illinois cases], porches [citing Kentucky, Massachusetts, Ohio and Virginia cases], or awnings [citing New York case]. An encroachment of an integral part of the building is, however, a violation. This rule has like the preceding one, been applied to bay windows and porches." 18 Corpus Juris, 389.

We infer from the statement of the case that the projecting eaves will not interfere with the light, air and vision of the occupants of the adjacent houses. If this is true, the case falls within the statement of the Illinois Supreme Court:

"The two objects of a building line restriction are to secure unobstructed light, air and vision for the lots for whose benefit the restriction is created, and to secure uniformity in the location of buildings with respect to the street line for the accomplishment of that object." (Loomis v. Collins, 272 Ill. 221, 230, 111 N. E. 999).

That the law regards substance, rather than technicality in enforcing building line restrictions is shown by the following summary of numerous decisions:

"While it has been held that a breach of a restrictive covenant may be enjoined regardless of the fact that complainant has suffered no substantial injury, the more general rule, particularly in the case of restrictions imposed by a general building plan, is that equity will not take cognizance of technical or immaterial violations. A person relying upon the defense, however, that complainant will not suffer any substantial injury through his violation of a restriction must clearly establish such fact." 18 Corpus Juris, 399.

The first qestion raised by the gentleman from South Carolina appears to be squarely answered by the decision in the New Jersey chancery case of Smith v. Spencer, 87 Atlantic Reporter, 158, wherein it was decided that an overhanging of eaves by two feet, two inches, did not constitute a substantial violation of a building line restriction. And in the case of Morrow v. Hasselman, 69 N. J. Eq. 612, 61 Atl. 369, it was decided that round towers, bays, or projections, and piazzas with slender columns on the second story of a house, a few feet beyond the building line, were immaterial deviations.

But even if it could be said that the overhanging of the eaves in this case constitute a substantial violation of the building restriction, it appears that others owning property in the block have previously violated the same restriction. This being so, our friend would probably have no trouble in establishing a claim that all parties interested in the enforcement of the restriction have virtually waived their respective rights to enforce it. Certainly those who have violated it are in no position to seek legal relief in this case. Nor can those who have permitted the building to be erected with knowledge that the eaves would overhang now seek relief in the courts. It has been frequently declared that objection to violation of a building restriction must be promptly asserted.

Were it to apear that the building restriction has been violated in this case and that one or more interested persons are in a position to bring suit to require the building to be moved back—which, for the reasons already stated, we do not believe to be true—it is likely that the gentleman from South Carolina could enforce a valid claim for damages against the person from whom he bought, covering the expense of so moving the house. But to do this it would probably be necessary to prove that the seller of the house built the house or knew when he sold it that the building restriction had been violated.

Right to proceed against the other owners of property in the block is covered by what has been said above concerning this property. There is no right to proceed against them if their violations are trivial or have been waived by failure earlier to proceed against them. Our friend is not in a favorable position to insist on adjacent buildings being moved back, since he bought with knowledge of their location. However, he would be justified in filing counter-suits against any one who may attempt to require him to move his building back, and who is open to a similar suit.

FINANCE and REAL ESTATE

Helpful Data for the Builder Who Builds to Sell

Interesting Home Financing Plan

MANY of the problems of the prospective home owner of moderate means arise mainly from the fact that he is generally ignorant of the ways in which the purchase may be financed. Many methods of financing a home proposition have been devised and these are all of interest to the building contractor, as financing building operations gives work to the different members of the building industry. Any sound method of financing that will tend to promote building of homes will receive the endorsement of the building fraternity.

An interesting home financing method has been devised by the United Home Owners of America, a Washington, D. C., corporation that operates on co-operative lines. It is not a stock company or a mortgage company, nor is it a building and loan association. It is an organization operating under an agreement and declaration of trust. Its purpose is to provide a practical way for people of moderate means to own homes of their own. Their method of operating is by forming a Pool. In other words, a group of intending home builders Pool their savings for the benefit of all. Thus, for instance, say 500 individuals are each saving $50 per month. This sum of money is paid into the holding company and this money is given out in loans on real estate. All loans are made in order of priority determined by the date of application. Thus, for instance, assuming that the 500 individuals are paying in at the rate of $50 per month, there is available for distribution $25,000 per month. In other words, approximately five loans of $5,000 can be made each month. In this way a man that has the first contract will receive his loan if he desires it quite rapidly. Of course one has to wait until his turn comes for his loan.

In cases where a loan is not desired at the time when the party's turn comes up, he may sell the loan to a person who is anxious to secure his immediately at perhaps a little premium and transfer his number to the other party who purchased his privilege from him.

By this co-operative method, the loans are made at an interest rate of 4% per annum, the legal interest rate in most states being 6%. Figuring on a basis of $1,000 loan the interest at 4% for a period of ten years would amount to $210.41. It has been figured out that the loan will repay itself in 10 years, therefore the total amount paid is $1210.41. Under the building loan plan, a loan is paid in 11 years at 6% interest per annum, amounting to a total of $1,660; therefore, this method results in a saving of $449.00 on every $1,000 borrowed.

There are about 9,000 building and loan associations in America. Five million people are interested in them and they involve over $2,000,000,000. Next to life insurance the Building and Loan Associations have been the greatest economic factors and most beneficial institutions ever devised for the human race. But, after 140 years of operation, they are, nevertheless, far insufficient in number, since the housing problem is as serious as ever.

Anyone desiring to take advantage of the plan to secure a loan with which to buy or build a home makes application on the regular form, the actual date and time determines the exact order in which he will be entitled to secure a loan in the series to which his contract belongs. With the application he begins making monthly payments of 1 per cent of the amount he desires to borrow. Upon receipt and acceptance of the application a contract is entered into.

Contracts are placed in series aggregating substantially $500,000 face value each and each series operates independently. The contract holders themselves create their own loan funds. As soon as the accumulation in the loan fund, from its monthly contributors, monthly repayments of principal and interest on loans and other sources of income has reached the amount desired by the borrower, he is so notified and is entitled to receive a loan equal to the amount of the face value of his contract. All loans are secured by mortgage on real estate and are repaid at the rate of $7 a month per each $1,000 advanced with interest at 4% on the yearly unpaid balance. As each year goes by, the payments become less and less, and in approximately 10 years' time the home is free and clear of debt.

Apparently realizing the urgent needs caused by the shortage of homes, the states of Missouri and Texas have endorsed and encouraged the plan by passing an act specifically authorizing similar organizations. Quite recently, the Supreme Court of a western state confirmed the validity and constitutionality of the act.

In common with all financial institutions located in District of Columbia, the United Home Owners come under the supervisory control and examination of the Comptroller of the Currency and is examined and submits reports regularly.

Review of the Building Situation

BUILDING statistics for May just published by F. W. Dodge & Co. show that the volume of contracts awarded are the highest ever recorded, being 3 per cent. greater than that of April, 1922, which previous to this, held the record. The May figures total $362,590,400 which is 50 per cent. greater than the figures for the corre ponding month of last year. The two record months of April and May bring the volume of construction started since Jan. 1st, up to the immense sum of $1,352,965,000, the highest record figured for the five months of any year. These figures are 61 per cent. greater than that of the corresponding period of 1921.

A very noticeable increase in building has taken place in the middle west district, which has heretofore been very much behind its normal amount of building.

Residential building still heads the list in construction activities, the amount expended for this form of construction being $140,932,500, which is 39 per cent. of the entire total amount. In the North Atlantic states, the immense sum of $76,872,600 is being spent for residence construction. This represents the construction of 6,914 separate buildings, therefore the average cost of the buildings being erected today is a little over $11,000 each.

Another important item in the May total is expenditure of $67,515,000 or 16 per cent. of the entire total for business buildings. This is an increase over last month's figures and is a very good barometer of the upward trend of business.

May building contracts in New England amounted to $33,130,000, which is 76 per cent over the figure for May, 1921, although it was a drop of 25 per cent from the April total, the high figure record for this district.

Construction started in New England during the first five months of this year has amounted to $137,063,000, which is more than double the amount for the corresponding period of last year.

Contracts awarded during May in New York State and northern New Jersey amounted to $88,295,000. This is 13 per cent under the April figure, which established a new high record for the district. The decline was entirely in New York city, the remainder of the district showing a May total equal to that of the previous month. The May total, however, was 53 per cent higher than that for May, 1921.

May building contracts in the Middle Atlantic States (eastern Pennsylvania, southern New Jersey, Delaware, Maryland, District of Columbia, Virginia and the Carolinas) amounted to $54,652,000, an increase of 12 per cent over the previous month and of 25 per cent over May, 1921.

Record of May, 1922. Building Contracts Awarded

Classification of Buildings	SECTION OF COUNTRY New England District	New York District	Mid Atlantic District	Pittsburgh District	Middle West District	North West District	Totals
Business	$4,842,600	$15,503,700	$8,247,300	$19,145,100	$9,352,900	$423,600	$57,515,200

The Home Beautiful Is the Home Profitable

A COMFORTABLE, attractive home invariably sells more homes and creates more business for architect, builder and dealer. That is why Natco "Tex-Tile" is a profitable investment for all three. The beautiful, comfortable and economical homes that have been built of Natco "Tex-Tile" are helping to build others today.

Natco "Tex-Tile," like all Natco Double Shell Tile, is easily and quickly laid. It is impervious to heat, cold and moisture. It is decidedly economical and brings a beautiful home within the reach of countless home building prospects.

Send us a card and ask for our circular: "The Home Beautiful," which shows Natco "Tex-Tile" in its beautiful, natural colors. It's free.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

NEW YORK PRICES

	May 29	June 27
LONG LEAF YELLOW PINE—		
B. and Better Edge Grain Flooring, 2½" Face	$71.50	$80.50
Dimensions, S1S1E, No. 1 Common, 2x4", 10'	39.75	39.75

$1,000 IN CASH PRIZES

for Best Photographs Showing

Durability of Copper, Brass and Bronze

$500 in Cash Prizes for
OBJECT LESSONS IN WASTEFULNESS

of using substitute metals where one of the non-rusting metals, Copper, Brass or Bronze, should be used.

First prize, $150 Second prize, $125
Third prize, $ 75 Fourth prize, $ 50
Ten prizes of each, $10

$500 in Cash Prizes for
OBJECT LESSONS IN ECONOMY

of using Copper, Brass and Bronze, which will not rust, and are practically everlasting.

First prize, $150 Second prize, $125
Third prize, $ 75 Fourth prize, $ 50
Ten prizes of each, $10

SUGGESTIONS FOR SUBJECTS

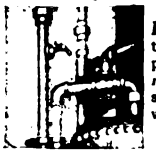
FAILURE OF SUBSTITUTES—

In Roof Drainage—Close-up photographs of rusted leaders and gutters. Take in portion of wall, showing paint spoiled, if any, by rust water from leaking leader or gutter State kind of metal and how long gutter or leader in use before rust caused it to leak

In Plumbing—Close-up photograph of section of rusted pipe removed from a plumbing system, showing hole or holes eaten by rust. Photograph showing a pipe closed, or nearly closed, by rust accumulation inside it. Close-up of bathtub, washbowl or sink stained by rust in water from rusty pipes

Interior Damage—Photographs of wall paper, painted or kalsomined wall or ceiling or other decorations, badly stained, or perhaps of plaster destroyed, by rust leaks resulting from failure to use Copper gutters, flashings, etc., on roof, or Brass pipe and Brass fittings in plumbing system; photograph of a wall, partition, floor or ceiling torn open to get at rusty, leaking pipes, or a similar operation made necessary by failure to use Copper or Brass, which do not rust.

In Building Hardware—Close-up photograph of a door hanging on rusted fragment of a hinge, or a door pried open because a lock rusted shut; a rusted doorknob, rusted letter drop, rusted mail box, rusted hinge, rusted screw, or a rusted example of one of the many other items of merely plated hardware which rust as soon as the thin plating has worn off, become unsightly and perhaps mar paint and injure woodwork with their rust—a condition that is avoided by the use of all-Brass or Bronze hardware instead of the dipped, short-lived article



DURABILITY OF COPPER AND BRASS—

In Drainage—Photograph of an old Copper leader still in place or an old Copper gutter still doing duty after many years of service without upkeep or repairs. Do not fail to give date the Copper leader or gutter was put up. Must be at least 35 years old to qualify

In Roofing—Photograph showing example of the everlasting life of the Copper roof. State number of years the Copper has been in service without upkeep or repairs. Photograph must of course show the roof clearly and cannot qualify unless the Copper has been in place 35 years or more.

In Plumbing, etc.—Photograph of a section of Brass pipe or a brass fitting *still in place* that has been in service 35 years or more without upkeep or repairs.

In Other Uses—Photograph of an item of Brass or Bronze hardware with a long service record, a Brass or Bronze plate, a building ornament of Brass or Bronze, a Copper or Bronze window screen, a Copper cooking utensil, or other Copper, Brass or Bronze article of utility or ornamentation. Must be at least 35 years old.

Get out your camera and look about you for subjects. You will find them everywhere.

Rules of the Contest

Photograph must have been taken by person entering it in the contest. A contestant may enter one or more photographs.

Name and address of contestant and all descriptive matter to be written on the back of the photograph.

Statements as to age and condition of object photographed will be verified before prizes are awarded and contestant should furnish with his or her entry information that will facilitate verification.

The subject need not be the contestant's property, but contestant must have the owner's permission to photograph it for entry in the contest unless the subject be public property.

By "best" photograph in the metals-that-rust class is meant the photograph of a subject which by reason of its condition, short life and interest is believed by the judges to furnish the most interesting object lesson in the error of using other metals where Copper, Brass or Bronze should be used.

By "best" photograph in the Copper-Brass-and-Bronze class is meant the photograph of a subject which by reason of its condition, long life and interest is believed by the judges to furnish the most interesting object lesson in the economy of using Copper, Brass and Bronze, which do not rust.

Where the subject is a part of a building or other structure the contestant may send also a photograph of the structure in which the subject is or was installed if the contestant feels such a photograph, in combination with the subject itself, will lend additional interest to the subject. Every such photograph should carry on its back information identifying it with the item entered.

Contest closes Sept. 1, and all entries must reach the address given below on or before that date. Every photograph received will be promptly acknowledged. Prizes will be awarded within sixty days after closing date.

Prize-winning pictures will be used in a publicity campaign to inform the public on the economy of using Copper, Brass and Bronze, and in entering a photograph the contestant agrees to such use of his entry.

Wrap your photographs carefully, protecting with cardboard, and send to Contest Committee, Copper and Brass Research Association, 25 Broadway, New York.

News, Notes and Comment

Philadelphia World's Fair

TO celebrate the 150th Anniversary of our Declaration of Independence, a large international exposition will be held in Philadelphia during the year of 1926. Fairmount Park seems to be the site mostly favored by the different committees, but this has not been definitely decided upon.

In all probability, this will be the largest international exposition ever held, and as many buildings will have to be erected it will certainly be of considerable interest to the construction industry.

From a study made by the committees, it was decided that the following buildings or their equivalent will be essential to a proper presentation of the world advances which have been made during the past 50 years: Manufacturers and Liberal Arts; Machinery, including Electricity; Mines, Metallurgy and Chemistry; Transportation; Agriculture; Fisheries; Food Products; Horticulture; Music, including an auditorium; Art Galleries; Education; Anthropology; United States Government Buildings; Administration Building; State Buildings; Foreign Buildings; Building Arts; Stadium and Drill Grounds; and other necessary buildings for amusements.

It was estimated that the main group of buildings of suitable size included above would require 100 acres of space, and that there would be other buildings incidental but necessary to the group which would increase the area to possibly 150 acres. To this area should be added from 300 to 500 acres additional to provide for various other services, which make a total of from 600 to 800 acres, as the estimated territory required.

A considerable amount of money will be spent for the erection of suitable buildings. What this amount will be has not been estimated, but we might state that $18,000,000 was spent at the Chicago exposition; $16,000,000 at the St. Louis exposition; $14,000,000 at the San Francisco exposition, so therefore, it is safe to say that there will be at least $20,000,000 worth of construction work for this 150th Anniversary exposition.

Book Notices

The High Cost of Cheap Construction: This is a title of a very interesting book of 66 pages; published by Weyerhaeuser Forest Products, St. Paul, Minn. A copy of this book may be had free from the publishers.

This is an interesting book for home builders on the importance of right construction in house building and the practical contractor will find many important points about proper methods of construction in this volume. It is well worth sending for and a careful reading will enable anyone to pick up a fund of valuable information on the little points that are so often neglected in house construction, they have a vital bearing on the lasting qualities of the completed structure.

* * *

House Owners Book: This is a book of 388 pages; by Allen L. Churchill and Leonard Wickenden; cloth bound; published by Funk & Wagnalls Co., New York. Price $2.00 per copy.

This is a rather useful hand book for the intending home builder, which also contains some good practical points for the contractor. Explains how to select a site, finance the building, merits of various materials and systems of plumbing, water supply, lighting, heating, ventilation, etc. It contains many useful points that will help the home builder.

* * *

Steam Heating: A book of 367 pages, 8 x 10½ in.; cloth bound; published by Warren Webster & Co., Camden, N. J. Price $3.25 per copy.

This book is quite a thorough book on the subject of practically all sorts of buildings; contains many tables, rules, data and useful information on every phase of designs and installation of a reliable steam heating system. Many excellent illustrations are used to explain the text. It is the most comprehensive book on the subject that has come to our notice.

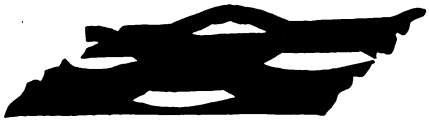
Kitchen Ranges

MANY of our suburban towns and rural districts are supplied with electricity but are without gas supply. Any housewife who has used gas for cooking purposes knows its advantages and to do without it is quite an inconvenience. In the summer time oil cook stoves are used when the coal range would prove very uncomfortable.

Electric stoves play an important part here, as they are quick and reliable, but frequently the kitchen is too small to have a separate electric stove. One enterprising manufacturer has perfected a combination coal and electric range that meets the popular demand—it is a perfect coal range complete in every detail of cooking, baking and water heater, besides it has combined with it an electric oven and broiler, three cover units with a plug attachment for connecting to it any electric device such as washing machine, iron, fan, cleaner, etc.

Enterprising builders would do well to examine into this and find out how it would help them in making better kitchens. Please a woman on the kitchen end of her house and she will talk about it to her friends and no builder can have better advertising.

Unequal Pitch Roof



(Continued from page 49)

short common side of the hip and valley rafters are the same pitch.

To lay out the bottom cut so that the jack rafters will fit against the side of the valley rafter at the proper angle, measure forward on a level line from plumb line D, on the side of the rafter, figure 10, the distance D-1, figure 9, and produce plumb line 1, figure 10. Connect plumb line 1 through plumb line D on the center line as shown at 2, top view, figure 10. Cut on line D for the cut against the ridge and on bevel 2 on the top edge and plumb line 1 for the cheek cut against the valley rafter on all five rafters and on rafters Nos. 7 and 8, cut on lines G and B for the birdsmouth and on rafter No. 7, cut on line F, for the plancher level.

Working Drawings Available to You

This home was designed for a private owner by one of the best residence architects in America.

Sometime ago we published a view of it in one of our books and it attracted so much favorable attention that we had hundreds of requests from all over the country for details and plans.

At last we have prevailed upon the architect to grant us the right of supplying complete working drawings and specifications. These working drawings are exceptionally complete and contain many full size details which make them unusually valuable and different from the ordinary.

Hiawatha's Cost Appeals to Buyers

This home can be built of Brick (solid masonry) for as low as from $9,000 to $13,000 depending upon location and the character of equipment and finish.

After you see the plans in circular No. 705 you should be able to determine the approximate cost of this popular home in your locality. With the complete plans—working drawings—and specifications, which are yours at a nominal price, you can estimate exactly what it will cost to build this home.

Costs Even Less With Ideal Wall

When this home was first built the Ideal Brick Hollow Wall was unknown. Its recent development makes possible the building of this Brick home for even less than the above figures. With the Ideal wall you obtain all the advantages of solid masonry construction at a saving of ⅓ in cost.

The Ideal Wall is thoroughly described in "Brick, How to Build and Estimate"—a 72-page manual of vital information for contractors and builders. It contains 30 tables, 9 full page detail drawings and other information which proves of wonderful assistance in estimating costs quickly and accurately. Only 25 cents postpaid.

The Hiawatha is one of a wide variety of Brick house designs shown in that fascinating volume, "Brick for the Average Man's Home." Here you will find all kinds of homes illustrated and described, together with much helpful information which will prove of great value in interesting prospective home owners, thus helping you to land jobs. The nominal price of $1.00 is to cover printing and distribution costs only.

$1.25 brings both books. Address The Common Brick Industry of America, 2133 Cleveland Discount Building, Cleveland. O.

The Hiawatha

A House You Can Sell Quickly and Profitably

This home is so good looking, practical and economical that it appeals to every one. It is declared by experts to be the finest of its class in America.

Think what a ready market you'd have for such a home if you built it. Think of its greater sales value—its better profit possibilities.

You can now secure complete plans and specifications for this remarkable brick home. Send for free circular No. 705 showing alternate floor plans and giving complete details.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

"Not a Single Stud Was Burned"—

The Walls Were Covered With SHEETROCK

C. HAFER LUMBER COMPANY
COUNCIL BLUFFS, IOWA

United States Gypsum Co.
238-40 City Nat'l Bank Bldg.
Omaha, Nebr.

Gentlemen:

It may be of interest to you to know that thru actual experience I am convinced of the fire-proof qualities of Sheetrock Wall Board.

As a dealer in building materials, I have sold quantities of Sheetrock with entirely satisfactory results. In fact, I built 17 small houses last year and used Sheetrock thruout for wall and ceiling covering.

About three weeks ago a fire started in one of these houses, burning the entire floor, window frames, and doors. The walls and ceilings were not damaged and not a single stud was burned because of the fire resisting qualities of Sheetrock.

We are glad to recommend Sheetrock to our trade as a wall and ceiling covering which gives highly satisfactory results.

Yours very truly,

C. HAFER LUMBER CO.
C. Hafer, *Pres. and Gen. Mgr.*

You, too, can count on "highly satisfactory results" if you use Sheetrock, the fireproof wallboard. It won't burn, because it is made from gypsum rock. Neither will it warp, shrink nor buckle. Due to the special USG process Sheetrock saws and nails the same as lumber. It makes tight-jointed, smooth-surfaced walls and ceilings which take any decoration perfectly. Your dealer in lumber or in builders' supplies can supply you with Sheetrock. Send for a sample of Sheetrock and for a plan that will help you get Sheetrock jobs. Mail the coupon *today!*

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

USG SHEETROCK

Reg. U. S. Pat. Off.

The FIREPROOF WALLBOARD

Magee Furnace Co., Boston, Mass.
259. *Illustrated booklet* describing the new heater. The Magee Furnace Co. have been very successful with their coal, gas and electric combination ranges which they manufacture in various styles and sizes. As they express it, they have just produced a new member in their electric family which they call the ElectriGas. This is a very compact and attractive electric and gas range. The electric half comprises an insulated electric oven or fireless cooker of good size and an electric broiler. These are controlled from electric switches in front on their patented switchboard. The Gas half includes four gas burners and a simmerer which are automatically lighted from a push button. These ranges are made in ebony black or pearl gray por-cel-a finish. The sales department of the Magee Company report that great interest is being shown in this ElectriGas range all over the country. There are so many good talking points and attractive features in the Magee ElectriGas that it will undoubtedly prove a great seller. This range is also made in straight electric and straight gas, as well as in this combination.
Sill Stove Works, Rochester, N. Y.
Strait & Richards, Inc., Newark, N. J.
88. *Catalog* describing fireplaces, electric and gas logs, heaters, etc.

HOISTS—See Elevators

Nothing is exclusive

about the sale of

Hess Welded Steel Furnaces

¶The price is based on cost, plus a moderate factory profit. We do not offer them through jobbers nor agents but we deal direct with local contractors and dealers, and others. If we plan the layout for any heating job, WHICH WE WILL GLADLY DO WITHOUT CHARGE, our binding guarantee of successful results will apply, no matter who installs the work.

¶Thousands of Hess Furnaces are in use everywhere (12,000 in Chicago alone,) planned and guaranteed by us.

¶Better service cannot be bought at any price and contractors in every neighborhood are buying and installing, with profit to themselves and satisfaction to their clients.

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

WHEN SOLOMON BUILT THE TEMPLE

THERE was no sound of mallet or chisel. Shaped at the quarry to fit exactly its appointed place, each stone swung true into position, despite the fact that this method multiplied the cost. Labor, time and money unreckoned were lavished to make the structure at once reflect Solomon's devotion and enhance his prestige.

LIKE that temple of Solomon's, on the great structures of today most of the work on the materials has been done far from the scene of operations. But, in contrast to those days, this method today saves both time and money.

Concrete, a major material in modern construction, is the most flexible, adaptable and generally economical of all structural materials—and this in spite of the heavy investment in equipment and scientific standardizing methods of the modern Portland Cement Plant.

For over a quarter century Atlas Portland Cement has been used in structures ranging from the simplest to ones even more monumental than Solomon's temple. Throughout that time it has been known as "the Standard by which all other makes are measured."

The Value of Kellastone for Stuccoing Purposes

BRIQUETTE tests reveal the fact that KELLASTONE Stucco exceeds the strength requirements for Portland cement established by the American Society for Testing Materials, by more than three times.

This extraordinary strength, accompanied by a flexibility unequaled by any other plastic material, combine to make Kellastone products of real worth in the field of architecture and construction. Kellastone also ranks very high in resistance to fire.

When twenty-eight days old, KELLASTONE possesses an average breaking strength of 700 pounds per square inch. It stands to reason that the greater the strength of any stucco, the greater the strain the material will stand before parting or cracking. KELLASTONE will remain perfect under strains and conditions that would ruin ordinary stuccos.

For interiors, uncased openings, arches, pilasters, etc,. KELLASTONE Interior Plaster is especially effective. It is a highly fibrous plaster, weighing only half as much as lime or gypsum plasters, and equaling KELLASTONE Stucco in tensile strength. The volume change during and after setting is so low as to eliminate internal shrinkage stresses. Write for interesting KELLASTONE literature.

Jaeger
"A MIX A MINUTE"

"One-Real" Feature
That Always Makes a Hit

10 Seconds to Load

45 Seconds to Mix

5 Seconds to Discharge

Loading	10 sec.
Mixing	45 sec.
Discharging	5 sec.
Total	1 min.

TALK to users of Jaeger concrete mixers. One will be enthusiastic about their low first cost. Another will mention their lower upkeep. Lower cost of operation appeals to many.

But there's one *big* advantage—*one real feature* of this sturdy, tilting-drum machine that they *all* praise—

~the Jaeger "MIX A MINUTE" ACTION

It takes 10 seconds to load a Jaeger; 45 seconds for the batch to mix; 5 seconds to discharge it—*a complete batch in a third to a half the time it takes with any non-tilting type mixer.*

Consider a day's output at that rate and you'll agree that *it costs less to mix concrete in a Jaeger* than in any other mixer on the market. And that means *more dollars in your pocket.*

Before you buy your next mixer why not get this tilting-drum question settled, once for all? With the new low Jaeger prices you cannot help but be interested in the profit-story of this standard line of tilting-drum outfits. *Mail the coupon today.*

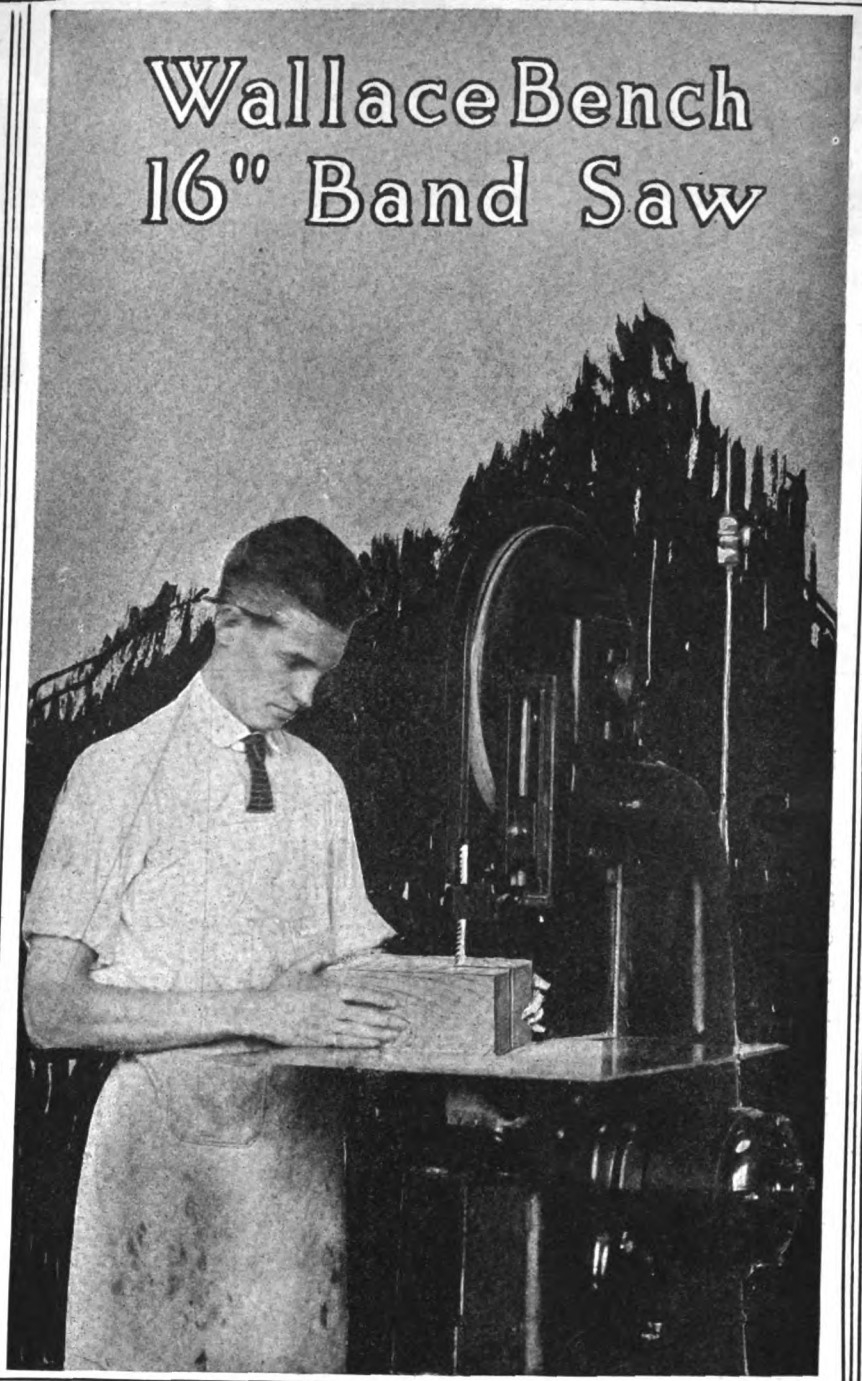
Wallace Bench 6″ Jointer

Wallace Bench Universal Saw

Wallace Bench 4″ Planer



Wallace Bench Plain Saw

Wallace Bench 16″ Band Saw

Wallace Bench 16″ Band Saw

Practically every woodworking plant and carpenter or builder can use one or more of the new Wallace Bench 16″ Band Saws to advantage, especially where extreme accuracy is required, and there are many places where this saw will handle the general run of work to better advantage.

Every part of the machine is accurately made to gauge. Is equipped with ball bearings throughout. Every movable part except the working surface of the blade is either totally enclosed or protected by guards. All adjustments are accurately and conveniently controlled by hand wheels or thumb screws without the use of special tools or wrenches.

Wallace Bench Machines are portable—take them to the work—they will save time and labor either in the shop or out on the job. Patented guard protects the operator. Operate on electric light circuit—push button or toggle start and stop.

OAK FLOORS
(For Everlasting Economy)

A Money Investment
Bringing Sure Return

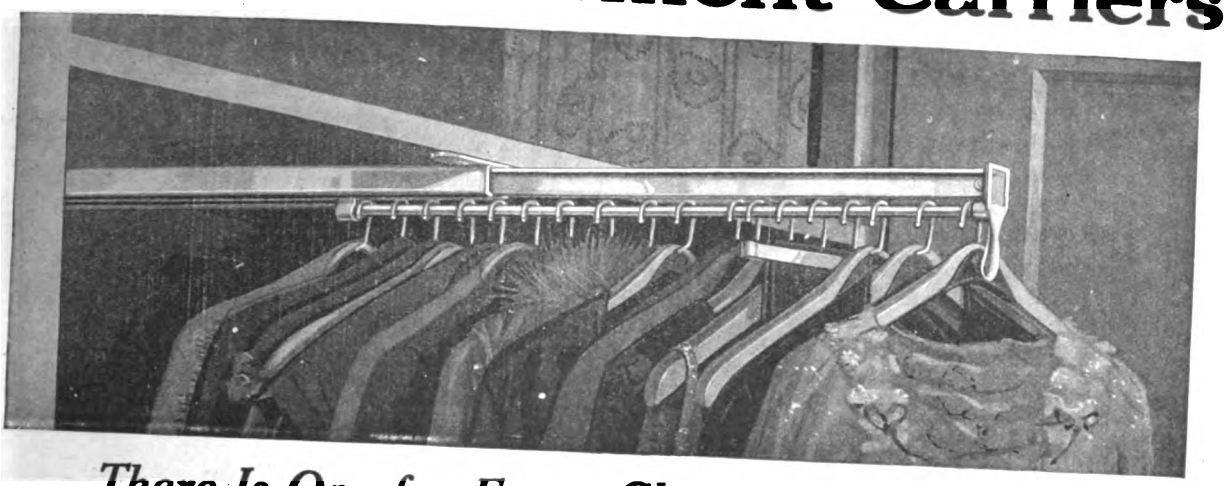
The public liking for Oak Floors is nowhere better shown than in "For Sale or Rent" advertisements where owners of Oak Floors *never fail* to list them.

Selling and Renting Values Increased 25%

The two flats above (separated by the black line) were built on N. State St., Chicago, in 1876. They are exactly alike. A few years ago Number One sold for $8,000 and Number Two for $10,000, the difference of $2,000 being entirely due to *Oak Floors* in Number Two. These floors cost approximately $350.00 when laid, being nothing more than 3/8-inch Oak Flooring laid over old floors.

Builders who use or recommend Oak Floors are making an investment for someone which pays cash dividends just as surely as a bond, in addition to securing the advantages of Oak Floors from the view-points of beauty, durability, cleanliness and all around satisfaction.

Our three free booklets, in colors, contain much accurate and valuable information for a builder's files. Write for them today.



SEE OUR CATALOGUE IN SWEET'S

For general specifications, see Sweet's Architectural Catalogue, page 458, 16th Edition; page 389, 15th Edition.

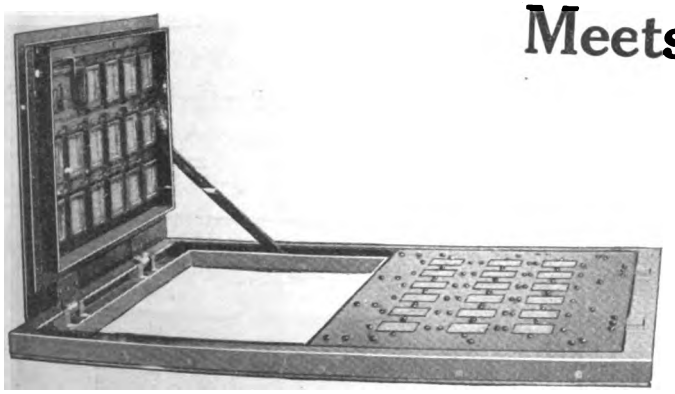
KNAPE & VOGT Garment Carriers

There Is One for Every Closet in Every Home

KNAPE & VOGT Garment Carriers are made in all lengths from 12 to 60 inches. They will fit any and all closets in old homes and transform disorderly clothes racks into modern garment cases.



In new homes—or homes about to be built, as much as 15 per cent in construction costs is saved when Knape & Vogt Garment Carriers are planned for in advance, because this modern system permits smaller, space-saving closets, which reduce the overall dimensions of the building without reducing the size of the rooms. And yet these smaller closets will hold more clothing, create order, cleanliness and lengthen the life of the garments. Architects and builders who do not know the Knape & Vogt Garment Carrier System are not giving their clients the benefit of the latest developments in home conveniences.

Write for prices and details of simple installation.

There is no longer any "speculation" about Fenestra Steel Basement Windows.

Three months ago, we BELIEVED that contractors would welcome these windows for installation in up-to-date residences, apartments and stores. They had so many advantages over wood basement windows, the method of installation so simple, and their cost was so low that they looked to us like a time, labor and money saver for contractors.

Now, we KNOW THIS IS TRUE.

In just ninety days, Fenestra Steel Basement Windows have developed a popularity which insures their constant and increasing use.

Hundreds of contractors are using these windows in large quantities.

Sales have tripled.

Thousands of inquiries have been received from home owners, architects and contractors, anxious to know more about these windows.

These facts PROVE beyond question of doubt that there is and will continue to be an increase in demand for Fenestra Steel Basement Windows. That contractors will find them of practical advantage in simplifying window installations and in aiding them to sell homes built for speculation is now established.

Let us send you, without obligation, fully illustrated literature, showing the sizes and dimensions, details for installing in brick and concrete block, how to glaze, screen, in fact, free information about these highly improved windows. It costs only a two cent stamp to investigate—Sign and mail the coupon Now!

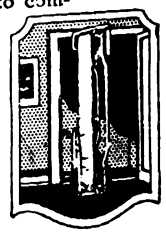
from Sun-Parlor to Sleeping Room



The MURPHY IN-A-DOR BED

It increases the livableness of bungalows of this type. Murphy In-A-Dor Beds are comfortable—equipped with Simmons springs "built for sleep."

The Murphy In-A-Dor Bed is *the* "modern convenience" which is so essential to completeness of the small home. The Murphy principle is unique. The Murphy In-A-Dor Bed swings with surprising ease through a regular size door. In fine apartments and residences, as well as small homes, it solves the extra bed room problem.

Homes equipped with Murphy In-A-Dor Beds inspire distinct pride of ownership.

A Service Department for Your Convenience.

This Department cooperates with architects and builders. It simplifies your lay-out problems and parallels your own purposes.

Write or wire for full information.

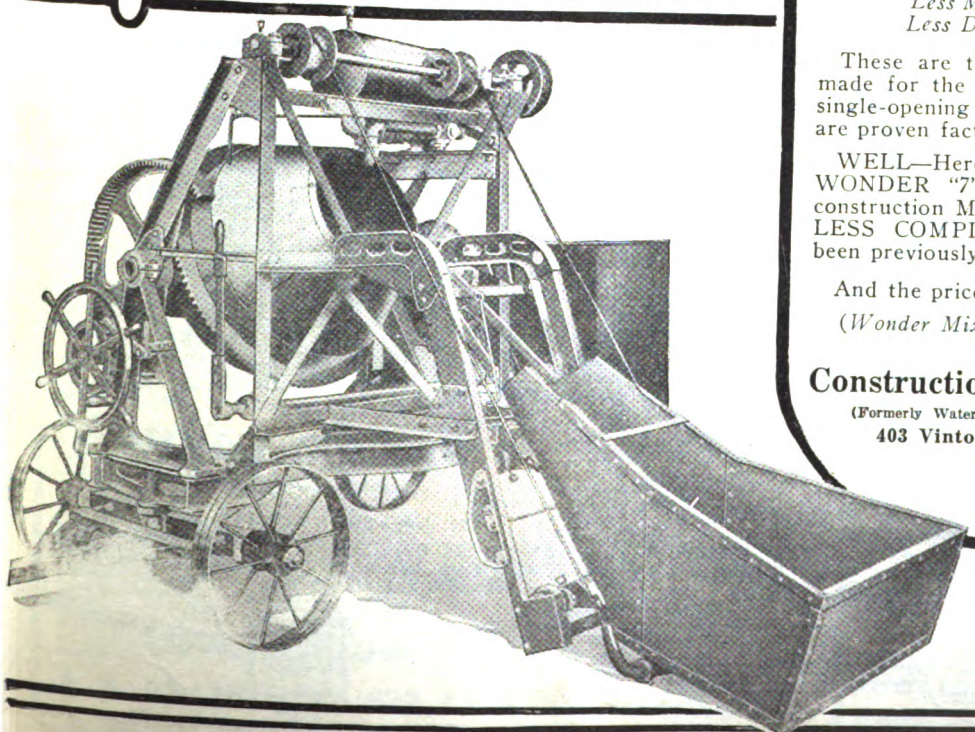
Now You Must Build Houses That Will Sell

THE man who buys a house today, as an investment or to live in, makes a careful study of its selling points, for he realizes that before long the supply of homes will be large enough to offer the prospect considerable choice.

One sales feature that always appeals to the prospective home-owner—and especially to his women-folk who usually influence the purchase—is the Kernerator. This modern system for disposing of household waste not only saves time and steps but also prevents the daily accumulation of garbage in the kitchen and the collection of inflammable refuse in basement or attic. Thus it promotes both health and safety.

Install the Kernerator in the houses you erect. It will improve your standing as a home-builder.

Write for our interesting literature, giving complete information regarding the Kernerator. Also see page 1906, Sweet's 1921 Catalog.



KERNER INCINERATOR CO. 1077 Chestnut St. Milwaukee, Wis.

KERNERATOR
Built-in-the-Chimney
Reg. U. S. Patent Office

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse—rags, sweepings, wilted flowers, broken crockery, tin cans and garbage. Non-combustibles are dried and sterilized and later dropped into the ash-pit. It costs nothing to operate because no commercial fuel is required. The Kernerator should be specified in the plans before construction begins.

WONDER "7" MIXERS

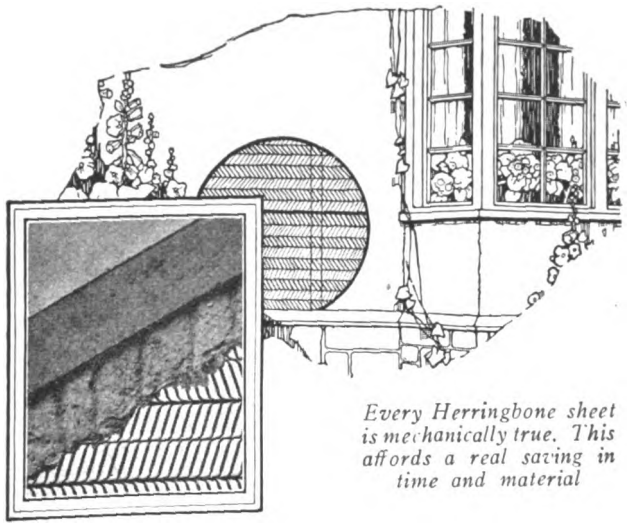
The Improved Wonder "7"

(7 Cu. Ft. Mixed Concrete Per Batch)

Offers

Perfect Mixing Action
Rapid Pouring Discharge
Lighter Weight
Less Maintenance
Less Depreciation

These are the claims that have been made for the past twelve years for the single-opening tilting Mixer. Today they are proven facts.



WELL—Here you have them all in the WONDER "7" in combination with a construction MORE RIGID and a design LESS COMPLICATED than has ever been previously accomplished.

And the price is consistently lower.

(Wonder Mixers' capacities are always rated wet.)

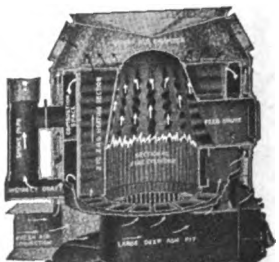
Choosing the Heating System



ALL heating systems are embraced under two classifications—fresh, warm air or stale, reheated air.

Steam and hot water systems do not provide fresh air, and the heat is so dry that floors and furniture dry out and pull apart.

What all home owners want is comfort, and they get it with Kelsey Health Heat. They are comfortable in mind because of their small coal bills and healthful in body because Kelsey Health Heat not only keeps them warm but keeps them well.

The Kelsey Warm Air Generator is totally different from any other heater and we would like to send you our Booklet No. 5 which tells in detail how it is constructed and why it gets such remarkable results.

Our Engineering Department will furnish you with detailed plans and specifications showing how the installation should be made.

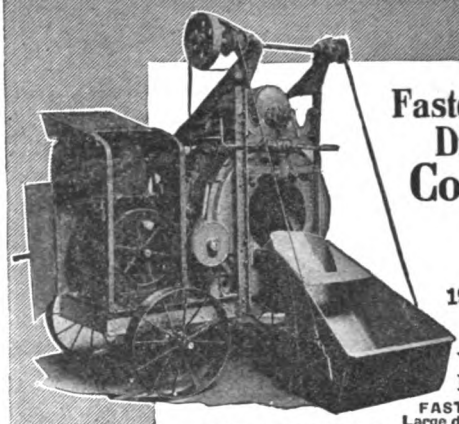
Want A Warm House?

Investigate This Splendid Furnace and the Reduced Prices!

THE bleaker the weather, the more you enjoy a glow of warmth as you enter the front door And the bleaker the weather, the more people appreciate the N. P. Sterling Furnace. For it heats every room in the house with a current of genial warmth. It doesn't burn a lot of coal; it is of modern, efficient design, built of good materials, with fine care. Two pipes flank the furnace. They draw the cool air down out of the rooms, and make way for the warmth that rises from the big fire-pot. It isn't a lot of work to install a Sterling; there is just one pipe and one register.

N. P. Sterling Furnace

The One Register Furnace



HERE is a furnace that is built to last. There is not a cheap feature about it. Everything that goes into its making is the best to be had. For instance, just look at the grates—the big water chamber (moist air is best to live in)—see the way the joints are made so you can't get a bit of ash dust or coal gas or wood smoke in the house. It's a fuel saver, too. Actual tests show that it gives out more heat from less fuel than any other furnace. It's a quality proposition thru and thru, built to give real service.

Before you install any heating plant, be sure to investigate the N. P. at the reduced prices.

Send today for an interesting booklet—Edition B

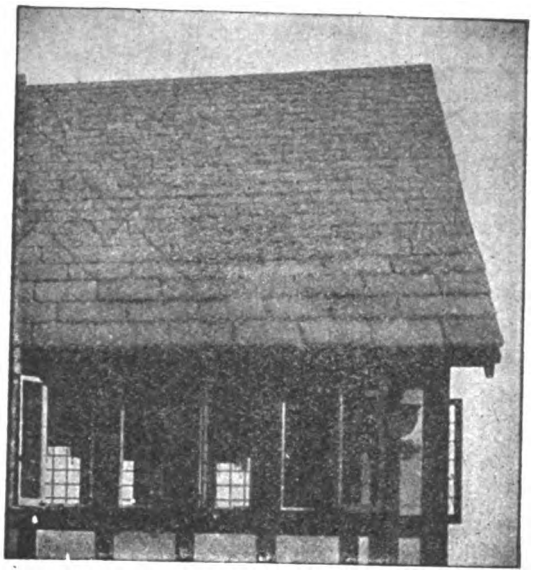
MOTTLED PURPLE
VARIEGATED GREEN and PURPLE
MOTTLED PURPLE and
WEATHERING GREEN



WHICH? The Vendor Slate Company definitely distinguish and define each and ship that which is ordered.

Mottled Purple in the Vendor production is a deep warm purple with distinct green markings on nearly every piece.

Variegated Green and Purple has on each piece cloudy markings of purple on a greenish background and both colors are of a different quality from the above.

Mottled Purple and Weathering Green is a frank mixture of two separate slates and so sold in competition with mixtures of loose definition.

All slates including unfading green, reds and the various greys of Pennsylvania, are defined and described in the new Vendor Architectural Slate catalogue.

On receipt of blueprints - we promptly return them - we will give an estimate for roofing slate, standard or architectural, for any building anywhere.

An "American" Contractors' Portable Variety Woodworker with 20-in. Band Saw

Take Your Shop Right on the Job

Do what a great many other carpenters and builders are doing—take an American Contractors' Portable Variety Woodworker on the job and have the equal of a complete mill right at your elbow.

Those vexing delays and the costs of running back to the shop to do this or that are eliminated when there's an "American" on the job. Each one of its fourteen machines (all in one unit) are high grade woodworking machines—the equal of any single machine. You will actually save money on every building contract that has an "American" on the job.

Write for Catalog No. 77 that illustrates and describes our full line of woodworking machinery.

FarQuar Automatic Control

—and What It Means

One of the first questions a home-owner should ask about a heating system, is—"Does it control the fire easily and successfully?"

In other words, do the drafts operate automatically and help to economize fuel?

The answer is a positive "YES!" with—

THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM

The expansion and contraction of the FarQuar one-piece firebox—electrically seamless-welded to make it gas and air-tight—is the actuating force of the FarQuar Automatic Control. A cold frame is fitted around the firebox outside the casing (shown in illustration at left), and so adjusted that the slightest variation of temperature causes the governor arm to automatically open and close the draft and doors.

The result is a complete control of the fire, giving uniform temperature with only once-a-day firing. No springs or batteries to get out of order. The desired temperature is obtained merely by setting the simple device shown at the right.

The FarQuar is the only heating system made possessing these exclusive features. Other distinctive FarQuar features are described in our free booklet. Write for it. Dealers should ask about the FarQuar Franchise for their territory. It carries a decidedly profitable advantage for them.

The Farquhar Furnace Company
507 FarQuar Building
Wilmington, Ohio

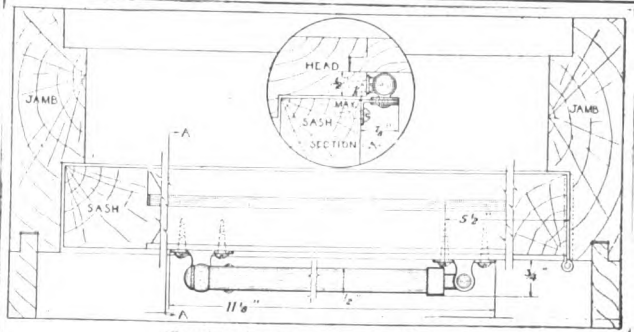
Exclusive "FARQUAR" Features and What They Mean

Electrically Welded One-Piece Steel Fire-Box Positively prevents contamination of air by gases or fire poisons

Storage Fire-Box with large grate area insures slow combustion and fuel efficiency.

Vent and Return System. Provides a generous supply of gently warmed, pure, fresh air instead of a hot blast of super-heated air.

Automatic Regulator actuated by fire-box, completely controls fire insuring uniform temperature regardless of weather with surprisingly low fuel consumption



ROCBOND
Exterior Stucco

Satisfaction for all

The dealer in Rocbond Exterior Stucco knows that this enduring stucco satisfies the architect, builder and owner. He is sure that the Rocbond Dealer Service is back of him ready to give intelligent advice and helpful co-operation. The dealer is satisfied that he handles the best stucco value on the market.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

New Tape Hook Makes Pullman Sash Balance

The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

283 South Avenue
Rochester, N.Y.

"PULLMANIZE YOUR WINDOWS"

Archt. Edward B. Caldwell, Jr., Bridgeport, Conn., used variegated colors of "CREO-DIPT" Stained Shingles on roof and side walls, for Dr. Geo. W. Hawley, Bridgeport, Conn.

White—Gray—Green—and Black

SUCH daring use of colors on side walls and roof would not be possible with any other building material.

"CREO-DIPT" Stained Shingles, because of their soft tones that blend, give results that are distinctive and pleasing. The side-wall shingles are laid with wide exposure, which means a decided economy of material. The roof has the same colors in 16-inch shingles with the addition of reds and yellows. The whole effect is softened by a gray stain which gives soft, velvety surfaces.

Many variegated color effects have been secured by the foremost architects in their use of "CREO-DIPT" Stained Shingles.

If you are going to build or remodel, send 6 cents postage for Portfolio of Fifty Photographs of Homes by prominent architects as well as color samples. Ask about 24-inch "Dixie White" Side Walls for the true Colonial White Effect.

FORSTNER
Labor Saving
AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.

Contractor-Agents Wanted

YOU MAY BE FOLLOWING a trade already or perhaps looking for a new one. Whichever it may be, install Allmetal Weatherstrip and have a real income.

We have a proposition to offer good live men that will put them on the road to success—$5,000 per year income is common among weatherstrip men.

Buildings are well under way now. They will soon be ready for the weatherstrip contractor. Just as soon as you get the new ones equipped, start after the old ones. Owners of old buildings are easy to sell. They are tired of big coal bills, draughty windows, dirty floors, etc.

It costs you nothing to enter the Weatherstrip business. We co-operate with you to land sales.

As for our selling plan

ALLMETAL WEATHERSTRIP CO.
122 WEST KINZIE STREET — CHICAGO

Build a Library of Books That Help!

The successful contractor and builder will tell you he owes his success to plugging and doing his work a little quicker and better than the other fellows. BE A FLOOR SURFACING CONTRACTOR

MAKE $5,000 to $15,000 OR MORE—YEARLY

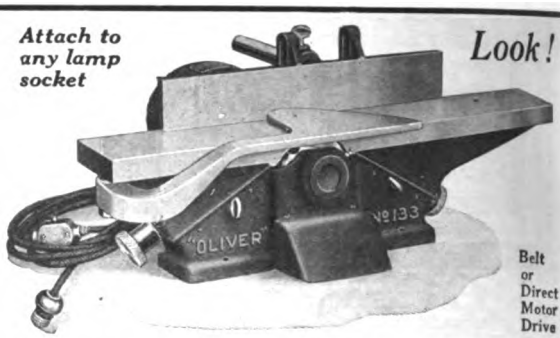
New, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

BUILDING BOOM CONTINUES

There is now more building than ever. There are innumerable opportunities for those equipped to handle work of floor surfacing. The American Universal Machine is essential to hustlers. Get in on the ground floor—get the machine now. It will earn more than the original investment in this busy season.

Resurfacing Old Floors

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need resurfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect.



Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.

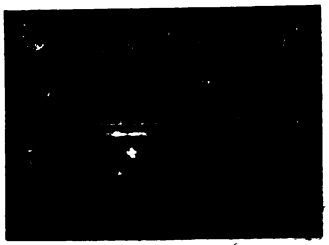
Improved Boring Machine



This machine is from new designs, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

SELLING PROGRAM

IN checking over the accompanying program of sales note that the designation "Q. M. SUPLIES" is a cloak to a list of 65,000 commodities. Not all of this great number is included in each sale, of course. Nor will the buyer in the building field be interested in all of the 65,000 items. Your individual needs govern your purchases. Catalogs of each sale will guide you to wise buying.

The sales listed will present some or all of the following commodities:

Hardware (nails bolts, saws, hammers, etc.); pipe, wire, rope, shovels, picks, toilets, showers, tubs, radiators, heating plants, water heaters, boilers, power plants, pumping plants, water and sewage pumps, motors, transformers; railroad tracks, ties, bolts, etc.; temporary buildings and installed fixtures.

SEND FOR CATALOG

Your attention is invited to an offering of 500 Troy Trailer bodies, 1½ tons capacity, which will be sold by auction at Camp Holabird, Baltimore, Md., on July 27. For catalogs and full information regarding this sale, write Chief, Sales Promotion Section, 2515 Munitions Bldg., Washington, D. C.

The Government reserves the right to reject any or all bids.

WAR DEP

5-G-A

Better Business

YOUR hand can dam the mighty Mississippi at its source. Lift your hand, and the labors of a nation cannot halt the majestic sweep of the waters near their mouth.

Business is like the Mississippi. Remove the barrier at the source of supply, and the stream of trade will grow in volume as the rivulet becomes the river.

The War Department today is the greatest single source of supply the business world has ever known. Impounded in its warehouses are millions of dollars worth of materials—bought to meet the acid test of use by your Army in the struggle "over there." Their nature is as varied as the demands of diversified industry.

Better business depends in large measure upon unhindered distribution of this surplus in the channels of trade. Do your part in releasing these stores. The catalogs of offerings show the way. Write:

Chief, Sales Promotion Section, Office, Director of Sales,

Room 2515, Munitions Building, Washington, D. C.

NEW ENGLAND COLONIAL STYLE

Illustrating the symmetry and stateliness of New England town houses of the period when Colonial architecture was at its height. This is another of the 17 architectural styles illustrated and discussed in "Good Houses," a book for home-builders interested in good design, efficient planning and thorough construction. "Good Houses" interprets those architectural styles which are the foundation of American building traditions, and which are adaptable to wood construction today. Send for your copy today.

Illustrating Good and Bad Bearing Post Footings

IF bearing posts under the girders in the basement of a house settle unduly the effect is apparent throughout the house. Cracks appear on plastered walls; doors become troublesome; floors become uneven. The bearing posts support a considerable amount of the weight of the house. Obviously they must be well supported or "rooted."

The footing shown on the right is too small in all its dimensions and is limited in its bearing power by its shape as well. Note how the post is set down into the concrete, a material which is always somewhat damp, thus needlessly subjecting the post to decay.

The greater sustaining power of the footing on the left is evident at a glance. Note its generous dimensions, its flat bearing surface, and note, too, how it extends above the cellar floor line, thus keeping the bearing post off the damp floor.

The success of concrete footings is dependent, too, upon the use of good materials in the right proportions, properly mixed.

Bearing post footings are just one of the many vital points in successful house building discussed in the booklet —"The High Cost of Cheap Construction," sent free on request to prospective home builders.

(This is the Weyerhaeuser Home-Building advertisement appearing in National magazines for June.)

What Will You Say About Your New Home Three Years From Now?

ASK any one of the better class of building contractors why so many people are dissatisfied with their houses a few years after they are built. He will tell you poor construction.

Constant repair bills, excessive heating costs and the endless annoyances that so often rob home-owners of the satisfaction they are entitled to, are the results of construction short cuts—mistaken for economy—behind plastered walls, beneath the floors and even under the very foundations of many houses that are being built today of all materials.

Yet at no greater cost than the prices that are being paid for compromise houses, the application of the right principles of building construction can make your house a substantial, economical, satisfactory home.

THE key to successful house building lies in right materials properly applied.

Lumber for house building is of the same good quality as ever. Developments in manufacture are constantly improving it.

Good workmen and the better class of contractors still want to do an honest job; in fact they have been preaching the value of right construction in house building for years.

But conditions, largely beyond their control, today are forcing legitimate contractors—the men who know good materials and how to use them, who understand fire-stopping and other modern construction practices, and who see house construction in terms of durability and efficiency — to bid against construction practices that every honest craftsman condemns.

That is why we say, go to a legitimate contractor—one who takes pride in his craft and would rather deliver a good job at a fair profit than a poor job at an unfair profit.

You will find these men more and more using lumber of the Weyerhaeuser standard of quality—trade-marked with the manufacturer's pledge of personal responsibility.

IN "The High Cost of Cheap Construction," a book which will be mailed you on request, you will find the essentials of good construction necessary to successful house building; the basis for judging the manner in which your house is built; and the means of making the lumber you use in the construction of your house of even greater service. Ask also for "Good Houses."

Weyerhaeuser Forest Products are distributed through the established trade channels (to contractors and home builders through the retail lumber yards) by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

EACH *year you will find an increasing number of retail lumber dealers recommending Weyerhaeuser lumber for house building—men who know the relation to correct building practice of properly dried lumber, of uniform grades and of the kinds best suited to your needs.*

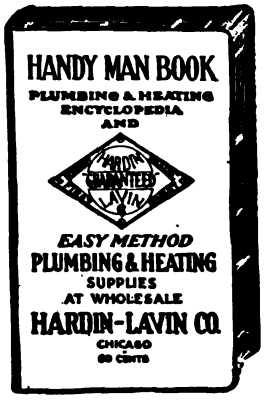
BUILDERS – INSTALL YOUR OWN PLUMBING AND HEATING BY OUR NEW EASY METHOD

Reduce The High Cost of Building



Contractors and Builders. Include the plumbing and heating in your next contracts. ***Our new easy method*** of installation enables you to do this without difficulty. You save the high cost of skilled labor, unnecessary material and heavy work with our simplified systems. Any handy man can do the installing by following our easily understood working plans and specifications. Our patented adjustable labor saving connections save much cutting, threading, time and unnecessary material. Even if you intend to employ a practical plumber, your big saving by using our products and ***new easy method*** of installation will surprise you. Contractors and builders are given special wholesale prices. ***Bid on the finished contract.***

Hardin-Lavin Hot Water Boiler

Send for Our Big Handy-Man Book Catalog

This well bound ***Handy-Man Book*** catalog contains hundreds of floor plans, elevations, diagrams, designs and installing sketches, from the simplest to the most difficult systems, plainly showing in detail our simplified method of installing or repairing your own plumbing and heating. Gives hundreds of mechanical rules, kinks, receipts, practical short cuts, etc.; how to repair leaks; how to lay out plumbing and heating; how to estimate costs, including labor; the proper care for heating plants. It shows and describes over 10,000

Factory Fitted Plumbing and Heating Plants

fixtures and supplies, with wholesale prices on everything; helps you select the best plumbing outfit, water supply system or heating plant to meet your needs; thoroughly describes our ***new easy method;*** shows you how to save skilled labor, unnecessary material and heavy work by this modern and quicker method. Any handy man can do his own work with the aid of this plumbing and heating encyclopedia. It is a revelation even to the most experienced contractor. It thoroughly explains

Hardin-Lavin Pipeless Furnace

Our New Inexpensive Easy Installing Method

We carry everything in first grade plumbing and heating supplies from the low priced plain designs to the larger and more elaborately designed fixtures. ***Bathroom outfits, closets, lavatories, bath tubs, sinks, laundry tubs, water supply systems, water heaters, pumps, pipeless and warm air furnaces, hot water and steam plants, pipes, fittings, valves, etc.,*** all factory fitted for the handy man, with Beauty, Lasting Durability and Ease of Installation built thru and thru.

Let Us Help You Plan and Install

Send us a rough sketch or plan of your building, or tell us about what you have in mind for a plumbing outfit, water supply system or heating plant and our ***Practical Service Department*** will show you the simplest, most inexpensive and best method of installation and will help you select the best suited fixtures or systems to meet your requirements.

Three men never needed for an (EVERlasting) Ambler Asbestos Shingle roof

Residence of Abbott Worthley, Bradevelt, N. J. Fred Jennings, Freehold, N. J., Contractor

Residence of Charles E. Grance, Cape May, N. J. Otis M. Townsend, Ocean City, N. J., Contractor

Residence of Dr. Homer Collins, Duluth, Minn. Richard Hanson, Duluth, Minn., Architect

EVERlasting!
And a joy forEVER!

For an Ambler Asbestos Shingle roof not only endures, but it possesses the beauty that is never-ending.

Four permanent colors—Newport Gray, Natural Slate, Tile Red and Moss Green—in three styles—American, French and Honeycomb—give architects and builders an opportunity to work out a great variety of unusual roof effects.

Being made of asbestos and cement, these slate-like shingles possess far greater strength and durability than slate or any other roofing material. Yet, being light in weight, they do not demand the heavy construction required by slate and many other forms of roofing.

USE FACE BRICK
—it Pays

A FACE BRICK LIBRARY

Contractors, builders, and dealers will find these booklets useful in their business

A comprehensive array of facts, general information, and suggestions regarding face brick and face brick construction methods, as well as an unsurpassed collection of house designs, for which working drawings are obtainable, have been compiled and are presented in the various books and pamphlets described below:

"S" **The Story of Brick.** A 56-page, 7 x 9¼ inch introductory booklet on the merits of face brick construction. Profusely illustrated. Abounds with sales reasons for the contractor to tell his clients. Sent free on request.

"M" **A Manual of Face Brick Construction.** A 116 page, 8½ x 11 inch text book on the three types of face brick wall construction, presenting information essential to the contractor, but useful to everyone interested in building. Illustrated. Contains 31 house designs for which working drawings may be secured. Price $1 a copy.

"H" **The Home of Beauty.** 72 pages, 8 x 10⅝ inches, a book of competitive designs, showing 50 small houses of 6 rooms each. Wide variety of artistic designs by reputable architects. Working plans available for each design. Price, 50 cents per copy.

"B" **Face Brick Bungalows and Small House Plans.** 100 pages, 8½ x 11 inches, four booklets of attractive small brick house designs of from 3 to 8 rooms. Complete working drawings and masonry material surveys obtainable at nominal charges. No B1—14 designs of 3- and 4-room houses; B2—30 designs of 5-room houses; B3—30 designs of 6-room houses; B4—22 designs of 7- and 8-room houses. Price, single booklets, 25c each; set of four booklets, $1.00.

"A-P" **The Architect's Portfolio.** 115 de luxe art halftone reproductions, 8½"x11", of well-known examples of the finest brick work details in the country, taken from various types of work. Sent free to accredited architects.

No. 15. **Bills of Cost Compared in a Face Brick House.** Folder with diagrams showing the comparatively small part face brick plays in the total cost of a house. Sent free.

No. 20. **Permanence and Beauty in Building.** An 8-page illustrated pamphlet presenting the merits of face brick construction, useful as an introductory appeal to prospects. Sent free.

No. 40. **Comparative Building Costs.** An 8-page pamphlet giving the actual figures, percentage differences and averages on the construction costs of three types of houses with six different kinds of wall, based on figures from thirteen leading cities. Sent free.

No. 70. **Estimating Masonry Materials and Labor for Face Brick Construction.** A 12-page pamphlet giving in convenient form very useful estimating tables for the builder. Sent free.

No. 50. **How to Read Plans for Building a Home.** A handy 8-page pamphlet illustrating and explaining various standard code signs and practices in interpreting architectural drawings. Sent free.

No. 60. **In Praise of Brick and Oak.** Reprint of a very entertaining article by Christopher L. Ward, which appeared in the Yale Review. Sent free.

No. 42. **My Dream of a Home.** A prize essay on the sentimental and practical value of a home. Sent free.

No. 72. **Data on Comparative Small House Costs in Chicago.** An 8-page pamphlet giving the bids of five Chicago contractors on Bungalow design No. 627-8 in the spring of 1922. Sent free.

No. 77. **Orienting the House.** An illustrated 16-page booklet explaining the placing of the house with reference to light and shade. Price 10c per copy.

Every one engaged in building will benefit by having the information contained in these various pieces of literature on hand for frequent reference. Write for those booklets which you do not already have. Address Dept. B 8.

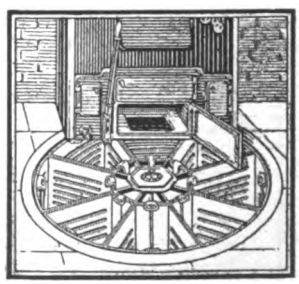
The best built home

That the house is well built is important. But the best built home, the one that reflects greatest credit upon the builder's skill, is the one in which careful forethought has done the most to lessen the labor of keeping it up.

The drudgery of furnace work and ash disposal have long been big drawbacks to home-owning. But the installation of a

Sharp Rotary Ash Receiver

does away with ugly ash cans and piles of ashes. The ashes are stored out of sight beneath the cellar floor till finally removed from the house. No more swirls of dirty, grimy ash dust go filtering through the house to work their havoc with furniture and draperies. No more tedious shovelling of ashes.



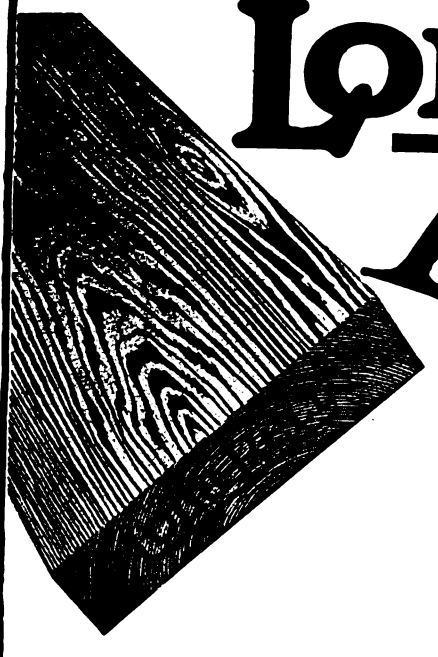
We have just prepared an interesting illustrated booklet about "The Cellar as Clean as the rest of the House." It shows how the receiver is installed and how it simplifies the care of the furnace work. There are also photographs of many homes where the Sharp Rotary Ash Receiver has banished furnace drudgery forever.

Write for your copy TODAY

Contractors and builders: Send for Specification Book, prices and discounts.

The cellar as clean as the rest of the house.

The Sharp Rotary Ash Receiver consists of a set of five, eight or twelve cans, mounted on a revolving steel frame, installed in a concrete pit, under the ash pit of any size or style heating plant. There's nothing to get out of order.



Sharp Rotary Ash Receiver Corporation

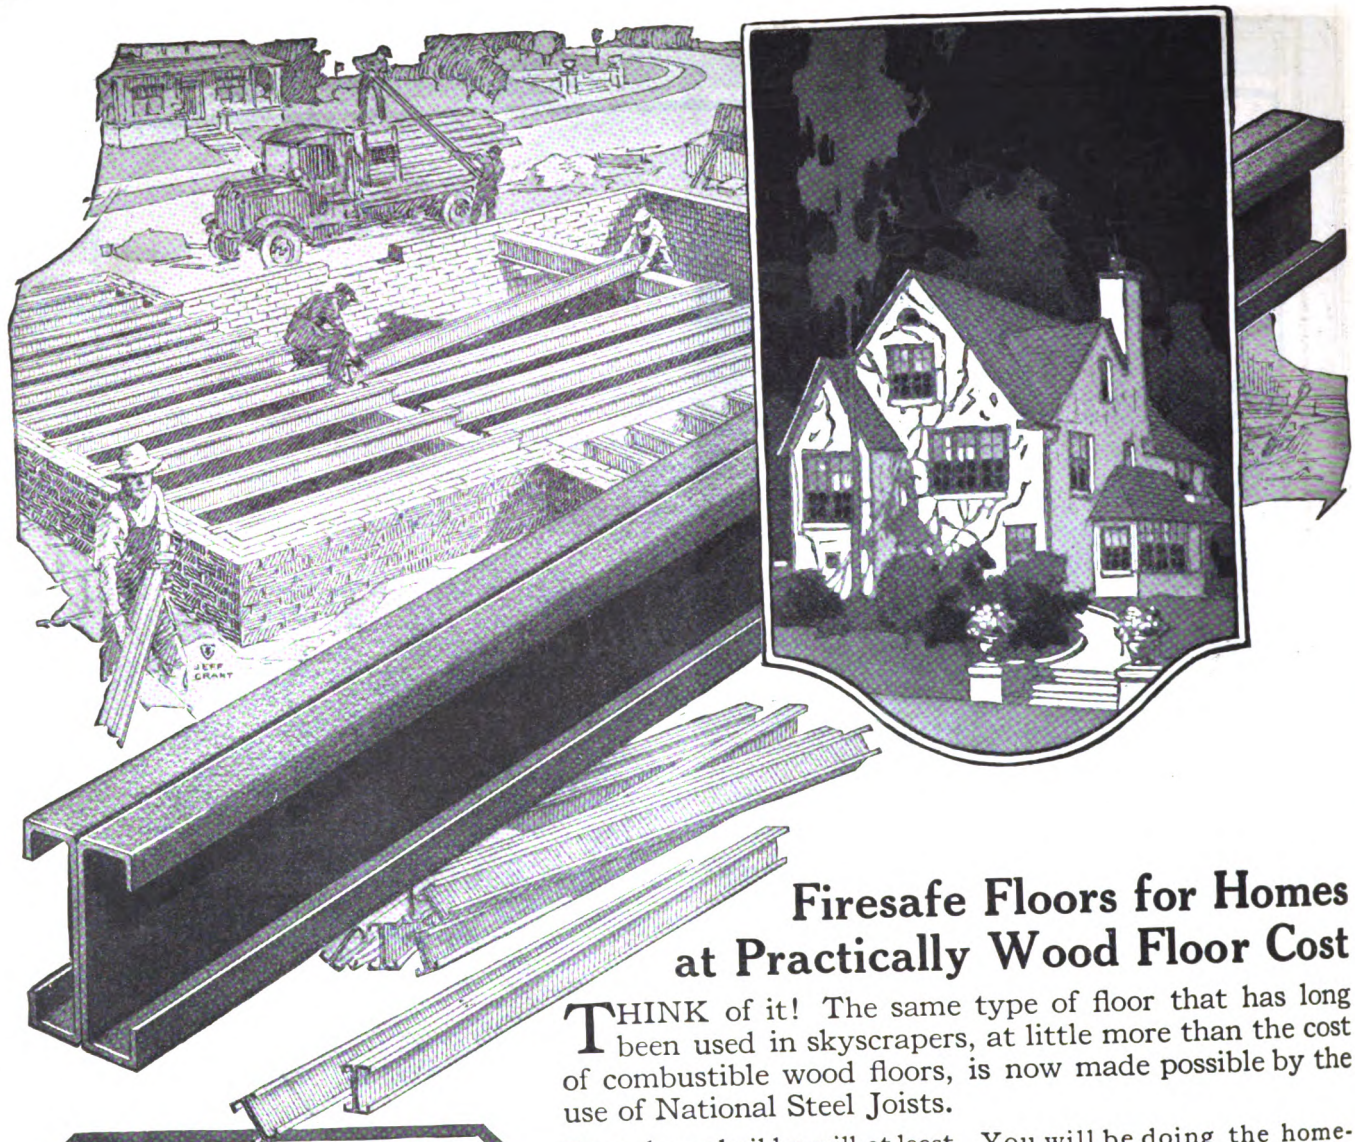
Easily Identified

LONG-BELL Lumber

LONG-BELL Lumber and Timbers are trade-marked with the name of the manufacturer. This means individuality, *unmistakable* identification—the same kind of a buying guide you demand on other merchandise.



BUYING BY BRAND has come to be the accepted rule with practically everything we use because the buying public long since learned that branded, identified goods are *dependable* goods. Certainly it is to the interest of the manufacturer who puts his name on his wares to make them the very best he can.

ISOMETRIC DRAWING
Showing steel lumber floor construction.

Firesafe Floors for Homes at Practically Wood Floor Cost

THINK of it! The same type of floor that has long been used in skyscrapers, at little more than the cost of combustible wood floors, is now made possible by the use of National Steel Joists.

Every home builder will at least want a firesafe first floor. It forms a firesafe blanket over the basement, where the vast majority of dwelling fires have their origin. Such floors are also dust and vermin proof. Won't sag or warp.

You, as a contractor, are often called upon to submit floor plans for homes. Design those homes with National Steel Joist firesafe first floors. They are easily embodied in plans—economical and easy to build. See detail drawing at the left. **Your own men do all the work.**

You will be doing the homeowner a favor by suggesting such floor design and will impress him with your knowledge of the most modern method of home construction. Millions of square feet of National Steel Joist floors are in use in stores, hotels, office buildings, garages, schools and homes.

Let us help you. Send in your plans or floor sketches. We'll show you how to embody National Steel Joist design and quote prices. Ask for special literature.

He Put a Zinc Roof on a Brown Shingle House

When he was discussing plans for his new home, this Brooklyn man surprised his architect by asking about a zinc roof.

The architect, one of New York's smartest, said, "Oh, you don't want that. It isn't done, you know."

"Why?" asked the Brooklyn man, who had spent his early life in Belgium where he had seen zinc roofs, some of which he knew to be over fifty years old and still as good as new.

"Well," said the architect, with that well-bred tolerance that the professional man is always called upon to display to the "show-me" man, "In the first place, you can't get an artistic effect with a metal roof, and with a pitched roof such as we are planning, you must remember the roof is going to be a big part of the design effect of the house. There is a zinc shingle made by the Illinois Zinc Company that is turned at the edge and so has a butt shingled effect, but I hesitate about pioneering with new materials."

"I know," said the Brooklyn man. "So do I, but I'm convinced that nothing equals zinc for durability, weather resistance, and reasonable laying cost, and I'd like to try it. I've heard of that Illinois Zinc Shingle, too. They tell me it is pre-oxidized at the factory so that there is a fine weathered gray appearance to it that blends perfectly with any background."

"Yes," said the architect, "that's true—and a weathered zinc is Nature's own color, but I'm shy about it along with a brown shingle house. Still, with the trees on the place—greens, browns, grays—why not? And, in winter, a good sky color. I'll look into it. Certainly on every other count there's nothing like zinc—for light weight, protection against fire and lightning, low construction cost, freedom from painting, repair, and up-keep costs—it's a marvelous material."

The architect looked into it. He saw a roof made with Illinois Zinc Shingle—the ingenious patented shingles with the butt shingled effect and, because of what he saw and specified, the Brooklyn man's new house is the pride of the street.

Put an Illinois Zinc Shingle roof on your next contract. You will never see it wear out because it will outwear the building on which you put it. But this first zinc roof of yours will immediately develop new business for you just as it has with everyone else. Send for detailed information today.

Like the Pyramids
—built to LAST

"RED CROSS" Ranges and Furnaces greatly enhance the sales possibilities of houses. They are so well designed, so well constructed and so well finished that they show their superiority at a glance.

"RED CROSS" FURNACES

"RED CROSS" AJAX, BERMUDA and EMPIRE Furnaces embody every desirable feature in a furnace for the modern home, school, church, store or other building.

These sturdy furnaces are substantially constructed of a better grade of iron than the average furnace—built to LAST. They are easy to operate, economical of fuel, and produce more heat than any other furnace made.

"RED CROSS" RANGES

"RED CROSS" WELCOME, POPULAR and PRIZE Ranges represent the highest attainable standard in range construction.

Beautifully nickeled and enameled in pleasing colors—they are an adornment to the most elaborately equipped modern kitchen. Coal and gas combinations, or either alone. All are famous as PERFECT BAKERS."

"Red Cross" Ranges are strongly built—to LAST—and many embellishments add to their attractiveness. "Red Cross" conveniences — gas water heater; hot water reservoir; high warming closets; elevated baking and broiling ovens; white enameled splasher and doors; roomy oven, etc. — make work in the kitchen a pleasure.

Distributors Wanted

In territory where "Red Cross" products are not at present being sold, we desire to add distributors.

Sixty years of experience in manufacturing furnaces and ranges as well as they can be made, and an extensive advertising campaign, stand back of the "Red Cross" Line. Red Cross Furnaces and Ranges sell rapidly and completely satisfy.

RED CROSS is the most profitable line to handle.

WRITE for Price List of "Red Cross" Furnaces, Stoves and Ranges, illustrated in color; also Plan Sheet, on which our engineers will recommend correct installation without charge.

A book of 100 pages, large size, 9″x12″, printed on heavy paper, illustrating the work of architects known nationally for excellence in design of houses of moderate cost—practical, economical. Handsome front cover design, in 3 colors.

Digitized by Google

Here is the Plan Book You've Been Waiting For!

A book no builder or contractor can afford to be without

Here is a plan book which is entirely different from existing plan books. Every design, whether it is of the simple frame dwelling or the larger residence has been designed so as to secure beauty and convenience.

Builders and contractors can use "Beautiful Homes of Moderate Cost" **to create more business.** Just show this book to your prospects and let them pick out the home they like best. Every home illustrated in this book will be a credit to the community where it is built and to the builder.

The designs include bungalows, one-family and two-family houses; frame, brick, hollow tile, stone, stucco and combination of these materials.

Complete Blue Print Plans, ¼" Scale, and Specifications for each design are available at small cost.

The book also shows Garages, Pergolas, Garden Furniture, Gates and Fences, Kitchen Arrangements, desirable Built-in Features, and articles on Financing, Carrying Charges, Landscaping, Wiring, Furnishing, Decorating, House Building Materials, Roofing, Heating, Plumbing, etc.

A book of exceeding importance to every prospective home owner, and, consequently, just the book for every builder, draftsman, lumber dealer, real estate operator, and mortgage and building loan organizations.

Published to complete our service to the industry and so priced very nominally—$1.00 the copy, heavy paper covers; $1.50 in cloth covers.

Grade is plainly marked on the box

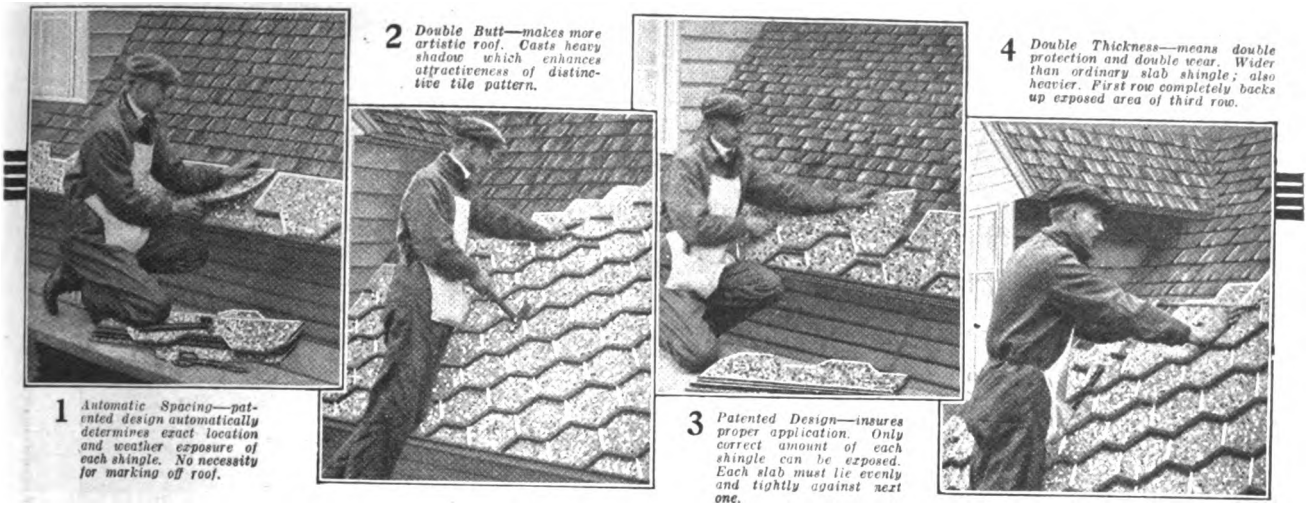
BUY your window glass by grade. The American Window Glass Company maintains the highest grading standards in the United States.

Only after two careful inspections is the grade affixed. Even the lowest grade of glass packed in an American Window Glass Company box must be good window glass. "AA" quality represents the best window glass that can be made. "A" (second) quality lights are hardly distinguishable from "AA", and "B" (third) quality lights are practically as clear as ordinary seconds.

Note the grade markings on the box. If it is the product of American Window Glass Company you may be sure it is the finest window glass obtainable in that grade.

This room is the favorite

"Let in the Sunlight"



THE importance of sunlight in the home cannot be over-estimated. Next time you spend a day at home notice the unconscious preference you give to the well-lighted room. Sunny, cheerful rooms are always the favorites and contribute to the health and happiness of the whole family. Large clear windows—and plenty of them—enhance the value of every house. When you build, give the windows careful thought—specify the grade of glass and be sure it is the finest obtainable in that grade.

Four Important Reasons for Using HEXAGON

1 *Automatic Spacing—patented design automatically determines exact location and weather exposure of each shingle. No necessity for marking off roof.*

2 *Double Butt—makes more artistic roof. Casts heavy shadow which enhances attractiveness of distinctive tile pattern.*

3 *Patented Design—insures proper application. Only correct amount of each shingle can be exposed. Each slab must lie evenly and tightly against next one.*

4 *Double Thickness—means double protection and double wear. Wider than ordinary slab shingle; also heavier. First row completely backs up exposed area of third row.*

THE Vulcanite Hexagon Slab Shingle offers everything a good roof can have—beauty with wonderful protective and wearing qualities—with decided advantages that belong to Hexagon alone—the *patented* exclusive design, for instance.

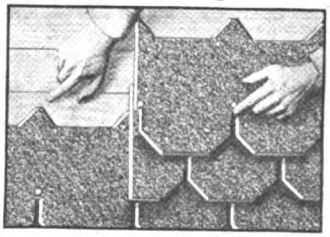
The Vulcanite Hexagon Slab Shingle, together with the Self-Spacing Shingle and Doubletite (shown at right), form a trio of Vulcanite Specialties that cannot be approached in any other line of roofings.

In addition, the Vulcanite line includes *a better roofing for every need*—shingles, rolls, ornamental effects and built-up roofings for every conceivable use. Also roofing cement and roofing paint.

With a thorough knowledge of the Vulcanite line any architect is in a position to specify a highly satisfactory roof for any purpose.

With Vulcanite, any dealer can supply exactly the roof to meet any call—and one that involves no comebacks except those for more business. The carpenter has a roof that is easily laid—automatically spaced in many cases—and that adds materially to his prestige.

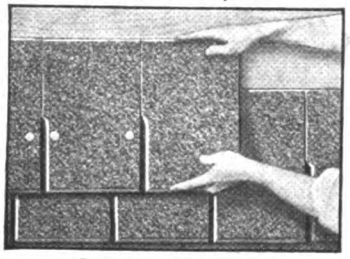
Quick deliveries and low freight rates to any section. Our factories and warehouses blanket the country.



We will gladly send one of our roofing experts to explain the Vulcanite line and proposition in detail—or send you full-sized samples of any item in the line. Communicate with our nearest office.

VULCANITE ROOFING DIVISION

(The Beaver Products Company, Inc.)



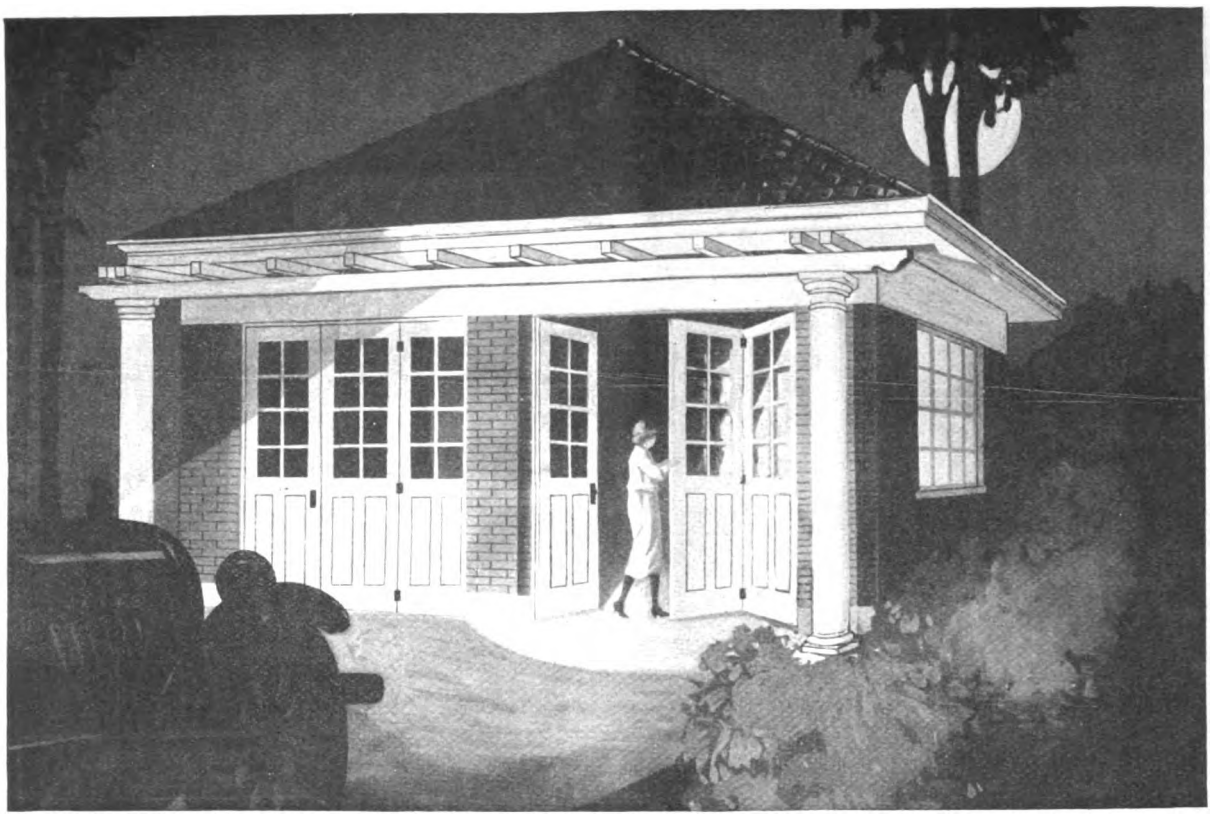
Administrative Offices—Buffalo, N. Y.; Ottawa, Ont., Canada; London, England.
District Sales Offices—Albany, N. Y.; Buffalo, N. Y.; Cincinnati, Ohio; Chicago, Ill.; Kansas City, Mo., and San Francisco, Calif.

Two Other Vulcanite Patented Shingles

Vulcanite Doubletite

Patented triangular projection gives double thickness all over with triple thickness at vital points. High quality, handsome appearance—automatic spacing—extra wide—medium-priced.

Vulcanite Self-Spacing



Self-Spacing Shingles build a roof that's three thicknesses everywhere except at the slot. Each shingle fits snugly against shoulder of one next. Rain and snow can't drive in to roof boards.

In the Spotlight

Although widely imitated, ***Slidetite*** Garage Door Hardware continues to hold its place in the spotlight of public approval. Various exclusive features, together with the ability to withstand long, hard usage, account for its popularity. Before erecting a garage of any size it will pay you to investigate the merits of ***Slidetite.*** No other garage door hardware can be depended upon to give such lasting satisfaction to the owner.

Slidetite
Garage Door Hardware

Slidetite is the ***only*** garage door hardware that is practicable for use in openings requiring more than six sliding-folding doors. Even in openings as wide as 30 feet, the doors will never stick or sag.

Doors hung on ***Slidetite*** fold up flat against the wall, completely out of the way. They cannot possibly blow shut, thereby harming either automobile or person.

Slidetite equipped doors operate on a jointless track—a mere push is all that is required to open or close them. Yet they fit the opening snugly and always remain weathertight.

Winthrop Dealers Get Real Sales Co-operation

Winthrop Tapered Asphalt Shingles are fundamentally correct—because of the Taper. Thick at the butt, thin at the top, they cannot warp nor curl. The buyer of a Winthrop Roof stays sold, he wants no other kind of roofing material.

We give the Dealer the most intensive co-operation in selling every prospect. The greatest direct mail campaign in use to promote the sale of roofing is used to sell the Winthrop prospect.

From two sources, the prospect receives Winthrop sales literature for a period of weeks. Every piece of this advertising is the kind that makes the buyer of roofing want a Winthrop Roof.

Hundreds of Winthrop Dealers are reaping a harvest of orders through the use of this co-operation. The advertising is carried on without cost to the Winthrop Dealer and he gets the benefit.

How

How will it look?

How will it wear?

How much will it cost?

Three Roofing Questions—Answered by FLEX-A-TILE

"How will it look?"

This is the first question of the home builder, who demands lasting beauty as well as service from a roof. And Flex-a-Tile satisfies that demand with a variety of colors that will suit any architectural taste. The Richardson Company has just added to Flex-a-Tile House Tops (exclusively) a new color—**Weathered Brown**—the soft, mellow tone of genuine slate that nature has aged for centuries in Richardson's own quarries at Flex-a-Tile, Georgia. Other colors also are available—a rich, natural green, and a fadeless red.

"How will it wear?"

This is the most important question that can be asked about a roof, for on its answer depend the reputation of the builder and the satisfaction of the owner. And Flex-a-Tile answers this question with Richardson Felt, a strong, durable fabric that has been standard for roofing purposes since 1868. The felt in Flex-a-Tile is thoroughly saturated with scientifically tempered asphalt from Richardson's own refineries—then asphalt coated on both sides to seal strength in and water out.

"How much will it cost?"

A vital question, too, for the buyer. Cost means more than the original price; final cost depends on length of life. On both counts Flex-a-Tile is an economical roofing, for quantity production and efficient manufacturing methods keep the first price down, and durability discounts this investment with every year of service. There is added economy also in the fact that Flex-a-Tile can be laid equally well over old shingles or new sheathing.

FLEX-A-TILE
HOUSE TOPS

Every square of Flex-a-Tile is uniformly made by skilled workmen, from the best of materials. Every square is backed by the Richardson reputation.

Flex-a-Tile answers every roofing *question* for the home owner, it solves every roofing *problem* for you. Send today for descriptive folders and samples.

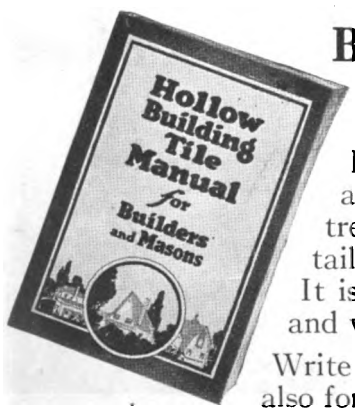
now is the time

To Become Familiar With Hollow Tile Construction



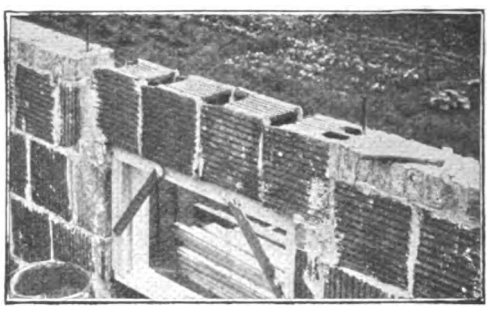
The owners of tile houses are so thoroughly enthusiastic that they are rapidly spreading the good news of the many advantages which building tile offers.

Cool in Summer Warm in Winter

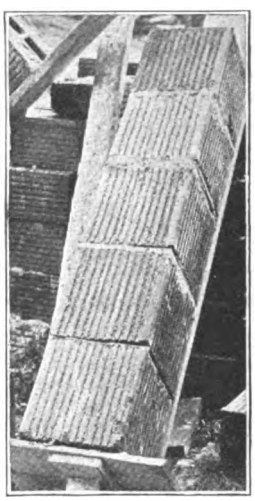
The air confined in the cells of a Hollow Tile home gives efficient insulation against heat and cold.

Tile can be furnished with a finished face similar to the best grades of brick and in rough structural form requiring a finish of either stucco or brick. Tile gives a permanent construction that is fire and wear-proof.

Every owner of a tile house is enthusiastic—you can depend upon your customers being equally enthusiastic. More and more tile houses are being built—now is the time for you to become familiar with tile construction.



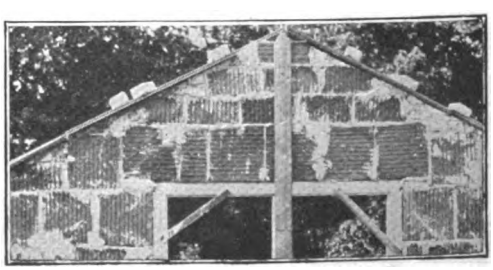
Builders' Manual *FREE!*



Every builder should have a copy of this book. It treats on every building detail in regard to hollow tile. It is complete, educational and valuable.

Write today for this book. Ask also for beautiful plan folders.

THE HOLLOW BUILDING TILE ASSOCIATION
Dept. 198 Conway Bldg. Chicago, Ill.



A simple method of pouring a re-inforced lintel on the wall. One end of each tile is chipped out so as to give access to the bottom cells. These are placed in position with re-inforcing rods in lower cells and filled with concrete.

Some contractors prefer to build their lintels on the ground and lift them into position. This is not practical except on small lintels, unless a hoist is used.

A story from Sherry's

TWENTY-FIVE years ago, when Sherry's Hotel was built, it was one of the show places of the great Metropolis. It had the best of everything in its construction. It had Bridgeport Brass Pipe thruout.

Changes in the times so affected the business of this world-famous restaurant and the money value of the site on which it was located, that the building was sold to the Guaranty Trust Company, who remodeled it into its present form for banking purposes.

During the remodeling, the pipe, along with other constructional elements, was carefully scrutinized to determine whether or not it should be replaced. The Bridgeport Brass Pipe was found to be as good as new. The lengths that had been removed were reinstalled and the pipe built back into the remodeled structure.

After more than 20 years of service Bridgeport Brass Pipe was as good as the main structural elements of the building; it will last as long or longer.

This is a story worth remembering when building plans are under consideration.

BRIDGEPORT BRASS COMPANY, Bridgeport, Conn.

Bridgeport Plumrite *The Improved* Brass Pipe

If YOU are at all interested in the subject of water service piping, we shall be glad to send you a copy of our book, "Brass Pipe and Piping," when it is off the press. It deals with corrosion, its theory and prevention; discusses the advantages and disadvantages of the various pipe metals; and gives instructions for handling brass pipe, laying out installations and figuring costs. Copies are gratis on request—use this coupon.

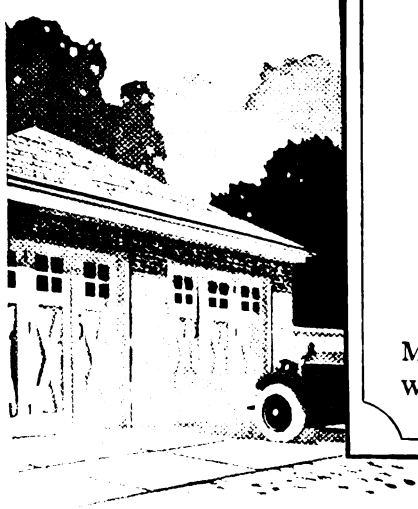
Every architect will find this book of considerable value

NOT simply because of its helpful suggestions regarding the designing of private garage doors, but because of the time it saves in specifying the hardware to be used in hanging the doors.

After you have determined the kind of door necessary for the particular garage you are designing, you merely turn to the page in the McKinney Garage Door Hardware Book devoted to that type of door. On that page you find a picture of the set of hardware necessary and the number of the set which can be used in your specifications. There are also simple working drawings to show just how the door should be hung for perfect operation.



Then the specifying of "McKinney Garage Door Set, Number 9025," or whatever the number may be, is all you need do to insure that you will include every article of hardware needed for that door and that the hardware will be of the highest grade—McKinney-made throughout.

The builder will appreciate the quality of this hardware and also the fact that it comes completely packed in a single box. There is absolutely no danger of it becoming mixed up with other hardware.

We will be glad to send you a copy of this book. And when it comes you'll be mighty glad you sent for it.

Where 57 Parts Are Reduced to 7

THERE are 57 separate parts in an ordinary frame. Andersen Standard Window Frames reduce these 57 parts to seven units.

Using only a hammer, these seven units can be assembled into a frame, complete with pockets and pulleys in place, in 10 minutes or less.

Any dealer in Andersen Window Frames can immediately supply 121 different sizes from a stock of only 11 standard frames, simply by interchanging heights and widths. This prompt delivery is a decided advantage over the method of ordering made-to-order frames weeks in advance with no assurance of delivery.

Because of its ability to endure for centuries without warping, rotting, shrinking or cracking, White Pine is used in all exposed portions of Andersen Frames.

Accuracy of construction and the use of White Pine make windows slide easily in Andersen Standard White Pine Frames.

Dealers prefer to handle Andersen Frames because they require less space, a smaller stock and a smaller investment. Builders prefer them because they save time and labor. You too, will prefer them once you have learned their advantages.

BUILDING AGE
AND
THE BUILDERS' JOURNAL

NEW YORK, AUGUST, 1922

Adaptation *of* Seventeenth Century New England Colonial Style *to* Modern Home

DWIGHT JAMES BAUM, Architect

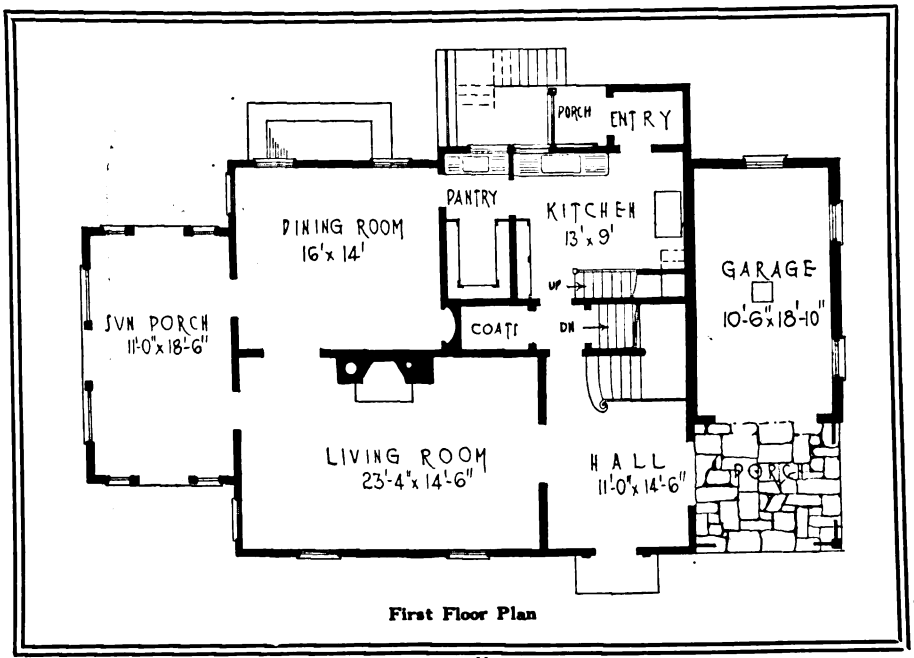
HOUSE building in America was slow to attain definite architectural style, but towards the end of the seventeenth century considerable progress was made in developing a style and construction that met with conditions the earlier settlers had to face.

As New England was largely settled by people who came from England it is only natural that the carpenters, etc., of that time brought with them the sturdy building ideas of old England. The rigors of the New England winters made adequate heat essential, therefore important features were the huge fireplaces and chimneys.

Quite often the second floor was framed to overhang the first, and to make this an ornamental feature the overhangs were generally embellished by carved "drops."

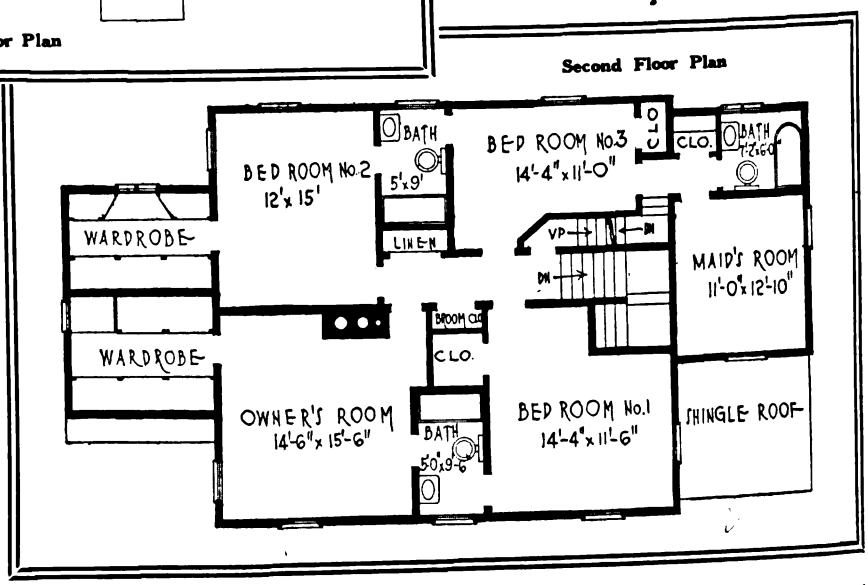
A house constructed in this style located at Salem, Mass., has been made famous by Nathaniel Hawthorne's book, "The House of the Seven Gables."

Quite a few interesting examples of the old New England builder's handicraft are still in existence in some parts of Massachusetts and Connecticut, even though they were built over 200 years ago.



In the design shown on our cover and pictured above, and of which floor plans are given on the next page, the architect has faithfully carried out the old New England traditions and adapted this style in the building of a modern home. This house was built at Fieldston, N. Y., for Miss Ellen Murphy.

Several features are included in this modern design that would certainly surprise our old New England ancestors could they visit us today.



Digitized by Google

IN a recent interview Mr. Dwight James Baum, prominent New York architect, disclosed many interesting developments in electrical installations.

Particular attention was paid to the wiring of the Murphy house, shown here, of which Mr. Baum was the architect. Outlets have been provided in all rooms for attaching the modern electrical appliances that mean so much for comfort.

First Floor Plan

Second Floor Plan

Mr. Baum was also the architect of the "Ideal" home illustrated in our April issue, which was built at the recent "Own Your Home" exhibition in New York City; and in conversation with Miss Alice Carroll, of the Society of Electrical Development, stated:

"I recommend separate circuits for light and power whenever possible and I insist that all wiring be laid underground. The most imposing residence is more or less disfigured if lines of wires extend to and from the roof."

"Have there been any marked changes in building methods within the past few years?" Mr. Baum was asked.

"There is a decided leaning toward the 'homey' type house and a distinct aversion to the mansion or 'show place.'"

"How has this affected wiring installations?"

"Centre ceiling illumination, except in the dining room and the hall, is falling into disuse. The popular 'homey' type of house calls for lower ceilings and lower ceilings are more effectively lighted from side wall brackets."

"How do you account for this tendency?"

"It has taken a great deal of educational effort on the part of the architect to bring it about," explained Mr. Baum. "People have lived in apartments so long that when they go to build a house they think they must have 10′ ceilings and at the same time they want a cozy, homey atmosphere. An 8′ 6″ or even a 7′ 6″ ceiling does more to create this homey atmosphere than any other factor of design."

"What lighting installation do you recommend?"

"More and more baseboard outlets—portable lamps everywhere—now for radio. Every house we build is supplied with baseboard outlets for laundry and other labor saving equipment."

"What percentage of building cost do you usually figure for wiring and lighting?"

"At least five percent," he replied, "but the present demand for radio equipment as well as refrigeration and special burglar alarm systems increases this percentage materially."

"How about sconce over the mantlepiece?"

"I do not favor them. I prefer to wire the mantlepiece so that candlesticks may be used—they are more decorative."

"How about centre floor outlets?"

"Always in dining room and living room. Two in the dining room—one for call bell and one to permit the use of electric appliances. There must be a centre floor outlet in the living room to permit the use of table lamps."

"Don't people object to having holes cut in rugs?"

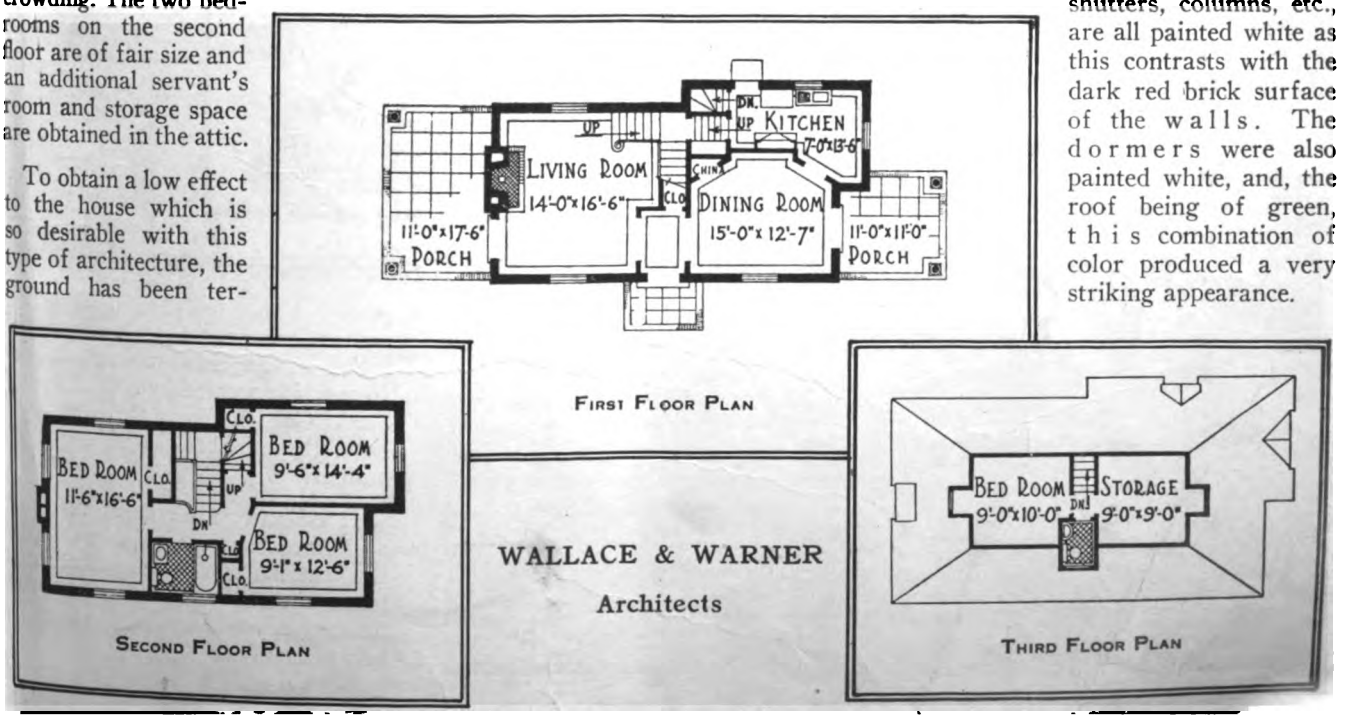
"Not if it is done properly—we never have any trouble about it."

"Has there been any marked change in the kind of equipment installed?"

"Yes, there has," he replied, "the transformer is always used now instead of batteries as this eliminates the nuisance and inconvenience of recharging. Electrical refrigeration is installed in nearly all modern homes and we are equipping all our houses table lamps, floor lamps, torchiers and wall brackets."

Digitized by Google

Brick Home *of* Attractive Design

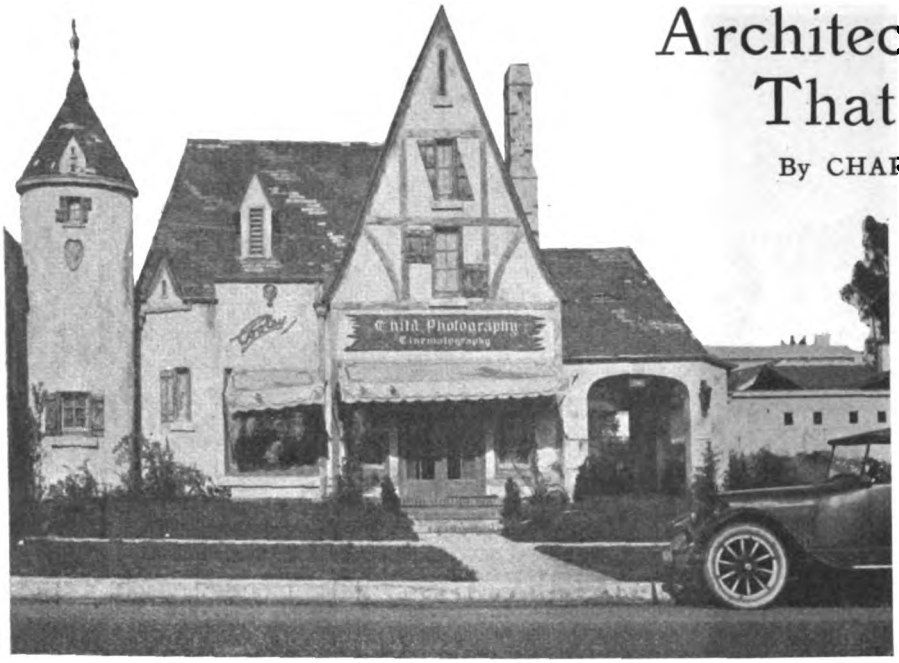


PLEASING in appearance is the small house pictured above. The design has been modeled after some of the older brick Colonial houses of **Pennsylvania.**

The rooms have been arranged so that everything is compact, and while there is no waste space, there is no crowding. The two bedrooms on the second floor are of fair size and an additional servant's room and storage space are obtained in the attic.

To obtain a low effect to the house which is so desirable with this type of architecture, the ground has been terraced along the front and beyond the side porches, but it does not extend to the rear allowing plenty of light to enter the cellar.

This interesting house is built at Narbeth, Pa., and the architects let out the work to different individual contractors; no general contractor was employed on the job, as the architects attended to the supervision and co-ordinated the work of the different contractors so that no difficulty was experienced in the construction of this house.



Brick lends itself charmingly to a house of this design. The trim, shutters, columns, etc., are all painted white as this contrasts with the dark red brick surface of the walls. The dormers were also painted white, and, the roof being of green, this combination of color produced a very striking appearance.

Architectural Designs That Advertise

By CHARLES ALMA BYERS

MAKING one's place of business, through its style of architecture, serve as an advertisement in itself constitutes an idea that is far from new. However that may be, it at least seems to be, at present, coming in for quite unprecedented development. Architecture, in shops, business offices, "studios," and so forth, that will attract and hold the attention of passersby, and thereby help to advertise such places, is, in fact—especially for those semi-business districts lying within or close to residential sections—becoming very popular, indeed.

The accompanying illustrations show three particularly interesting examples of such architecture, all from Los Angeles, California.

The first building here illustrated is the studio of a portrait photographer. The interior is partitioned into reception room, business office, exhibit room, various work rooms, and so forth, and, like the exterior, is also finished in rather striking style, with a fine, large fireplace in the reception room. It was designed by Charles D. Wagner, architect, of Los Angeles.

The second illustration is of a building that is likewise somewhat representative of an old home of Northern Europe. Its outside walls are of cement-stucco over frame construction, and are tinted, with mottling effect, in brown, buff and gray, while the wood trimming is done in dark brown. The roof is of wood shingles so laid as to produce a thatched effect, and, to carry this suggestion to greater effectiveness, is painted a weathered straw color.

It should also be noticed that the ground in front is paved with cobblestones. Only the division to the right, in this instance, is used for business purposes, it being the office and studio of E. Petersen, interior decorator. The other portion, planned with much greater depth, is devoted to living rooms.

The lower illustration shows an attractive little flower shop, with an architect's studio adjoining it to the right and rear. The building was expressly designed and built for the present occupants. It is of a modification of English architecture. The former is occupied by A. E. Hanson's "Kew Gardens," and the latter by H. F. Withey, the building's designer and builder.

It is easily understood that shops and offices of the kind shown in these illustrations will be sure of attracting unusual attention, and that, of course, means advertising—and advertising brings business.

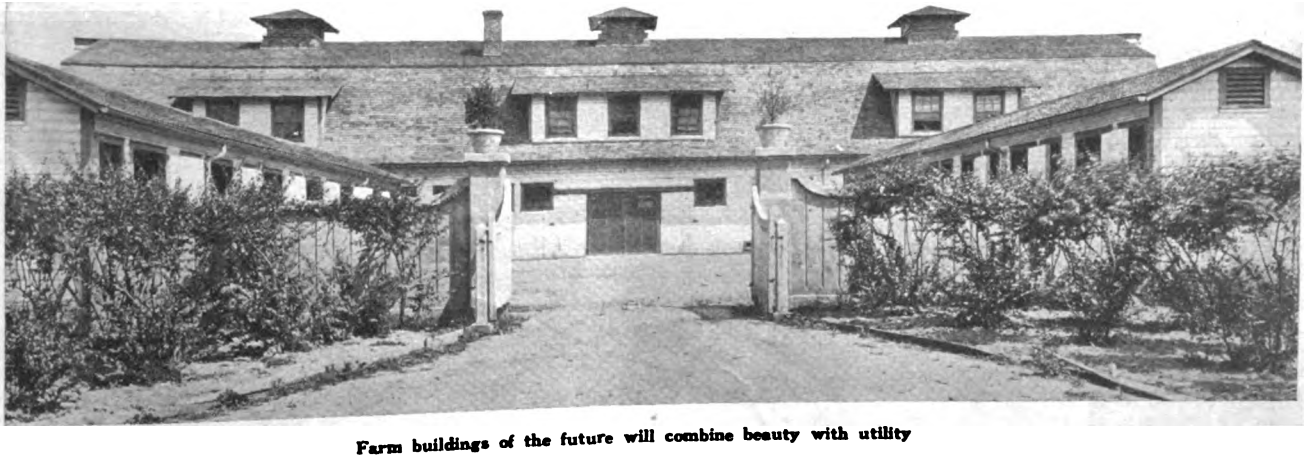
Type of well-kept, but old-fashioned, farm it will pay to modernize

ENCOURAGING FARM BUILDING



Profitable Field of Work Developing for Builders in the East by Formation of a Joint Stock Land Bank in New York Liberal Financial Aid for Improvements

FINANCING a desirable building improvement on farm property has been rather a hard thing to do at reasonable cost. In our Eastern States which built up earliest there is a lack of modern farm buildings and equipment. In the West, farm buildings and their equipment are more modern.

There are many farms in the East that are in poor shape, the ground is poor for lack of fertilizer, and the building and equipment are old, but their proximity to the large buying market makes their location ideal for carrying on a profitable farm business. The money to finance necessary new construction, etc., has been hard to obtain at a profitable rate, so the farmer was handicapped with old equipment and it was hard to compete with those having modern farm equipment.

Many young men have been left large farms by their fathers who worked it profitably for more than a generation. The son inherits it, but is handicapped by being unable to meet modern competition as he must depend on hand labor and his old equipment. This situation in the East has resulted in many abandoned farms as the owners have found it unprofitable to continue in business. Now this condition of affairs can be remedied to a large extent, within the next few years, as through the agency of a farm loan bank, the money for making the necessary improvements can be had on very favorable terms (33 years to repay loan) so that it will pay to modernize these old farms.

Some few years ago, Congress passed the Federal Farm Loan Act, but like all good things it takes a seemingly long while to get in operation. A bank under this act has just been formed in New York and it is

Farm buildings of the future will combine beauty with utility

Digitized by Google

now ready to do business. This is known as the First Joint Stock Land Bank of New York with offices at No. 61 Broadway, New York. By their charter, they are limited to make loans in the States of New York and Pennsylvania only, but it will not be long before a number of these banks will be established to cover all the Eastern States.

Study Farm Buildings

BUILDERS will do well to post themselves on the construction and equipment of modern farm buildings, as many a profitable contract may be obtained. Farm improvements during the next decade will mean Big Business for alert, progressive builders, especially in the East.

The building contractor will get in touch with a wide-awake farmer and suggest to him for instance, that a good large dairy barn would perhaps be a very profitable business undertaking for Mr. Farmer. Mr. Builder will know how the money can be obtained by Mr. Farmer, to make the desired improvement and make it pay for itself out of the profits earned by reason of his new equipment and increased facilities.

As we have repeatedly advised our readers, we think that they should be able to advise their customers how to finance some worthwhile improvement thereby obtaining a desirable contract for themselves. This is the right kind of salesmanship and the wide-awake contractor who does this is the one who will get the business.

A Joint Stock Land Bank operates under a charter granted by the United States Treasury Department, through the Federal Farm Loan Board, which directly supervises the operations.

The Federal Farm Loan Act was passed to provide capital for agricultural development, to create standard forms of investments based upon farm mortgages, to equalize rates of interest on farm loans, to furnish a market for United States bonds, to create government depositories and financial agents for the United States. These banks are by law, allowed to make loans on agricultural land only in the state in which they are located and one adjoining state.

Loans are made only where money will be used for agricultural purposes. This means not only for the improvement of the soil itself, but also for buying of cattle, for purchase of equipment, and for erection of new farm buildings or dwellings, to provide working capital for the operation of the farm, as well as to pay existing debts. To obtain a loan is a simple matter. An application blank is to be filled out by the party desiring to make a loan. This is to be properly filled out with a description and location of the property and for what purpose the money secured from the loan is intended. A statement of the valuation of the property is to be made and then, within a few days, the property will be appraised by a government appraiser, and the report is made on the title by a government title inspector. If everything is found satisfactory, the loan can be closed at once.

Cost of Loan

THE loan is made at the rate of 6% annually, and by the addition of a small annual payment of $10 for each $1,000 borrowed, in addition to the interest, the whole loan is paid for in thirty-three years. In other words, a building loan may be secured which will pay for itself or "amortize" in thirty-three years by a payment of 1% annually on the principal. As an illustration, take a loan for $10,000. This would require an annual payment of $700, payable $350 semi-anually. $600 of this amount goes annually for interest and $100 annually goes towards wiping out the loan.

Unless one has calculated it out, it does not seem possible that 1% annually will be able to pay the full debt in thirty-three years, but it is shown that $50 deposited semi-annually at 6% compound interest, will amount to $10,000 in a little less than thirty-three years. In actual cash, the depositor would have only paid in $3,300, but the compound interest in that time will amount to $6,700.

This is the plan on which these loans are made and paid. It is no charitable scheme of the government, but just simply good, practical, hard common sense, based on sound financial experience. The borrower does not get something for nothing. He pays at the rate of $70 per year for each $1,000 borrowed from which is deducted the regular 6% interest and the 1% balance is applied on his debt.

Builders can impress their farmer customers with the advantage of this system to make some needed improvements. Unlike an ordinary mortgage that falls due in a certain time in one lump sum, this farm act of the government enables a mortgage to be paid off in small instalments over what practically amounts to a generation. Should the farmer by reason of his increased income, feel like paying off the loan before its maturity, he has that privilege after five years.

After the loans are made, the Land Bank deposits the mortgages on which they have loaned with the government registrar who is the direct representative of the United States Treasury. He in turn forwards them to the Farm Loan Board at Washington, D. C., for their approval. When they have approved of this mortgage, Joint Stock Land Bank bonds are issued to the bank and they sell these to obtain money to make other loans. In this way, by government aid, the money is kept constantly in circulation and adequate sums can be realized for the furtherance of any worthy farm project.

Cost of Appraisal

THE borrower furnishes, with his application, an abstract of title to the farm and pays the expense of appraising and examination of his title by the Federal Appraiser. This appraisal and title examination cost will not exceed the actual expense of making same. The cost will vary from $15 to $25. Loans are made for an amount totaling 50% of the land value plus 20% of the value of the buildings.

As an illustration of the above, take a farm of 100 acres that is valued at $200 per acre, with buildings worth $8,000. The farmer in consultation with the progressive builder desires to erect a modern dairy barn as he knows he will be able to make more money this way, but he lacks the money to go ahead. The new barn will cost $6,500, therefore, the owner can secure the following loan on his property:

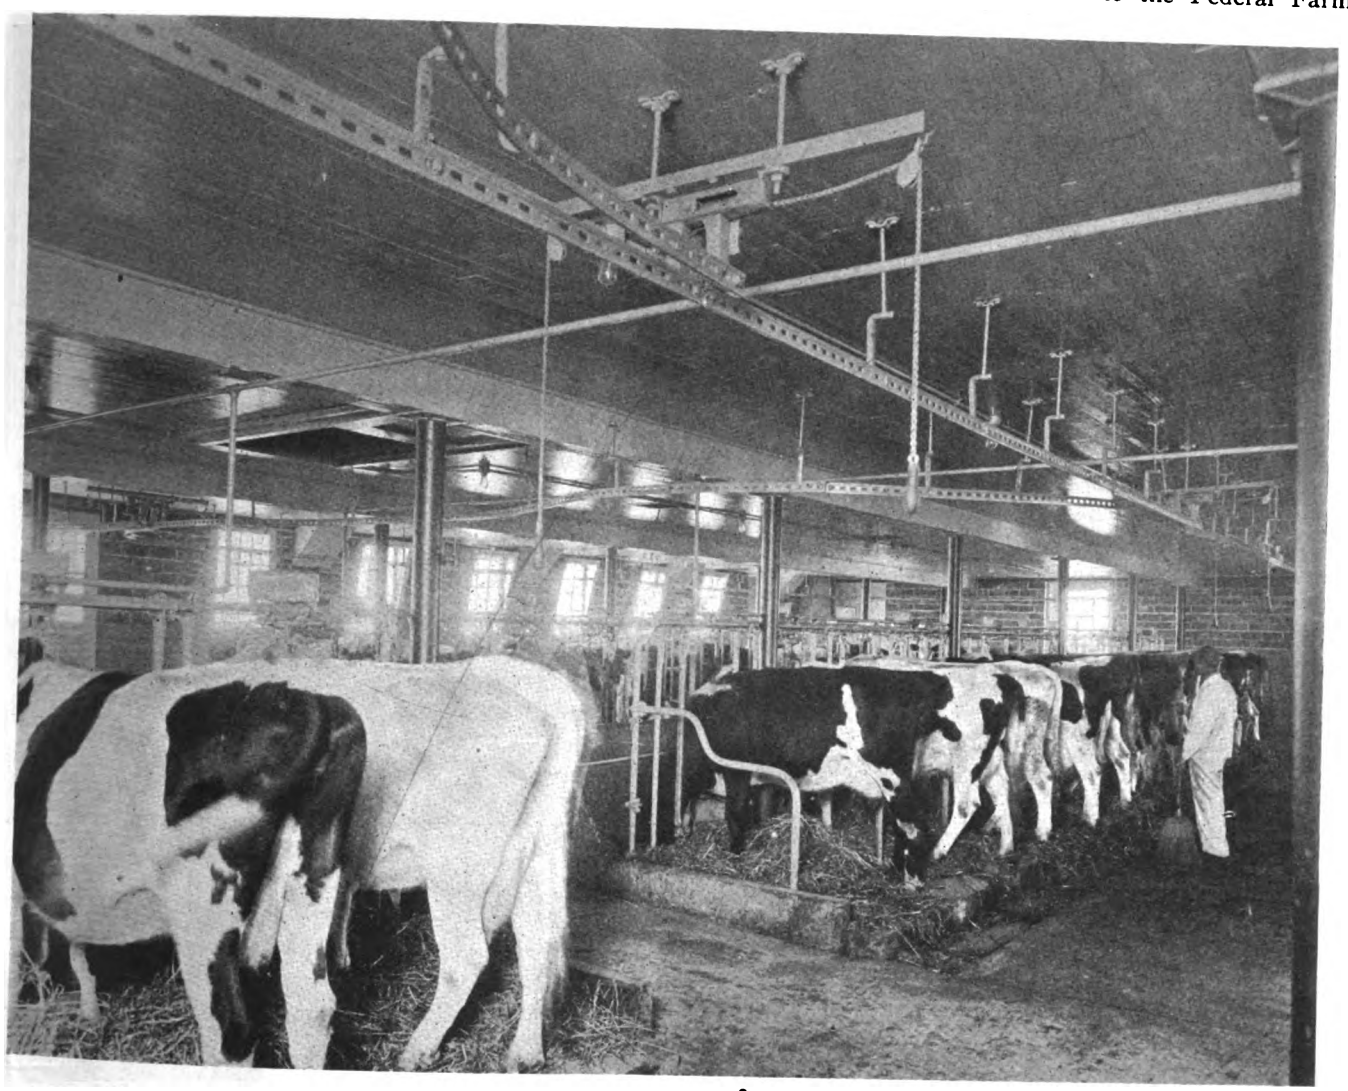
50% of $10,000, the value of the land, equals $5,000.

20% on the existing buildings valued at $8,000 equals $1,600.

20% of the new barn valuation of $6,500 equals $1,300.

Digitized by Google

This totals $7,900, which can be secured on a loan.

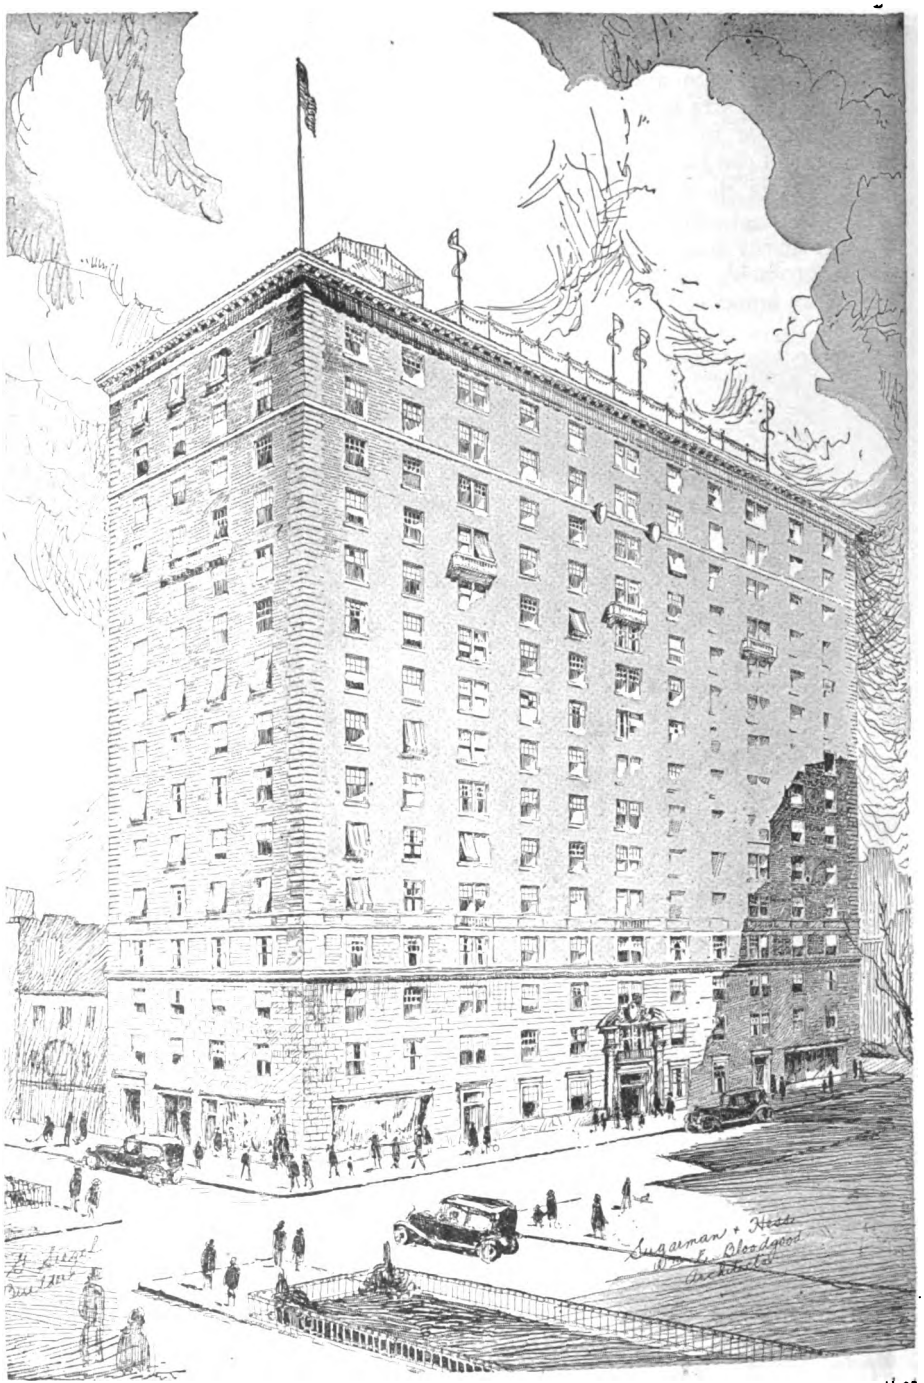


If the maximum amount of loan is desired, the extra money so secured above the cost of the contemplated improvement can be used for the purchase of extra stock, etc.

It is not only in the construction of large barns that the builder will find a profitable line of work, but there is an immense amount of buildings such as tool sheds, ice houses, garages, milk house, chicken house, hog house, granery, corn cribs, etc., that are required on the up-to-date farm.

Builders should inform themselves regarding the construction of all these different sorts of buildings. They should have a collection of reliable plans of farm buildings, as suggestions for the farmer who wants to improve his place. It is not only in the erection of the farm buildings themselves, that the contractor can make a profit, as there is the equipment, water system, electric light plant, anything that will lighten the work of the farmer or his household.

Today, farming is again becoming a very popular form of employment. The day of the awful lonesomeness and weariness has passed. We are now living in the age of the telephone, wireless, moving pictures, aeroplane, good roads, automobiles, etc. Farms are no longer isolated; modern inventions have cut down the time it takes to go from one place to another. Years ago it was a hardship to hitch up a horse and buggy for a five-mile ride; today the farmer thinks nothing of going twenty-five miles away to visit some folks. Farm buildings of the future will be good to look at, the farmer will take pride in his possessions and his wife and family will have a home with all modern conveniences. Attention will be given to landscaping; entrance gates, fences, etc., will be objects of beauty instead of eyesores. The farmer of the future is going to dwell in a veritable park surrounded by everything that will give him comfort and pleasure.



Any builder interested in this matter can write to the Federal Farm Loan Bureau, Treasury Dept., Washington, D. C., for circulars on the subject. They will then be equipped with information that will enable them to go to their farmer friends and talk on the basis of dollars and cents. The building boom that is now existing for the construction of residences will in time recede to normal and it is then that the builder who knows where to go for business is going to get it. The farms hold out the horn of plenty.

The kind of construction and equipment needed in our modern dairy barns

Hotel *of* Modern Design

EVERY city has the need of several hotels for the accommodation of its transient population. In a great many instances, hotel life appeals to permanent residents desiring to be free from all care and worry of housekeeping, still they desire absolute comfort. A hotel can give it to them by having living room with one or more bedrooms in a suite.

The design shown here is that of the Hotel Prisament that is now nearing completion at Broadway, Amsterdam Avenue and 74th Street, New York. The general contractors on the job are J. G. Siegel, Inc.

In appearance, the building will be worthy of the conspicuous position it occupies. The facades of the building are designed with 3½ stories of limestone. Above this, a tapestry red brick with terra cotta belt course and balconies.

The main entrance of the hotel is situated on the 74th Street side; this carries a suggestion of the Italian style of architecture in its detail.

The street floor will be given over to main restaurant, lobby, office, ladies' rest room, physician's office, etc..

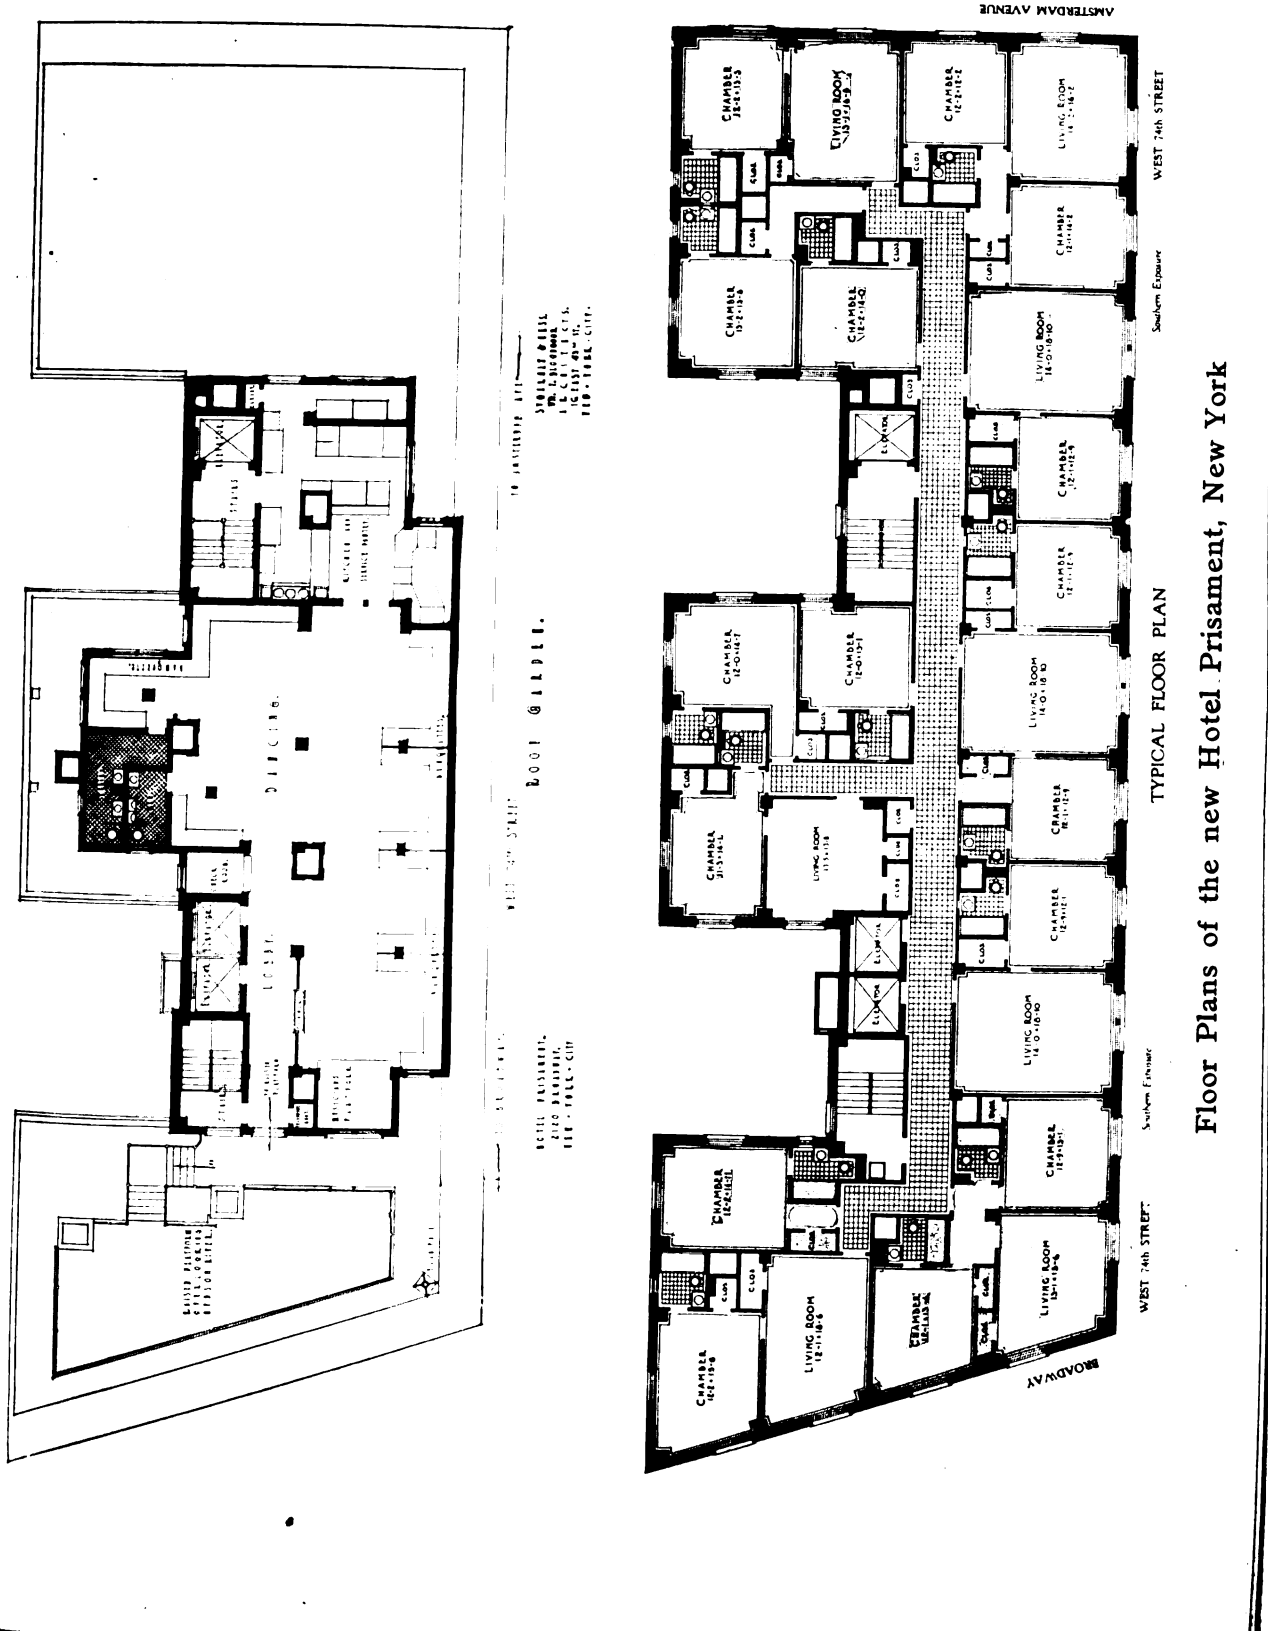
The main lobby is being finished with wood paneling after the style of the old English Manor House. The restaurant will have a 350-seating capacity.

Above this main floor there are fourteen floors divided into guest rooms. The plan on the opposite page shows how this division has been carried out.

In the planning, particular care has been taken so that a number of rooms can be joined together for the use of permanent guests.

There will be approximately 340 rooms in the hotel. Each floor will contain fifteen baths. Circulating ice water will be supplied each room.

SUGARMAN & HESS,
Architects



WM. E. BLOODGOOD,
Associate Architect

Every appliance and feature that could be thought of to add to the comfort and safety of the guests has been included in this modern hostelery.

A popular feature will be a glass enclosed roof garden with dance floor and sun parlor located on the roof. This can be used both summer and winter.

There will be a restaurant surrounding the dance floor. The garden will be more than 160 feet above the street level and a wonderful panorama view can be had by the guests as the beautiful Hudson River is within a short distance.

Substantial House with Garage Attached

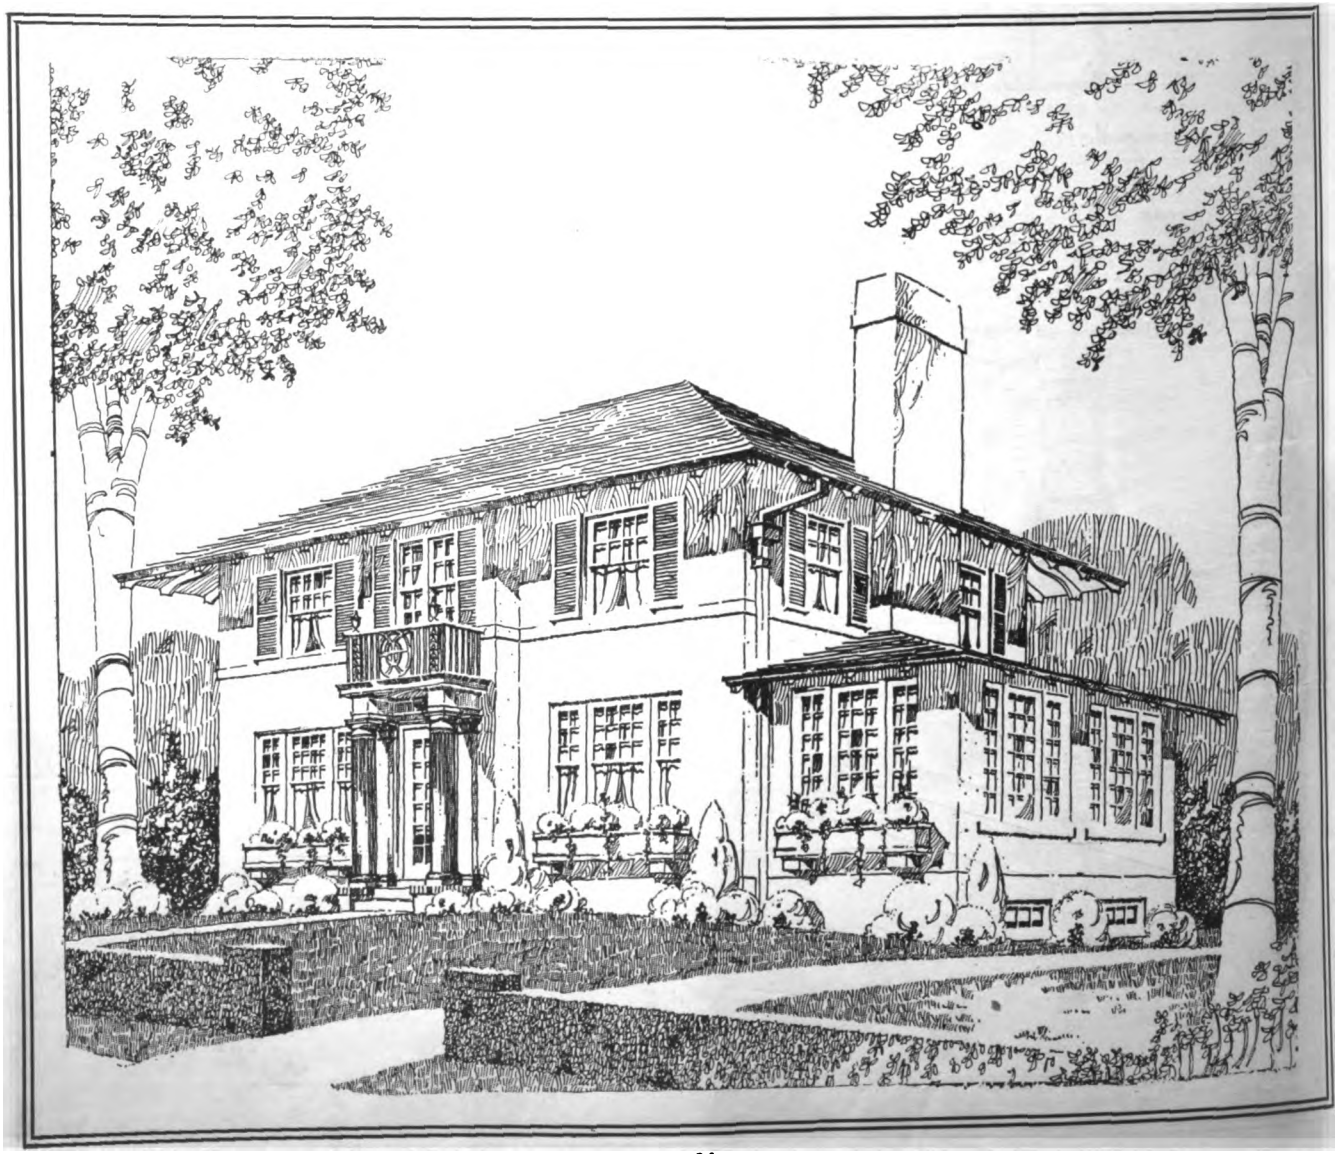
Hollow Tile Design Specially Prepared for Readers of Building Age and The Builders' Journal

By R. C. HUNTER & BRO., Architects

FOR those who like a plain, substantial house, something with a suggestion of dignity and permanence, here is one that will appeal.

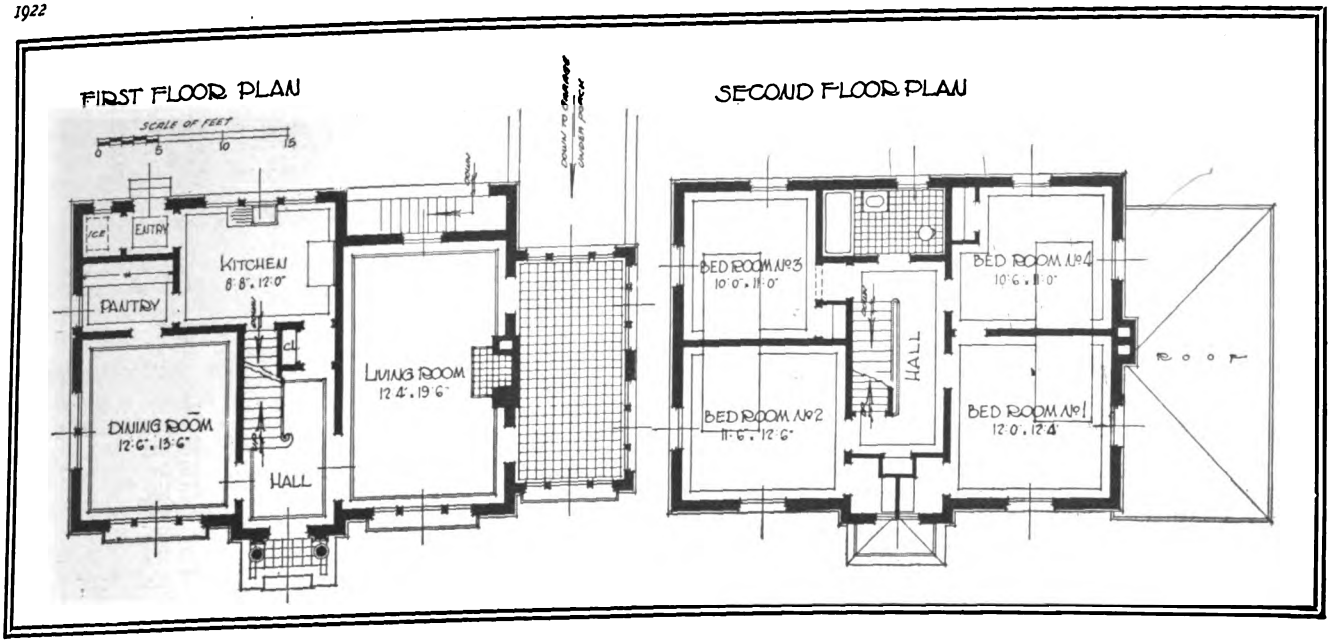
The house is designed to be built of hollow tile with stucco finish. The hipped roof with broad overhanging eaves gives good appearence.

The group windows with their flower boxes and the well designed entrance lend interest to the exterior and offers a pleasing contrast with the plain stucco walls.



A feature of this house is the garage which is placed under the living porch. A concrete incline leads down from the grade in the rear to the garage floor which is at the same level as the cellar floor. A fireproof door connects the garage with the cellar, thus making the car accessible without going out of doors.

The garage has complete water, lighting and sewer service, all connected to the house supplies at a very slight cost.



The reinforced concrete floor of the living porch forms a fireproof roof for the garage. In the living porch a quarry tile floor is laid over the concrete. The living porch has been made another room by completely enclosing the openings with sash and screens, and a room that proves to be the most popular one.

The living room, dining room, kitchen and pantry are all well arranged. On the second floor are four corner bed rooms, bath room and linen closet.

A stairway leads to the attic where good storage space is provided. The laundry and other utility rooms are in the cellar. Estimated cost about $9,500.

Quantity Survey of the Substantial House

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protections, scaffolds and general equipment and supplies, have not been included. Items marked "Unit" are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	308	cu. yds.
Excavation for footings	27	cu. yds.
Excavation for areas and runway	48	cu. yds.
Backfilling around walls, etc.	44	cu. yds.

Masonry

CONCRETE WORK

Concrete for Cellar Walls	990	cu. ft.
Concrete for footings	144	cu. ft.
Concrete for area walls	50	cu. ft.
Cellar floor and runway (3 in. concrete and 1 in. cement finish)	1130	sq. ft.
Area Bottoms (brick and sand)	32	sq. ft.
Outside cellar steps (concrete cement faced)	42	sq. ft.
Ent. Porch floor (12 in. cinders, 3 in. conc. and brick finish)	40	sq. ft.
Rear Steps (con. cement faced)	24	sq. ft.
Reinf. Conc. runway walls	201	cu. ft.
Reinf. Conc. Living Porch Floor.. (4 in. T. C. tile, 2 in. conc. top, 4 in. joist)	180	sq. ft.
Reinf. Conc. lintels	102	cu. ft.
Concrete brackets for Flower Boxes	6	
Concrete forms	3300	sq. ft.
Pointing Cellar window sills	22	lin. ft.

Tile Work

Tile work for bath room Floor (1 in. hex. white)	35	sq. ft.
Wainscot 3 in. x 6 in. white wall tile	92	sq. ft.
6 in. base	16	lin. ft.
Cap	26	lin. ft.
Quarry tile floor for living porch	140	sq. ft.
4 in. base	45	lin. ft.

Hollow Tile

8 in. x 12 in. x 12 in. block (or 1550 blocks)	1550	sq. ft.
10 in. x 12 in. x 12 in block	130	blocks.
4 in. x 12 in. x 12 in. block for corners	80	blocks.
8 in. jamb blocks	220	
1 in. leveling slab	80	

Brick Work

Common brickwork for chimney (or 2 M.)	100	cu. ft.
Face brick for fireplace hearth and jambs (or 112 brick)	16	sq. ft.
Face brick for fireplace	20	sq. ft.
8 in. x 12 in. T. C. flue lining	56	lin. ft.

Mason's Iron Work

Fireplace damper (2 ft., 8 in. opg., with throat, etc.)	1	Unit.
C. I. cleanout door for boiler flue, (8 in. x 8 in.)	1	Unit.
Thimble for boiler flue (10 in. dia.)	1	Unit.
Anchor bolts for wall plate, (3/4 in. dia. x 24 in. long with 4 in. washer and nut)	38	
Wrought iron pipe railing, 2 ft. 6 in. high (1 rail 1 1/2 in. dia.)	51	lin. ft.
Wrought iron pipe railing, 2 ft. 6 in. high (2 rails, 1 1/2 in. dia. on steps)	7	lin. ft.

Plastering

Three coat Patent plaster on metal lath, gross (Net 407 sq. yds.)	490	sq. yds.
Three coat patent plaster on hollow tile, gross (Net 168 sq. yds.)	245	sq. yds.
Dampproofing under stucco, net	2500	sq. ft.
Stucco on hollow tile, etc, gross (Net 260 sq. yds.)	325	sq. yds.
Stucco on metal lath	7	sq. yds.
G. I. corner beads	80	lin. ft.

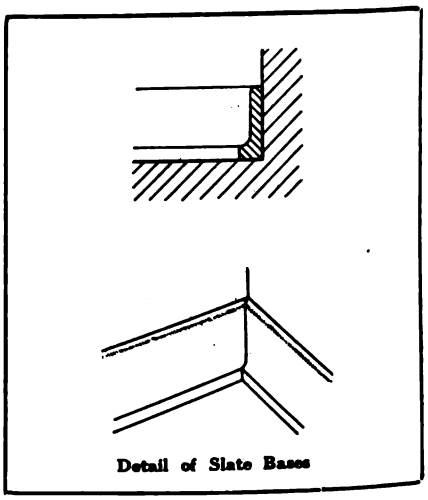
A Missouri Modern School

By P. H. PATRICK

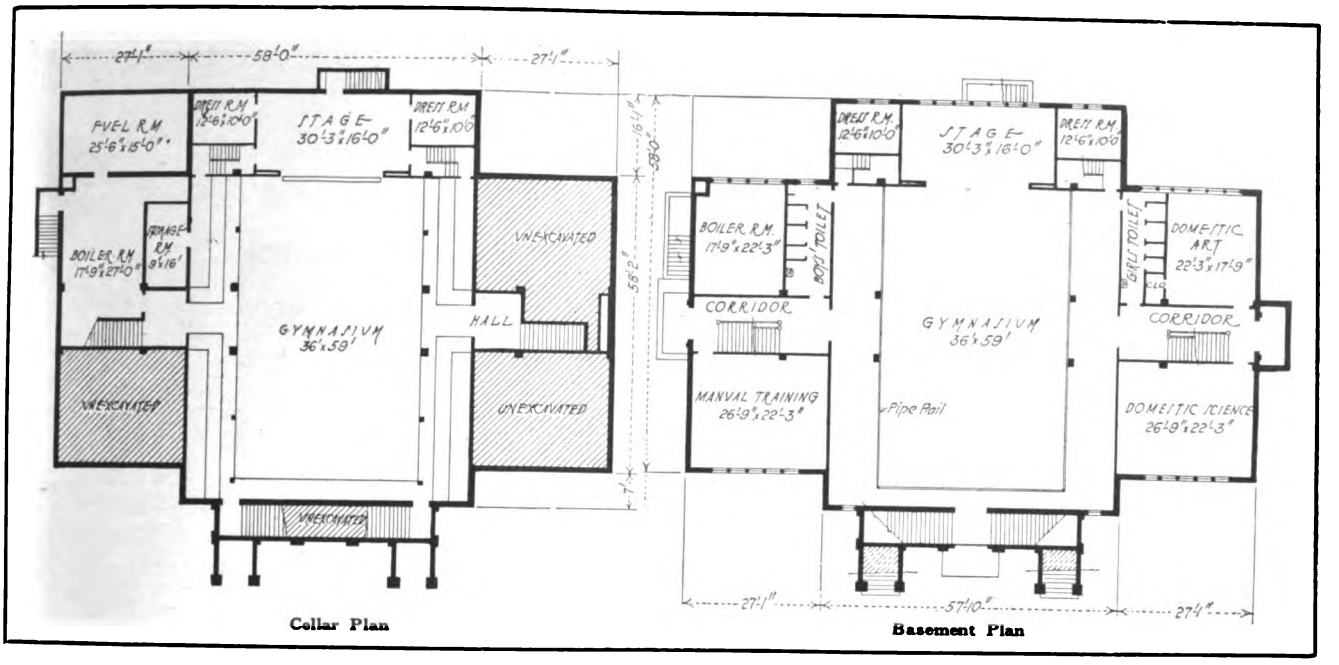
THE modern school building pictured here was completed in June, 1921. It was built at Brookfield, Mo., from plans prepared by W. E. Hulse & Co., architects, Sioux City, Iowa, and it fills the needs of 700 school children most admirably. Perhaps the imposing entrance attracts more notice than any other feature of the exterior, the whole effect, carried out in brick and limestone, is simple, pleasing, and massive.

Detail of Slate Plinth



Two short flights of stairs on the exterior lead to the first floor while the low and central door leads direct to the ground floor and to the combined auditorium and gymnasium which is located in the basement. The idea of combining auditorium and basement as used here, is both economical and practical. The polished floor for gym work, furnishes seating room for concerts, lectures, etc.

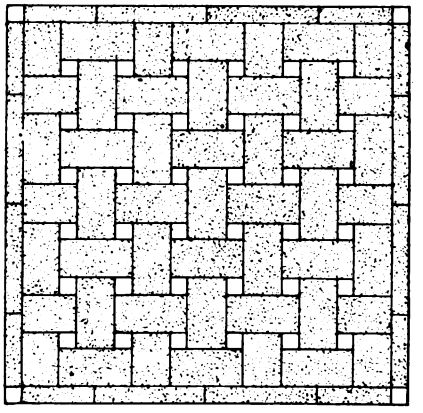
A storage room is provided for extra seats and the storing of gym equipment when it is not in use. A good size stage, with a dressing room at either end and racks above for storing scenery is also included.



A boiler room and fuel room also finds space in the basement. This boiler room has its own separate outside entrance. Exits are provided on all four sides so that the auditorium is safe in this respect. On the ground floor besides the upper part of the auditorium and gymnasium is placed the manual training room, also rooms for domestic science, domestic art, with toilets accessible from the corridors and opposite sides of the floor.

The first floor contains six grade rooms and a teachers' room and an office. The corridors are wide and glass panelled doors open into them.

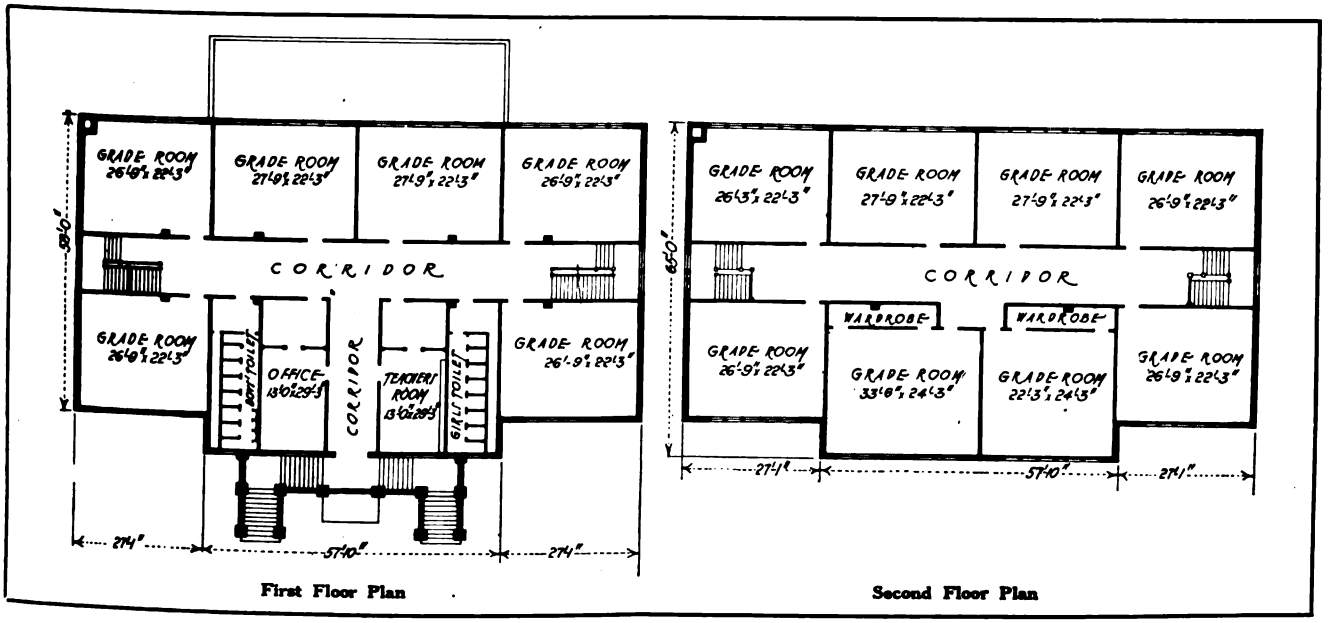
Each class room is provided with blackboards and wardrobes. All outer doors are equipped with anti-panic locks, the bars of which automatically unlock when pushed upon. The second floor plan shows eight grade rooms. These are fitted up similarly to the class rooms on the floor below.



Detail of Slate Bases

Digitized by Google

In the selection of materials for the interior finish of school buildings, there are certain portions, particularly the floors and wells of entrances and corridors where the choice is limited to a material which will resist the hard usage usual to these locations. The floor should be of a material which can be easily washed and kept clean and sanitary. Floors of slate or of slate with a tile insert as shown in our illustration form an effective and practical floor which is resistive to wear and is sanitary.



For the side walls of corridors, etc., the use of slate wainscoting is a protection to the walls in that it affords a strong rigid moisture-proof surface

Design for Slate Floor. Tile Inserts Lend Color

to take care of the natural rubbing against the walls by pupils of all ages and various heights.

We show an illustration of how slate is used for base when there is a slate wainscot, but the slate base can be used at the bottom of side walls in connection with floors and walls of any material. In this position, slate is particularly of value in that the floors may be washed or cleaned without damage to the side walls above the slate base. Where slate or other similar material is used for the bases of side walls, the use of slate plinths out of the trims of door openings, adds protection to the wood trim of these openings.

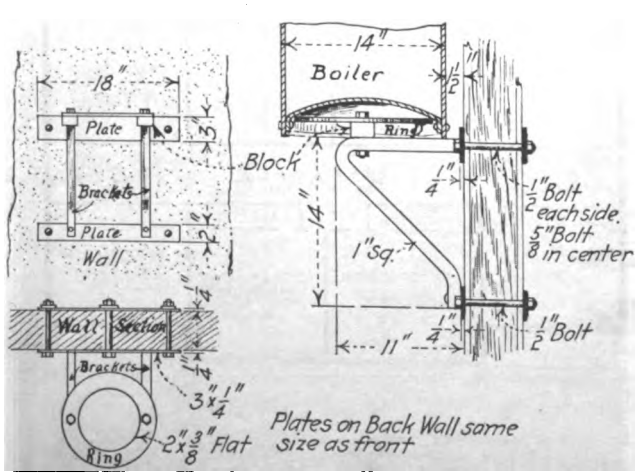
Boiler and Gas Range Without Legs

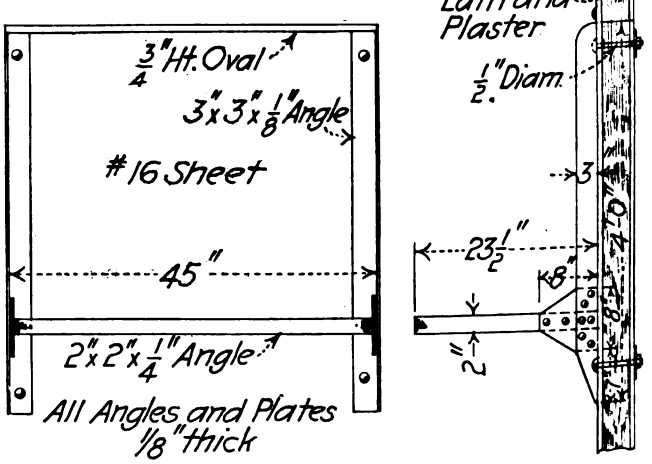
Novel Arrangement for Kitchen Which Leaves Entire Floor Clear

BUILDERS on the lookout for new methods of installing equipment of buildings will be interested in the accompanying picture which shows a gas range and hot water boiler supported by brackets from the wall, the usual legs have been entirely eliminated and a clear floor space underneath is the result, cleaning the floor is thus far easier done than when one has to work around the obstructing legs.



In this case, before the plastering was applied, small angle irons were fastened to studs and smaller angle iron brackets supported the stove and boiler, this gave it a solid support.

Here is a novel method of installing kitchen fixtures that will be welcomed by many housewives, and the builder suggesting this arrangement will gain the reputation of doing an up-to-date job.



The drawings given below clearly show all the details of construction for the making of these supporting brackets. It is essential, of course, that a good, solid support be had against the wall, as there is considerable weight to be carried both in the boiler as well as the gas range.

As a protection to the wall the space in back of the stove is covered with a piece of No. 16 gauge galvanized sheet iron, which has been painted black to correspond with the stove. The iron supports are simply made from light structural steel.

This interesting kitchen arrangement was devised and installed by Mr. William H. Force, Jr., in his own residence at Madison, N. J.

Building Homes That Save Coal

How Heat Is Lost from Poorly Built Houses

By J. D. HOFFMAN

Professor of Practical Mechanics, Purdue University

THE ordinary type of small house can be made just as resistive to the loss of heat as can a large office building, and at a very small additional cost. In the average frame house, it is usually the practice to have only one-half inch of lath and plaster separating the room space from the space between the studs. Lath and plaster is a very poor insulator, as it is porous, and the heat from the room easily goes through this material and enters the space between the studs, only to be carried to the attic by convection, or to be passed through the sheathing to the outside air. The effect of this air movement through the walls and partitions can be easily observed on any old plaster wall and ceiling. The dust carried by the air currents will have penetrated the plaster between the lath, and left a series of dark streaks upon the plaster and the wall paper.

Many buildings are constructed with this hollow space within the studs opening up directly into the basement space. Such construction

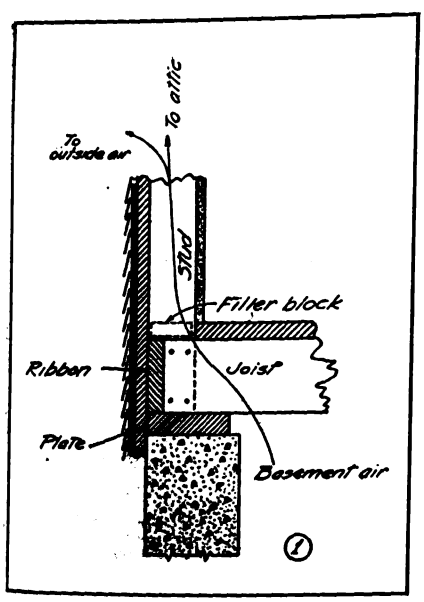

Fig. 1, showing air space between the studs and how the air is carried by convection through from basement to attic, carrying the heat to the outside air. Also shows method used for stopping up space between studs with block at floor level, may be used in both old and new jobs.

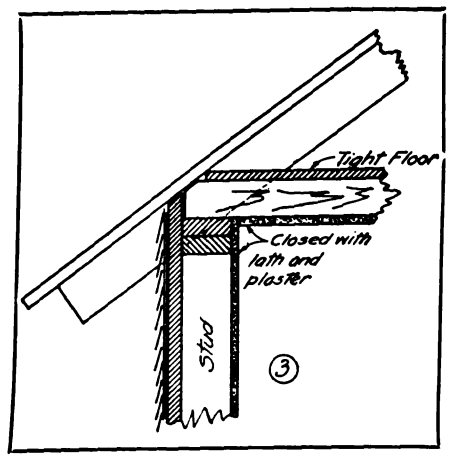

Fig. 3 shows a recommended detail for closing all air spaces between the studs and joists at the ceiling. The most effective method is to floor over the entire upper side of the joists with any good, tight flooring material.

is extremely bad, and it should be corrected. In old buildings, where the studs extend to the plate, and the floor meets the inside edge of the studs, this space is probably open.

The way to remedy this error is to insert filler blocks between the studs on the level with the floor. In new construction, it is best to floor over the entire first floor or subfloor between the sheathing, on all sides, and set the studs upon a plate placed upon this floor. (See illustration.) This will effectively cut off all air communication between the basement and the stud spaces. In attics, where the joists are laid upon the rafter plates, these spaces are usually cut off; but in attics where the floor is lowered to obtain head room, the spaces between the joists and between the studs must be closed with tight sheathing, as shown in the diagram. It is important to make sure that all stud spaces are tightly closed at top and bottom. This process is often known as fire stopping.

For the exterior finish provide straight, solid boards, with ship-lap or tongue-and-groove joints, and see that they are well laid. A good grade of building paper should be placed underneath the sheathing, also between the studs and inside lath and plaster. The best application of the latter is to nail the building paper onto the studs and then attach the lath to furring strips over the paper.

Pieces of studding material, commonly called "fire-blocks" should be nailed between the studs at a point midway between the first and second floors, to still further reduce convection. This treatment will also tend to decrease the fire hazard of the building.

One of the worst conditions to meet is the bungalow with one or two second story rooms. These upper rooms are frequently hard to heat and special precautions should be taken in the design of the structure. The principal difficulty lies with the attic spaces beside and above these rooms. Usually no attempt is made to floor over these spaces, and it is often found that the heat losses in this type of house are greater than in a two-story building. It is necessary to floor over all such sections with some type of insulating material. This is a good place to use wall board as it is easily fitted in place.

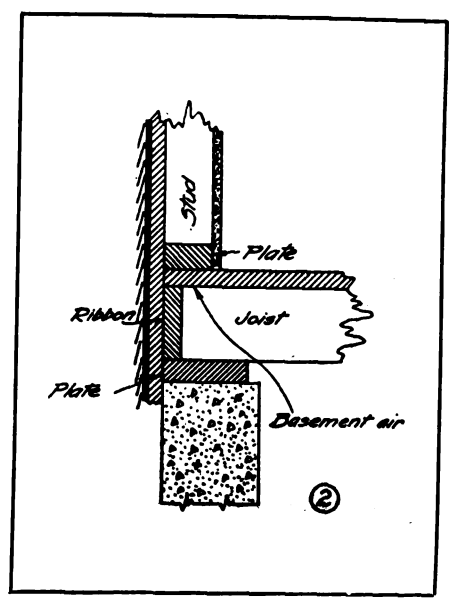

Fig. 2 shows the details recommended to be used in new construction. Here the flooring is laid all around to the sheathing, and the studs are set on plates resting upon the floor. No air can be carried up between studs, therefore no heat lost. Also prevents spread of fire.

Digitized by Google

1. Cut off all spaces between the studding, from the basement and the attic.

2. Insulate all outer walls with good ship-lap or tongue-and-groove siding, well laid.

3. Always use a good quality of building paper over the sheathing.

4. One layer of building paper laid over the inside of the studs is recommended.

5. Floor over all attic spaces with a tight floor.

6. Sheath with ship-lap or wall board, or other equivalent, over all studded walls between upper floor rooms and attic space.

7. Insulate all floors that come in contact with cold air, where these rooms are to be used for other than sleeping porches.

The average citizen does not realize what great sums of money are lost every year because of improperly designed homes. The following statement will establish the value of extra expenditure for the conservation of heat. In Indiana, alone, the public spent about $54,000,000 for domestic fuel in 1920. If all heating units had been operated efficiently during that year, at least ten per cent of this money could have been saved. This ten per cent, amounting to $5,400,000, would have been sufficient to run all the colleges and universities of the state for one year, and the public would not have been asked to provide one cent additional for the purpose. If all residences had been constructed so as to conserve heat, the saving would have been nearer twenty-five per cent than ten.

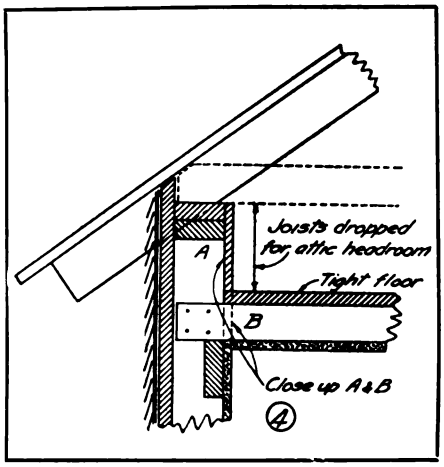

Fig. 4 shows the best detail for insulating the upper floor where the hoists are dropped below the eaves to afford room space in the attic. The open space A and B should be closed up with tight sheathing and a perfectly tight floor laid. Any good wall board can be used to cut off space A.

It is self-evident that, if all buildings in the states where heating is necessary were built as suggested in this article, an enormous amount of money would be saved each year. The cause of conservation is one that deserves the full support of every contractor and architect in the United States.

The above are extracts from a paper read by the author at the National Construction Conference held in Chicago, April 5, 1922.

Building Construction Fire Hazards

By CHARLES C. DOMINGE

BUILDINGS in course of construction are usually considered good fire risks, especially if of brick or fire resistive construction. Theatres, churches, halls and other types of buildings calling for a large open floor space are not as desirable course of construction risks as those of ordinary type, owing to the great amount of scaffolding necessary to complete and finish the high interior of the building.

Up to several years ago, most fires in this class have been caused by the use of "salamanders" or open fire stoves or gasoline torches as used by careless mechanics. Electricity, generally of a temporary and makeshift nature, with its exposed wires, is responsible in some cases, as is evidenced by the severe loss several years ago in the Pennsylvania Hotel in New York City. In this case a temporary overhead wood platform was erected on the grade so that pedestrians could traverse the street. Under this platform the temporary electrical installation and switchboard were installed. A fire, apparently from defective installation, started at this point and was severe enough to destroy over 150 feet of the limestone front of the building under the platform and severely scorched buildings on the opposite side of the street.

Several months ago, the fire department responded to three fires in two weeks in a building in course of construction on Maiden Lane, New York City, the cause being either red hot rivets or red hot particles from acetylene welding apparatus dropping on canvas covered platform or oil soaked litter on the floors.

In these new buildings asphaltum paint is used to coat the interior walls to keep them waterproof. The usual method is to build a wood fire directly on the fireproof arches of the floor and then place a bucket filled with asphalt on the fire in order to keep the asphalt from becoming too thick, thereby making it easier to apply to the walls. A fire of this kind must be constantly watched, otherwise the liquid will boil over and start a fire which is hard to extinguish.

During the winter months, buildings in course of construction house practically all the combustible materials to be used eventually in the interior finishing, and at this time there is a considerable amount of packing cases containing glass with excelsior, straw and hay packed between.

The writer has seen workmen removing the glass from the cases and scattering the packing material over a great portion of the floor. Smoking and filling kerosene lanterns are also hazards met with.

In conclusion many losses occur at the eleventh hour, when the building is almost ready to be turned over to the owner. At this stage, carelessness on the part of painters and decorators in the handing and storage of their supplies, and oily rags and waste help to increase the loss ratio.—Extract from paper to National Fire Protection Association.

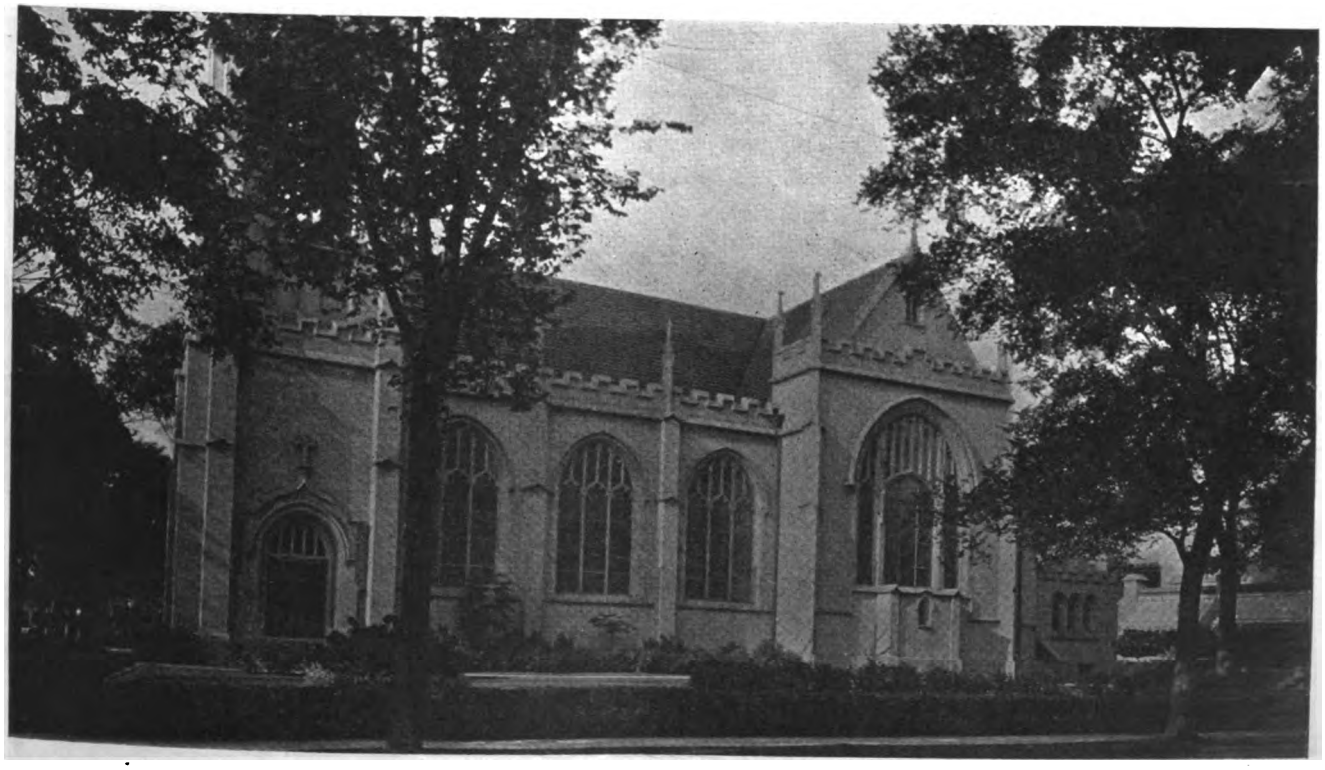
Modern Church *of* Gothic Design

HENRY J. SCHLACKS, Architect

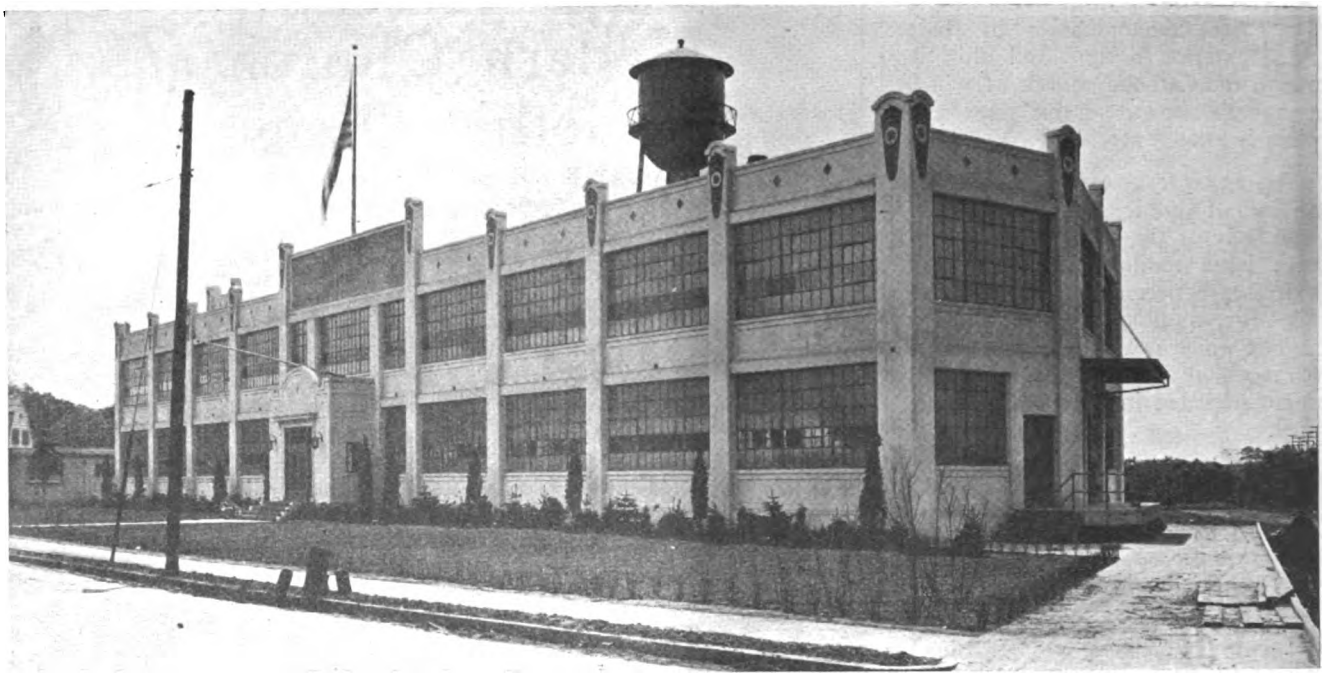
CHURCHES quite often reflect their denomination in their exterior design and this is true of the Catholic church of which a picture's shown on this page and which is located at Oak Park, Ill.



The exterior is carried out along the lines of Gothic architecture. The main body of the church consists of three large mullion windows with buttresses between; a transept with two larger mullion windows and the narthex which is entered by the side entrance shown here, and also a front entrance located in the center of the front.

The mullions of these windows are of wood carried out in simple Gothic style. Stained glass is used in all the windows with an outside protective covering of rib glass.

The interior has also been carried out in Gothic style with a groined ceiling of both nave and aisles. This is finished in plaster with ornamental rib work.



The organ is placed in a loft situated over the vestibule or narthex and a handsome memorial stained glass window is placed above the organ console. The exterior of this window does not show in our picture, but it is similar to the two windows, it is placed directly over the central entrance.

Building a Daylight Factory

Pleasing Design Embodied in Practical Commercial Structure

TURNER CONSTRUCTION COMPANY, Designers and Builders

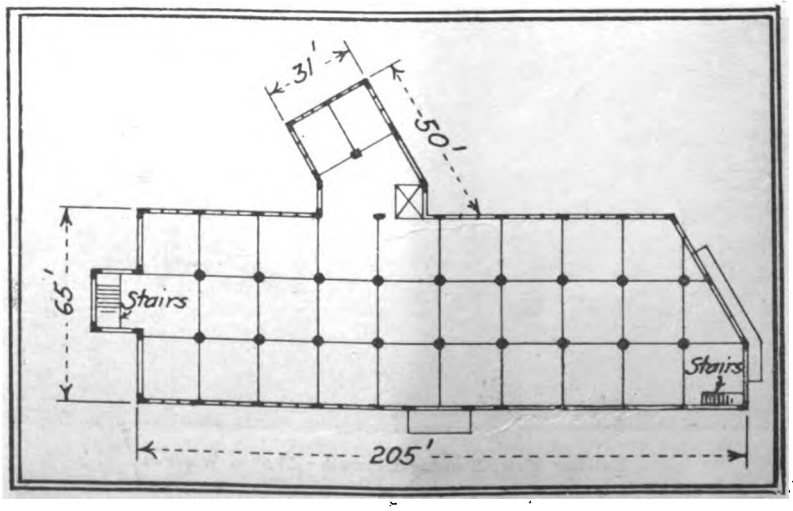
THE interesting series of pictures shown on these two pages illustrate the construction of a reinforced concrete factory which has just been completed for Messrs. Kops Bros. at Ozone Park, Long Island, New York.

The above picture of the completed factory was taken May 20th, 1922. The evergreens, shrubs, grass and hedge have just been planted, and in a few years when these have had a little growth, this factory will be an interesting example of commercial architecture, one in which some attention has been given to beauty, as well as utility.

Unlike a great many factory buildings, it sets back from the street so that a decent size lawn is possible in front.

The owners evidently take a good deal of pride in having a nice looking factory. Being keen business men, they know people will talk favorably about the building and they also realize that they will have more contented employees when they work in a nice looking factory.

This interesting building was designed and erected by the Turner Construction Company of New York, and while no effort was made to beat any construction records, it was completed in a very short time.



The series of pictures that we show illustrate the progress made at different dates in the erection of this factory. In designing this building, the builders took into consideration that additions may be required in the future, therefore the walls and interior columns have been made strong enough to carry several extra floors.

Although plain in its design, the lines of the exterior are quite pleasing, consisting of a number of sash bays set in between concrete piers. The top of each pier has an ornament in tile which gives it a distinctive appearance that is pleasing.

A variation has been made in the central bay design as this is divided into three sections; the middle serves as the vestibule to the front entrance; this vestibule projects beyond the main structure and gives a pleasing break in its appearance.

As the walls are practically entirely of sash, a maximum amount of light is secured from the interior. Of course, all this sash is of steel.

In the erection of this factory, rein-

October 25th, 1921

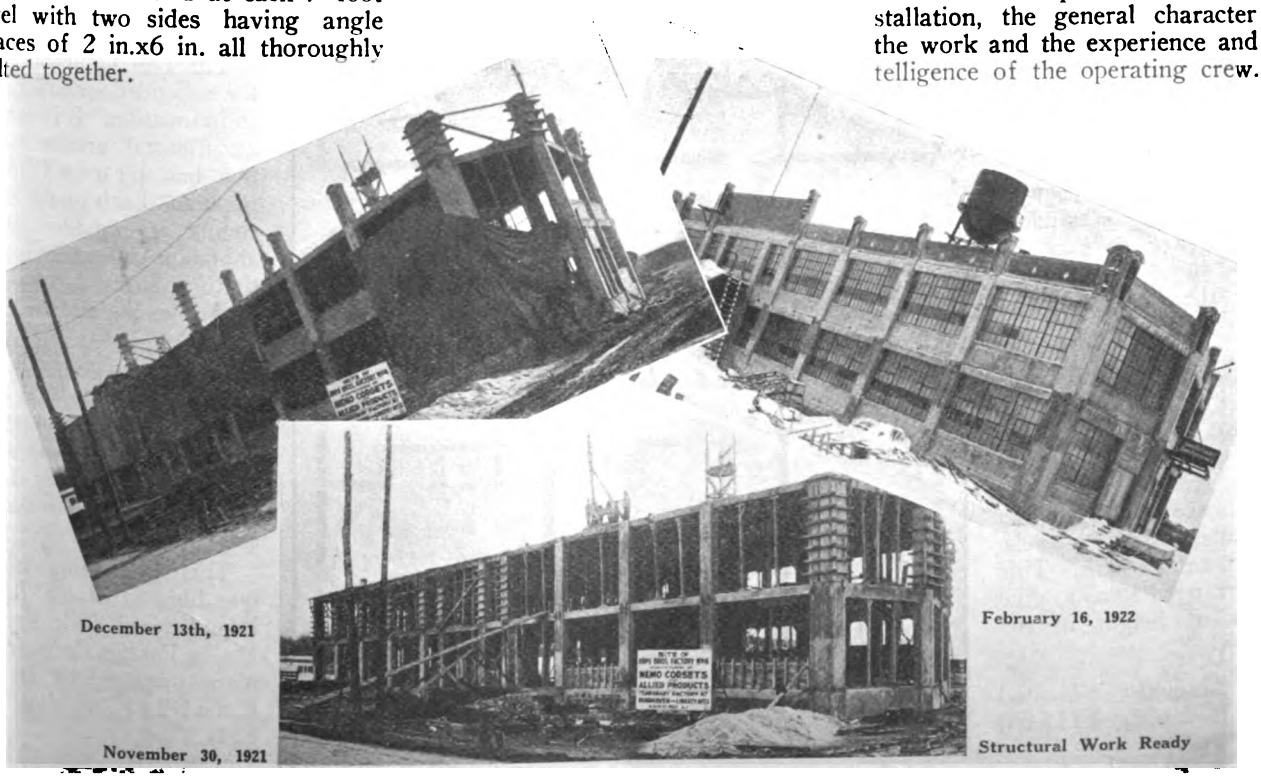
November 12th, 1921

forced concrete construction was employed, being poured in wood forms. The runway shown in the November pictures was a very handy contrivance and saved a lot of hoisting which otherwise would have been necessary. Fortunately, this runway could be used very economically, as the building was only two stories high.

As our pictures clearly show, a hoisting tower was used for the concrete and this was distributed by means of a spout to the desired location.

In making such hoisting tower, if it is no higher than 100 feet, the corner posts can usually be made of 4 in. x 6 in. timbers. For constructing such a tower with the necessary braces, etc., it would take about 2700 board feet for the timbering. This quantity of timber allows for a 2 in.x 10 in. bolted around at each 7 foot level with two sides having angle braces of 2 in.x6 in. all thoroughly bolted together.

A tower of this sort should be carefully made, so it may be taken down and rebuilt wherever it is needed. When a tower is to be used as a standard piece of equipment it should receive several protective coatings of paint. It will look better and will save you money. The painting should be done before erection. It is really surprising what one of these towers cost; according to some figures that we have seen, $4.50 to $5.00 per foot of height is a fair average, so be careful to include enough in your estimate to cover this item. When a wood tower is bolted together, the dismantling is much easier than when spiked.



The following data, on what the plant consists of, from the revised edition of Arthur's New Building Estimators' Handbook will be of considerable interest:

The concrete gravity plant consists of a hoisting bucket in a tower, a receiving hopper near the top of the tower, and a series of gravity chutes for distribution to the form.

If the concrete is delivered to the chutes in a plastic, viscous, homogeneous condition, it will flow generally on the following slopes, which have been found to be successful and are used by many contractors:

Small gravel, 1 to 3 or about 18° with the horizontal.
1 in. stone, 1 to 2¾ or about 20° with the horizontal.
1½ in. stone, 1 to 2½ or about 22° with the horizontal.
2 in. stone, 1 to 2¼ or about 24° with the horizontal.

The unit cost of placing concrete by the gravity plant is controlled by many factors, the size of the mixer, the preparation of the forms, the rate of wages paid, the quantity of concrete to be placed from one installation, the general character of the work and the experience and intelligence of the operating crew.

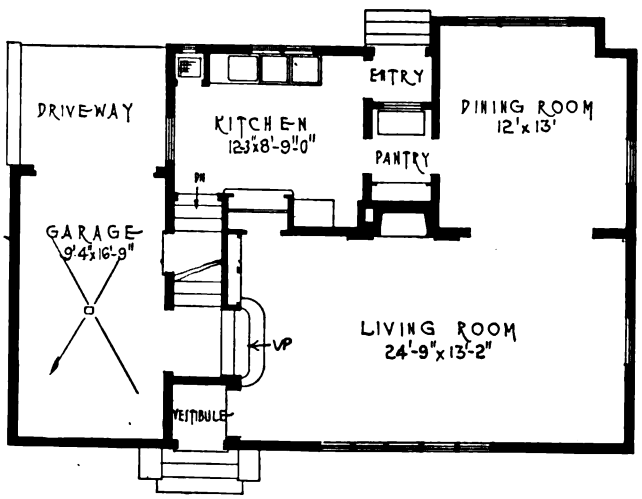
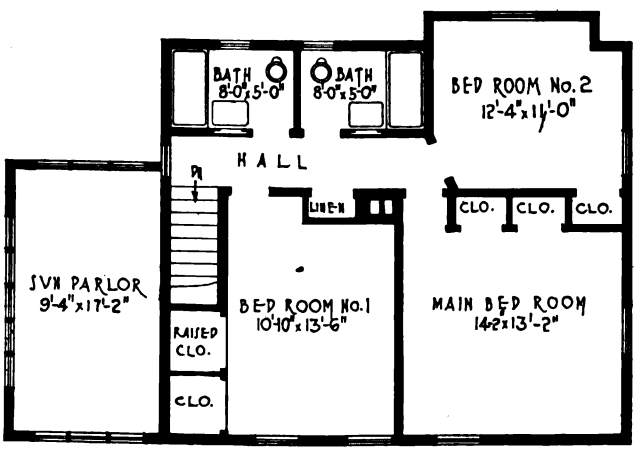
Sun Parlor *and* Garage Feature *of* This Home



INTERESTING indeed is the layout of the home shown on this page. By the owners and architect it has been termed "Chateau Amerique," it being modeled after a French private residence, but adapted to American conditions.

The most interesting feature is the sun parlor, placed over the garage, both of which are integral parts of the house; the garage is entered from the rear, so that the appearance of the front of the house is not marred in the least.



There is a slight slope in grade towards the rear of the lot, and this was taken advantage of so that the garage level is slightly lower than the street grade.

The main entrance is direct into the living room through a vestibule. As will be noticed, there are a number of steps and an additional step in the vestibule so that the house sets up rather high. This was arranged so as to give plenty of height in the garage.

As this house is located close to Long Island Sound, raising the sun parlor in this manner enables the occupants to have a very pleasing view of the water, the elevation being sufficiently high to overlook the tops of the intervening low trees.

First Floor Plan

Second Floor Plan

The pantry, between dining room and kitchen, is an interesting feature, enabling the ice to be placed in the refrigerator without iceman coming into kitchen. The refrigerator in this location is convenient to both kitchen and dining room.

The two bathrooms on the second floor are quite an innovation. It is rather an unusual arrangement, but has proved quite popular. Each of the bedrooms is provided with abundant closet room, and there is also a large linen closet opening into the hall.

The house as shown here is constructed of frame covered with stucco. The rooms are exceptionally large in size, due to the fact that there is no space used unnecessarily for halls.

This interesting home was built at Malba, Long Island, New York, by the Malba Estates Corp. from plans prepared by H. B. Knowles, architect, of New York.

What the Editor Thinks

Farm Improvements

ON another page of this issue we give an outline of a loaning system for farmers. This opens up a vast field of construction work along the line of farm improvements both in new buildings and repairs as well as equipment. As soon as a lull occurs in the building of houses in our cities and towns a big business for the builders in the East will be that of farm improvements, and many years of profitable work are ahead in that line.

It will be well for the builders to be ready to take care of this line of business in the near future. Find out about modern farm requirements, be ready to render real service.

Roof Improvements

UNCONSCIOUSLY to most of us, there has been quite a revolution in roofing within the past 20 years. The old time sameness and monotony is disappearing from our sky lines.

Roofs today are much more attractive than in the old days. There is more color to them and greater variety. The old wood shingled roof is transformed by means of colored stains and methods of laying so that many artistic results are obtained entirely different from anything that our building predecessors ever used.

The newer type of roofing has come into use, giving variety, color, attractiveness and fireproof qualities. Asbestos, slate, asphalt, tile, composition, zinc, tin, copper and galvanized iron all lend themselves to artistic treatment and practical use.

We recently saw an interesting example of corrugated galvanized iron roof, which looked very attractive. This was painted with the dark brown metallic paint, then covered with the second coat of light chrome green which was rubbed off in spots and streaks so as to reveal the brown under coat. This gave the appearance of bronze and made a very attractive appearing roof.

Even by the use of ordinary materials, we are obtaining artistic results. Much of the benefits of this new order of things is directly due to the instructive advertising that is being done by the manufacturers of these various products. All this is tending to increase the beauty and usefulness of our buildings.

The Apprenticeship Question Again

CONSTRUCTION work in many localities has been slowed up on account of the lack of sufficient skilled labor.

Recently in Washington, builders who were anxious to complete their contract in a certain time paid as high as $16.00 per day for bricklayers! This is a condition of affairs that deserves decisive action. The question arises: "Why have not the young men gone into the building trades?"

American young men are as bright a lot as can be found in any country. Evidence of this fact will be vividly recalled if you will think back but a few years.

Several hundred thousands of our young men were called upon for the war, and they had to take up, not only the terrible battle part, but many mechanical trades that were entirely different from their previous vocations. We need not remind our readers that they did well—that is a matter of history.

The same spirit of winning that was shown in the war can also be made use of in peacetime pursuits, and the building trades can get their share of enthusiasm if they will offer the right inducements for the young men to come in.

There has been too much of an attitude of "stay out, the field is overcrowded." In other words, no inducements were made for young men to enter the various trades. We are now paying dearly for this oversight of ours.

The different building trades offer as attractive a calling to follow as any. Skill, endeavor, courage and strength, always interest young men. They have a chance to use all in the building game.

Stucco Protection

WHEN applying the dash coat to stucco, it is a very wise precaution to cover the roof, trim, etc., with pieces of sheathing paper which can be lightly tacked down.

The spattering of the stucco will then be prevented from falling on the roof, trim, etc., and will save a good many hours of work usually spent in cleaning it off.

We have noticed asbestos roofs, the appearance of which were badly marred by the spattering of stucco; through carelessness this was allowed to harden and it was quite a job to make a presentable looking roof. A worse case was one where asphalt shingles were used.

The little precaution of covering finished work before the dash coat of stucco is applied will save all this annoyance and expense.

Business Ability

BUILDERS are merchants in every sense of the word, in all relations with their customers. Just like a storekeeper who wants to have a satisfied customer the builder should do his utmost to please, and successful builders are the ones who stay in business in one location and are known as the successful contractor.

There is a type of builder who comes to a town and gets hold of somebody who intends to build, makes all sorts of promises of wonderful work at a marvelously cheap price, and then "beats it" when first or second payments are made, owing bills for materials, labor and board.

Another type of builder takes hold of a contract and will "skin" the job at every possible point, quite often, fortunately, they come seriously to grief.

Others, when a mistake is made will insist that it is right and that the owner accept it. Now, when a mistake is made, the easiest and most pleasant thing to do is to admit the mistake and have it done right. The owner thinks so much more of you and you are only doing the square thing at that.

CARPENTRY

Good Practice in Frame Construction and Finish

How to Frame a Roof of Unequal Pitch

By RICHARD M. VAN GAASBEEK
School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

CONTINUING the problem from our July issue, we can now proceed to lay out the hip rafter. In our next article we will show how to lay out the valley rafters.

The hip rafter travels the diagonal distance of an oblong with reference to the plates of a building, due to the fact that the roof surface on one side of the hip rafter has a greater pitch than the roof surface on the opposite side. The top edge of all rafters must be in alignment to receive the roof boards. The plancher level should be level throughout the entire roof. The outside lines of the roof that are seen, or facia lines, must intersect.

Referring to figure 12, an enlarged section through R-R, figure 1, it will readily be seen that the hip rafter traveling the diagonal distance of an oblong, intersecting with the return corner on the facia line, crosses the plate at an angle, A-B, figure 12. The hip rafter only crosses the corner of a building in roofs of equal pitch, where the roof surfaces on both sides of the hip are the same pitch and the hip travels the diagonal distance of a square or crosses the plates of a building at an angle of 45 degrees.

In all roofs of equal pitch the run of the hip rafter is 17 inches for every foot of run of the common rafter, or the diagonal distance of 12 and 12 inches. This rule then cannot apply in roofs of unequal pitch because the hip rafter runs the diagonal distance of an oblong, it therefore becomes necessary to determine the rise in inches per foot of run, so that the constant unit of 12 inches can be used in framing all the rafters throughout the entire roof. The total rise of the hip rafter is determined by the pitch of the long common rafter, to conform to the requirements of the specifications, or a total rise of 11 inches.

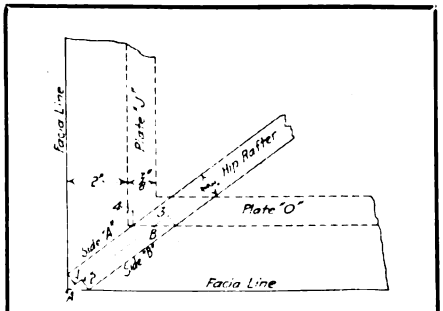

Fig. 12—Full size section through R-R, Figure 1, showing intersection of the hip rafter, plate and facia line.

Take the run of the hip rafter from the layout, figure 1, measuring from the return on the facia line to the butt joint against the valley rafter, A-T, figure 1, or run of 13 5/8 inches. Thus with a total rise of 11 inches and total run of 13 5/8 inches find the rise in inches per foot of run. The formula is:

$$\frac{\text{Rise in inches}}{\text{Run in feet}} = \text{Rise in inches per foot of run.}$$

$$\frac{11}{13\ 5/8} = 9\frac{8}{12} = \text{Rise in inches per foot of run.}$$

Note: Reduce the last number to twelfths of an inch for an accurate reading, the standard steel square being laid out in twelfths so that it is an easy matter to make an accurate measurement. Another way to determine the rise in inches per foot of run is shown in figure 13. The same reading should be obtained provided the triangle has been laid out accurately. It is good practice to check up the figures with the graphic method to avoid errors. Lay off the run on the horizontal line, 13 5/8 inches and the rise on the vertical line, 11 inches and connect the two lines with a diagonal line forming a triangle. Measure off on the horizontal or level line from the intersection of the horizontal and diagonal line the unit for one foot run, 12 inches. Project a vertical or plumb line up from this point until it intersects the diagonal pitch line. The length of this vertical line from the horizontal base line to the diagonal pitch line is the rise in inches per foot of the rafter, or 9 8/12 inches.

Set the fence and square at 9 8/12 inches rise on the tongue and 12 inches run on the blade. Mark on the tongue for all plumb cuts and on the blade for all level cuts. Press the fence firmly against the top edge of the stock to be used and produce the facia line or first plumb line to the extreme left, A, figure 11. Slide the fence to the right and measure on a level line from facia line A, the run of the hip, 13 5/8 inches, and produce plumb line T, figure 11, the extreme length of the rafter forming

Digitized by Google

the butt joint against the valley rafter.

To simplify picking up the bevels, top cut, backing and other measurements required in laying out the hip rafter, draw in a section of the hip rafter and plate, full size on the layout, figure 1, as shown in the section, figure 12, which is a section through R-R, figure 1.

Where the outside edges of the hip rafter intersects the facia line, square lines across at right angles to the center line, from both edges of the hip until they intersect the center line as at 1 and 2, figure 12. Also where the outside edge of the hip intersects the wall line, square a line across at right angles to the center line until it intersects the center line as at 3, figure 12.

To complete the layout of the lower end of the hip rafter, measure in on a level line the diagonal distance of the projection A-B, figure 12, from facia line A, on the side of the rafter, or 3 7/16 inches, locating wall line B. Square this line across the bottom edge of the rafter and locate the center point.

To make a fit against the wall at the proper angle measure in on the side of the rafter from wall line B, the distance B-3, figure 12, and produce plumb line 3, figure 11. Connect plumb line 3 through the center of plumb line B on the bottom edge as shown at 4, bottom view, figure 11.

To complete the birdsmouth measure down on facia line A from the top edge of the rafter, 5/8 inch, the width of the facia and produce plancher level F. Measure up from plancher level F on a plumb line 2 5/8 inches, locating plate level G.

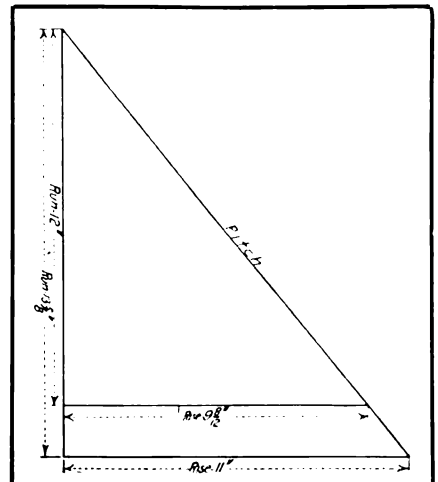

Fig. 13.—A simple method of finding the rise in inches per foot of run.

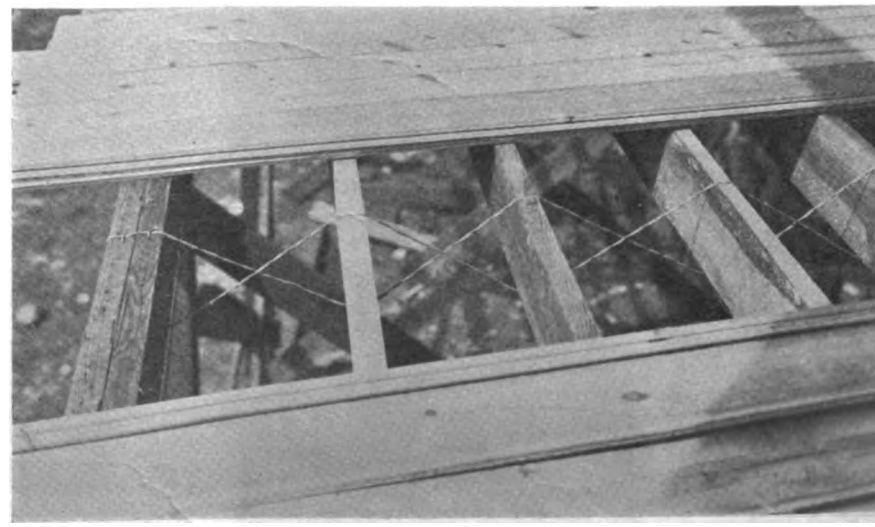
The hip rafter crosses plate O, the same plate upon which the short common rafters rest, therefore, the distance between plancher level and plate level is the same for both short common jack and common rafters and hip rafter.

To make the return on the facia line at the corner of the building measure back on side A of the hip rafter from facia line A, the distance A-1, figure 12 and produce plumb line 1, figure 11. On side B measure back on a level line from facia line A the distance A-2, figure 12, and produce plumb line 2, figure 11. Square facia line A across the top edge of the rafter and locate the center point. Connect plumb lines 1 and 2 on the side of the rafter with the center point on the top edge as shown in the top view at 5, figure 11. Cut on bevels 5 on the top edge and plumb lines 1 and 2 on the side of the rafter for the facia, on line F for the plancher level, on line G make a square cut and on line 4 on bottom edge of the rafter a bevel cut for the birdsmouth and on line T for the butt joint against the valley rafter.

Backing the Hip Rafter



To determine the amount of stock to be removed in beveling the corners of the hip to bring the center line in alignment with the center line of the jack and common rafters, produce a level line on either side of the hip. On side A from the top edge on this level line, point off the distance A-1, figure 12, as shown at A-1, figure 11. On side B from the top edge on the level line point off the distance A-2, figure 12, as shown at A-2, figure 11. Gauge a line through these points on either side of the rafter and also through the center on the top edge. Remove the corner between these lines as shown in the end view, figure 11.

The problem of laying out the valley rafters will be discussed in our next article.

Use *of* Wire *for* Bridging

HERE is something that will be new to most of our readers. Instead of using wood bridging with its expensive cutting, fitting and nailing cost, the builders of the New York Velodrome employed two strands of galvanized iron wire simply fastened by a bent-over nail.

The object of bridging is to transfer any extra load that may be placed on a certain joist to the adjoining ones as well as for stiffness. With wood, the bridging is subject to compression and the load is transferred downward along the diagonal bridgings to the bottoms of adjoining joists. With the wire bridging a reverse action takes place as the wires are subject to tension.

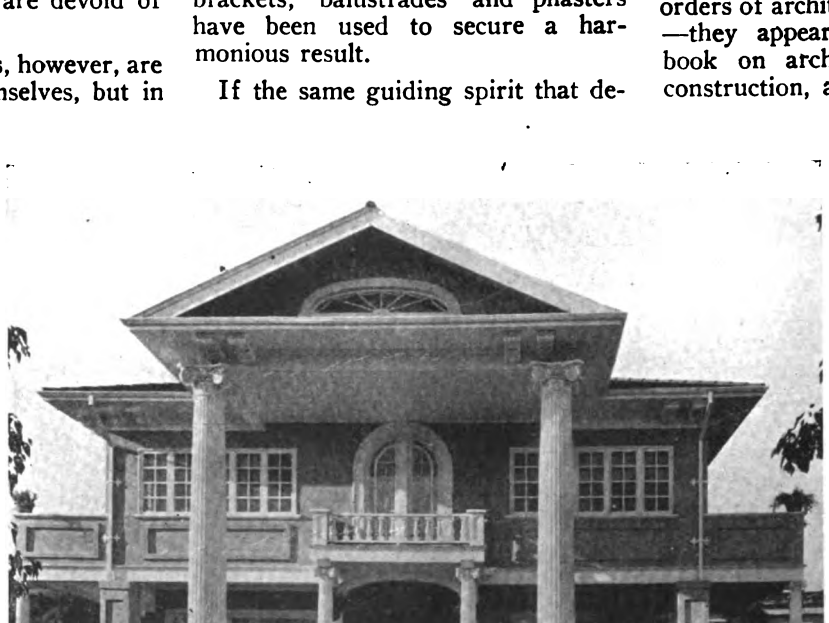
Beauty by Correct Proportion

RUNNING amuck is not only the habit of some South Sea Islanders, but is also a bad disease that grips some folks in the building profession.

Good materials and excellent workmanship are frequently employed in erecting buildings that are devoid of all architectural merit.

The individual details, however, are most excellent by themselves, but in the jumble that results, a horrible mess is the outcome.

The lower picture shows an interesting example of running amuck in architectural design. Here in the erection of a four-family apartment, excellent material has been used, the columns are well proportioned and the brackets are architecturally correct; so are the balustrades; but on account of lack of proper proportion in the designer's part the resulting structure is an architectural nightmare.



The same amount expended would have produced a handsome looking building if a proper exterior design had been used.

In direct contrast with this building is the one shown above. This has a considerable amount of ornament, but it has been used with judgment—brackets, balustrades and pilasters have been used to secure a harmonious result.

If the same guiding spirit that designed the lower structure attempted the house shown above, he would have made a mess of it, due to his entire lack of knowledge of the simple elementary principles of architectural proportions.

The rules regarding the different orders of architecture are well known, —they appear in practically every book on architecture and building construction, and it is a pity that a little more pains was not taken to get proportions right.

One glaring fault with the design in the lower illustration is the entablature. It is entirely too small for the size of the columns used. Note also particularly the treatment of the brackets above the columns in both illustrations. In one it results in a pleasing design, and in the other it is awkward, the brackets appearing as though they are about to fall down. The balusters have also been set a little too far apart, and the rails on top are not heavy enough.

Lots of Good Detail Here, But All Spoiled by Incorrect Grouping and Lack of Proper Architectural Proportion

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

How We Find Actual Cost *of* Building

By LEWIS BOWMAN

THE actual cost of the material and labor in a building is naturally the most important factor in the total cost. After this has been determined it is not a difficult task to add the overhead and profit and thus determine the final estimate. By that I mean, that a builder in figuring on a garage costing about one thousand dollars may feel that a small operation like this should net him a slightly larger percentage of profit than on an entire building costing ten times as much. But that, as I said before, is the purely business side of the question and the amount he secures above the actual cost is dependent upon his salesmanship and the condition of his business at the time the bid is sent out.

If a builder attempts to run his estimating in a systematic and logical manner, so that anyone can pick up

his cost sheet and tell exactly the cost that each individual item is figured at, he should have regular estimating sheets printed for the purpose. We are assuming that the builder is specializing in one class of work in this article—namely country houses, because it is perhaps easier to carry one idea through in an article of this kind than to dart into other phases of the building business and mix the conditions.

Also as we handle only this type of houses ourselves, our knowledge of this particular and special business is more concrete and the suggestions that are made in this article after the trial of various systems may prove more valuable perhaps to anyone who is attempting to secure the fundamentals of this most interesting and perplexing branch of building.

After the average builder has placed a bid in competition with several others, finally finds that he is the lucky—or unlucky bidder, if he is wise, the first thing that he turns to is his cost sheet—that cost sheet at this time has a very magnetic influence. The desire to count the unhatched chickens may be the cause—that is bad business—or he may want to turn the sheet over to his bookkeeper for entry into the ledger, which is real system—or he may want to find out why he received the contract; if he left out anything—which is human nature.

There is a cartoon hanging over the desk of our general superintendent, depicting a "successful bidder" looking pessimistically at an awarded contract—and the caption which is the *burden* of his thought reads "I wonder what I forgot."

And that is the builder's constant bugbear in estimating; namely, what he forgot to include as part of his cost. We have solved this phase of our system by the use of a detailed estimating sheet which contains every item that usually goes into the country house; at the end of each branch of the work are enough blank spaces to enable one to take care of the varied conditions of the individual houses. These sheets could, of course, be extended for larger and more costly work and the experienced builders and contractors of larger operations have systems that entail pages of indexed items to be carried through.

The system I am speaking of now, and of which the illustrations are given, for the man who is constructing our greatest need of the hour, namely—housing facilities, Usually the builder of this type of house is cautious about having large office costs; his business force is small, as it is more often than not—a one-man affair, as far as ownership is concerned. And then more than ever is a detailed and printed cost sheet of inestimable value—our sheet is just as useful to an office with one clerk as in ours, where it is checked over by three persons before being finally submitted.

The principal thing, of course, is to have a definite reminder in front of one all the time. A general schedule being on the wall is good, or a general form from any of several good books on the subject. While there may be lists published that I have not seen, the common fault with most of those now on the market is that they contain items pertaining to building generally instead of the particular branch wanted. Such a list can be condensed—and after a little study can be copied and used as a standard form for individual cases

But nothing can give as much satisfaction as having the sheet all tabulated so that after the plan or specification is looked at for certain printed items and they are not shown or called for—to write "none" after such an item has a tendency to give the estimate a more stable appearance than a sheet showing merely the items that will be furnished. And the sheet also is a constant reminder of what is not figured and whether or not the architect is careless or has a loose specification; in submitting the bid these exceptions can be carefully noted for the architect's and owner's benefit.

It will help to clear up the problem of extras that are absolutely necessary—and which the builder knows are necessary. For the builder knows even more than the architect and owner what will be necessary to make the construction complete and thorough. This brings us to a point of digression that may not be out of place here—namely, the new theory that is being advocated in this country of submitting bids according to quantity estimates. It is quite prevalent abroad and in one sense—places the responsibility on the architectural end of the work. This method gives the builder the quantity of dirt to be excavated, cubic feet of foundation and footing work, yards of plastering, etc. Most builders would, of course, prefer this as it would eliminate his chance of forgetting items or making a miscalculation in taking off his own quantities.

In Fig. 1 is shown a typical estimating sheet as used by our mason department. The form only is of interest as the detail refers only to our type of work. The form can be enlarged and added to suit the needs of the individual. It has proven of unestimable value to us from both a cost and record standpoint.

Fig. 2 shows a carpenter material sheet which is also compiled for our particular business. Together with these two sheets are others that have no bearing on this article but the summary sheet which brings in the total of the sub-divisions of the mason work, carpenter work, sub-contracts, etc., shown in Fig. 3 is the complete office total for the job.

(To be concluded in Sept. issue)

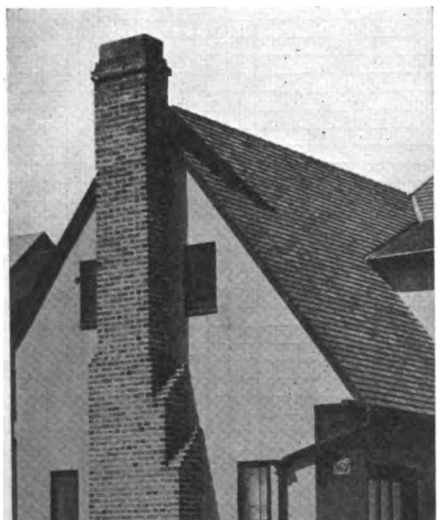
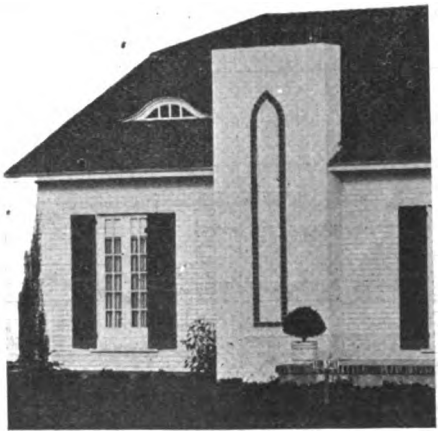
MASONRY
Practical Information on Materials and Latest Construction Methods



Correct Building of Chimneys and Flues

By FRANKLIN H. WENTWORTH



IN connection with the construction of chimneys, and with a view to reducing the fire hazard, it is urged that the following recommendations be observed in chimney and flue construction.

Build all chimneys from the ground up. None of their weight should be carried by anything except their proper foundations. Foundations should be at least 12 inches wider all around than the area of the chimney and be started well below the frost line.

No chimney should be started or built upon any floor or beam of wood. When a chimney is to be cut off below, in whole or part, it should be entirely supported by brick or stone work, or steel construction, properly erected from the ground up. The practice of supporting chimneys or flues on wooden or iron brackets, or iron stirrups, however carefully devised, is hazardous. A small fire around the base from any cause may drop the flue and allow draft for rapid spread of fire.

Beauty in Proper Use of Brick

Artistic Chimney of Stucco and Brick

Build all chimneys to a point at least 3 feet above flat roofs, and 2 feet above the ridge of peaked roofs.

Under no circumstances should the brick work of the chimney be extended out over the roof by the projection of the course of brick nearest to it. Such a shoulder or overhanging projection will inevitably cause cracks in the chimney in case the chimney settles, the roof in such event lifting the upper portion by means of the overhang, or shoulder, and causing a crack at the most dangerous of all places. The chimney should be carried up of uniform thickness to the top, copper flashing being relied upon to prevent leaks at the joint with the roof.

It is best to have the wall no less than eight inches in thickness, and use only cement mortar up to the first floor and above the roof line.

Chimneys with but 4-inch exterior walls are commonly permitted, and if lined with fire clay are reasonably safe, but they frequently crack and are also easily chilled, which causes a bad draft. Where fireplaces are built of stone, the minimum thickness of the wall should be 12 inches.

The upper part of chimney walls may be only four inches in thickness,

Cast Stone Used to Advantage

Digitized by Google

from a point at least six inches above the roof to the top of chimney, provided the chimney be capped with terra cotta, stone or cement, or the bricks are carefully bonded or anchored together.

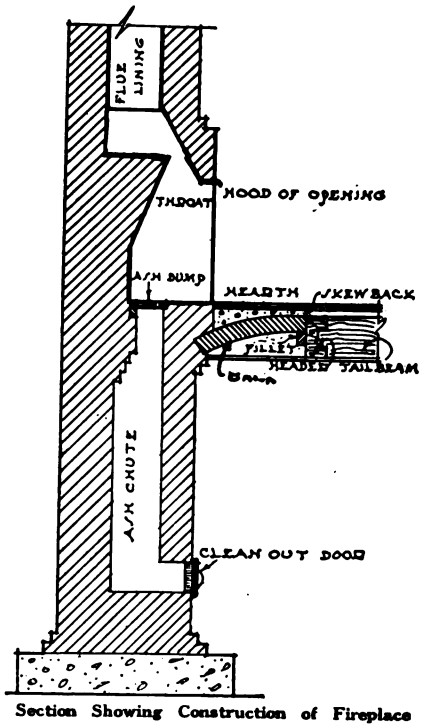
The best coping is a three-inch bluestone, and it is important to see that the holes cut in the capstone correspond in size with the flues, otherwise shoulders will be formed and the draft of the flue interfered with.

In brick buildings the walls of buildings when not less than 13 inches in thickness may form part of chimney or flue. In no case should a chimneys or flue be corbeled out more than 3 inches from the wall, and in all cases the corbeling should consist of at least five courses of brick. Flues in party walls should not extend beyond the center of said walls.

Build all chimneys large enough to give a separate flue for each fire, using fire clay or terra-cotta tile linings at least one inch in thickness.

The fire clay lining is not subject to disintegration by any of the ordinary flue gases.

The lining should be put in as the flue is constructed, using great care to see that the joints in same are carefully made.

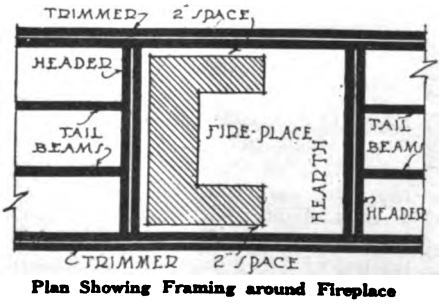


When two or more separate flues are provided in chimney, the division walls between flues may be only four inches in thickness.

Two connections to a single flue will result in fire from one communicating to the opening of the other, and thousands of fires have originated in this manner.

Flues in throat capacity should not be less than eight inches square on the inside, and for fireplaces in which wood is to be used they should be eight by twelve inches (or better, 12x12 inches) in the clear. A good rule is to make the flue size not less than one-tenth the area of the fireplace opening. Green or unseasoned firewood will require a flue of this size to insure a good draft and prevent smoking. The furnace flue should also be not less than eight by twelve inches in any case.

Be careful to see that the flues are properly built. Faults cannot be remedied afterwards. All flues should be as nearly vertical as possible.



Masons are often careless about lining the flue even where the specifications call for it, and are apt to omit it until they get to the straight part of the flue. This makes the flue dangerous at its hottest point, near

Section Showing Construction of Fireplace

the fireplace, especially if it be surrounded by only four inches of brickwork. Make sure that the flue lining is carried up from the throat of the fireplace.

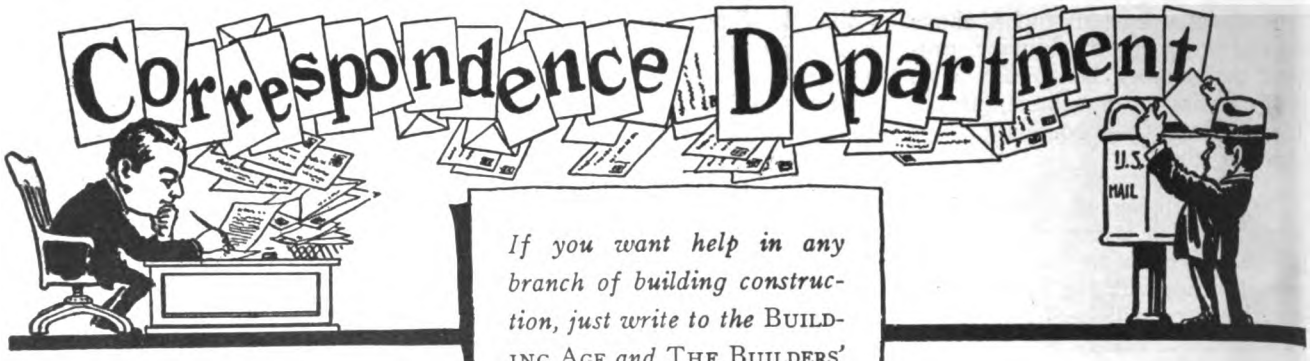
Where flue linings are not provided, be careful to see that all joints are struck smooth on the inside, and that projections of bricks or mortar are not allowed, and also that no pargeting nor plastering of the inside of the flue is permitted under any circumstances. The plastering is liable

Plan Showing Framing around Fireplace

to fall afterward under the influence of heat and rain and not only stop up the flue, but tear out the plaster between the joints of the bricks. The flue lining will prove the cheapest in the end, for it will maintain a smooth throat and thus discourage nest building by chimney swallows.

All flues in every building should be properly cleaned and all rubbish removed, and the flues left smooth on the inside upon the completion of the building.

Do not run floor joists or other woodwork into chimneys or flues nor allow wood casing, lathing or furring within two inches of chimneys. All spaces between the chimney and the wooden beams should be solidly filled with mortar, mineral wool or other incombustible material.



Where the chimney breast over the fireplace or mantel is furred out and finished with lath and plaster, only metal lath should be used. If the mantel is of wood, it should not project far enough to be blistered or ignited. Care should be exercised in its selection.

All floor timbers should be "trimmed" clear of the hearths and brick work of the chimney, so as not to be in contact with it at any point.

This is easily secured by "header" beams, carried in front of the fireplace and at least twenty inches from the chimney breast, supported by the "trimmer" beams, which enter the wall on each side of the chimney, as shown in the illustration. These should not approach the side of the chimney closer than four inches. The intervening "tail" beams are mortised into the header. Where more than three tail beams are framed into the header, however, it should be supported in iron stirrups by which the weight is carried on the trimmer beams without mortising into them by "tenon and tusk" joints, which sacrifice material and carrying capacity. In this way the floor beams are free of contact with chimney flues. All hearths should be laid on trimmer arches of brick or a reinforced concrete slab carried across from the chimney breast to the header beam, so that the hearth shall not rest upon or near wooden beams in any case. The length of trimmer arches should not be less than the width of the chimney breasts nor their width less than 20 inches in any case measured from the face of the chimney breasts.

Line fireplaces with fire brick or cast iron.

Wood Worker's Chisel From Worn File

FILES of square or rectangular cross-section, when worn are ordinarily discarded as worthless; yet they may be made into another valuable new tool, namely, a wood worker's chisel by the simple operations as follows:

1. Grind teeth off surface of old file on emery wheel.

2. Heat file to a cherry red; then allow it to cool in atmosphere. The file is originally glass-hard and too brittle for the purpose of a chisel; this treatment is therefore necessary to give it the proper temper.

3. Grind bevel for chisel on emery wheel; take caution against "burning."

4. After bevel is obtained, grind cutting edge on oil stone.

5. Place the tang end of the file in a turned wood handle with brass ferrule.

The result is a very good chisel of good quality and temper for wood working. See illustration. **C. Nye.**

Water Conducted Over A High Ridge

OCCASIONALLY the carpenter fails to visualize his complete work in the making, and when the work is finished finds himself confronted with an awkward or unseemly result. The illustration Fig. 1, shows a not infrequent situation caused by such a failure; an extension has been built up against the side of a building, and the comb or ridge is so high that it will scarcely finish up under the eave of the main building. If the owner wants all the water from the main roof conducted to the left for cistern or other purposes, a problem is encountered.

The situation could be handled very nicely with an ordinary roof gutter, but in this instance that was not satisfactory to the owner; he would not allow the necessary shingles taken up from a good roof, and would not stand for the dirt and litter caused by their removal. An eave trough could have been hung the full length of the eave if the comb of the lower building had been cut down to accommodate it, but this would have made an ugly piece of work, it necessarily would have had to be lined with metal inviting leakage and affording a catch-all for leaves and rubbish which would have eventually resulted in rusting out the trough, so the following plan was used.

An eave trough of suitable size was hung in the usual manner, extending as near to the comb as its beveled end piece

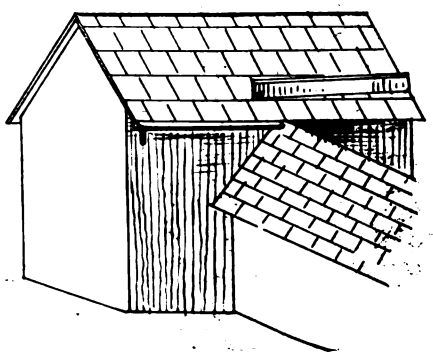

Figure 1

(made to fit the roof pitch) would allow; then a square cornered flash, Fig. 2, was inserted under the first row of shingles above the eave course, this length being given a slight pitch toward the hanging trough and extending some inches over the end of it to insure all the water running into it and not being blown to the back, or over the trough in case of a high wind.

Cut or punch a hole or two in the end corner of the flash (as shown in Fig. 1) so that when a considerable body of water is carried down to the trough, the water will have a chance to spread over the roof, and not depending to have all of it shoot out of the flash end, in one stream.

Eave trough is made in lengths of 10 ft. and when these sections are of a size large enough to flatten on the back for the apron "Y" Fig. 2, and also provide the beaded front from 2 to 3 inches high, they will be found convenient to use from

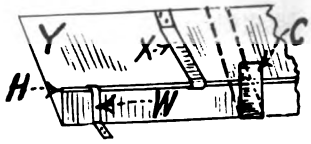

Figure 2

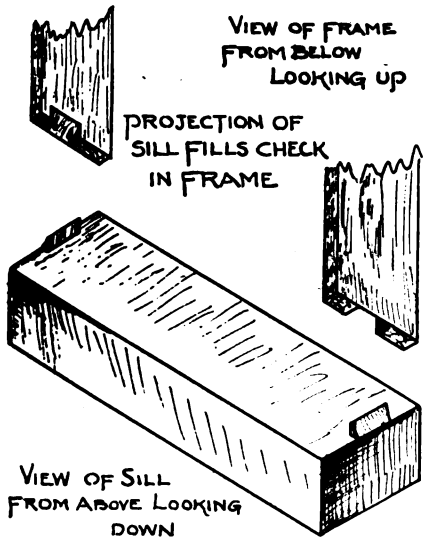
the fact that the bead will interlock and telescope for the lap readily, if needed, when it takes two or more sections to reach the gable end.

For the sake of explanation the sketch is somewhat exaggerated, as the gutters show too prominently. They should be as close together as it is possible to get them so that an awkward break is avoided.

When large eave trough (6 or 7 in.) is not available for this purpose flat galvanized iron strips can be cut, a stiff finish, H, Fig. 2, can be formed by folding the metal double on one edge after which it can be formed into the flash by bending up the front with tongs or over a plank; when more than ten feet of the flat edged flashing is required, connection of another piece or length to reach the gable is shown at C, Fig. 2.



The folded part of edge is sheaved in width of the lap, at which point the sheaved folded edge will abutt the first section, then the extension C made by the sheaving can be folded down over the first length.

As a precaution against this flashes being bent or broken under the weight of snow and ice, roof strips as shown at X should engage the front bead or edge of the flashing and be nailed back upon the roof.

A cleat W may be used at the bottom to stiffen the gutter and hold the corner down solid and smooth.

The flashing front should be no higher than is absolutely necessary to carry the water; then it probably will not show at all from the ground.—**L. S. Bonbrake.**

Securing Door Frames to Concrete Sills

I AM sure the method of holding a door frame in place as shown below when concrete sills are used will be interesting to many of your readers.

The check is cut in the jambs as indicated and then the frame is set in place. When the sill is made the mortar is pressed into the cavities of the jambs and when this sets the frame is held firmly in position.

The advantage of the sloping lug is that moisture will not collect between the sill and frame.

I have been using this method for some time and the frames stay where they are placed.

D. W. Daley.

Ornamental Shingling For Plain Walls

THE severity of a plain expanse of shingled wall can be relieved by "working in" an ornamental design executed with plain shingles of random widths.

In doing this work, the very best grades of shingles should be used, laid with grain tipping outward and downward so as to conduct water outward should cracks or checks develop in later years.

Also, butts should be clean-cut, true and smooth, joints fit perfectly and "line up" straight away from a common center like spokes in a wheel.

The final appearance of any shingled wall is very much improved by smooth, straight laid butts, close fitting joints and perfect surfaces. Perhaps no other exterior finish suffers more at the hands of incompetent labor than shingling and more so unnecessarily for the very best effects obtainable with shingles can be secured with ordinary skillful workmen.

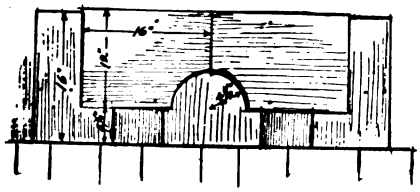

Figure 1

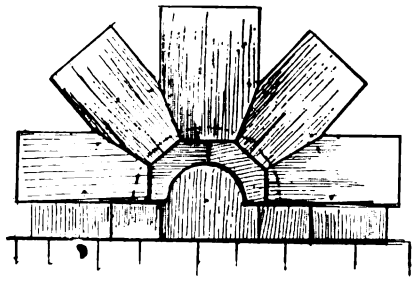

Figure 2

Figure 1 shows the first step toward working in this design. Two good 12" shingles are tacked on lightly, compasses set at 4½" and the first circle struck. Take them off and saw perfectly to this struck line, put 'em back with nails in same holes and then nail thoroughly and this completes our figure one.

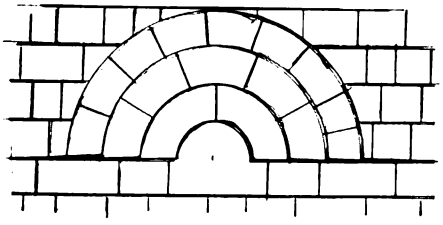

Figure 3

Figure 2 shows how second and all succeeding circles are struck. The dotted line shows course line struck on a radius of 9" upon the two 12" shingles forming the first circle course. Fit these shingles forming this second course as shown, allowing the butts to extend below the dotted line; now strike this 9" radi line, take off and saw and replace as previously directed and so proceed until the design has attained the desired proportion, Figure 3, remembering it will look better too small, rather than too large—do not try to make it a main feature. Now bring up the straight, regular courses and terminate them upon this design, in a circle to correspond with the work in place.

C. A. Doner.

Squaring the Sides of Excavation

THE outline for a basement or other excevation can be quickly squared, not by driving a single stake at the four corners, but by setting two at each corner, one on a line with each contemplated side. In this way the cord can be run past the corner, and when once square, there is no danger of loosening the stakes when digging.

The photo shows a typical method. Here stakes have been set, two at each corner and several feet from the sides of the excavation. Accurate work was accomplished by shifting one of the stakes at each corner until a line stretched diagonally from one corner to the other opposite, exactly equalled in length, one stretched from the other two

Once the lines have been determined, the intersections of the lines at each corner is then taken as the true corner. A plumb dropped from the intersection gives the desired information all of the way down and it is easy to tell whether the walls are being undermined or run in at the bottom.

The use of one long line can be obtained without cutting, by tying one end to one of the stakes and then tunning it first to the next back around the other stake in line with the next wall, and so on back again to the first stake.

Dale Van Horn.

Legal Department

APPLYING the mechanics' lien law of Pennsylvania the Supreme Court of that commonwealth recently said in the case of Dyer v. Wallace, 107 Atlantic Reporter, 754:

When are Pennsylvania Architects Entitled to Mechanics' Liens?

"The services of an architect in preparing plans cannot be made the subject of a mechanic's lien . . . except in connection with other services rendered in the construction of the building. . . . A construction of the act of June 1, 1901 (P. L. 454), that would extend its benefits to an architect, merely for preparing plans, would render it invalid as a special law for the extension of liens, or as changing the method for the collection of debts, in contravention of section 7 of article 3 of the Constitution of 1874. . . .

"A mechanic's lien can be sustained only for work done or materials furnished, and not for unliquidated damages for breach of contract."

It was decided in this case that plaintiff, an architect, who had been engaged to supervise the construction of a manufacturing plant for 10 per cent. of its total cost, and who, before the work was completed, was discharged, might file a lien against the plant for the value of the work actually done, coupled with an averment that full performance of the contract had been prevented by the owner.

AN interesting decision of the California District Court of Appeal, handed down in the case of Harris vs. Central Union High School District, 188 Pacific Reporter, 617, shows that where a public board has definitely accepted an architect's plans and specifications, it can not afterwards revoke the acceptance without liability to the architect for his compensation.

A Binding Acceptance of An Architect's Work

Defendant school district's board of trustees invited architects to furnish plans and specifications in detail for a proposed addition to a high school building, stating in the notice that the board would award to the architect whose plans were adopted a specified premium and compensation. On considering the plans and specifications submitted, the board accepted those submitted by plaintiff "when modified and changed to the satisfaction of the board." Afterward the board purported to rescind its action in accepting plaintiff's plans and specifications. But the court approves a finding of the trial judge that there was an acceptance of plaintiff's work, entitling him to be paid the agreed compensation. Concluding its opinion the District Court of Appeal says:

"We do not doubt that the board of trustees of a school district, having authority to contract for the construction of a school building, may, in making its contract with the architect or with the contractor, reserve the right to make alterations during the progress of the work, so long as the general plan of the building is not changed. That appears to be the kind of reservation intended in the present case, and this was not inconsistent with a complete acceptance of the proposed plans and specifications."

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

THE decision of the West Virginia Supreme Court of Appeals handed down in the late case of Parker Paint & Wall Paper Co. v. Local Union No. 813, (105 S. E. 911) will prove to be a very important judicial precedent on the subject of improper picketing methods adopted by trades unions against employers and persons with whom the employers have contracts.

Unlawful Methods of Building Trades Unions

"It is not clear just what reasons dictated the acts complained of in the bill. If for the purpose of compelling plaintiff to withdraw from membership in the Master Painters, it is unlawful. Plaintiff is as free to join an organization for the lawful furtherance and protection of its affairs as are the members of the Local Union No. 813 to become members of that organization, designed for their protection. If for the purpose of preventing a member of the Master Painters from laboring with his hands in performing his own contracts, it is unlawful. A man's labor is his most sacred asset. It is often his only capital, and as long as he exerts it without injury to others government will protect him. A government which imposes taxes and other public duties, even going so far as to demand life for its defense, and which will not protect its subjects in the 'enjoyment of life and liberty with the means of acquiring property and of pursuing and obtaining happiness and safety,' is not worthy of the name of government, nor of the support of its subjects."

In the West Virginia case, differences arose between members of the Master Painters' Association at Huntington and members of a journeymen's local. Plaintiff, a corporate master painter, and the union accordingly fell out, and the union undertook to carry its point by interfering with plaintiff's contracts.

It is found by the court that defendant and its members caused plaintiff to lose contracts by picketing the places of business where plaintiff's employees were at work, etc. The following excerpts are taken from the

Digitized by Google

opinion of the Supreme Court of Appeals, upholding plaintiff's right to injunction against defendants:

"There can be no question of the right of the defendants to form a union for their mutual protection and advantage, and enlarge their union by inducing others to join for this legitimate and proper object; but there can be no question, on the other hand, that this right must be so used as not wantonly to conflict with the rights of others. The same is true of the Master Painters' organization. . . If one person wantonly or maliciously, whether for his own benefit or not, induces a person to violate his contract with a third person to the injury of that third person, an action will lie. . . The bannering of the 5 & 10 Cent Store, charging it with being unfair to union labor, and unfair to union painters, could be for the purpose only of causing that store to break its contract with plaintiff. . . .

Authority of Members of Building Committees

A DECISION of the Texas Court of Civil Appeals will serve to remind architects and engineers who have dealings with public corporations, church and fraternal organizations, etc., of the importance of ascertaining the full authority of one or more members of a building committee who pretend to have authority to contract on the part of their corporation or organization.

In this case—Allen vs. Grand Lodge of Colored Knights of Pythias of Texas, 221 Southwestern Reporter, 675—it was held that defendant organization was not bound by a contract purported to have been entered into on its part by a subcommittee of its building commission. In denying plaintiff's right to recover on his claim for additional work performed at the instance of the subcommittee, the Court of Civil Appeals said:

"If the plaintiff was entitled to recover anything in this case under his pleadings, it was upon a verbal contract with the agents of the Grand Lodge. It is not pretended that he made any contract with the lodge itself, but that the contract was made by its authorized agents. The right to contract was vested by the Grand Lodge in a commission, consisting of six members.

"It is not pretended that the contract sued on was made by the commission, acting as a body. It is insisted that a subcommittee made the contract with plaintiff. The Grand Lodge made the six commissioners its joint agents. Authority conferred on two or more to represent their principal in the transaction of business of a private nature it ordinarily will be presumed was conferred upon all from considerations of a personal nature, and in order to derive the benefit of their combined experience, discretion, or ability. Such business usually can be performed only jointly unless an intent appears that it may otherwise be executed."

Unsatisfactory Work Done by Subcontractor

IN March, 1917, I contracted to build a bungalow for $2,340," writes a North Dakota contractor and builder. "The work was done under plans and specifications furnished by the owner. I sublet the foundation and basement floor to a cement man. The house was completed, accepted and occupied in September, 1917. The last payment on the price was made one year later. Some time in 1918 a patch of the cement floor heaved up and crumbled, having the appearance of air-slacked lime. I notified the subcontractor and he took out the bad floor and put in a new floor. In March, 1920, the owner's wife desired some changes made in the house. I did this work and charged $130, but the owner refuses to settle until I again have the cellar floor repaired; it appearing that the floor had again crumbled. The subcontractor refuses to repair the floor, claiming that there is alkali, or some other chemical, in the ground which destroys the cement. Now, what will be the square thing for me to do?"

If the floor can be repaired at an expense less than it will cost to sue the owner or the subcontractor, or both, we would advise fixing the floor, on condition that the owner give a final release of all further responsibility on account of the building. It may be that the subcontractor, in the same spirit of fairness, will stand one-half the expense of the repairs. These suggestions are made with a view to an amicable adjustment without litigation.

The legal principles governing the case seem to be clear, leaving nothing but questions of fact to be solved should litigation follow.

Of course, any defect in constructing or repairing the cement floor constitutes no defense to the owner's liability for the additional work covered by the bill the contractor is now seeking to collect.

But, if the floor was not constructed or repaired in a good and workmanlike manner, the owner can counterclaim damages sustained by him. The amount of such damages would be the cost of putting the floor in proper condition.

The contractor is liable for any failure on the subcontractor's part to construct or repair the cement floor properly, just the same as if the work had been done by the contractor himself.

So, the decisive question is whether the work was properly done. If so, the owner's suit or counterclaim for damages must fail. If not, the owner is entitled to recover. In that case, the contractor's only recourse is to come back on the subcontractor.

It seems that the owner never disclosed until late in 1921 that he made any claim that the floor had again proved to be defective, although the floor had been repaired some three years previously and although the contractor had been employed in the meantime to do other work on the building. These circumstances will have strong tendency to show that the owner's present claim is unjust. In any event, the burden will be on him to prove that the floor was not constructed and repaired in a workmanlike manner. That the work was properly done can be established on the part of the contractor by showing that proper materials were used and applied in proper manner.

But litigation involves time, expense and worry, and that is why we suggest that a spirit of fairness may lead all three parties to reach a compromise which will leave all of them in better condition than if suit were prosecuted.

"The proof does, indeed, show that at that time conditions were such not only in Little Rock, but everywhere, that labor as a whole was inefficient, but it does not show that efficient labor, but skilled and unskilled, could not be obtained at the prevailing schedule of prices.

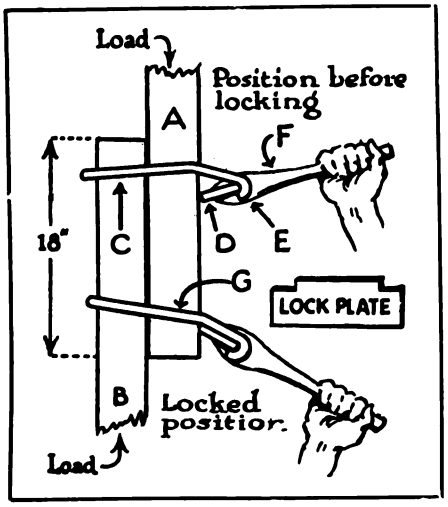
"The proof also shows beyond a doubt that this lowering of the efficiency of labor began more than a year before this contract was entered into, and if it increased after that time it was only in degree.

"At any rate, we think that under the contract the selection of efficient labor was one of the things that appellants undertook, and it was not exempted from its guaranty on account of losses from that cause.

"The interpretation of the contract must be drawn from its own language and the peculiar circumstances of the case. It is therefore unnecessary to cite authorities announcing general principles of law on this subject."

Violation of Compensation Law

ONE of the heaviest penalties yet imposed on an employer for violation of the Workmen's Compensation Law in New York State was that of the case of a builder of Queens, Long Island, N. Y. He was sentenced recently to sixty days in jail for failing to provide adequate insurance for his employees, quite a costly lesson.



An inspector of the State Industrial Commission of New York made the complaint against this contractor. It would seem that builders would take care of this matter for their own financial interest, if not for humanitarian reasons.

WHAT'S NEW

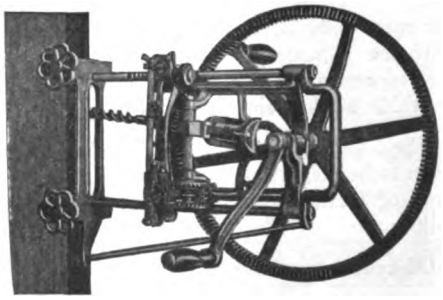
New Materials and Equipment that Keep Your Work Up to Date

Useful Timber Clamps

TO eliminate spliced joints, nailing, sawing and wedging, in the erection of scaffolds and forms for concrete work, the clamp pictured above will be found very useful, as it is low in price, easily applied and easily taken down. These clamps are made by the Schenk Timber Clamp Corporation of 501 Fifth Avenue, New York City.

They are made in sizes to fit 2x4, 3x4, 4x4, and 2x6 timbers. To operate, first place two timbers A and B together in such a manner that they will have an overlap of at least 18 inches and with the *direction* of their loads indicated by the arrows; namely, with the load on *A* downward and on *B* upward.

Next, place the steel loop *C* of your Schenk Clamp around both timbers and place the two niches in lock-plate *D* into the hooks *E* on both sides of the loop as shown in the illustration.



Next, insert the lock-plate between the jaws of the wrench *F* and pull downward. This locks the clamp securely and fastens the timbers together in such a manner that the joint is the strongest part of the structure. The greater the downward and upward load on the two timbers the tighter the grip of the Schenk Clamp. This can be seen at *G*, which shows the clamp in the locked position.

Door Mortiser

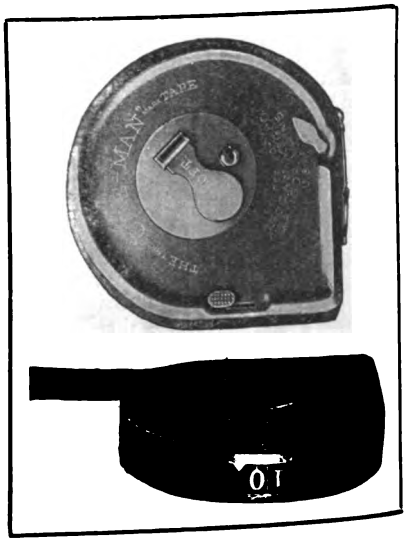
MAKING the mortises for door locks is no hard job to the experienced man, but it takes time. With the simple machine pictured here, the complete mortise ready for the lock can be made in 2½ minutes without the use of brace and bit or chisel.

This machine, which is made by the Enterprise Mortise Machine Company of Columbus, Ohio, is simply operated. To operate it is simply clamped to the door, etc., which is to be mortised and as it is adjustable, different sized mortises from 1½ in. to 6 in. long and any depth to 3¾ in. with all size bits from 1¼ in. to 1 in. can be made.

The complete mortise is made without moving the machine after it is set to the size of the mortise required.

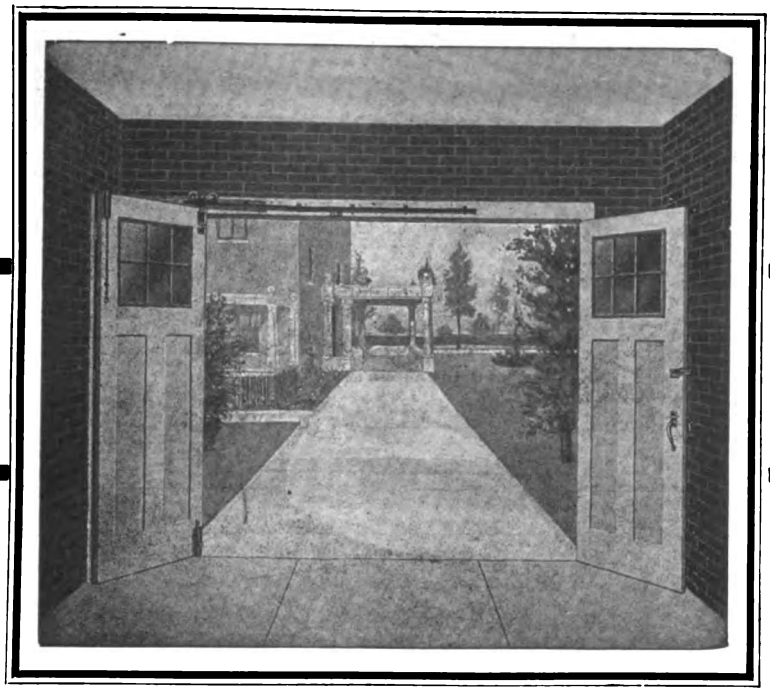
Turning the main gear runs the bit at a high speed and turns the oscillating screw that carries the bit up and down through the mortise; the rotation of the oscillating screw is reversed at any point automatically by the bit arm striking a pin at top and bottom of movement. These pins are moved together or apart by turning one thumb nut at top of mortiser, thereby changing the length of mortise as desired; the movement of bar that carries these pins imparts a rotation movement to the feed spiral and causes the bit to be fed forward into the wood at top and bottom of mortise.

This feature locks the bit so it can not draw in when it strikes a hole or soft wood, nor push back when it strikes a dowel pin or knot.



The "One Man" Tape

THE ordinary steel tape has been replaced by a practical and more useful steel tape, the "One Man" Tape, which, as the name suggests, can be easily and accurately operated by a single person. It is made by the A. S. Aloe Company of St. Louis, Mo.



This type of a tape has many advantages over the old style tape for obtaining accuracy in readings on both inside and outside measurements. The grasping cam lock retains the measurements after they are taken and the winding drums inside the casing are improved so as to present slack or back-slack in the line. The cases are formed from solid brass, heavily nickeled, insuring the tape for long wear under hard usage.

All projecting parts on the case are so arranged as to fold and lock in place, leaving the surface of the case free from sharp points and edges that would scratch the hands or tear the pockets.

Anyone who has experienced the trouble of obtaining measurements single handed with an ordinary tape knows the difficulty only two well and we do not need to dwell on them. This new invention, therefore, will be truly welcome.

Efficient Service—

NATIONAL GARAGE DOOR sets are built right—Skillfully designed and carefully constructed they stand, ever ready to give 100% of Real National Service.

These garage door sets work as freely and as easily as any house door—simply push and the doors are open; a slight pull and the doors are closed.

There is absolutely no binding or friction, and the doors are adjustable in case of swelling or raising of cement floor.

National service is the best service you can offer your customer.

Send for our garage plan booklet "F" and give dealer's name.

Slate Roofing

SOME very practical information on the use of slate for roofs is contained in a booklet just issued by the Vendor Slate Co. of Easton, Pa.

The information is given on selection, estimating and specifying slate roofing, together with detailed drawings and directions showing the proper way of laying slate so as to obtain different effects.

This interesting book of twenty-four pages will be sent to any builder interested.

How to Apply Hardware

SEVERAL useful booklets have just been issued by The Stanley Works, New Britain, Conn., showing by means of detail drawings, the proper application of butts, bolts, blind and shutter hardware, garage hardware, screen and storm sash hardware, etc.

These booklets will be sent to any of our readers who will write for same. They are very well illustrated and contain some very valuable data.

Steel Toilet Partitions

INSTEAD of marble or slate, toilet partitions are now being made of steel. They are sanitary, easily kept clean, nonbreakable, have an excellent appearance, are easily erected and moderate in cost. Any builder who has a school job or other public building to construct will do well to have the new catalogue issued by the Hart and Hutchinson Co. of New Britain, Conn., as it contains some valuable information about such partitions.

Brick Houses

A SUPPLEMENT to "Brick for the Average Man's Home" has just been issued by the Common Brick Manufacturers Assn. of America, Cleveland, Ohio.

This supplement contains twenty designs of artistic brick houses and is sent free to anyone having the earlier book "Brick for the Average Man's Home."

Floor plans are given for each house giving dimensions for all the rooms.

Built-In Ironing Board

THE builder who desires to make a success will be on the lookout for different appliances that will please his customers.

A device of this kind is described in a circular just sent out by the National Mill & Lumber Company, 2 Rector Street, New York. It describes their National Built-In Ironing Board, which comes in a cabinet containing the folding iron board with separate sleeve board and three shelves for laundry supplies.

This is a built-in device that is installed while the kitchen is being built; and they also have a similar device to install in kitchens already built.

As there is a useful hint here, it is worth while sending for this circular.

Useful Catalogs

ON this page we give short descriptions of some very interesting catalogs, etc., that have just been issued by different manufacturers.

They will be sent free on application to any of our readers who are interested, but should you prefer to write us, give the date of this issue and title of the catalog desired, and we will have them sent to you.

Wiring Device

A RATHER interesting catalogue has just been issued by the Arrow Electric Company of Hartford, Conn., describing their complete line of wiring devices for modern homes and other buildings.

The builder should be posted on all sorts of electrical equipment and in his building he should provide enough outlets and proper wiring so that many electrical appliances can be readily attached.

Paints and Varnishes

SOME very useful information is given in the descriptive catalogue issued by John Lucas & Co., Inc., of Philadelphia, Pa. This interesting catalogue of 90 pages will be sent to any of our readers who are interested.

Garage Hardware

IN an interesting catalogue of sixteen pages, issued by the McKinney Mfg. Co. of Pittsburgh, Pa., they describe the complete hardware for various types of garage doors—double swinging, sliding and folding, also combinations of the above.

A copy of this booklet in your files may help you solve a troublesome garage door problem put to you by one of your customers.

It is best to be informed as to what can be obtained in this line and you can receive a copy of this catalogue by asking for it.

About Saws

SOME very interesting information is contained in the booklets published by E. C. Atkins & Co., Inc., of Indianapolis, Ind.

Among these, we may mention particularly the ones on cross cut saws, saw sense, and the hack saw chart,—the latter showing the right blade to select for every kind of work and metal.

These interesting booklets and chart will be sent to any reader interested.

Builders Hoists

A RATHER interesting catalogue of sixteen pages has just been published by the Brown Clutch Co. of Sandusky, Ohio. It lists the different hoists they manufacture from the single drum hoist up to large double drum hoists. Some very useful information is contained in this interesting catalogue.

Waterproofing

VALUABLE indeed is the book of specifications on the subject of waterproofing, dampproofing, oil proofing, floor hardeners and protective finishes for concrete surfaces that has just been issued by the Trucson Laboratories, Detroit, Mich.

The book contains fifty-two separate specifications of methods and materials of properly coating concrete work, also steel and wood work.

It is a valuable hand book and will be sent to any of our readers who wish to guard against troubles from dampness.

Home Water Systems

IN localities where water under pressure is not obtainable, a house may be supplied with fresh running water direct from the well or cistern, by the use of an automatic pump.

An interesting catalogue has just been issued by F. E. Myers & Bro. Co., of Ashland, Ohio, describing their direct water system. They have a complete automatic system operated by electric motor with a sufficient capacity to pump directly against the faucets such as are contained in an ordinary residence. The opening of any faucet automatically starts the pump.

This interesting catalogue will be sent to any of our readers who may be interested in installing a water system.

Artistic Mantels

NOTHING adds so much to the charm of a well designed room as a properly proportioned open fireplace and mantel. It will therefore interest builders to secure a copy of the new catalog of the King Mantel and Furniture Co., Gay St., Knoxville, Tenn. It contains many period and modern designs of mantels and fireplace fixtures, besides some very useful data. It certainly is worth while sending for.

Electrical Outlets

IN building the modern home, particular attention should be paid to the electrical wiring, both for present and future use.

Sufficient outlets should be provided in all the different rooms for attaching various electrical appliances. A most interesting catalogue on these wiring devices has just been issued by the Bryant Electric Co. of Bridgeport, Conn., and builders would do well to have a copy so as to acquaint themselves with the newest things in this line.

Residence in Country Club District, Kansas City, Mo. Redwood Siding, painted white. Built by the J. C. Nichols Investment Co. Edward W. Tanner, Architect.

Residence and Garage at Belmont, Mass. Redwood Siding, painted white. Built by George Almgren. George Reid, Architect.

Residence at Des Moines, Iowa. Redwood 8-inch Colonial Siding, painted white.

Residence at Highland Park, Ill. Redwood Special Sawn Shingles, painted white. Robert Seyfarth, Architect.

Homes of Redwood from Missouri to Massachusetts

REDWOOD'S resistance to rot and its consequent lower annual cost for repairs and repainting give the builder the strongest selling point. For every unit and part of the exterior of a frame house you can secure T P L Co. Redwood lumber and milled products to meet all requirements of design and construction.

During the growth of Redwood every fibre is permeated with a *natural*, odorless preservative which permanently protects it against all forms of rot and decay.

Containing no pitch or other highly inflammable resinous compounds, Redwood is slow burning—reduces the fire hazard wherever used. A uniform cell structure free from pitch or other substances gives Redwood a remarkably good painting surface,

The high proportion of clear lumber, its soft texture and good wood-working qualities keep waste at a minimum when you use Redwood.

You may be surprised to know that the price of Redwood compares favorably with the prices asked for wood that cannot compare with Redwood in resistance to rot, high percentage of clear lumber and for freedom from warping, swelling and shrinking.

Use these selling points and you will find that using Redwood you can get better prices.

Redwood should be specified for

Exterior Construction

Including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish

Natural, stained or painted. Wood block floors.

Industrial Uses

Tanks and vats for water, chemicals and oil—factory roofs and gutters—wood block flooring.

Wood Specialties

Such as—Caskets and burial boxes—incubators and ice-cream cabinets—cigar and candy boxes—furniture manufacturing, etc.

Railroad Uses

Such as—Railroad ties and tunnel timbers—signal wire conduits and water tanks—car siding and roofing.

Farm and Dairy Uses

Such as—Silos, tanks and troughs—hog feeders and implement sheds—wood block floors, etc.

For the convenience of builders and architects we have prepared our "Construction Digest" and our "Engineering Digest." They will be sent free on request by either our New York or Chicago office. Write for them.

PAINTING

Practical Points of Interest to the Builder

Saving Time When Painting

By DALE VAN HORN

NO other attention quite so enhances the value and appearance of the home buildings as a good coat of paint. There are but few who do not realize this and yet, knowing this to be true, many fail to apply the brush as often as it should be applied.

One reason for the wanton neglect of some cases is the fact that some do not go about a painting job in the right way. Viewed with apprehension at the start, it looms up bigger than it really is, but when a few ideas for saving time and labor are put into practice, an apparently difficult job dwindles into a commonplace chore and an enjoyable one at that.

Below are described and in the drawings illustrated a few ideas which may be utilized to advantage when painting roofs or other surfaces of buildings. Each one or more may be adapted to any one job.

When leaving off over the noon hour or at night, it is customary to drop the brush in the pail of paint or lay it on a board. Figure one shows a better method. Cut a piece of tin or sheet iron of about the shape of a mower section, but only an inch or so each way. Tack this on to one side of the brush just above the base of the bristles and bend the free end out slightly so that it will slip easily over the edge of the pail. When leaving work for a short time slip this over the rim of the pail. This leaves the bristles immersed in the paint, and prevents bending of the bristles and at the same time keeps the rest of the brush out of the paint. When in use the tin does not interfere in any way with the manipulation of the brush.

Many jobs are done almost entirely from a ladder. A nail driven into the side of the ladder is a handy way to support the paint pail, yet lacks some marks of being entirely satisfactory. On straight siding work a hook such as is shown in figure two may be found superior to the other method of a nail driven in the side of the ladder, or a small shelf on the ladder either. This consists of two small iron rods one quarter of an inch in diameter, one riveted to the other. One end of the horizontal rod is flattened and bent at right angles to the rest, and this is slipped under one edge of one of the siding boards and the hooked end of the brace rod set against the surface lower down. This will readily support a gallon pail full of paint in any condition and has the advantage of being easily placed where desired from time to time and in a jiffy. The hole through the horizontal rod need not be larger than is necessary to take a shingle nail, which can be used for the rivet.

Figure three shows two devices which will come in handy when painting roofs. The question of properly supporting a pail full of paint on a steep roof sometimes seems a big one and it becomes necessary to provide some sort of a support which is easily moved and which will not slip. The support shown consists of a piece of one-inch board ten or twelve inches square. Two six penny nails are driven through the back side, one at each corner, and through the corresponding corners on the front are driven spikes. The difference in the lengths of these two sized nails will more than make up the pitch on an ordinary roof.

In connection with this support, two others somewhat similiar in action should be made for the painter. If the pitch of the roof is slight and the surface dry, which of course, it must be, a pair of rubbers may be all that is necessary to prevent the feet of the painter from slipping. Under other circumstances, however, it becomes necessary to provide secure footing of some sort.

BUSINESS GETTING METHODS

Ideas that have worked for others

Desirable Publicity and How Obtained

Interesting Paper Presented at Secretaries Conference of the National Association of Builders' Exchanges

By J. HALE PARDONNER
Secretary the Dayton, O., Builders' Exchange

PUBLICITY in connection with the building game is one of the remedies for the many troubles which confront the builder of today.

The ignorance of the public as to the general conditions pertaining to situations both in material and labor is of such dense character that it is almost impossible for the builder to get across the most fundamental ideas which concern the building public.

In other lines of industry the layman has a fair general knowledge of conditions, such as the coal situation and the railroad situation, but the building industry which ranks among the largest in the country is a black fathomless ocean.

The only remedy for these conditions is the proper kind of persistent publicity. This object is sought very keenly by a few of the different branches of the building industry, among them being the cement industry and the lumber industry, but these are only units in the big system, and it will require concerted effort on the part of the building industry as a whole to attain this object.

The combination of building and real estate is ideal from the publicity standpoint, as the two lines of endeavor are so closely allied that they will work together to their mutual advantage. It has been found that where publicity is carried on by a co-ordinated committee from both the builders and the real estate men that the public in general is greatly benefited, and as a result the builders themselves.

The ideal situation would be to have a real estate board or a committee act in conjunction with the Builders Exchange, appointing a representative on a salary basis to handle this matter. If it is allowed to be carried on by one or two members of each branch independently, it has been found after a time both branches will fall down and the public will lose interest.

It is a situation that requires very skillful handling on the part of advertisers and the person to whom this duty is delegated should have this and nothing else to look after.

The creation of a building and real estate page as a weekly event in one or more of the newspapers of a community, establishing an information bureau to which the prospective builder can go for unbiased information should be carried on.

This page should be conducted so that it contains editorial matter which is absolutely free from any self-advertisement of any individual or firms, and also should contain live news of the day as to the progress of construction of real estate in the vicinity as well as advertisements of firms interested in this work.

Public opinion can be established and sentiment moulded, thereby creating a buying impulse when times are right. Further, many of the unreasonable things to which builders are subjected can be brought to light and cured by an airing in the public eye.

The advantages of publicity are too many and undeniably beneficial for anyone to argue against the use of this means as a furtherance in the development of the industry.

In this state of age of affairs too much stress cannot be laid upon the benefits which are accrued from a logical, consistent and concentrated effort to acquaint the public with the many phases of the building industry with which they are directly connected although in ignorance of this connection.

This is a matter of tense study on the part of special committees, and we would recommend that they be appointed from both real estate boards and builders exchanges in all communities.

> ONE of the most desirable things for any business is proper publicity. Let the public know something about your work and methods.
>
> Co-operative advertising is what is needed, the cost is evenly distributed and all benefit.

YOUR Needs—complete.

If you use sheet metal of any type, we can furnish a product specially adapted to your requirements. We combine good materials with the most approved manufacturing methods.

KEYSTONE
COPPER STEEL

Copper is the anti-toxin for sheet metal rust. Properly proportioned, it puts into sheet metal building products a new measure of endurance and resistance to rust that cannot be attained without its help. Keystone Copper Steel assures more lasting and satisfactory construction. Its use is strictest economy.

Use Apollo-Keystone Galvanized. Shall we send new Weight Cards and Apollo Calendar?

For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use Keystone quality Galvanized Sheets and Roofing Tin Plates. Time and weather prove it best for both builder and owner. Sold by leading metal merchants. Look for the added Keystone.

Write for booklets describing Keystone Copper Steel Sheets, Formed Products, and Terne Plates.

News, Notes *the* Comment

Lectures on Building Materials

NEW YORK University announces a series of lectures on the geology of commerce and industry.

There will be several lectures on building materials, taking up the subjects of the American building stone industry; the lime and cement industry; brick, tile and associated clay, gypsum and plaster and the various roofing materials.

This interesting series of lectures will be given during the Fall term, on Wednesday evenings at 8 P. M., beginning September 27th.

Any of our readers who are interested can write to the Secretary, New York University, Washington Square, New York, and full information will be sent.

Built-in Kitchenettes

THERE is a large demand today for small apartments and the old time kitchen that was thought to be an absolute necessity has given way to the kitchenette, in the equipment of which some very handy space saving fixtures are employed.

Quite a novel arrangement is a kitchenette consisting of sectional steel cabinets that will fit into small space. These steel cabinets are 18 in. deep, 30 in. wide and 82 in. high, so that they fit into a closet 7 ft. high and less than 2 ft. deep.

One cabinet contains a three burner gas range with broiler in oven with a drawer below and a cabinet above. Another section contains a substantial refrigerator with a cupboard on the top. Above the refrigerator is a draw shelf covered with zinc which forms a small but useful work table when pulled out.

These different steel units can be arranged in different ways so as to make any desired combination. The regular sink is placed either between two units or to the one side if desired and the whole arrangement may then be closed in by folding or sliding doors, an arrangement often desirable at one end of a living room, as when the doors are closed it is entirely out of sight and does not interfere with the appearance of the living room.

In combination with an in-a-door bed it is possible to have an one-room apartment with the conveniences of living room, dining room, kitchen and bedroom. This, in connection with a bathroom and closets for clothes and bed surely makes an "apartmentette."

Book Reviews

The Design of Steel Mill Buildings by Milo S. Ketchum; published by McGraw Hill Book Co., New York. Price $6.

This is the 4th edition of this book. For present edition, the entire book has been rewritten, and in its present shape is a valuable contribution to the designer or architect of structural work. The calculation of stresses is carefully gone into and in natural sequence the design and construction of steel framework is considered. The subject of trusses is carefully gone into and simply explained. Even though it is a short chapter, the one on steel mill erection is replete with some very valuable information. Different specifications and notes on details are given to make the book a rather complete and valuable hand book.

* * *

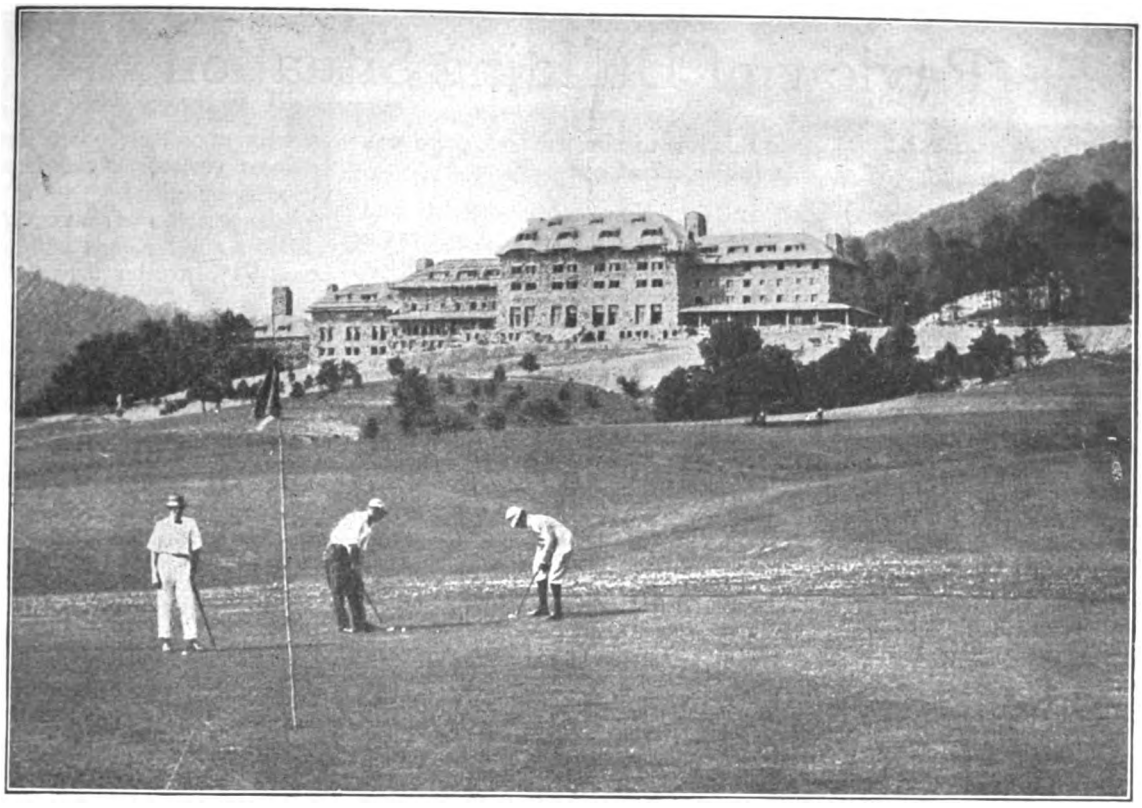
The American House Edited by Charles J. Keefe; published by the U. P. C. Book Co., 243 W. 39th St., New York. Price $10.00.

This is quite an elaborate book with pages 9″ x 12″ in size, so that illustrations of large size can be used. It is a collection of illustrations of the best type of American Houses and indicates the high standard of our present domestic architecture. Examples of the different various styles has been included and these have been separated in different sections. 219 different plates are shown and everyone is accompanied with a brief description. Both exterior and interior views of the house are shown and it will form a very valuable book for the builder and architect as it abounds with illustrations of the best work. The book is especially well printed on heavy paper and bound.

Good Houses by Russell F. Whitehead architect, published by Weyerhauser Forest Products, St. Paul, Minn. Sent free.

A very attractive and valuable book of 64 pages that contains examples of the different domestic architectural styles. This to most people is the most popular problem that confronts the intending builder. The idea of the book is to help people determine what kind of a house will lend itself best to the site and conform to one's mode of life. The different types of architecture are described as well as the English, Italian, Spanish, Swiss, bungalow types, etc. The book is exceptionally well written and contains some very practical information that was certainly the result of a good deal of study on the part of its author. The illustrations are exceptionally good.

* * *



Modern Plumbing Illustrated by R. M. Starbuck; 407 pages, 6″ x 9″; cloth bound; price, $5.00; published by N. W. Henley Pub. Co., New York.

This is a comprehensive and practical work on the most approved methods of installing plumbers work. It is exceptionally well illustrated and the diagrams in each case have been specially drawn by the author for this book. Practically every method of installing plumbing fixtures has been taken into account. It is a valuable book on the subject and building contractors can read it with a good deal of profit, as they will have a better idea of right methods.

School for Building Mechanics

PRATT Institute announces the opening schedule of evening classes for the Fall Term beginning Thursday evening, September 21, 1922. Classes will be organized for carpenters and other woodworkers for the study of roof framing, stair building and steel square problems under the personal supervision of Mr. R. M. Van Gaasbeek. Circulars of information and application blanks will be mailed to all readers of the BUILDING AGE upon request by addressing Pratt Institute, Grand Avenue, Brooklyn, N. Y.

GROVE PARK INN, ASHEVILLE, N. C.

Would rather do without carpets than

BRASS PIPE

"When I built Grove Park Inn," says Mr. F. L. Seely, President of the Corporation which owns this famous resort hotel "I profited by the mistakes I understood other hotels to have made, and every inch of hot water piping in the Grove Park Inn is Brass. After ten years of service it is exactly like it was the day it was put in.

"And if I were building a cheap commercial hotel instead of Grove Park Inn, the finest resort hotel in the world, I would install Brass hot water lines if I had to go without carpets on the floor, for I have seen the troubles other hotels have had."

Mr. Seely adds that he used Brass pipe in the building of his home also and that he does not believe the equipment "will be any different a hundred years from now than it is today."

"Brass is cheaper because you pay for it only ONCE"

Review of Building Situation

BUILDING statistics for June just published by F. W. Dodge & Co. show that the volume contracts awarded are but little less than that of the record month of May, it being only 5% under the May figure, but 52% increase over that of June 1921. The total of contracts awarded amounts to $343,439,800.

Residential construction still keeps in the lead, in fact, for the six month period of this year, this class of construction accounted for 40% of the total to date and this is 89% ahead of last year's figures. As was to be expected, there is a decline in the amount of contracts awarded but the surprising part is that it was so slight. This indicates continued building activity for the balance of the year.

There has been quite an increase in industrial buildings in all the Eastern States. In the Chicago district, which showed an advance last month in this line of construction, there was a falling off of over 40%.

In the New York district and Middle Atlantic districts there was a substantial increase in the amount for residential construction. In all the other states, there was slight decreases in this line of construction.

As we have passed the first half of this year, it is interesting to know the following figures: Total amount of construction for which contracts awarded for the first six months of this year, amount to $1,690,984,000 which is by far the highest figure for the first half of any year on record, it being 89% greater than the corresponding six month period in 1921. Of this vast sum of money which is being spent for construction this year, $682,663,000 was for residential construction, this being an increase of 89% over that of the corresponding period of 1921.

As pointed out by us, during the past few months, the best sign of the business revival is the demand for business buildings. During this six months period, the sum of $280,329,000 was for business buildings, this being 94% greater than that of last year.

School building is keeping pace with the progress of the times, the sum of $164,641,000 being spent for additional buildings which is 58% greater than that of the corresponding period of 1921. Other lines of construction show equally as great improvement.

The vast amount of residential construction in the Eastern States would seem to have filled all requirements for some time to come, but evidently many more homes are needed and will be erected before things in these sections become normal again. It certainly is a most gratifying sign for the builders of the East to have this amount of work in contemplation.

Record of June, 1922, Building Contracts Awarded

ATKINS
SILVER STEEL SAWS

Straight Back, Skew Back, Old Style or New Improved Perfection Handles

On this page we illustrate four patterns of saws which are liked by many carpenters. If you do not see any that YOU like, write for our Saw Sense Book.

Our trade mark is etched on all Silver Steel Saws and it serves to identify us as progressive saw makers who apply skill, art and science in the production of them.

The methods we employ in the manufacture of Silver Steel Saws is your assurance of obtaining "The Finest on Earth," in saws at a fair price.

If you want service you can get it in Atkins Saws, the Saws that you can count on to do your work well, Saws that cut clean, fast and smooth, Saws that give you the most service with less filing.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

NEW YORK PRICES

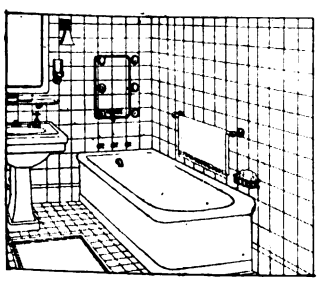
BUILDING MATERIALS

VAN GUILDER DOUBLE WALL CO., INC., 20 Engineering Bldg., Rochester, N. Y.

Founders of The Double Concrete Wall

Over eighty Subsidiary Building Companies. New ones organizing continually. The builder controls company and territory. A saving of over one-half the labor cost.



The cost of machines is not the question. It is the quality and cost of the finished product.
We train all our companies; Successful construction Assured.

We have no competition; absolutely in a class by ourselves.
We advocate all Fireproof Construction for the conservation of life and property in the Home.

Established 12 Years

The Carnegie Steel and the Cambria Steel Companies have invested about a MILLION DOLLARS in Van Guilder Double Wall Concrete homes. *Write for particulars*

The
Complete Family Shower Without Curtain

This no-splash shower with its converging streams makes the ideal bath for all the family.

A Kenney Shower, Congress Model, as shown, installed over the end of any built-in tub, makes the complete modern bathing unit. This fixture is moderately priced; and requires the minimum amount of labor to install.

See display at your plumbing contractor or supply house, or write us.

Send for Catalogue. A Kenney Shower, portable or stationary model to meet every need

The Kenney-Cutting Products Corp.
507 Fifth Avenue **New York**

Note its ruggedness

The Bessler Movable Stairway is built for service. Strength and sturdiness are incorporated into every part.

In addition, it is a space saver and is cheaper than a stationary stairway. It can be easily and cheaply installed. Let the Bessler solve the problem of attic space. Add another room to the house you are designing.

ARCHITECTS' SPECIFICATION HAND BOOK

Truscon Company, Detroit, Mich.

270. 52-page paper-bound, loose-leaf specification book. 8½ x 11 in.

ASBESTOS PRODUCTS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

1. *Ambler Asbestos Shingles. Catalog* 5½ x 8½ in. 40 pp. Illustrated.
2. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 36 pp. Illustrated. Standard Purlin Spacing Tables.
3. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.
4. *Ambler Asbestos Building Lumber.* Catalog, 8½ x 11 in. 32 pp. Illustrated.
5. *Engineers' Data Sheets.* Catalog, 8½ x 11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

ASBESTOS ROOFING—See also Roofing

ASH HOISTS—See also Hoists

ASH RECEIVERS

Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.

7. *Catalog E.* Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.
8. *Catalog F.* A book for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with tables of dimensions for installation. 8 pp. Ill. 6 x 9¼ in.

BALANCES, SASH

Caldwell Mfg. Company, The, Rochester, N. Y.

9. *Suggestions for the Present-Day Architect.* Booklet, 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.

10. *Catalog* describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS

American Saw Mill Machinery Co., Hackettstown, N. J.

11. *Catalog No. 22* describing a general line of band saws of various sizes.
12. *Technical Data.* Four-page folder, 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires. Proper size for filling.

Crescent Machine Co., Leetonia, Ohio.

241. Descriptive 144-page Catalog.

BAR BENDERS AND CUTTERS

Koehring Company, Milwaukee, Wis.

13. *Four-page folder,* giving illustrations and sizes of Koehring Bar Benders and Cutters.

BATHROOM FIXTURES

Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.

BEDS

Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.

BOILERS—See Heating Equipment

BOOKS

American Technical Society, 58th and Drexel Blvd., Chicago, Ill.

Architectural House Planning Service Co., 20 So. 18th Street, Philadelphia, Pa.

Arrow Book Company, 347 Fifth Avenue, New York City.

U. P. C. Book Co., 243 West 39th Street, New York City.

BLUE PRINTS

Peerless Blue Print Co., 347 Fifth Avenue, New York City.

BRICK

American Face Brick Association, 110 South Dearborn Street, Chicago, Ill.

15. *The Story of Brick.* Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Sent free.
16. *A Manual of Face Brick Construction.* The history of brick making, types of face brick, showing details of construction for walls, chimneys and arches. Details of use of tile and brick construction and different types of bonds are given. A series of plans and elevations of small brick houses, descriptions, useful tables and suggestions are illustrated and described. Size 8½ x 11 in. 116 pp. Price $1.00.
17. *The Home of Beauty.* A booklet containing fifty prize designs for small brick houses submitted in national competition by architects. Texts by Aymar Embury II, Architect. Size 8 x 10 in. 72 pp. Price 50 cents.
18. *Architectural Details in Brickwork.* Three series of beautiful half-tone prints of brickwork detail, contained in closed folders suitable for standard vertical letter file. The three series contain 124 prints in all. Size 8½ x 11 in. Price $1.50 per set.

Common Brick Manufacturers' Association of America, 1309 Schofield Bldg., Cleveland, Ohio.

19. *Brick—How to Build and Estimate.* 3rd edition, 32nd thousand, a manual of solid brick and Ideal wall construction. Contains data on the strength of brickwork, on mortars, bonds and joints and equipment, and contains complete estimating tables for quantities of brick, mortar, material and approximate mechanics' time for various thicknesses and square foot areas of solid and Ideal wall. 8½ x 11 in. 72 pp. Price 25 cents.
20. *Brick for the Average Man's Home.* Book, 8½ x 11 in. 72 pp. Color plates. Book of plans for bungalows, houses and apartments for which working drawings are available. Price $1.00.

Fiske & Company, Boston, Mass.

245. Tapestry brick, other grades of front brick. Manufacturers of "Fisklock" Brick.

BUILDING CONSTRUCTION—See also Garage Construction

National Manufacturing Co., Sterling, Ill.

Truscon Steel Company, Youngstown, Ohio.

21. *Truscon Floortype Construction.* Form D-352. Contains complete data and illustrations of Floortype installations. 16 pp. Ill. 8½ x 11 in.
22. *Truscon Standard Buildings.* Form D-398. Describes Truscon Standard Steel Buildings, with diagrams, illustrations of installations, descriptive matter and list of users. 48 pp. Ill. 8½ x 11 in.
23. *Truscon Building Products.* Form D-376. Contains a brief description of each of the Truscon Products. 112 pp. Ill. 8½ x 11 in.
24. *Modern School Construction.* Form D-395. Contains illustrations of schools, with typical elevations, showing advantages of Truscon Products for this construction. 16 pp. Ill. 8½ x 11 in.

Bisk Corporation, Brockton, Mass.

BUNGALOW AND SMALL HOUSE PLANS

American Face Brick Association, 110 South Dearborn Street, Chicago, Ill.

25. *Four booklets* of small houses from 3 to 8 rooms, containing 98 reversible designs. (1) 3-4 rooms, (2) 5 rooms, (3) 6 rooms, (4) 7-8 rooms; size 8½ x 11 in. Each booklet 25 cents, set $1.

Architectural House Planning Service Company, 20 South 18th Street, Philadelphia, Pa.

CANVAS—See Roofing Materials

CASEMENTS—See Doors and Windows

CAULKING AND GLAZING COMPOUND

Allmetal Weatherstrip Co., 126 West Kinzie Street, Chicago, Ill.

246. Illustrated catalog sent on request.

CEILINGS, METAL

The Edwards Manufacturing Company, Cincinnati, O.

33. *Pamphlet* of 32 pages, describing metal ceilings and wainscoting. Well illustrated, with list prices and rules for estimating. 7 x 10 in.

Keighley Mfg. Co., 124 Third Avenue, Pittsburgh, Pa.

CEMENT

Alpha Portland Cement Company, Easton, Pa.

34. *Alpha Cement—How to Use It.* Handbook 6 x 9 in. 96 pp. Illustrated. A practical handbook on popular forms of concrete construction, including form work, proper proportions in mixing, waterproofing, colored concrete, etc.
35. *Alpha Service Sheets and Bulletins.* Special suggestions on the construction of Industrial Housing, Garages, Inclosures, Walls, Steps, Sidewalks, Barns, Silos, Farm Buildings, etc.
36. *Alpha Aids.* A bi-monthly magazine for those who buy, sell or use Portland Cement, sent complimentary to approved names.

The Atlas Portland Cement Co., 25 Broadway, New York, N. Y.

37. *The Atlas Book on Concrete Construction.* A text book written for the average builder in concrete and from the practical rather than from the technical standpoint. Treats on both plain and reinforced concrete. 144 pp. 4½ x 7 in. Cloth bound. Price $2.00.
30. *Set of Blue Prints.* Drawings showing how to apply Portland Cement stucco to the different standard types of wall construction. Appended are tables of the quantities of cement and sand required to cover a given wall surface. Size 8½ x 11.
31. *Concrete on the Farm.* The most comprehensive book of its kind. Practical and thoroughly reliable instructions, with plans and pictures of all possible farm structures for which concrete can be used. Complete directions in practical terms for selection of aggregates and the mixing and placing of concrete.
32. *Other Publications.* The Atlas Portland Cement Company has numerous other publications, covering nearly every phase of concrete construction. Their Service Department will give sound advice on any phase of concrete construction to anyone applying for it.

Koehring Company, Milwaukee, Wis.

38. *Concrete—Its Manufacture and Use.* Book, 4½ x 7 in. Illustrated. 207 pp. Comprehensive discussion from the practical standpoint of concrete.

Lehigh Portland Cement Co., Allentown, Pa.

40. *The Expense-Proof Farm.* Book of 96 pp. Illustrated. Showing methods of constructing various buildings, fence posts, water troughs, etc., used about the farm.

CHAINS

Bridgeport Chain Co., Bridgeport, Conn.

29. *Catalog No. 14.* Contains 64 pp. Illustrated, of different chains that can be used in all parts of building construction.

CLAMPS

James L. Taylor Mfg. Co., Poughkeepsie, N. Y.

Working Drawings Available to You

This home was designed for a private owner by one of the best residence architects in America.

Sometime ago we published a view of it in one of our books and it attracted so much favorable attention that we had hundreds of requests from all over the country for details and plans.

At last we have prevailed upon the architect to grant us the right of supplying complete working drawings and specifications. These working drawings are exceptionally complete and contain many full size details which make them unusually valuable and different from the ordinary.

Hiawatha's Cost Appeals to Buyers

This home can be built of Brick (solid masonry) for as low as from $9,000 to $13,000 depending upon location and the character of equipment and finish.

After you see the plans in circular No. 705 you should be able to determine the approximate cost of this popular home in your locality. With the complete plans—working drawings—and specifications, which are yours at a nominal price, you can estimate exactly what it will cost to build this home.

Costs Even Less With Ideal Wall

When this home was first built the Ideal Brick Hollow Wall was unknown. Its recent development makes possible the building of this Brick home for even less than the above figures. With the Ideal wall you obtain all the advantages of solid masonry construction at a saving of ⅓ in cost.

The Ideal Wall is thoroughly described in "Brick, How to Build and Estimate"—a 72-page manual of vital information for contractors and builders. It contains 30 tables, 9 full page detail drawings and other information which proves of wonderful assistance in estimating costs quickly and accurately. Only 25 cents postpaid.

The Hiawatha is one of a wide variety of Brick house designs shown in that fascinating volume, "Brick for the Average Man's Home." Here you will find all kinds of homes illustrated and described, together with much helpful information which will prove of great value in interesting prospective home owners, thus helping you to land jobs. The nominal price of $1.00 is to cover printing and distribution costs only.

$1.25 brings both books. Address The Common Brick Industry of America, 2133 Cleveland Discount Building, Cleveland, O.

The Hiawatha

A House You Can Sell Quickly and Profitably

This home is so good looking, practical and economical that it appeals to every one. It is declared by experts to be the finest of its class in America.

Think what a ready market you'd have for such a home if you built it. Think of its greater sales value—its better profit possibilities.

You can now secure complete plans and specifications for this remarkable brick home. Send for free circular No. 705 showing alternate floor plans and giving complete details.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

"Sheetrock is the best material I have ever handled"

April 10, 1922

UNITED STATES GYPSUM CO.

Gentlemen:

I have just purchased some Sheetrock from the East End Lumber Co. of this city and feel very proud to say that it is the best material that I have ever handled. I would not think of using any other material in my home. I have just done a small job with it so far and intend to tear out all plaster and lath and use Sheetrock throughout my entire home and also my next door neighbor's home.

I have already recommended Sheetrock to several of my friends and will always do so wherever I can.

My neighbor says it is the best and most substantial material he has ever seen and is very glad that I suggested it for his home.

Thanking you for particulars about Sheetrock, I remain

Yours truly,
(SIGNED) Edward K. Hoida
1608 West Wood St.
Shamokin, Pa.

Former address
1750 West Wood St.

Mr. Hoida's letter is a fair example of the frank statements which are coming from Sheetrock users in every state in the Union. Sheetrock, being made from gypsum rock, is fireproof and will not warp or buckle. It is factory-cast in 3/8-inch thick, ceiling-high sheets which go up fast. Sheetrock makes tight, permanently smooth walls and ceilings which take paper, paint or panels. In new construction or remodeling, your work with Sheetrock is sure to please the owner. Mail the coupon and we will send you a sample of Sheetrock and a plan that will help you get Sheetrock jobs.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

U.S. SHEETROCK

Reg. U. S. Pat. Off.

The FIREPROOF WALLBOARD

87. *Valves, Syphons and Traps.* A series of pamphlets to enclose in envelopes, describing the well known Thermostatic Return Line Valves and other heating equipment specialties made by this company.
Magee Furnace Co., Boston, Mass.
259. *Illustrated booklet* describing the new heater. The Magee Furnace Co. have been very successful with their coal, gas and electric combination ranges which they manufacture in various styles and sizes. As they express it, they have just produced a new member in their electric family which they call the ElectriGas. This is a very compact and attractive electric and gas range. The electric half comprises an insulated electric oven or fireless cooker of good size and an electric broiler. These are controlled from electric switches in front on their patented switchboard. The Gas half includes four gas burners and a simmerer which are automatically lighted from a push button. These ranges are made in ebony black or pearl gray por-cel-a finish. The sales department of the Magee Company report that great interest is being shown in this ElectriGas range all over the country. There are so many good talking points and attractive features in the Magee ElectriGas that it will undoubtedly prove a great seller. This range is also made in straight electric and straight gas, as well as in this combination.
Sill Stove Works, Rochester, N. Y.
Strait & Richards, Inc., Newark, N. J.
88. *Catalog* describing fireplaces, electric and gas logs, heaters, etc.

HINGES
McKinney Mfg. Co., Pittsburgh, Pa.

The Hess Welded Steel Furnace

BURNS ANY FUEL
NEVER LEAKS

WITH PIPES

Phantom picture showing through the side of the furnace. The firebox and ashpit are wholly inclosed within the welded steel radiator.

This furnace has no castings next to the air chamber, to warp and open in the joints and leak gas and dust. Everything is hermetically sealed up in the steel inclosure. There are no cemented joints (cracks). No inner flues nor passages to clog and prevent radiation. All the inner parts may be removed without dismantling the heater.

Perfectly efficient and economical with every fuel, even the cheapest soft coal. The large grate surface and firebrick lined firebox insure clean combustion with any fuel.

Send your sketches and let us show you—by a free heating plan, just how we would heat your house—and what it will cost.

Our booklet on heating (1922 Edition) will interest you. Drop us a card and get one.

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

SAMUEL CABOT, Inc., Mfg. Chemists
BOSTON, MASS.
342 Madison Av., N. Y. 24 W. Kinzie St., Chicago
Cabot's Conservo Wood Preservative, Stucco Stains, Brick Stains, Damp-Proofing

---

This stucco home built by and for R. C. Edwards, Architect, 347 Fifth Ave., New York City.

MICASPAR Crystals were used for the stucco.

MICA SPAR CRYSTALS

is the only

STUCCO DASH and CONCRETE FACING

that is absolutely non-absorbent and non-fading

VARIEGATED tints of Green-Pink-White and Black. Rich tone, and beautiful, permanent lustre, resisting all weather conditions. Takes a firm bedding in the stucco and cement. Distinctive and unusual.

The Remarkable Bonding Strength of Kellastone

THE disappointment frequently experienced in ordinary stucco construction is often due to the lack of affinity between the stucco and the surface to which it is applied. The natural result is cracking, falling off and eventual complete deterioration.

Kellastone forms a perfect bond with any of the construction surfaces in common use. It sticks so tightly that its removal or separation from any surface over which it has been applied is accomplished only with extreme difficulty. After it has been permitted to thoroughly set on an ordinary brick surface, it is difficult to remove without chipping the face of the brick.

Such remarkable bonding strength is conducive of the practically indestructible character of **Kellastone**, developing the longevity of service for which it has become famous on all types of construction.

Kellastone Interior Plaster is the hardest and strongest material available for this purpose. It attains 600 pounds per square inch tensile strength in thirty days. For this reason it is not necessary to apply it as heavily as ordinary lime and gypsum plasters. Can be applied to any surface, is fireproof and immune to water damage

American "Jewel" Bench Planer

American "Variety" Tilting-Table Saw Bench

American "Universal" Saw Bench

American "Triumph" Planer, Matcher and Moulder

"Furnishes All Necessary Mill Work"

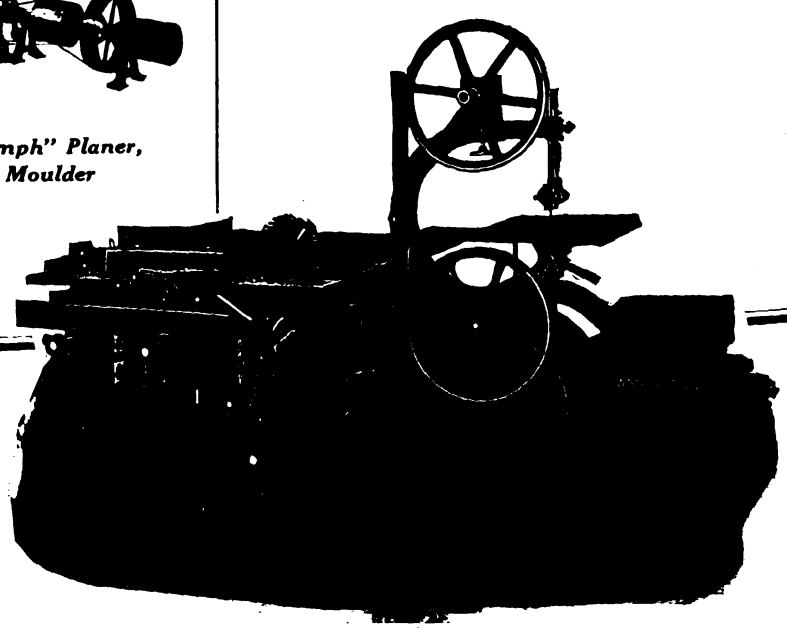
THAT is what Frederick Skon, a carpenter and builder of Jersey City, N. J., says about the American Contractors' Variety Woodworker.

His letter is as follows:

> "The Contractors' Variety Woodworker has proven very satisfactory in my shop. I cannot say what department the machine has proven most useful in, as the rip-saw, cross-cut saw, jointer and mortiser are in constant use by two men in my shop. I think it is sufficient recommendation for the machine to say it furnishes me with all necessary mill work."

Hundreds of contractors, builders and carpenters the country over voice the same enthusiasm, on the all around utility of the "American" Contractors' Variety Woodworker.

Put an "American" in your shop and from the start it will prove a dividend paying investment in time and labor saved and volume of work turned out.



Write for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of woodworking machinery.

American Saw Mill Machinery Company

4 cu. ft. capacity with light duty hoist, 80 ft. per minute rope speed, lifting capacity, single rope 500 pounds.

4 cu. ft. capacity. 6 cu. ft. unmixed materials. Discharges heavy concrete in 10 seconds. 3 H. P. engine.

How do we keep the price down?

Not by taking it out of the construction of the mixer! No! The Dandie sets a new standard for light mixers, both in speed of operation, and in long service life. Yet it sells within the price range for light mixers. Big volume production, standardization in every part, and labor saving machinery only possible with the largest mixer manufacturer, keeps down the price.

7 cu ft. capacity. 4 H. P. engine. 5 H. P. boiler.

KOEHRING DANDIE MIXER

A light, easily portable mixer for footings, culverts, foundations, etc. Mixes concrete or mortar. As splendidly engineered as the big Koehring Paving Mixers. Great strength without excess weight! Double drum gear drive. Universal joint bearings. The Koehring heavy duty drum roller construction! Discharge controlled from either side. Extra liberal simple power. Genuinely, a trouble-proof mixer that stands up to all you can give it. Write for catalog.

Dandie Capacities

4 cu. ft. mixed concrete gasoline. 7 cu. ft. mixed concrete steam and gasoline.

May be equipped with low charging platform, power charging skip and light duty hoist.

Send Back Coupon

The Dandie is not the cheapest mixer you can buy, but the sturdiest, strongest construction which makes it the remarkable value in the light mixer field. Send back the coupon.

This BOOK opens the door to bigger profits!

A gold mine of information that will interest every contractor and carpenter —the Desco Store Front Manual details how you can build up a profitable business installing attractive, modern store fronts.

It tells how we will co-operate with you to make you the store front specialist in your town.

It contains valuable store front suggestions as well as a simple price list.

Desco is built to the highest standard of quality. The copper used is of heavy gauge, all glass-bearing members are so built that the glass is protected. Glass expansion, contraction and vibration are taken up in the sash by the creosote-dipped cypress blocks, and the flexible face plate. Ventilation and drainage are amply provided for. (See Sweet's Catalog.)

Fill out the coupon today and let us mail this money-making book to you.

Making Buildings 25% More Valuable

The premium on Oak Floored buildings, shown by the thousands of such advertisements appearing annually, evidences the public regard for Oak Floors.

But unfortunately the average individual overestimates the cost of Oak Floors, although well aware that they are unsurpassed in beauty, durability, and cleanliness and can be kept clean with a minimum of attention. When he learns the real figures, however, and also that Oak Floors increase his sale and rental values 25% or more, he is usually eager to have them. And as time passes the building owner appreciates more and more the judgment of the contractor or builder who recommended Oak Floors.

In quoting Oak Flooring prices to the public it is always advisable to quote by the room instead of by the thousand.

A notable phase of the Oak Flooring business today is the increasing use of the special ⅜ thickness for overlaying old, worn floors.

SEE OUR CATALOGUE IN SWEET'S

Practical information on the most popular home improvement—

Fenestra Steel Basement Windows

Mail This Coupon Now!

Detroit Steel Products Company
2375 E. Grand Blvd. Detroit, Mich.

Gentlemen:
Kindly send me a copy of "The Hows and Whys of Fenestra Steel Basement Windows". This incurs no obligation on my part.

Name.....

Address.....*City*.....

Do you know how much easier it is to install a Fenestra Steel Basement Window than an ordinary wood basement window?

Send for a copy of the pamphlet illustrated above, and learn how you can save time, labor, and money on each installation.

Find out how you can use these new steel windows in any type of basement construction —brick, concrete block, brick veneer, poured concrete, tile, or field stone.

See for yourself the advantages of using a window that comes complete—sash fitted and hung, hardware in place, and the priming coat of paint applied at the factory.

Home owners have been waiting for a *steel* window. The durability, strength, and trimness of steel is recognized. And when you can install a steel window for no greater cost than an ordinary wood window, there is no question about the choice between the two.

Thousands of these windows have been installed. They are now a standard basement window installation. You will want to use them in the next house you build.

Don't wait until one of your customers asks you to put in Fenestra Steel Basement Windows. Get this pamphlet today and be familiar with the simple methods of installation. This places you under no obligation, whatsoever.

A Brief Description of The Kelsey Warm Air Generator

The Kelsey Warm Air Generator is designed to deliver warm (not hot) air in large volumes at high velocity, automatically humidified, either by the gravity system for moderate size houses or the mechanical (fan) system for larger buildings.

Heating Surfaces

In proportion to its grate area, the Kelsey has three times as much heating surface as the ordinary furnace. The fresh air is conducted through a series of zig-zag tubes, all sides of which are exposed to the products of combustion. So little heat goes up the chimney that the smoke pipe will not burn the hand.

Automatic Humidifier

The automatic humidifier consists of a small tank, which automatically supplies water to a container in the dome of the generator, giving to the warm air the proper amount of moisture for health and comfort.

Special Cap

A special cap is provided which directs the warm air from two or more of the zig-zag tubes to the room that is hard to heat.

Economy

By repeated tests, it has been proved that the Kelsey delivers more heat to the ton than any other system. It has made good for thirty years, and has the unqualified approval of the best architects in the country, many of whom use it in their own homes.

Our Engineering Department will furnish detailed plans and specifications, insuring satisfactory installation.

Let us send you descriptive Booklet No. 5

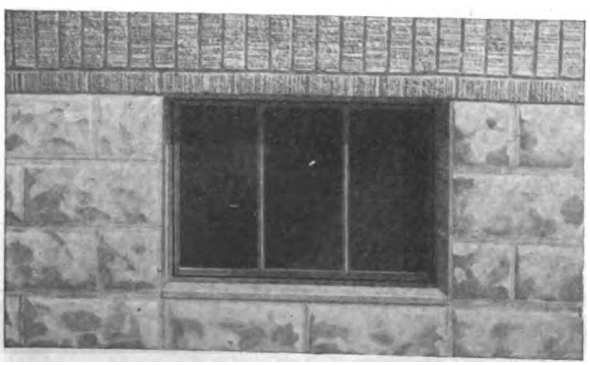
TRUSCON STEEL BASEMENT WINDOWS

Build daylight into your basement, make it a bright, cheerful, useful part of your house. Use windows that will give 50% to 80% more daylight, that won't swell, warp or stick—that keep out the rain and the wind—that are completely equipped with heavy hinges and automatic locks.

Just think—Truscon Steel Basement Windows have all these remarkable features, but yet they actually cost as little as wood. You simply cannot afford to build without them.



Ask your Building Supply Dealer about them, or write us today for complete information.

FOR THE CLOSETS OF MODERN HOMES

KNAPE & VOGT Garment Carriers

KNAPE & VOGT Garment Carriers are made in all lengths from 12 to 60 inches. They will fit any and all closets in old homes and transform disorderly clothes racks into modern garment cases.

In new homes—or homes about to be built, as much as 15 per cent in construction costs is saved when Knape & Vogt Garment Carriers are planned for in advance, because this modern system permits smaller, space-saving closets, which reduce the overall dimensions of the building without reducing the size of the rooms. And yet these smaller closets will hold more clothing, create order, cleanliness and lengthen the life of the garments. Architects and builders who do not know the Knape & Vogt Garment Carrier System are not giving their clients the benefit of the latest developments in home conveniences.

Write for prices and details of simple installation.

KNAPE & VOGT MFG. CO., Grand Rapids, Mich.

Want A Warm House?

Investigate This Splendid Furnace and the Reduced Prices!

THE bleaker the weather, the more you enjoy a glow of warmth as you enter the front door. And the bleaker the weather, the more people appreciate the N. P. Sterling Furnace. For it heats every room in the house with a current of genial warmth. It doesn't burn a lot of coal; it is of modern, efficient design, built of good materials, with fine care. Two pipes flank the furnace. They draw the cool air down out of the rooms, and make way for the warmth that rises from the big fire-pot. It isn't a lot of work to install a Sterling; there is just one pipe and one register.

N.P. Sterling Furnace
The One Register Furnace

HERE is a furnace that is built to last. There is not a cheap feature about it. Everything that goes into its making is the best to be had. For instance, just look at the grates—the big water chamber (moist air is best to live in)—see the way the joints are made so you can't get a bit of ash dust or coal gas or wood smoke in the house. It's a fuel saver, too. Actual tests show that it gives out more heat from less fuel than any other furnace. It's a quality proposition thru and thru, built to give real service.

Before you install any heating plant, be sure to investigate the N. P. at the reduced prices.

Send today for an interesting booklet—Edition B

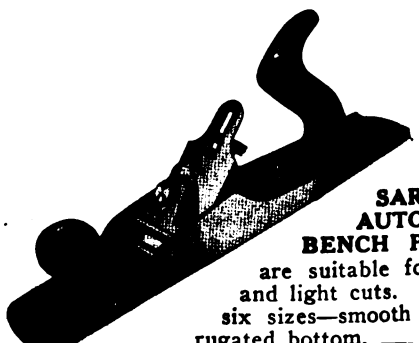
SILL STOVE WORKS, Rochester, N. Y.

Makers of Sterling Ranges and Furnaces

SARGENT
LOCKS AND HARDWARE

THE KIND OF TOOLS GOOD WORKMEN USE

The pride a man takes in his kit is wholly justifiable when his tools are Sargent. In design, in materials and in finish they live up to the Sargent reputation for the truest and best in tools and hardware. And they have, besides, exclusive features that will save you time and make your work more satisfactory.



Sargent Auto-Set Bench Planes make it possible to remove the blade for sharpening and then to replace it at the same angle without readjustment.

Ask for detailed information about these labor saving tools. No obligation on your part.

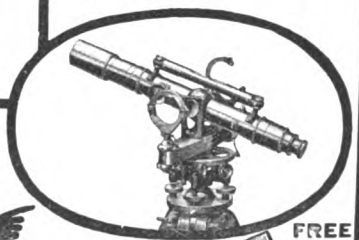
Level and Plumb With Your Own Instrument



$5.00

BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

BE A BIGGER BUILDER

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

You Too Can Save $1,000 On a $40,000 Job

The building shown above called for concrete floors of three changes in floor height.
No lumber had to be cut for scaffolding or shoring
No nails and boards were used for connecting the timbers
70% was saved on the assembling cost
90% was saved on the cost of dismantling
In other words, $1,000 was actually saved on this job by using Schenk Timber Clamps.

Let us prove these statements. Write today for samples.

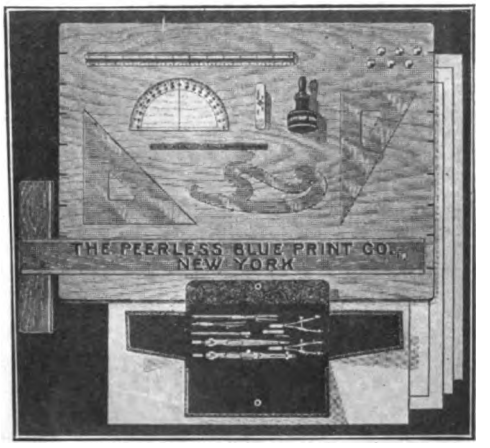
DONLEY DEVICES *Modernize the Home*

Build for Safety

ONE rarely hears of a serious fire in a house that is Kernerator-equipped because this modern system for taking care of household waste makes it so easy to dispose of inflammable refuse each day. Due to the sales value of this safety factor every year more contractors install Kernerators in the houses they build.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all refuse—rags, sweepings, wilted flowers, broken crockery, tin cans, garbage. Non-combustibles are sterilized and dropped into the ash-pit for removal. The Kernerator costs nothing to operate, for no commercial fuel is required.



Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, *Sweet's* 1921 *Catalog.*

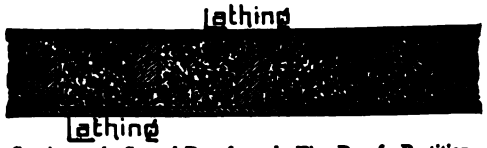
Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building



Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

EVERLASBESTOS FLOORING—The Composition of Highest Quality—makes a permanent sanitary floor, good looking, fireproof, dustless. Superior materials, formula, and methods of laying as given in our special instructions make it the floor of 100% satisfaction. Can be laid over old floors or in new building. Base and floor in one piece. Colors—red, buff or gray.

Write for free sample catalog showing how and where to sell Everlasbestos Floors.

Everlasbestos Flooring Co.
104 North Street Rochester, N. Y.

Everlasbestos Flooring

The Detroit Housing Organization secured these fine results on the home of Arther H. Otten, Highland Park, Mich. with 24-inch Silver Gray "CREO-DIPT" Stained Shingles on sides and 16-inch Light Green on Roof.

THE economy of "CREO-DIPT" Stained Shingles is due not only to the quality of material; to the best grade of vertical grained cedar; but also to the creosoting and preserving stain that penetrates the wood.

"CREO-DIPT" Stained Shingles are of selected grades, are vertically grained cedar, thoroughly dried. Shingles can not be successfully stained on the job because of uneven temperature conditions, unavoidable moisture in the wood, and uneven grading of vertical and flat grained shingles on the open market. Our process not only preserves shingles but saves the muss, waste, time, and labor of staining-on-the-job.

If you are going to build or remodel, send 6 cents to cover postage of Portfolio of Fifty Large Photographs of Homes by Leading Architects; Sample Colors on Wood. Ask about 24-in. "Dixie White" side walls; also about "CREO-DIPT" Thatch Roofs.

New Tape Hook
Makes
Pullman
Sash Balance
The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

FORSTNER
Labor Saving
AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.

HUTHER SAWS HAVE PROVEN THEIR WORTH FOR MORE THAN 50 YEARS

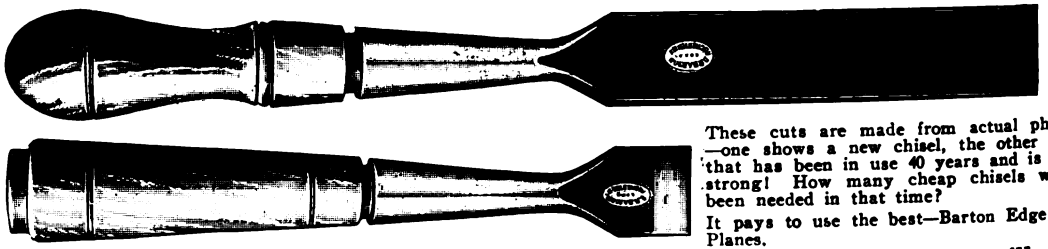
Huther Bros. Dado Head

Huther Saws represent the difference between a tried and an untried product. Their superior workmanship, strength and efficiency have been demonstrated beyond dispute by their performances over half a century.

HUTHER BROTHERS DADO HEAD

The saw that makes intricate cutting and grooving easy. Consists of two outside cutters and enough inside cutters to perform the required operation.

Huther Bros. Hollow Ground Saw



HUTHER BROTHERS HOLLOW GROUND SAW

Free cutting, leaves a smooth, even surface. Ground with xtreme accuracy.

Illustrated catalogue sent promptly on request

Huther Bros. Saw Mfg. Co.
Rochester, N. Y.

Over 40 Years of Comfort and Satisfaction!

These cuts are made from actual photographs; —one shows a new chisel, the other shows one that has been in use 40 years and is still going strong! How many cheap chisels would have been needed in that time?

It pays to use the best—Barton Edge Tools and Planes.

Genuine only if stamped "D. R. Barton." If your dealer won't supply you we will.

Write for "The Carpenter's Catalog" and "True Stories." Free, of course!

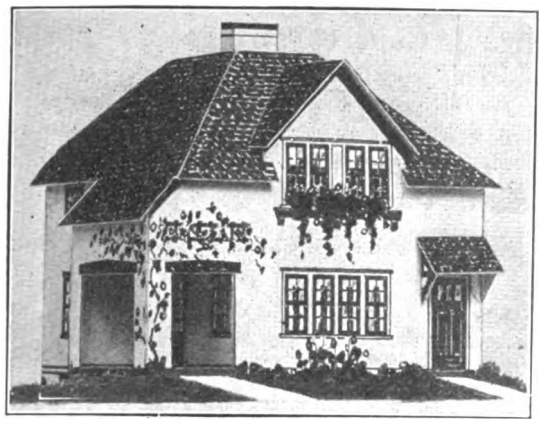
MACK & CO., Brown's Race and Platt Street, ROCHESTER, N. Y.

"Jim, we're lucky"

"I know a dozen contractors—good fellows, too—who haven't had enough work to keep them busy one month this season, while we've worked every day.

"Why?

"I guess it's because we're progressive. We started the season right by getting our new Beckmann instruments early. We were always ready for the job that came along, and always **'on the job.'**



"You're not forever being 'laid up for repairs' when you buy a Beckmann. Their catalog and booklet, 'What is an Instrument Guarantee Worth?' tells why. Ask for free copies."

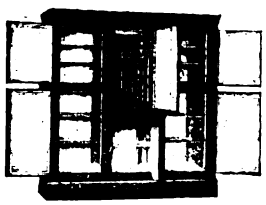
Cardboard Model No. 102

Show Your Customers Models as Well as Plans and They Are Sure to Build

People like to know what their homes are going to look like before they build. Show them models as well as plans and you make easy sales of your contracting or building services.

The plan book, "Small Homes of Character," contains 50 examples of 4-, 5-, 6- and 7-room houses. Plans, specifications and bill of material are available for each house built of frame, brick or stucco. We furnish a cardboard model for each house, scale ⅛" to the foot, done in colors to show attractive color combinations. The models can be obtained without buying the rest of the service.

Use our plan service to get business and our plans to build from.



Send only $1.00 for the book, "Small Homes of Character," and make a start toward increased business.

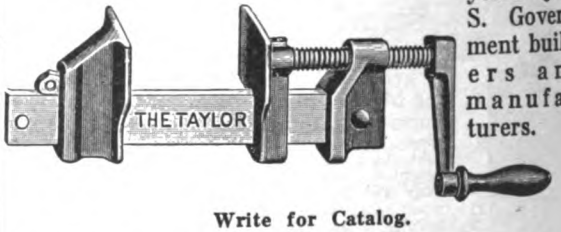
Contractor-Agents Wanted

YOU MAY BE FOLLOWING a trade already or perhaps looking for a new one. Whichever it may be, install Allmetal Weatherstrip and have a real income.

We have a proposition to offer good live men that will put them on the road to success—$5,000 per year income is common among weatherstrip men.

Buildings are well under way now. They will soon be ready for the weatherstrip contractor. Just as soon as you get the new ones equipped, start after the old ones. Owners of old buildings are easy to sell. They are tired of big coal bills, draughty windows, dirty floors, etc.



It costs you nothing to enter the Weatherstrip business. We co-operate with you to land sales.

As for our selling plan

BE A FLOOR SURFACING CONTRACTOR

MAKE $5,000 to $15,000 OR MORE—YEARLY

Now, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

BUILDING CONTINUES OVER U. S.

Building is booming all over the country. There are innumerable opportunities for those equipped to handle work of floor surfacing. The American Universal Machine is essential to hustlers. Get in on the ground floor—get the machine now. It will earn more than the original investment in this busy season.

Resurfacing Old Floors

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need resurfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect.

Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.

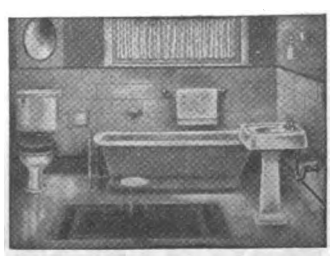
Improved Boring Machine



This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

NEW ENGLAND COLONIAL STYLE

Illustrating the symmetry and stateliness of New England town houses of the period when Colonial architecture was at its height. This is another of the 17 architectural styles illustrated and discussed in "Good Houses," a book for home-builders interested in good design, efficient planning and thorough construction. "Good Houses" interprets those architectural styles which are the foundation of American building traditions, and which are adaptable to wood construction today. Send for your copy today.

Illustrating Good and Bad Bearing Post Footings

IF bearing posts under the girders in the basement of a house settle unduly the effect is apparent throughout the house. Cracks appear on plastered walls; doors become troublesome; floors become uneven. The bearing posts support a considerable amount of the weight of the house. Obviously they must be well supported or "rooted."

The footing shown on the right is too small in all its dimensions and is limited in its bearing power by its shape as well. Note how the post is set down into the concrete, a material which is always somewhat damp, thus needlessly subjecting the post to decay.

The greater sustaining power of the footing on the left is evident at a glance. Note its generous dimensions, its flat bearing surface, and note, too, how it extends above the cellar floor line, thus keeping the bearing post off the damp floor.

The success of concrete footings is dependent, too, upon the use of good materials in the right proportions, properly mixed.

Bearing post footings are just one of the many vital points in successful house building discussed in the booklet —"The High Cost of Cheap Construction," sent free on request to prospective home builders.

(This is the Weyerhaeuser Home-Building advertisement appearing in National magazines for June.)

What Will You Say About Your New Home Three Years From Now?

ASK any one of the better class of building contractors why so many people are dissatisfied with their houses a few years after they are built. He will tell you poor construction.

Constant repair bills, excessive heating costs and the endless annoyances that so often rob home-owners of the satisfaction they are entitled to, are the results of construction short cuts—mistaken for economy—behind plastered walls, beneath the floors and even under the very foundations of many houses that are being built today of all materials.

Yet at no greater cost than the prices that are being paid for compromise houses, the application of the right principles of building construction can make your house a substantial, economical, satisfactory home.

THE key to successful house building lies in right materials properly applied.

Lumber for house building is of the same good quality as ever. Developments in manufacture are constantly improving it.

Good workmen and the better class of contractors still want to do an honest job; in fact they have been preaching the value of right construction in house building for years.

But conditions, largely beyond their control, today are forcing legitimate contractors—the men who know good materials and how to use them, who understand fire-stopping and other modern construction practices, and who see house construction in terms of durability and efficiency — to bid against construction practices that every honest craftsman condemns.

That is why we say, go to a legitimate contractor—one who takes pride in his craft and would rather deliver a good job at a fair profit than a poor job at an unfair profit.

You will find these men more and more using lumber of the Weyerhaeuser standard of quality—trade-marked with the manufacturer's pledge of personal responsibility.

IN "The High Cost of Cheap Construction," a book which will be mailed you on request, you will find the essentials of good construction necessary to successful house building; the basis for judging the manner in which your house is built; and the means of making the lumber you use in the construction of your house of even greater service. Ask also for "Good Houses."

Weyerhaeuser Forest Products are distributed through the established trade channels (to contractors and home builders through the retail lumber yards) by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

EACH *year you will find an increasing number of retail lumber dealers recommending Weyerhaeuser lumber for house building—men who know the relation to correct building practice of properly dried lumber, of uniform grades and of the kinds best suited to your needs.*

What You Can Do with THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM —And Why

A scientifically constructed heating plant should do two things at least—produce a comfortable atmosphere and do so at a minimum cost.

Merely to fill a house with heat doesn't make it comfortable—and it is far from healthful. There should be a moderate temperature supplied in large volume with positive and uniform distribution to all rooms—not hot and cold by spots.

Also, there should be an equalization of heat between floors and ceiling to insure real comfort and prevent annoying drafts along the floor.

The FarQuar Vent and Return System assures a constant circulation, with fresh air continually supplied, while the "dead" or devitalized air, contaminated by the occupants, is carried out of the rooms.

The FarQuar one-piece steel firebox electrically welded, without seams or joints positively prevents the escape of combustion gas and fire poisons. Such results are impossible with an ordinary firebox made porous by heat.

And the fuel economy of the FarQuar System is remarkable. The large grate area means slow combustion and long smoke travel permits practically every atom of heat to be extracted therefrom before the smoke can reach the chimney. That is one reason why the FarQuar System consumes so little fuel.

These Are Basic Reasons for the Supremacy of the FarQuar System

The Dealer who sells the FarQuar System never has to apologize. The FarQuar System accomplishes results impossible with any other heating system. That is why the FarQuar Franchise is a distinct advantage and a profitable acquisition for the FarQuar Dealer.

USE FACE BRICK
—it Pays

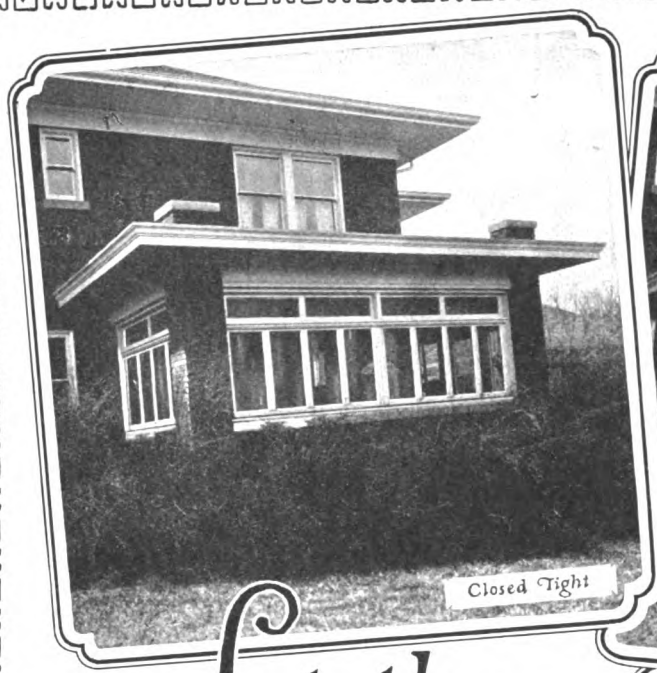
Home Lovers Covet These Homes of FACE BRICK

THEY are selected at random from over one hundred distinctive designs reproduced in our booklets of "Face Brick Bungalows and Small House Plans." These attractive homes are the work of capable architects especially skilled in small house designing, and because of their artistic exteriors and convenient interior arrangements have proved exceptionally popular with prospective home builders.

You Can Build These Homes From Plans We Supply

With these booklets of face brick home designs in your office you can interest your prospective clients in the designs illustrated with full assurance of being able to secure the complete architectural plans. If desired, to meet individual lot conditions, reverse plans may be obtained. These working drawings with masonry material surveys range in price from $12 a set for 3 and 4-room designs, to $21 for 7 and 8-room designs.

For your convenience, 3 and 4-room designs have been grouped together in Booklet No. 1; 5-room designs in Booklet No. 2; 6-room designs in Booklet No. 3; and 7 and 8-room designs in Booklet No. 4. These booklets, with reverse plans, place in your hands an unmatched selection of over 200 house arrangements, supplemented with a high grade plan service. Single booklets are 25c, the set of four $1. Write for them to Dept. B. 9.



Other Booklets of Value to You

"The Story of Brick," a complete discourse on all factors and advantages of brick construction, sent FREE; "The Home of Beauty," a book of the 50 best house designs submitted in a country-wide architectural competition, price 50c; and the "Manual of Face Brick Construction," a text book of face brick construction, with designs and plans for 30 homes, price $1.00.

Let the Outdoors In

Happy is the home owner who installs AiR-Way Multifold Window Hardware. It throws his home wide open to the benefits of sunshine and fresh air. AiR-Way makes a sun room or sleeping porch of almost any room.

AIR-WAY TRADE MARK

Happy is the builder who installs AiR-Way Multifold Window Hardware. Like all R-W hardware, it gives such lasting satisfaction that every user becomes an enthusiastic booster.

AiR-Way provides sliding-folding windows which may be opened and closed from the inside without interfering with either screens or draperies. Although easy to operate, the windows fit the opening snugly and are absolutely weathertight when closed.

You will find it profitable to introduce AiR-Way in your locality. It should be used in every new and remodeled home. If you are not already familiar with this widely advertised hardware, write today for Catalog J-4.

This strong 2-page advertisement opens the

Our town finds innumerable uses for

ELMER WALKER'S CAR used to freeze up every cold night. The little stove in his garage tried hard to heat the whole outdoors, but couldn't make the grade. Finally Elmer had the garage lined with Beaver Board. His car hasn't frozen since.

GEORGE SMITH'S WIFE wanted a playroom in the attic for the twins. George covered the bare beams with Beaver Board. He did the work himself. When it was finished, the room was so cozy and comfortable that George tried to get it for a den.

THAT GOOD-LOOKING paneled effect made such a hit with Walter Jones that he put Beaver Board on the walls and ceilings of every room of his new house. It saved him lots of money and folks say he has the best-looking house in town.

WHEN FRANK TUTTLE was taken in as junior member of his father's firm, he graduated into an enclosed office, with a mahogany desk. The office partitions are made of Beaver Board and Frank is proud as can be every time a client comes into the shop.

HANLEY'S DRUG STORE has been entirely remodeled with Beaver Board. You'd never know it's the same old place. Even the prescription counter is enclosed with Beaver Board and the stock bins are made of it, too. The says it didn't cost much, either.

BEAVER

WARNING--BE SURE YOU GET GENUINE BEAVER BOARD

WE ASKED ourselves this question, "What is the best way to send still more buyers of Beaver Board to our dealers this fall?"

The above advertisement is part of the answer. It appears in the Saturday Evening Post on September 9th. Read it. Notice how we have brought out the many different uses of Beaver Board. And how these uses are brought right home to the reader. Don't you agree that this kind of advertising is going to help boost your sales this fall?

Digitized by Google

in The Saturday Evening Post fall campaign on Beaver Board!

Beaver Board

MRS. WILL BROWN made her husband's life miserable till he promised to have the bathroom done over. They used that special tiled Beaver Board. It didn't cost much, but Mrs. Brown is delighted.

GEORGE HARTER, of Harter & Son, furniture manufacturers, not only has Beaver Board on the walls and ceilings of his plant, but uses it for backs of bureaus and mirrors, for folding screens and in other ways too numerous to mention.

AN UNTIDY KITCHEN was the bane of Mrs. Watt's existence until she conceived the idea of having the walls and ceiling covered with Beaver Board. Now, the kitchen is the pride of her heart. And she says you'd be surprised to know how little it cost.

IN EVERY TOWN there are innumerable uses for Beaver Board. Doubtless you, yourself, have some construction or repair work in mind for which this versatile material can be used much more economically and satisfactorily than ordinary lumber.

A partial list of the ways in which Beaver Board can be used is given below. Read it and see if it doesn't suggest something to you—some new addition or improvement you have been putting off, some repairs you have been postponing—because you feared the cost.

Genuine Beaver Board is a wonderfully economical material. It is flawless, knotless manufactured lumber—made from the long, tough fibres of white spruce. And it comes ready for use in panels that are sized by our *patented Sealtite process*, which makes a perfect surface for painting and decorating.

Any carpenter or lumber dealer in your town will gladly figure on the cost of the Beaver Boarding you want to do. Ask one of them about it to-day. Or, write direct to our Builders' Service Department in Buffalo, enclosing a rough sketch, giving dimensions, locating doors and windows, and specifying the type of room. Our designers will prepare specifications at no cost to you.

ABOVE ALL, be sure you buy genuine Beaver Board. All wall board is not Beaver Board. Genuine Beaver Board is made only by the Beaver Products Company, Inc., of Buffalo, New York. Identify it by the Beaver trade-mark on the back of each panel. We stress this point, because the success of genuine Beaver Board has been such that imitations have entered the field. Use *genuine* Beaver Board and you can rest assured of an economical, permanent, fully satisfactory job.

THE BEAVER PRODUCTS COMPANY, Inc., Buffalo, New York
The Beaver Company, Ltd., Thorold, Ont., Canada, and London, England
District Sales Offices at New York, Atlanta, Buffalo, Chicago and Kansas City

CHECK UP YOUR USE FOR BEAVER BOARD. HOME USES: *Walls and ceilings throughout houses, bungalows, summer homes and cottages. Finishing the attic. Dining-room wainscots. Beamed ceilings. Lining sun porches and garages. Covering up old plaster. Remodeling large rooms into more, but smaller quarters. Putting extra rooms in waste space. Building-in bathrooms. Additions. Tiled wainscots for kitchens and bathrooms. Sheathing for small houses. Building workroom or laundry in basement. Cellar partitions.* FARM USES: *Lining dairies and other buildings that need sealing or weather protection. Lining tool houses, bins, granaries and stockrooms.* BUSINESS USES: *Built-in private offices, partitions, etc. Walls and ceilings for stores, moving-picture theatres, clubs, etc. Lining factories and workrooms where a sanitary, dust-proof and jar-proof construction is needed. Window displays. Display booths. Cut-outs. Triumphal arches. Floats for parades. Folding screens. Cabinet work, drawer bottoms, backs of mirrors, etc., and many other uses.*

BOARD

BEAVER QUALITY

IDENTIFIED BY THE BEAVER TRADE MARK

THE OTHER PART of the answer is the campaign to follow. There are more big pages in the Saturday Evening Post—and a striking series for newspapers. Then, there is a well-planned campaign for your tie-up. All are based on the one big idea—*more sales of genuine Beaver Board right away!* If you aren't a Beaver Board dealer now—wire or write for full details of our dealer proposition. It will interest you. Prompt delivery.

Use PLATE Glass

No other glass will do

PLATE glass is the right glass for hotel, office-building, apartment or house. In strength or appearance it cannot be equaled by any other glass.

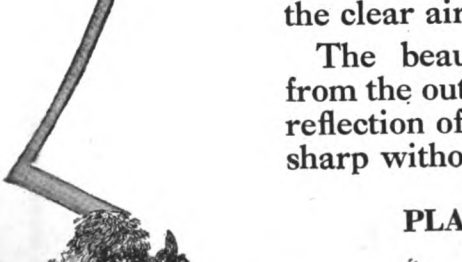

Plate glass is made to withstand the sudden changes in air pressure and the strong winds encountered on the upper floors of buildings. It is made to give clear vision from any angle without distortion. Looking through plate glass from the inside is like looking through the clear air itself.

The beauty of plate glass from the outside lies in the true reflection of objects—clear and sharp without waves or swirls.

Plate glass registers an immediate impression of architectural refinement. The effect is the same in any building or house. Cheaper quality may be substituted in some materials without any great change in the appearance of the building. But substitution of common glass for plate glass is immediately apparent.

See that plate glass windows are written into the specifications. Ask any glazing contractor for prices on both plate glass and common glass. The difference in price is astonishingly small and is more than compensated by greatly increased value, rentability or salability.

PLATE GLASS MANUFACTURERS *of* AMERICA

Window Glass Grading Depends on Standards

FIRST, second and third quality are relative terms which depend on the standards used in grading.

The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

"Let in the Sunlight"

The Friendly Hearth

Hospitality and good cheer pervade the home that is protected by storm sash. The double panes form an effective shield against the searching winds of fall and winter, assuring a comfortable interior in any weather.

The installation of storm sash enables a saving in fuel equal to many times their first cost and upkeep.

Insist on plenty of windows equipped with storm sash. Specify the grade of glass and make sure it is the finest obtainable in that grade.

"I'm putting Winthrops on my new house"

The man who said that is a Winthrop Tapered Asphalt Shingle Dealer. He has been selling these tapered asphalt shingles for years and he has never had a complaint from any of his customers.

He knows that Winthrops lie flat on the roof, that they make a perfect seal aginst the weather and are beautiful to look at. He knows they will last for years because the first few squares he sold are still giving absolute satisfaction and show no signs of age or wear.

There is still time to get a lot of re-roofing jobs done before winter and Winthrops are the shingles to use. Because of their shape, tapered, they can be laid right over the old shingles and will stay as flat and smooth as though laid on new roof boards.

There is some valuable Winthrop territory open. Full information on the enviable Winthrop Dealership will be sent on request. Don't let your competitor get this valuable business. Write now. Address the nearest factory.

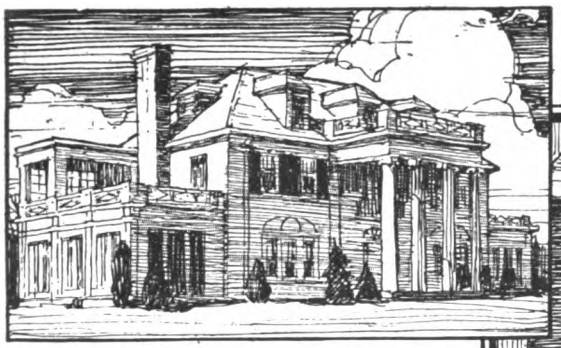
Workmen spreading cement roof on Metal Lath supported by Steel Joists resting on ***Structural Steel Truss***

Build Garage Roofs and Floors Firesafe with National Steel Joists

AMERICA is dotted with garages built with National Steel Joist firesafe roofs and floors. The ease and speed with which such roofs and floors can be constructed make this a most economical and popular type of construction.

National Steel Joists are also used in building firesafe floors and roofs in office buildings, hotels, schools, stores, public buildings, hospitals, theatres and residences.



National Steel Joists and also National Rib Lath are carried in stock in leading cities. Delivery is made promptly. The joists are delivered to the job cut to meet plans. Write for joist sizes, weights, safe loading tables, etc.

An Added Room Without Added Cost

There's no need to build a large house to provide space for that needed extra room. The cellar is large enough for all its accustomed purposes—and more beside. The cellar, when well built and properly equipped, offers plenty of extra space which can be readily adapted for use as a laundry, or even a comfortable card or billiard room.

The Sharp Rotary Ash Receiver

makes this a real possibility. This device does away with ash cans and ash dust in the cellar, and keeps the ashes concealed under the floor until finally removed from the house. Free from ashes and their dust and nuisance, it is easy to keep the "cellar as clean as the rest of the house."

Our new illustrated booklet describes the receiver in detail. It shows a few of the possibilities of "The Cellar as Clean as the Rest of the House," together with photographs of many homes where the receiver is installed. It will be sent on request—write for your copy today.

Contractors and Builders: Send for Specification book, prices and discounts.

SEE OUR CATALOGUE IN SWEET'S

The Cellar as clean as The rest of the house

The Sharp Rotary Ash Receiver consists of a set of five, eight or twelve cans mounted on a revolving steel frame, installed in a concrete pit, under the ash pit of any size or style heating plant. There's nothing to get out of order.

Fred Ferris—Fire Fighter

That was the way his business card read. He was a fire insurance agent. He made his money selling insurance—and showing his customers how, by using fire preventive materials and methods, to get the most for the least.

As his business grew, and prospered, he built himself a home that was a model of preparedness against fire—hollow tile, fire-stop doors on all floors; chimneys lined with chimney tile, and packed about with gypsum blocks cut to fill the space; —two independent stairways; a buried gasoline tank fifty feet from the house—and

An Illinois Zinc Shingled Roof properly grounded against lightning.

Fred knew that about one-sixth of all our annual fire losses came from sparks on the roof and lightning, and he suspected that a good deal of the 50 million dollar loss annually classified as "Spontaneous Combustion" was roof sparks, and he went to all the fires! He had seen real fires stopped by zinc-covered houses and buildings, and he knew zinc.

He knew, for instance, that a zinc roof would outlast his house and never need a cent's worth of repair. He knew that it cost less than some and as little as any good-looking roof, as far as first cost goes.

He liked the soft-weathered gray look of a roof he had seen made of Illinois Zinc Shingles when they first came out. And he was particularly sensitive to avoid anything freakish in the appearance of his new home. He wanted it to be just his home—but he couldn't help embodying in it all the features his business had taught him belonged there.

So, when he saw that these zinc shingles had been designed in such a way that they looked just like a butt shingled roof—with no shine or fancy designs like old-time metal shingles, and no longer flat—that settled it.

Fred's house looks very much like any other house, but it feels more like home to him because he knows it has a roof that welcomes all weathers, will never wear out, and will protect him and his forever against the spark that falls in the night—the lightning that strikes without warning—the fire that sweeps the block.

Put an Illinois Zinc Shingle roof on your next contract. You will never see it wear out because it will outwear the building on which you put it. But this first zinc roof of yours will immediately develop new business for you just as it has with everyone else. Send for detailed information today.

Know the lumber you buy

FEW PERSONS take time to give *personal* attention to selecting the lumber to be used in their homes. Yet they insist on their favorite brand of shirts or shoes because they know that brand means dependability and maximum quality for the amount spent.

They buy shirts and shoes many times in a lifetime, but a home only once. It is their most valued possession. How important, then, to be sure the lumber is *right*, because they will live with it always and upon its quality may depend the permanence and beauty of the house.

By *identifying* all its lumber and lumber products with a trade-marked brand, THE LONG-BELL LUMBER COMPANY believes it has helped immeasurably to make lumber buying easier, more convenient and *safer* for the home builder—to assure him that he is getting full value for the money he pays.

To those who say "all lumber looks alike to me," we point to these facts:

LONG-BELL Lumber has back of it 47 years of honorable enterprise.

LONG-BELL Lumber comes from exceptional stands of virgin timber; manufactured in modern mills.

LONG-BELL Lumber is made by skilled workmen—men who take a personal pride in a product bearing their company's name.

Each process of manufacture and each step in the grading is under the supervision of experts who work to a standard. Each log is cut for purposes for which it is best adapted. LONG-BELL Lumber is of uniform quality.

LONG-BELL *lumber is trade-marked. This means* ***unmistakable*** *identification—the same kind of a buying guide you demand on other merchandise.*

"CREO-DIPT" Stained Shingles

Send For This Portfolio of Homes and Pad of Colors on Wood

Shingles, since Colonial days, have been used on side walls, but the common use of the material to most people has meant "roof."

"CREO-DIPT" Stained Shingles have exploded that idea. It is just as important to protect side walls against rot and decay; it is just as easy to make both attractive in color and material.

You can save delay, annoyance, cost of painting and labor of other materials, if you will use "CREO-DIPT" Stained Shingles. Select a pleasing combination of colors for side walls and roof—using "CREO-DIPT" Stained Shingles, 16 inches or 18 inches long for roof, and narrow effect on side walls; for the wide shingle effect on side walls use "CREO-DIPT" Stained Shingles, 24 inches long, with a 10-inch exposure.

"CREO-DIPT" Stained Shingles are made only of straight grained cedar shingles of first quality; preserved with earth pigments and pure linseed oil, carried into the wood with creosote. They are proof against rot; colors last; they give the charm that no other building material lends to your roof and sidewalls.

If you are going to build or remodel, send 6c to cover postage for Portfolio of Fifty Large Photographs of Homes by Prominent Architects with color samples. Also ask about our special Thatched "CREO-DIPT" Stained Shingles for Thatched Roof effect; 24-in. Dixie White Side Walls for the true Colonial White Effect.

This booklet will solve some vexing problems

THE planning of a garage is almost an essential part of planning a new home. The McKinney Booklet, "Complete Garage Sets," is a helpful booklet to keep before you when planning the garage.

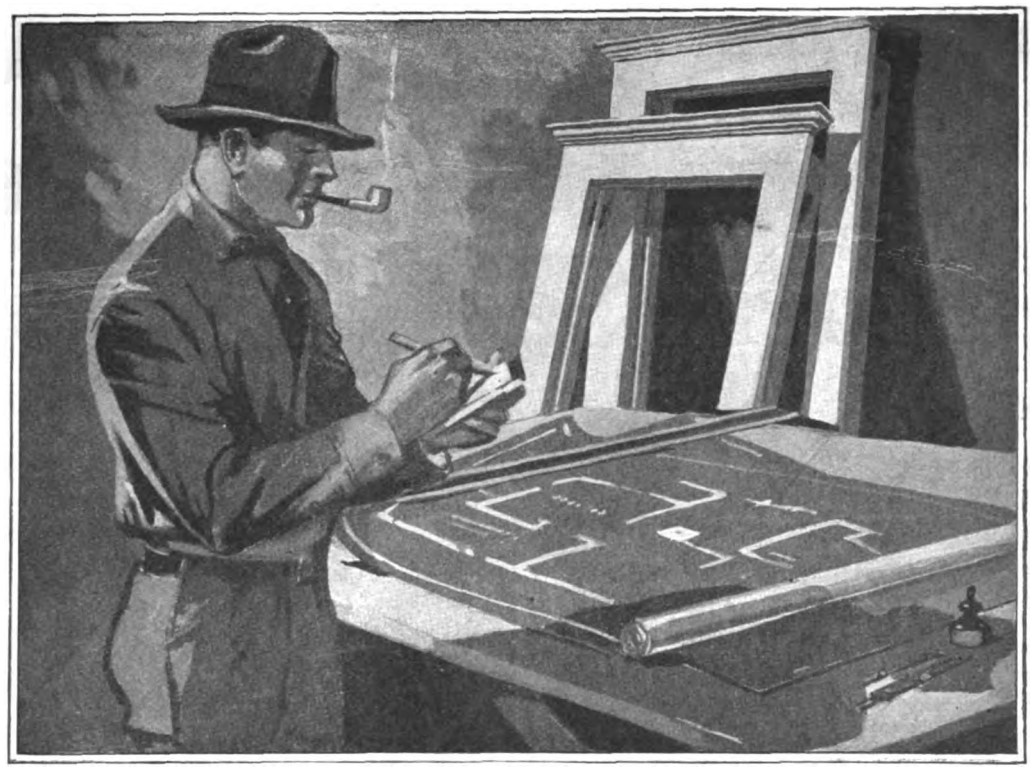
It illustrates swinging, sliding-folding and around-the-corner doors that answer every problem of space allowance and entrance widths. It visualizes the completed entrance for your clients as no description will do.

And, best of all, it will allow you to control the purchasing of the necessary hardware for the hanging of the doors. Too often, an otherwise perfect plan goes awry because the purchasing of the hardware has been largely a matter of guesswork. All that is necessary to insure a perfect installation of the proposed doors is to write on the specifications the number of the McKinney set that corresponds to the entrance you have planned.

The hardware is delivered to the builder boxed, ready for use. Not a piece is missing. The various parts harmonize throughout. It is good hardware—McKinney made.

The McKinney Booklet is full of valuable suggestions for the architect and builder. It will be sent free on request.

McKINNEY
Hinges and Butts and Hardware



Also door hangers and track, door bolts and latches, shelf brackets, window and screen hardware, cabinet hardware, steel door mats and wrought specialties.

Cut Costs with Andersen Frames

WHY take chances on delayed deliveries of window frames. It's expensive. Guaranteed immediate delivery is a direct saving to everyone concerned.

Any dealer in Andersen Frames can supply immediately 121 different sizes of frames, simply by interchanging heights and widths of his stock of 11 standard frames. Window frames need not be ordered weeks in advance. Expensive delays on the job are no longer necessary.

Windows run smoothly in Andersen Standard Frames because the frames are accurately made. The use of White Pine in all exposed portions of Andersen Frames insures longer life and an accuracy that will not change with time or weather.

Seven units make a complete Andersen Window Frame. These are shipped in two compact bundles, each weighing less than 20 pounds. These small bundles are easily handled, permit larger truckloads, and require little storage space. The seven units of an Andersen Window Frame, complete with pockets and pulleys in place, can be nailed up in 10 minutes. The little time required to assemble and handle Andersen White Pine Window Frames saves time, labor and money on any building.

Further Economies.

We have prepared a book telling in detail how building costs are cut through the use of Andersen Standard White Pine Frames. Write for your copy today.

BUILDING AGE
AND
THE BUILDERS' JOURNAL

NEW YORK, SEPTEMBER, 1922

BEAUTY BY GROUPING HOMES

NOT enough attention is being paid to the grouping of buildings. We too often find that some buildings do not harmonize with their neighbors on either side and perhaps they in turn do not harmonize with the others. The result is an unfortunate muddle as far as real beauty goes.

During the past few years more attention has been paid to this important subject and a good deal of improvement is already to be noticed in the newer developments. The bungalow court idea is spreading and buildings are now being grouped so that from any angle a picture is obtained.

Our first illustration shows quite an artistic grouping of five two-story dwellings. An enlarged picture of the building at the rear of the group is next given. This interesting design for a home forms the background for the court. In this particular group of five buildings, it will be noticed that while each is different, still the general form and placing is harmonious to all. There is a central path with two light standards which serve to illuminate the court at night.

There is no crowding, plenty of space has been left between the fronts of the buildings so that parties living in the rear may have a view of the street.

The reader can see in the third picture another artistic grouping of homes which really form a small park. Only one-half of this interesting development is shown but it indicates what may be had.

Digitized by Google

Close-Up View of House at Back of Court

Many, of course, start out to do the right thing, but by reason of no experience or lack of artistic judgment the result fails of its purpose as will be noticed in our fourth picture. Here is a group of eight bungalows placed with a very narrow space between them, the idea is good, but the close proximity of the houses deprives each occupant of privacy.

One could hardly speak in one of the front rooms without having the neighbor across the court hear every word. Had these same houses been placed about fifty feet apart, this disagreeable feature would have been avoided and there would be the chance of introducing a handsome garden between that all could enjoy.

Our fifth picture shows quite an artistic handling of a group of ten semi-detached houses. Here a beautiful parked space is laid out, which is sufficiently illuminated at night by a single lamp standard placed in the central path. Each separate doorway however has its own light so at night the court is very effectively and artistically illuminated. In line with this light standard in the rear is a little fountain which adds to the harmony of the entire development; it is beauty added at small cost.

So much depends on design and harmony of the grouping that it will be of interest to quote from the book of Small Houses by Ernest Flagg, the noted architect, who certainly is a master of design:

ONE of the best ways to economize in building is to economize on ugliness. A good-looking house will rent better, sell better, be pleasanter to live in, and altogether worth more than if ugly.

Nothing can be of greater service in avoiding ugliness than a knowledge of the principles of design. Acquaintance with even a few of them will aid powerfully in that respect. If the chief rules of good design were understood by the masses as they might be, nothing would do more to promote beauty, improve workmanship, add to the value of manufactures, and in many other ways further the general welfare and prosperity of the country. They are simple, easy to acquire, and should be taught with the alphabet.

When one understands the principles of design, his taste will have something more solid as a basis than mere whim or fancy, which in the untutored is more likely to be bad than good. He will know what is right and why it is right. Acquainted with the rules of good design, he will not accept articles made in defiance of them. Therefore, if this knowledge were general, all products dependent on design would be elevated and improved in quality, and find readier and wider markets.

The neglect of this study in the United States is astonishing. How few people, even among the supposedly well educated, can give an intelli-

Charming Grouping—Only Half of Court Shown

Digitized by Google

gent explanation of the qualities of a design!

Most of the qualities of good design may be broadly classed under two heads, viz., essential and desirable—the desirable ones being those which reflect the character and personality of the artist, and the essential ones those which are necessary in order that the design may be worthy to be classed at all as a work of art.

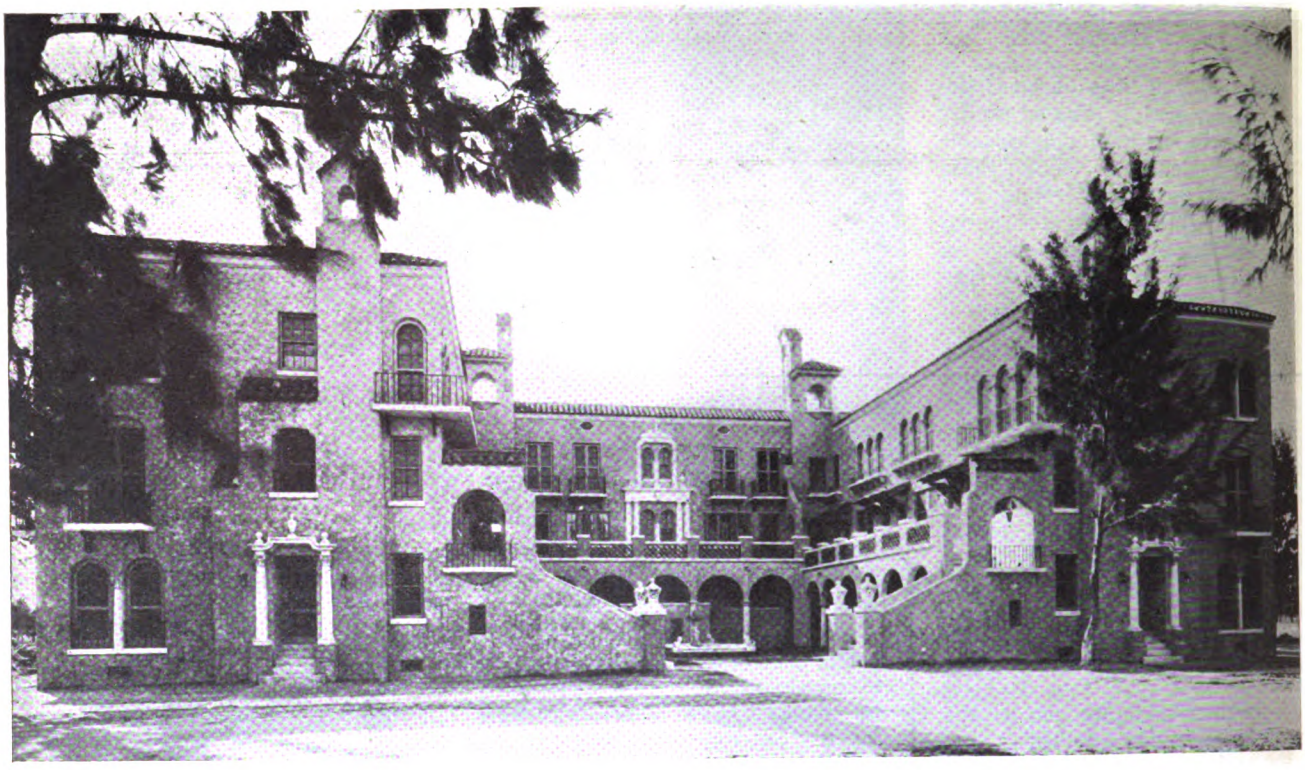
Among the essential qualities are reason, unity, harmony, clarity, and variety.

Among the desirable qualities are imagination, interest, refinement, simplicity, dignity, and style.

A design may be good which conforms to requirements of the kind mentioned in the first list, but cannot be great unless endowed with other qualities partaking of a personal nature, as illustrated by the second.

In the human figure as it approaches perfection—nature's supreme production—is contained the sure guide for the determination of all true principles of design. In it may be found the exemplification of all the above-mentioned qualities except imagination, which is spiritual, and many more besides. So in stating the rules of art one has simply to record what is there revealed. The study of the best specimens of the human form is, therefore, of the utmost importance in the refinement of taste, and it was because the ancient Greeks realized this truth that they excelled all others in art.

Harmony is essential in design as it is in music; it is all-embracing and should reign throughout—harmony in purpose, harmony in dimensions, harmony in form and harmony in color. In good design discord can have no place. Harmony of dimensions is proportion. In good design there is an agreeable and fitting relationship between all dimensions. In like manner harmony must exist in all other matters, whether of form, color, purpose, or other element entering into the design, so that all may unite to form a complete, harmonious, and well-rounded composition; of which the human figure affords the best example.



Too Close for Comfort or Beauty

IT is hard to change long established building habits; such habits sometimes endure for ages in certain localities with little or no change. It is, however, easy for new communities to acquire bad building habits. When the necessity for shelter is great and the means of obtaining it scant, flimsy and makeshift methods of building find ready acceptance; and once introduced are hard to eradicate. Such habits, formed here in early times, still influence construction, as is abundantly proved by our inordinate fire loss; fully ten times greater than where building is done with a little more care.—ERNEST FLAGG.

Nothing Pretentious, but Pleasing and Dignified

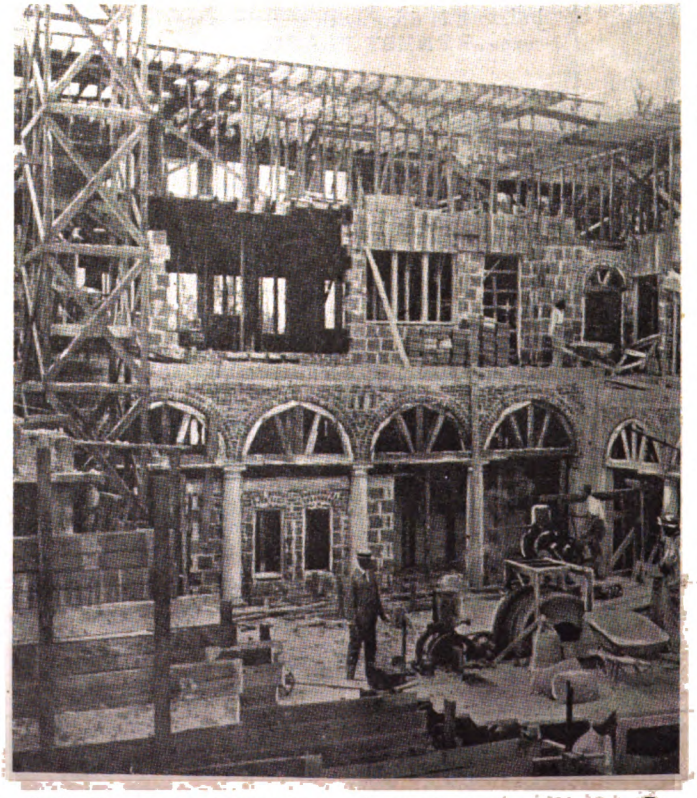
Apartment House *of* Novel Design



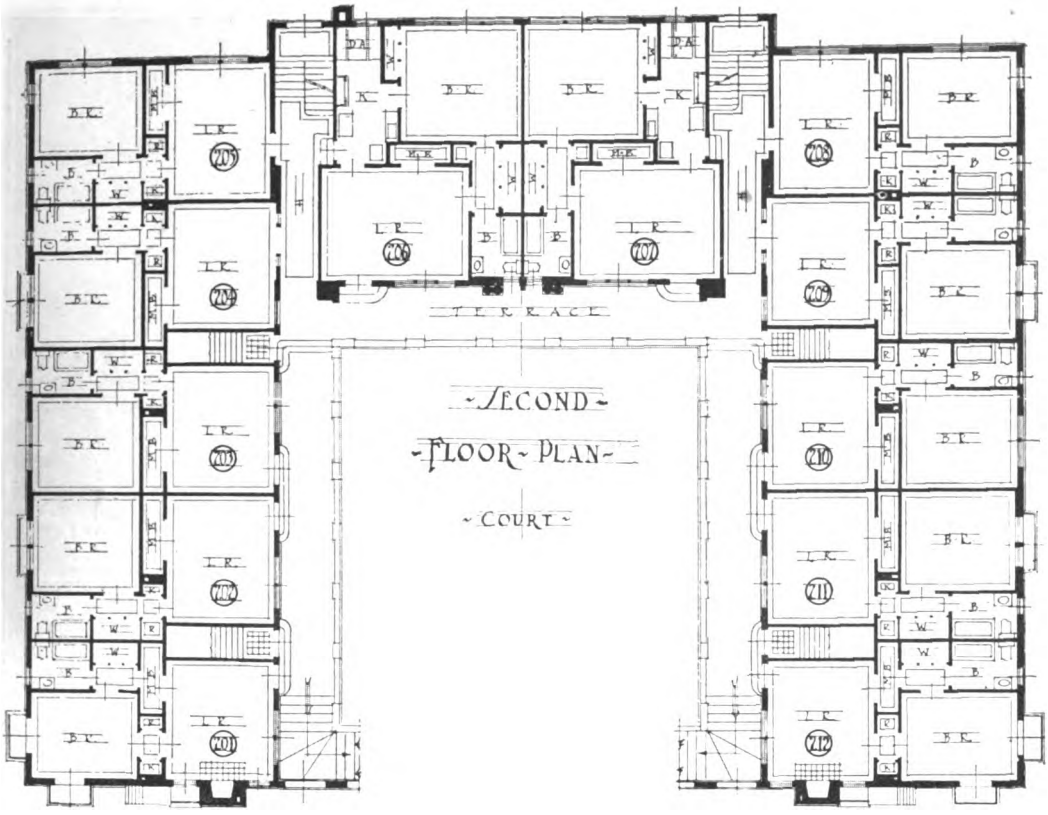
"The Helene" Located at Miami, Florida

HAMPTON & REIMERT, Architects

RATHER unusual is the design of this apartment house—a splendid exposition of the combined Spanish and Moorish with just enough ornamentation in the way of old, hand-made Spanish tile, wrought iron grille and unique balconies to add to its quiet dignity.

The construction is of reinforced concrete piers and girders with hollow tile curtain walls, the exterior being covered with stucco in a two-tone finish. Stairways and gallery are of concrete. The latter as well as all walks in the court surrounding the fountain, give access to the first floor apartments, being laid with 6 x 6″ quarry tile.

Much credit is due to the contractor, Mr. Charles S. Ewing, of Miami, for the production of a first class job of construction work.



A Gasoline Operated Hoist and Concrete Mixer Were Found to Be Indispensable for Economical Operation on This Job.

This apartment house was specially designed to be rented furnished to winter guests at this popular winter resort.

The general color scheme of the whole of the interior is a soft French grey, though each floor has its own distinctive tone and its own period furniture. Several apartments are equipped with fireplaces. The others are heated by electricity, whenever the need is felt to remove the slight occasional chill.

It being assumed that most of the patrons will hardly care to be bothered with cooking, only six of the apartments have been provided with full culinary equipment. These apartments have electric ranges, built-in kitchen cabinets, with dining alcove. The remaining thirty apartments have small electric grills.

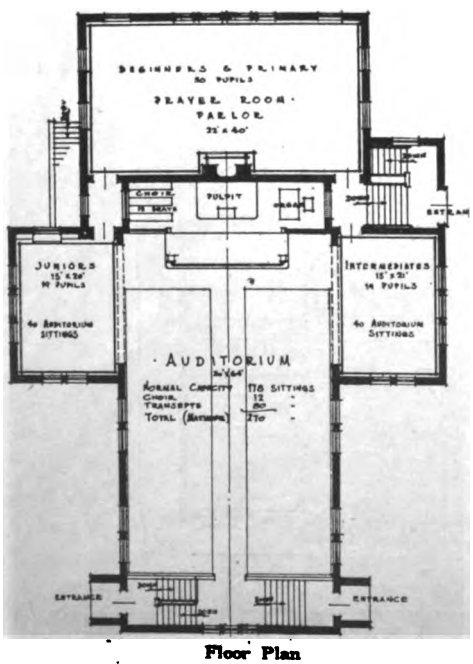
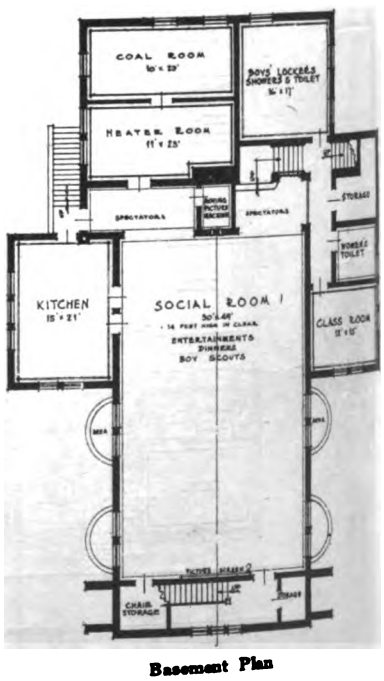
Small Village Church

RECENTLY a committee was appointed by the Episcopal Church in the United States to give a report regarding church architecture. A large number of photographs of existing edifices were taken and these were carefully examined by a committee.



The examination disclosed a rather poor quality of art displayed in the erection of most of the churches. The committee recommended the establishment of a course in church architecture for divinity students so that later ministers would have the ability to judge what would be good.

Some years ago the Methodist Episcopal Church established a bureau of architecture in Chicago and by the aid of this bureau many congregations have been guided in the right path by erecting creditable looking buildings.



The design shown here was prepared by this bureau for a small rural community church. The basement hall can be used for games, meetings and other recreations; a kitchen is attached to it for the preparation of refreshments, etc. Proper space is given over to the heater room and coal storage. A moving picture booth is arranged as part of the structure, being of fireproof construction, and on each side of it there is a platform for visitors. Toilets, storage space etc., occupy the basement.

There is one feature of this layout that will commend itself, and that is the number of exits provided from this basement meeting room, there being four separate stairs.

The exterior of this church design is worthy of special commendation. It is English in character and is to be built of brick and stucco, with half timber work.

METHODS OF FINANCING THE BUILDING OF HOMES

Different Sources of Obtaining Building Capital Discussed, Showing that the Building and Loan Association is Vital to the Building Industry

By K. V. HAYMAKER
Sec.-Treas. Detroit Home Builders' Savings & Loan Company

THIS said that seven Grecian cities dispute the honor of claiming to be the birthplace of Homer. We have about three or four different cities claiming to be the home of the largest building and loan association in America, but the real claimant entitled to the honor has not been named. The biggest building and loan association in America today is the Railroad Men's Building & Loan Association of Indianapolis with between twenty-three and twenty-four million dollars of assets.

This whole conference is based on the fact which we all recognize and all acknowledge, that some efficient practical means must be obtained, must be arrived at, by which we can satisfy the hunger for homes that is felt in every community in America. You realtors all know that you don't get far in any sale of a home until you come to the question, how is this deal going to be financed?

Now, in almost every instance when a man starts out to buy a home, or to build a home, he lacks sufficient money to pay the entire cost. That gap between his available cash and the cost of the property must be bridged by some form of credit, and that credit almost invariably takes the form of a mortgage loan. Hence it becomes a vital necessity for you individually in your business to have available an ample, abundant, reliable supply of money ready for investment in mortgage loans. In the last few years there has been a wonderful change in the methods of doing business in all lines. In none of them has there been a greater change than in mortgage loans.

WE have had heretofore, four sources from which we secured funds with which to finance mortgages. First, private investments Under the present income tax law with its heavy income tax and its mounting surcharges, the income from large estates and from men of great wealth, is no longer being invested in mortgage loans.

For example, some years ago, Hetty Green, said to be the wealthiest woman in America, died, and when her son inherited the estate and came to invoice it, he found almost every dollar of it invested in mortgage loans, about fifty million dollars, and when he came to get the returns, he found that after he had paid the income tax with its high surcharges, he was getting less than one per cent on his money. He at once sold his entire holding of mortgage loans and invested in other securities. That is just one example. Thousands and scores of thousands of wealthy investors who have left the mortgage loan market are no longer buying mortgages.

> THE business men of America in all lines of big business are beginning to appreciate the fact that the building loan association is a co-worker and co-operator with them, and that it is to their interest as well as to the interest of the public. This is not altruism. It is to their own selfish interest, to help along the building and loan association in their home town.

Then the second are the insurance companies. What is true of the individual investor is largely true of the insurance companies. There are two or three or four perhaps prominent exceptions to that rule, the Metropolitan represented by the first speaker, Mr. Cody, is one which is doing a magnificent work in financing home building loans.

The Equitable of New York has another home purchase plan which is available in many instances. The Prudential of Newark, New Jersey, is another that is investing in mortgage loans in small amounts, in reasonable amounts that help the home builder, but taken in the aggregate the insurance companies of America are curtailing their mortgage investments. Some thirty years ago 58 per cent of the assets of the life insurance companies of America was under the head of mortgage loans. Today it is less than thirty per cent of their assets that is invested in that type of security.

The third item, the third source from which money for mortgages was obtained was the commercial banks and the savings banks and trust companies. Today you will find that there are many of them, perhaps a majority of these banks and trust companies, that are not interested in mortgage loans. Several causes lead to that. First, these commercial banks and savings banks and trust companies are financing the commercial and the industrial and the transportation business of the country and as this financial depression from which we have been suffering is passing away and as the industry of the country is going to develop and spread and increase, it will take all the resources of all those institutions to finance that business on the short time commercial paper which is so much more profitable than the frozen credits of the mortgage loans, that the banks are not investing in mortgage loans to the extent that they formerly did.

Another most important reason why you will never again see the banking interest of America invest in mortgages in the future as they have in the past grows out of the effect of the Federal Reserve System.

Digitized by Google

Now the advantage which a bank gets by affiliating with the Federal Reserve System is that it affords a place where they can rediscount their paper, but the paper which they can rediscount in the Federal Reserve Bank must be short time commercial paper. They can't rediscount long time paper. They can't rediscount mortgage paper at all, and for that reason all these institutions, if they affiliate with the Federal Reserve System, will curtail their mortgage investments in order to supply the more profitable business of financing the short time commercial paper.

THEN there is a fourth source from which mortgage loans have been obtained and that is the building and loan system. Unless your attention has been called to it you may not appreciate the magnitude of the building and loan association interests of America. Do you know there are more building and loan associations in America than there are national banks? Do you know this further fact, that the actual cash paid in to the building and loan associations on their capital stock in America is almost double the combined capital stock of all the national banks in America? They have between two and one-half and three billion dollars of gilt-edged securities in their vaults.

A few months ago Mr. Fiske, the president of the Metropolitan insurance Company, made a statement at a meeting of the Life Insurance Presidents' Association, as a boast, that in the year 1920 the combined life insurance companies of America made mortgage loans to the extent of $237,000,000. That is a tremendous pile of money. $151,000,000 of that was on farm loans and about $78,000,000 was on city property, and it is a matter of common knowledge that many of the loans made by these insurance companies on city property were on office and apartment buildings and structures of that character which did nothing toward improving the housing conditions in America.

It is a liberal estimate to say that the combined life insurance companies of America in that year did not loan to exceed $50,000,000 on homes in America. Compare that, with what the building and loan associations of America did in that same year when they loaned $550,000,000 in America. So many people have an idea that the building and loan association is a little two by four sort of an institution where children save their pennies, and where the working man saves the dollars and dimes that they can pinch out of their savings.

> EACH line of business should co-operate with every other to stimulate the growth and swell the assets of the building loan associations, and in so doing will not only advance their own interest and make their own business bigger and more profitable but at the same time will be doing a great public service in helping to make this country a better place to live in.

Support and back up the building and loan association in your own home town. If you haven't got one, go out and organize one.

SOME years ago I was employed by the National Association of Lumber Manufacturers to travel all over the country. I made a tour of some 15,000 miles from Albany, New York, to Great Falls, Montana, and from Minneapolis and Milwaukee to Dallas, Texas and New Orleans. My message to the lumber dealers of America was that they should get behind the building and loan associations, because every time a building and loan association made a loan in their home town it meant the sale of a bill of lumber, it meant business for them, and as a result of that tour, more than one hundred building organizations were organized in America by the lumber dealers, getting their neighbors around them and organizing an association to build up the community in which they were operating.

Last month they had a big meeting down in Chicago, the American Lumber Congress. A Kansas City man. Mr. James R. Moorehead, read a paper on this subject, and he prefaced his paper by telling this story:

He said, "After I got my paper ready for this convention, just as I was about ready to take the train, I called up my son in Lexington, Missouri, who is running a lumber yard.

"I said, 'Hello, son. What are you doing down there? Any business coming in?

"'Yes, nice business this morning.'

"What did you do?

"'I sold a bill of lumber for a house down here to John Smith. He is going to build over on Elm street.'

"Well, did you get your money?

"'Sure I got the money.'

"Where did Smith get the money?

"'Out of the Building and Loan.'"

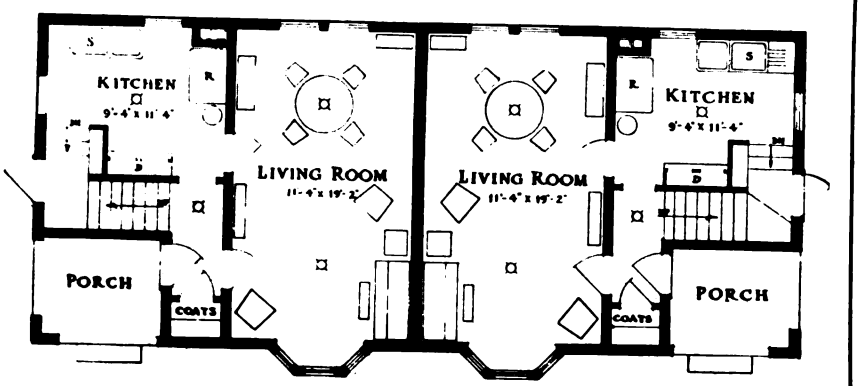
Mr. Moorehead said that he sold that bill of lumber thirty years ago when he organized that building and loan association there, and the story, his boy told him over the telephone that morning, has been repeated in greater or less degree every week, and sometimes a half dozen times a week during this whole thirty years. Mr. Moorehead said that the best stroke of business he ever did was when he organized that building and loan association.

Does that convey any lesson to you realtors? Don't you know that every time a building and loan association makes a loan to a man it increases the value of the property all around you? Perhaps you even get the money with which he buys the lot. Now isn't it up to you to back up these building and loan associations and help to make them popular and help to finance them in the efforts which they are putting forth?

ONE of the most hopeful signs in our current events is the growing spirit of co-operation and mutual helpfulness which is so rapidly growing up in all lines of business.

The great problem of providing adequate funds for financing the great program of home building with which our country is confronted is of vital importance not only to the public at large but to every line of business which must take part in the work.

Each one of these lines of business is vitally interested in the building association which must be the source from which the funds come to finance all these various steps which convert the wandering, rent-paying tenant into a home-owning, home-loving, patriotic citizen.



[Extracts from an address delivered before the National Association of Real Estate Boards durirg the Conference on Realty Financing held in San Francisco, Cal.]

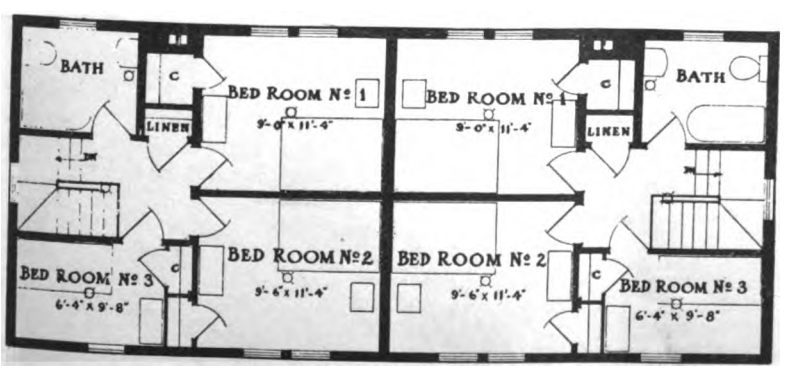
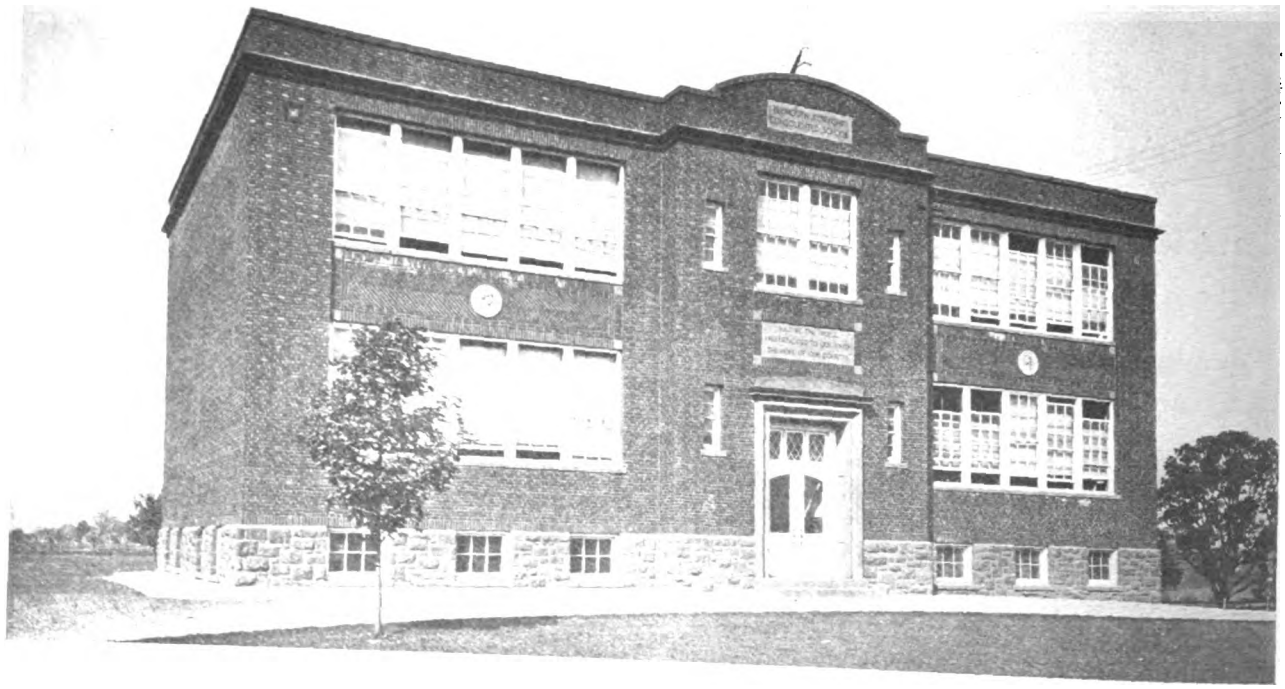
Twin House Design



Convenient Layout of Five Room Home

MURPHY & DANA,
Architects

First Floor Plan



Second Floor Plan

PLENTY of room in a small space has been secured in this charming little twin house design.

The entrance porches are located at opposite ends of the buildings, so that the utmost privacy is obtained and extra room is obtained upstairs by utilizing the space over this porch.

Some may object to this as being too cold in the winter, but modern insulation materials can be had which eliminates this otherwise objectionable feature. The design of porch is such that it may be very easily glass enclosed.

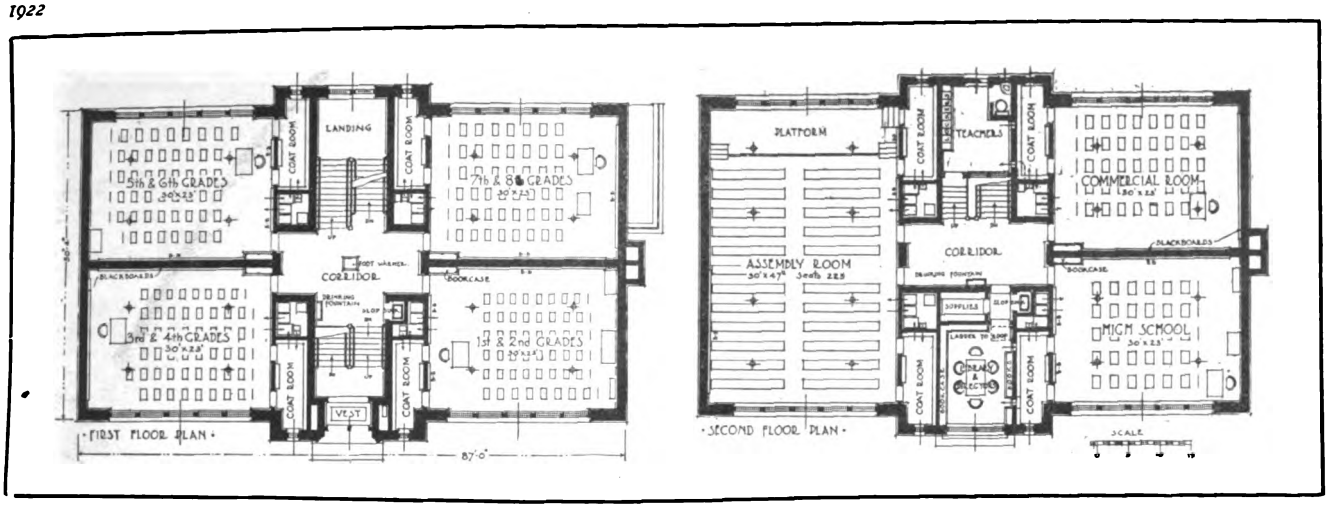
Artistic School Design

Convenient and Practical Layout of a Modern School

SCHERMERHORN & PHILLIPS, Architects

BUILDING statistics reveal the great demand for schools and the erection of many more are in contemplation, therefore, it will interest our readers to carefully examine the design and details of the school shown herewith.

This school was erected at Plymouth Meeting, Montgomery County, Pa. It is called the Plymouth Township and Consolidated School, and Alexander Chambley of Philadelphia was the general contractor. As will be observed by an examination of the plans shown on the next page, the building contains eight classrooms, two of which are used as an assembly room when the folding doors are opened. An interesting view of this assembly room looking towards the platform is given in another picture.



The corridor construction is of reinforced concrete and the stairs of steel with slate treads, the details of which are given later. The corridor floors are covered with battleship linoleum which tends to deaden the noise of walking and prevents disturbing the scholars.

Slop sinks are provided on each floor, as well as drinking fountains. The basement contains playrooms for

Interesting View of Assembly Room Looking Toward Platform

Digitized by Google

both boys and girls with separate entrances to each, and toilets connect with same.

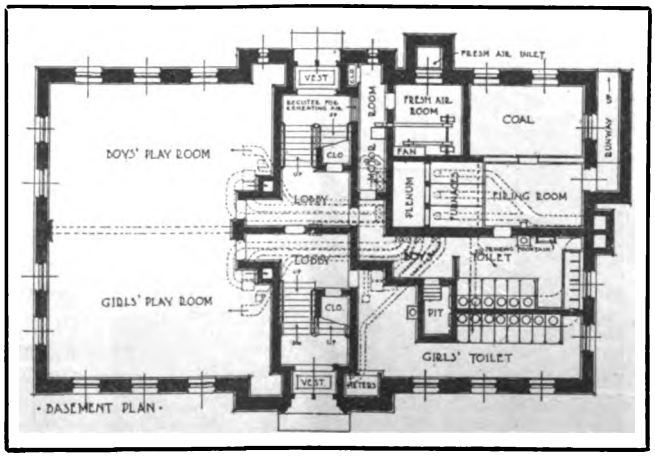
On the second floor there is a good size teachers' room containing private toilet and a locker for each teacher.

Adequate coat closets have been provided in each classroom and extra space for supplies. Book cases have been supplied in most classrooms. Metal ceilings have been used throughout and the building is electrically illuminated by chandeliers as shown in the pictures.

The building is adequately heated by a fan furnace system located in the basement. This allows for proper ventilation at all times, no matter what the state of the weather may be.

Blackboards are provided on at least two sides of the wall. The entire building has been designed with the idea that four room wings may be added to each end when required.

We give an interesting photograph of one of the stairways in this school. This is the stairway on the first floor rear and it shows the entrance door on the left hand side into the fifth and sixth grades school rooms and at the right of the picture the rear vestibule is shown.



As many readers will be interested in the construction of stairways which are such an important part of a school building—we give a detail of the construction of this stairway.

Halls and stairways in school buildings must be convenient to exits and of a size and construction that will properly safeguard the lives of the children within the building, as well as to provide ample accommodations for interchange of classes and other school purposes. The location and design are primarily peculiar to the individual building—the problem of construction, however, is somewhat similar in the same types of structures.

Tread in Inches	Riser in Inches	Angle of Stairway with Horizontal
12	6½	28° 27′
11¾	6⅝	29° 25′
11½	6¾	30° 25′
11¼	6⅞	31° 26′
11	7	32° 28′
10¾	7⅛	33° 32′
10½	7¼	34° 37′
10¼	7⅜	35° 44′
10	7½	36° 52′
9¾	7⅝	38° 02′
9½	7¾	39° 12′
9¼	7⅞	40° 25′
9	8	41° 38′
8¾	8⅛	42° 53′
8½	8¼	44° 09′
8¼	8⅜	45° 26′
8	8½	46° 44′

The stairs must be rigid and strong, built of noncombustible material whenever possible in order to minimize the danger of spreading fire and smoke.

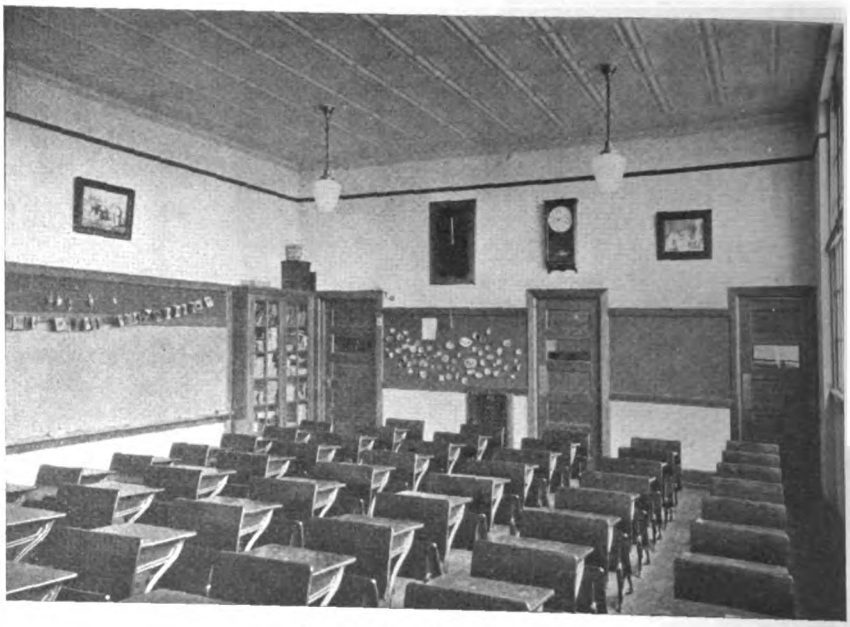
The rise and tread should be such that going up and down is easy, considering that the majority of the people using these stairs are children, therefore risers should not be as high as for grown ups. The stairs should be a sufficient width so that excess crowding will be eliminated. Winders or steps on platforms should not be used. Most of the unfortunate accidents in school buildings have occurred on the stairs or hallways, therefore these should be of ample size with exits in at least two directions.

The illustration shows the arrangement of the stairs in this modern school. This stairway is constructed of steel strings with cast iron risers and slate treads. The treads used are of hard veined ribbon stock Pennsylvania slate as this has proven to fill all requirements of strength and resistance to wear.

Another point is that the non-absorptive qualities of slate are such that frequent washing of the stairs will

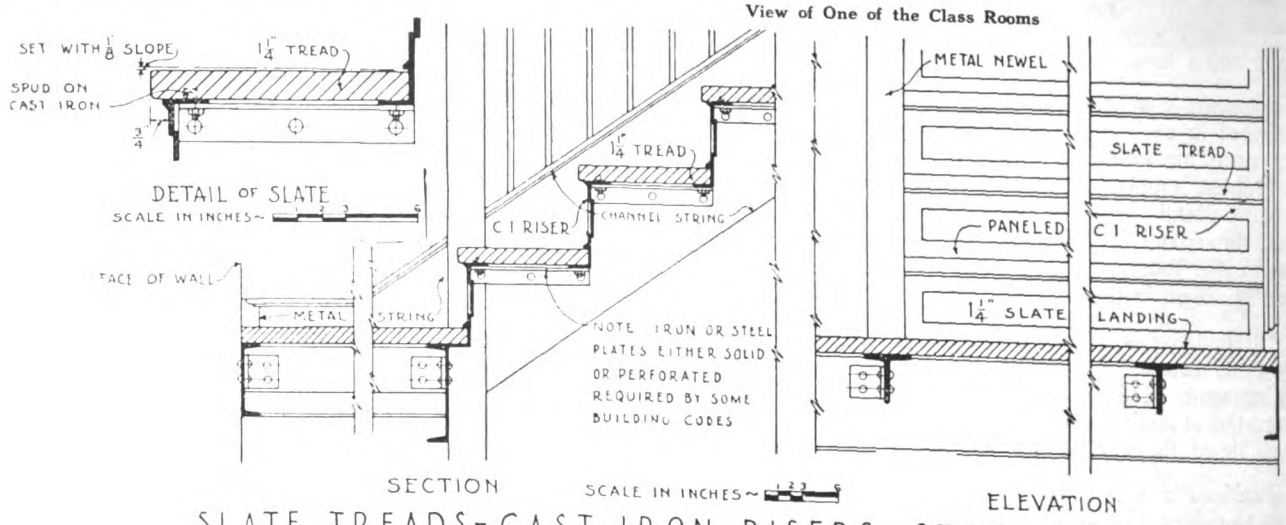
Digitized by Google

not in any way injuriously affect the material.



The detail drawing showing the construction of this stairway was prepared by Mr. D. Knickerbacker Boyd for the Structural Slate Association as a model for this type.

Where Building Code regulations do not specifically state the load to be provided for in calculating stairs, it is advisable to use 150 lbs. per sq. ft., as it has been developed that a densely packed crowd in a flat space weighs approximately that amount. While such a load could probably never be placed upon the stairs, there is a certain amount of vibration due to the movement of the load which makes this figure none too great for safety.



The arrangement of a stairway for ease in walking up and down depends upon the proportion of rise to the tread. Of the several rules applicable to proportioning stairs the best one is as follows:

The sum of twice the rise, plus the tread, should total from 20″ to 26″—thus a stairs with a rise of 7½″ and a tread of 10″ would total 25″ according to this rule. The table presented here will be useful for reference. It is recommended as good practice by the National Fire Protection Association.

The relation of tread to riser is a question of judgment; outside steps to a public building or to an interior monumental stairway should have wider tread and less rise than ordinarily would be the case. It means safety for the crowd, as the wide treads give ample standing room.

Practical Pointers *on* Selection *and* Use *of* Hot Air Furnaces *for* Residences

Some Principles of Hygienic Heating Discussed

By R. B. MONFORT

FOR the past ten years you have heard a great deal about bacilli, contagion, germs, infection and the need of sanitation. Also you have learned that scientists have made great progress in combating various diseases arising from different sources and that the advancement made along these lines has proven a great benefit to humanity.

Along with the many good things accomplished it would seem, however, that the old adage " An ounce of prevention is worth a pound of cure," should be the ultimate goal, thereby eliminating much unnecessary suffering.

Such a course might not prove practical for all ills, but a very large per cent. of the ailments classified under the head of "bad air diseases" are really preventable, and their elimination, to a very great extent, would lessen the mortality in the home. Death by disease is most miserable but the majority of us go that way.

Although winter is supposed to be the recuperating period, the so-called modern methods of living have apparently caused a reversal of nature's plan and these afflictions could rightfully be called "winter diseases." When we shut ourselves in the house with artificial heat, and no serious effort is made to exclude the fire-poisons or provide adequate ventilation, the membranous and nervous disorders become prevalent and often violent.

Real if Not Visible

Unfortunately very few of us pay any attention to the quality of the air in our homes when it is most essential to our very existence. Did you ever stop to think that you could live ten thousand times as long without food and fifteen hundred times as long without water as you can without air? If it is advisable to pay so much attention to the purity of our food and water, it behooves us to pay even greater attention to the purity of the air which we breathe.

Nature performs wonders if her ways are not interfered with too seriously and this article is written with a hope that in some measure we can contribute to better hygienic conditions in the home, during the winter months, more than one-half the year, by showing how to preserve nature's vitalizer—pure air.

Is the Mission to Serve or Destroy?

ONE of the most dangerous sources of contamination from the heating plant is the escape of the products of combustion through the fire-box into the air circulation. Of these you must realize that carbon-monoxide, an insidious gas, is the most dangerous because its presence in the atmosphere even in minutest quantities, acts as a slow poison destroying the "haemoglobin" or half-mature cells in the process of formation. This breaking down of the cells is responsible for many serious nervous disorders, kidney and heart afflictions, and their accompanying disastrous effects.

Should you save the newspaper clippings you would be astounded by the number of families that are entirely wiped out by carbon monoxide poisoning, which only emphasizes that it is the most deadly gas known.

Irregular temperatures are not conducive to good health nor do they add to the comfort of the occupants of the building. They seriously interfere with the natural thermostatic action of our bodies, which is nature's method of protecting us against too sudden changes, consequently play their part in causing colds.

Super-heated air has the same depressing effect as stagnant air, both having the vitalizing principles or energizing properties destroyed. Very few people are able to distinguish between "scorched" or "stale" air and both are recognized as "stuffy" or "dead." Chemical analysis seems to reveal no difference. They both have a decided depressing effect upon our physical stamina.

It is easy to understand why but few people realize to what degree the air in a building becomes contaminated by the occupants, because they have never studied this subject.

The exhalation of carbon dioxide from the lungs, the evaporation from the body, saturate the atmosphere with foul moisture which by lessening our powers of resistance increases our susceptibility to disease. To show that this point is worthy of consideration, the actual secretion of H_2O from the eye, nose and mouth of the average adult in one hour is eight ounces or one common glass full. Add to this the effluvia from our bodies, consider the total pollution and you will realize why many homes are "culture medium" for the multiplication of germ life. These facts are called to your notice to impress upon you what the atmosphere in most houses lacks that is essential, and what it contains that is detrimental to your welfare.

Cleanliness for Self Protection

TO enjoy the measure of satisfaction, happiness and health, that one should rightfully expect, extra precaution must be taken to prevent the contamination of the air by the heater itself; to prevent the destruction of the energizing properties of the air by overheating and to promptly remove any contamination to the atmosphere by the occupants of the building. In other words build your homes a safe refuge for your customers during the winter, by having the atmosphere as fresh and invigorating as it would be outdoors.

To obtain a heating equipment that will insure necessary hygienic benefits it will naturally require some outlay of money and in order to come within the means of a large per cent. of the intending home owners you will naturally recommend the warm air gravity system. Steam or hot water heating plants combined with a ventilating system are satisfactory in large buildings. In small cottages, however, the cost generally prevents their use.

Digitized by Google

The Fire-Box the Critical Element

Steel, which is impervious to penetrating gases, answers admirably for the construction of the fire-box, the different parts should be securely welded, eliminating all rivets and seams so that it is made imperforate, or into one continuous piece of metal. All top surfaces should be eliminated and the radiating surface should be free from all irregularities with ample space between heater and casing to permit an uninterrupted air supply of large volume.

Avoid Scorched Air

THAT the air may be only mildly heated, never above 150 degrees F. at point of contact with the furnace, large capacities must be specified in both heater and warm air pipes, and a positive automatic control should be utilized, of which the fire-box proper is the principal and actuating member. This not only prevents overheating that devitalizes the air but is a great personal relief from many of the anxieties and uncertainties that seem to be a part of the ordinary heating plant. Not only uniform temperature with but slight attention to the equipment is secured, but it is a protection to the heater and a protection to the home which gives a great sense of security from unexpected disaster.

Advantages of Rapid Internal Air Movement

The ventilation and heating are so interdependent that they must be embodied in the same system. On this point you must not compromise the health, vitality or personal development of the household.

The air should be completely changed in each room every ten or fifteen minutes and the analysis should be such that at no time will it test more than six parts of carbon dioxide to ten thousand parts of air, which comes within the prescribed limits of the health authorities. To make this possible it is essential that the return capacity to the furnace equal the capacity of all warm air ducts and in addition an outside air pipe be provided of sufficient size to supply twenty-five hundred cubic feet of air per hour, per person, figuring twice as many persons in bed rooms as the average occupancy.

The returns must be scientifically distributed so as to positively prevent annoying and dangerous drafts upon the floor. If the home has an open stairway, a large return face should be located near the bottom to prevent the cooler air from upstairs spreading over the first floor, and the other return faces should be so distributed throughout the living rooms to avoid any disagreeable drafts, even to small children playing upon the floor. The ordinary fire place is usually sufficient for vent purposes.

In addition to the advantages outlined you are assured of a rapid internal circulation that trebles the movement of the air; positive distribution which makes the heating of windward rooms feasible; the avoidance of great differences in temperature between floor and ceiling and the prompt removal of the vitiated air.

Economy Essential

ITEMS in furnace construction that spell *Economy* in big letters are as follows: Design of fire-box eliminating irregularities with maximum radiations; complete down draft principle; large fuel space with large grate area in proportion, insuring slow combustion and automatic regulation preventing wasteful fires and disastrous over-heats.

Two other things are such important factors that they deserve special mention, not because they come within the province of the building contractor, but because they mean such a saving to the home owner: The depth of the basement, which should be eight feet in the clear if drainage will permit, and the air tight construction of a furnace flue of proper capacity. The greater the depth of the cellar the more elevation to the warm air pipes, consequently the more positive the distribution of heat. Helping to reduce fuel consumption to the minimum with no valuable head room utilized are other valuable features insured. A long article could be written on flue construction but we will pass the subject by saying a leaky chimney often increases fuel consumption over 100 per cent. and decreases heating efficiency over 50 per cent.

Harmony Important for Ideal Results

The heating plant should have right of way over plumbing and electric wiring because the two latter can easily avoid obstruction and not interfere seriously with their efficiency.

The building contractor can assist in many ways by extending his co-operation in the practical location and installation of heating equipment. This means greater heating efficiency at less cost which gives a greater sense of satisfaction to the home owner, consequently works to the advantage of all concerned.

By planning the heating layout with the building, with the view of obtaining maximum results, the builder will render invaluable service to his client.

The selection of the proper heating apparatus combined with the harmony of forces as suggested will render a great service to humanity and enable many a progressive man to realize his life's ambition of a nice home, which provides comfort, health and happiness for his family. Nature's restorer, pure air, should prove his greatest blessing.

The Chimney

FEW owners of heating plants realize that the chimney is a vital factor in securing the proper combustion of fuel and the satisfactory distribution of heat. The chimney creates the draft for any kind of heating apparatus. The furnace, in itself, has no appreciable draft—a fact not recognized when the furnace smokes and the house is cold. Far too much worry, inconvenience, and ill-feeling have resulted from a lack of knowledge about chimneys on the part of many house owners and some chimney contractors. If the furnace smokes. if the fuel does not burn properly, if the temperature does not register the degree specified in the contract, the heating system, too often, is condemned. Then follow complaints, discussions, tests, loss of time and loss of money. The conclusion of the whole matter, in a very large percentage of cases, is a poorly constructed flue.

The primary function of a flue is to provide a suitable conduit for the escape of the smoke and gases thrown off by the process of combustion. A necessary physical condition is a small area wherein a uniformly higher temperature can be maintained than that of the outside temperature. The essential object must not be overlooked in chimney building.

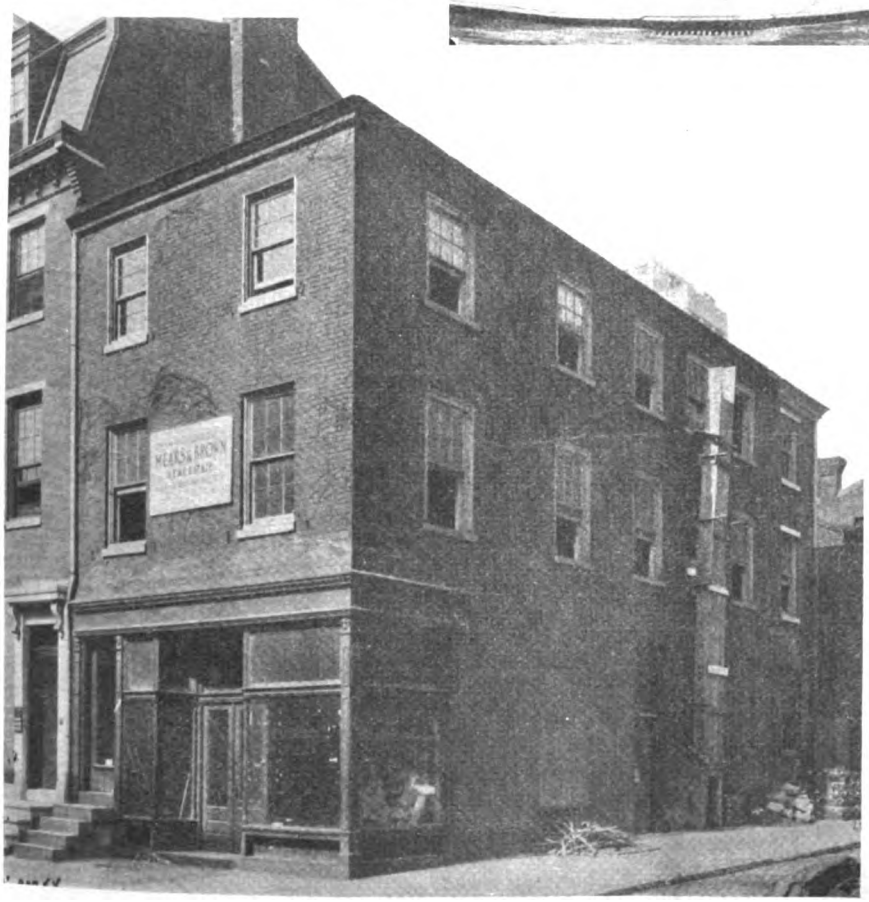
From Corner Grocery *to* Small Office Building



CLARENCE E. WUNDER,
Architect

ON a recent visit to Philadelphia, the editor of Building Age and The Builders' Journal had the pleasure of seeing a very cleverly handled alteration job. It was to quite an old brick building located at 254 South 15th Street, which was used as a grocery store with apartments above.

This section of Philadelphia is changing quite rapidly to a business district, therefore the owners of this building decided to change it and called on Mr. Wunder to undertake the job.

Old Colonial traditions, with which Philadelphia abounds, have been carefully carried out in this remodeling job. The two pictures speak for themselves and a glance at the lower picture, which was taken when the alteration work commenced, makes one wonder what could be done with such a building.

The Old Building Had But Little in Design to Commend It

A cornice of galvanized iron was run around at the roof line and a parapet wall carried above this, thus giving a finish to remodeled structure that was entirely lacking in the old building, which looked like it had been chopped off.

The old stoop and store front were removed and the brick work and windows substituted. This is about all that was done to the exterior structural work, except repainting the old brick work. Of course, the entire interior was ripped out and divided into offices. A fire escape of the improved tower form was provided at the rear end of the building.

It may truly be said that a wonder has been made by Wunder in the alteration of this building.

Modern Automobile Service Station

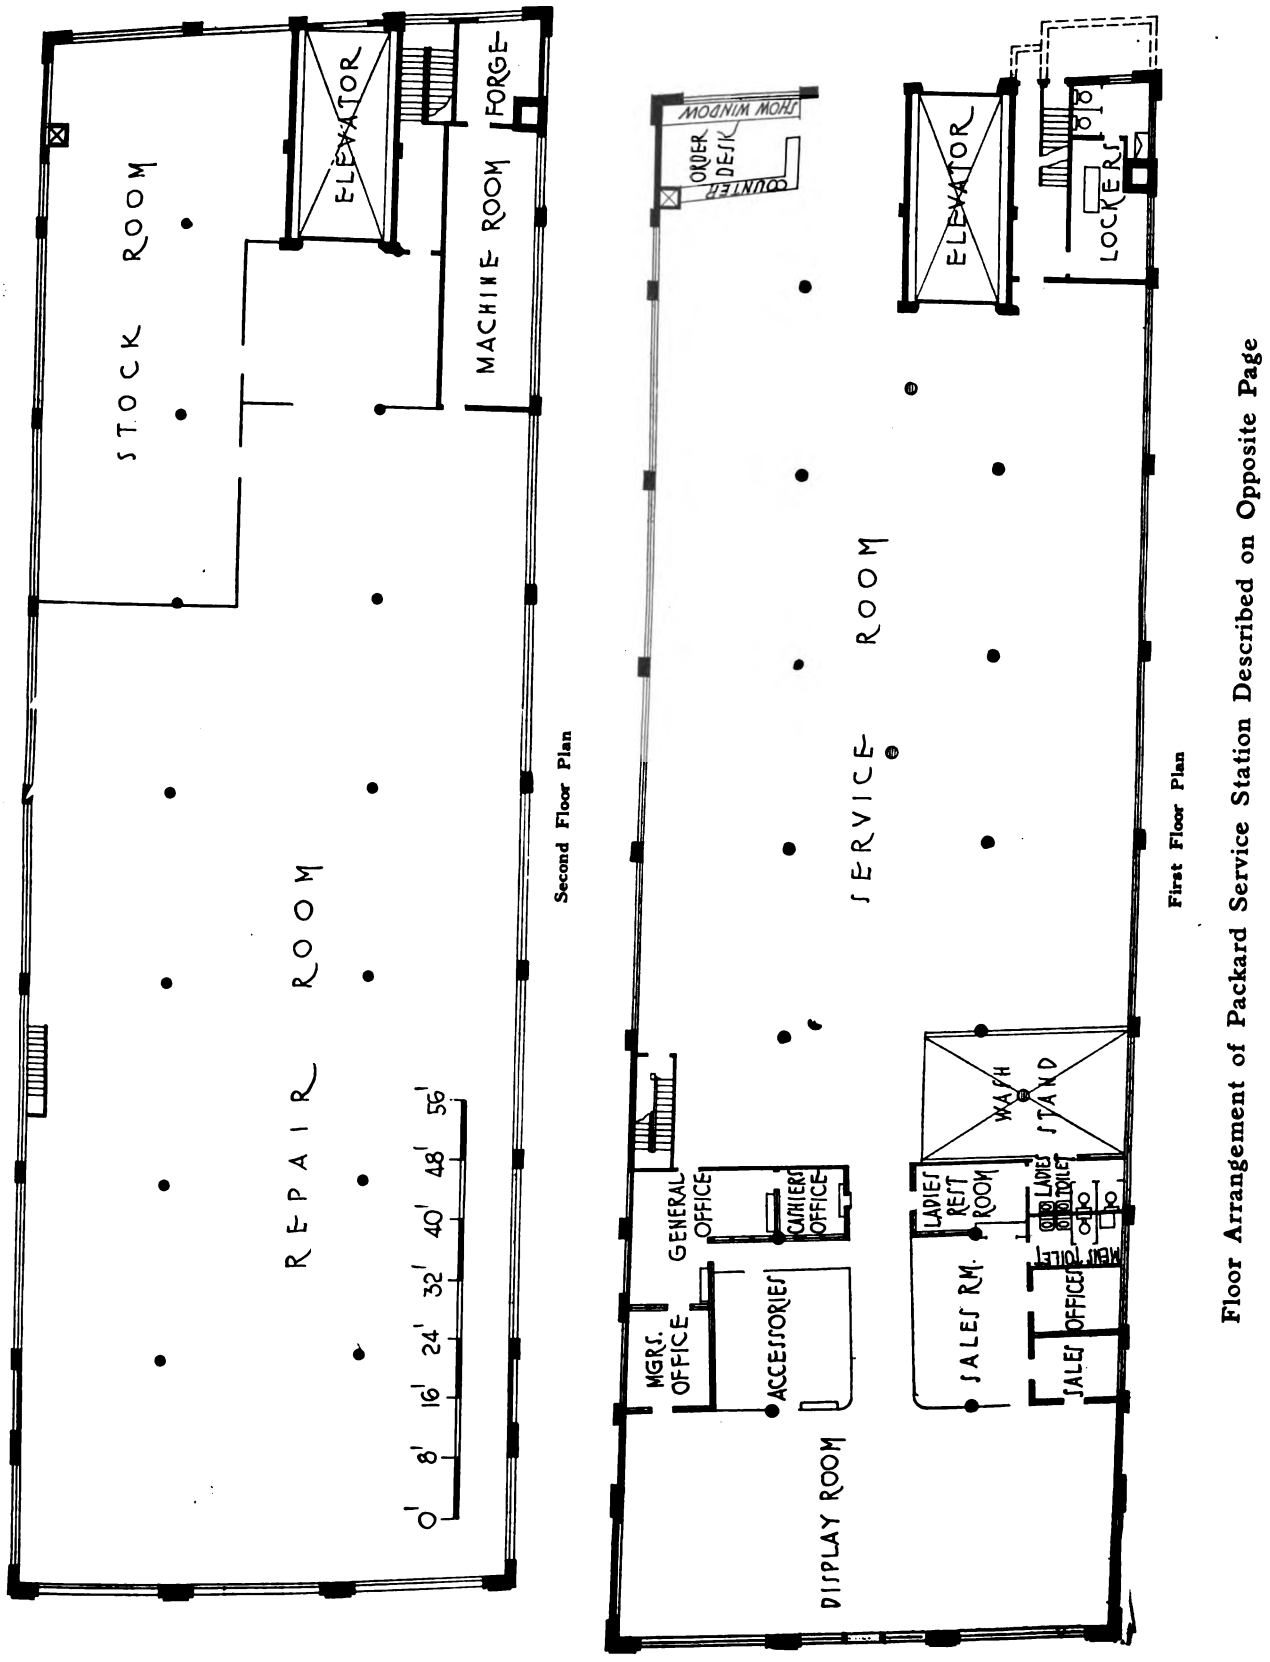
Interesting Building Erected at Springfield, Mass.

REPAIRING automobiles has developed into a large business, not far removed in importance from that of manufacturing them. All the big auto manufacturers pay particular attention to service stations where different repair parts are kept and repairs actually made.

A rather interesting building for this purpose is illustrated herewith. This was recently erected for the Packard Motor Car Company and Samuel N. Green Company of Springfield were the engineers and builders. Our picture shows the completed structure and on the opposite page are the plans of the two floors which show the layout of the principal departments. The building has a frontage of 70 feet and a depth of 209 feet 9 inches.

As the picture reveals, the front is of pressed brick with art stone bases and trim. Large plate glass show windows enable the passerby to see the cars on display. The structural part of the building is of reinforced concrete with brick inserts from the floor level to the window sills which are made of concrete.

Steel sash has been used throughout. The exterior walls consist of practically only piers so that the maximum amount of light is obtained for the interior. The interior of the building is supported by reinforced concrete piers 18 inches in diameter, set on footings 2 feet deep by 6 feet wide. These piers are spaced about 25 feet on center. The first floor is of concrete 6 inches thick, laid directly on the earth. No cellar has been provided as it was not necessary in this type of building.



The second floor is of reinforced concrete 10 inches in thickness, but there is some slight variation over certain areas. The columns supporting the roof are of reinforced concrete 14 inches in diameter and the roof itself is composed of a thickness of 8 inch reinforced cinder concrete and to make a practically water tight job, four-ply tar and gravel was placed on the top. The roof was given a pitch of one-half inch to a foot crosswise and one-quarter inch to the foot lengthwise. The roof drained to downspouts in 4 inch cast iron drains inserted in some of the concrete columns.

As is well known to every student of the strength of materials, the central portion of a column adds nothing to its strength, and this is why hollow columns are used to such an extent. In concrete construction columns are usually solid owing to the expense of inner-molds. However, the use of pipes for drains, etc., takes care of them, keeping them out of the way of other parts of the structure and at the same time does not affect the strength of the structure.

The second floor is given over to a repair shop. The machine room and forge shop are separated by plastered partitions.

As an interesting example of a modern commercial building, the owners and builders can be complimented on the artistic and practical handling of the entire operation.

The Importance of Ventilating a Garage To Eliminate Poisonous Gases

By CHARLES L. HUBBARD, M. E.

VERY little, if any, attention is paid to the ventilation of the average garage, while, as a matter of fact, no building in common use requires greater precaution in this regard.

The reason for this is the presence in varying quantities of two invisible gases, one violently explosive and the other a deadly poison. The first of these comes from spilled or leaking gasoline, and this being a volatile liquid, at once forms a gas, which, when mixed with air in the right proportion forms an exceedingly explosive mixture, the same as is produced in the cylinder of an oil or gasoline engine. This fact has an important bearing upon the heating and lighting systems, as it prohibits the presence of any fire or exposed flame in spaces exposed to this mixture.

The other gas is known as carbonic oxide or carbon monoxide, and appears in the exhaust from a gasoline engine when the carburetor is not properly adjusted or when, for any reason, there is not sufficient air supply for complete combustion. It is the same gas that is given off from coal stoves under certain conditions and causes asphyxiation. It is both invisible and odorless, and therefore difficult to detect. When present in sufficiently large quantities it kills quickly, while in smaller quantities it acts more slowly and gradually undermines the health of persons breathing it more or less continuously.

The danger comes from running motors for test or other purposes in closed rooms without special provision for ventilation, or from breathing the exhaust fumes when working under a car in which the motor is running. There have been a number of deaths from this cause in small private garages where the doors have been closed on account of cold weather. In larger buildings, where there is more space, the harmful results are likely to be more gradual unless the workman breathes the fumes directly as they are exhausted from the motor, as already noted.

Having noted the conditions brought about by the presence of these two gases let us see what practical means may be employed for their removal.

Taking up the gasoline vapor first, the simple arrangement shown in Fig. 1 often proves all that is necessary in case of a small garage, and these openings may be multiplied in buildings of larger size. The scheme illustrated in Fig. 1, consists of a wall opening at the floor level, provided with a register for closing when not in use, and an outside hood for preventing the wind from blowing directly into it.

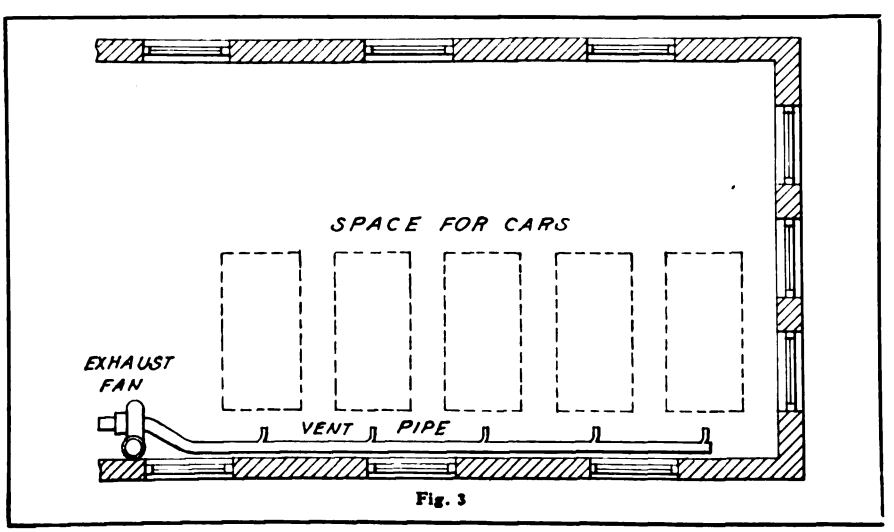

Fig. 3

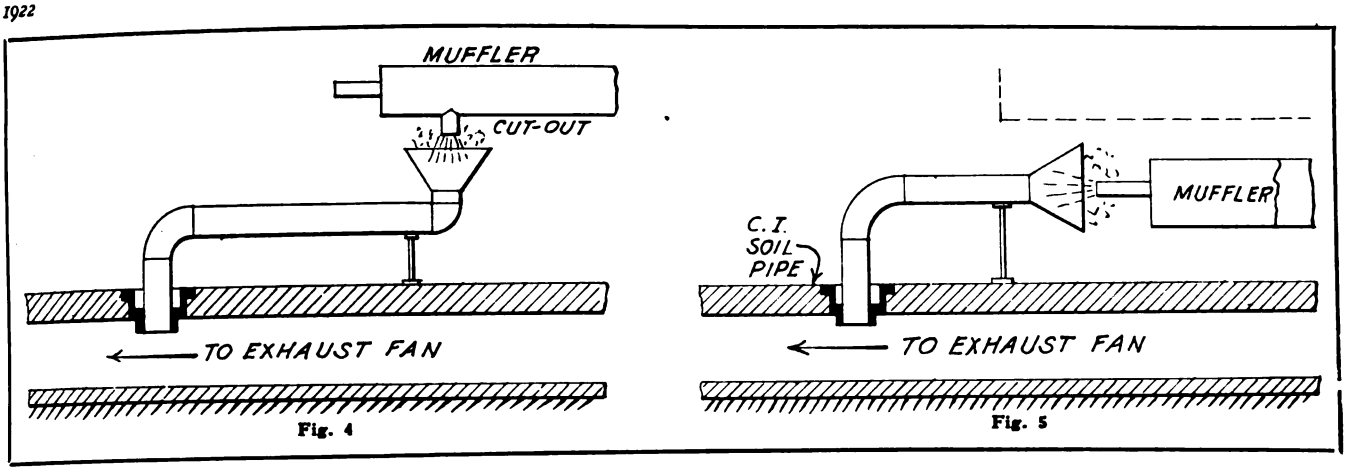
Digitized by Google



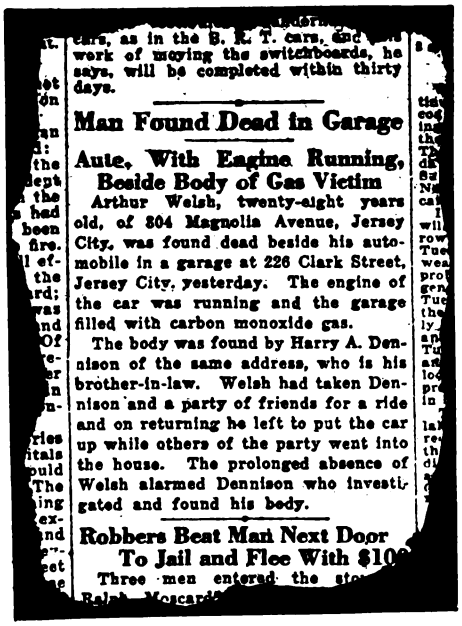


Fig. 4 Fig. 5

As this vapor is heavier than air, it falls to the floor and will flow out of an opening of this kind like water, unless opposed by too strong a wind pressure. When the weather is warm enough, open doors provide the best means for disposing of this gas. A community garage like picture below is safe with doors open but when closed should have ventilation.

One of the simplest and newest effective ways of removing the exhaust gases from a small garage is shown in Fig. 2, and requires but little description. An iron exhaust pipe is carried out of doors, and provided with a flexible rubber hose, the free end of which is furnished with a special nozzle which fits closely over the exhaust outlet from the muffler, thus preventing any of the poisonous or irritating gases from entering the room.

If it becomes necessary to start up the motor for testing or adjustment with the doors closed, the hose should always be slipped over the end of the exhaust pipe and it is a good precaution to do this anyway if the rear of the car is away from the door and a person is exposed directly to the exhaust gases. An adaptation of this same scheme to a larger building is shown in Fig. 3, in which a horizontal vent pipe is carried along the wall at the rear of the space provided for cars, having outlets at different points to which a hose connection may be made with a motor exhaust, in the same manner as already shown in the illustration Fig. 2.

These openings should be capped and enter the main vent pipe on an angle toward the outlet. By attaching an exhaust fan to the end of the main pipe, as shown in Fig. 3, and leaving the hose connections open, a certain amount of general room ventilation may be obtained which will care for much of the gasoline vapor also, if the openings are close to the floor. Another similar arrangement, especially adapted to trucks, where the exhaust may be either through the muffler or cut-out, is shown in Figs. 4 and 5.

cars, as in the B. R. T. cars, and ... work of moving the switchboards, he says, will be completed within thirty days.

Man Found Dead in Garage

Auto, With Engine Running, Beside Body of Gas Victim

Arthur Welsh, twenty-eight years old, of 804 Magnolia Avenue, Jersey City, was found dead beside his automobile in a garage at 226 Clark Street, Jersey City, yesterday. The engine of the car was running and the garage filled with carbon monoxide gas.

The body was found by Harry A. Dennison of the same address, who is his brother-in-law. Welsh had taken Dennison and a party of friends for a ride and on returning he left to put the car up while others of the party went into the house. The prolonged absence of Welsh alarmed Dennison who investigated and found his body.

Robbers Beat Man Next Door To Jail and Flee With $10

Three men entered the sto...

The opening into the under-floor duct is through the bell of a castiron soil pipe, and when this is not in use it should be covered with an iron cap the top of which is flush with the floor, the same being provided with a finger hole for convenience in lifting and also to furnish a continuous draft opening into the vent duct to draw off any heavy gases which may collect at the floor level. A considerable number of these openings should be provided according to the size of the building.

To impress the importance of ventilating a garage on our readers we give here a newspaper clipping of a recent fatal accident. Had any of the precautions that we point out in this article been provided a life would have been saved. When building a garage builders will be doing their customers a real service by calling their attention to this matter. It is as important as providing fire exits in theatres, etc.

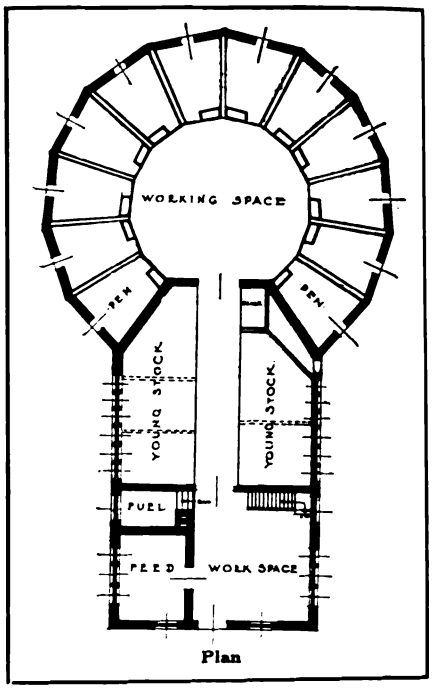
Type of Community Garage That Should Be Provided with Adequate Ventilation

Digitized by Google

Hog House *of* Unusual Design

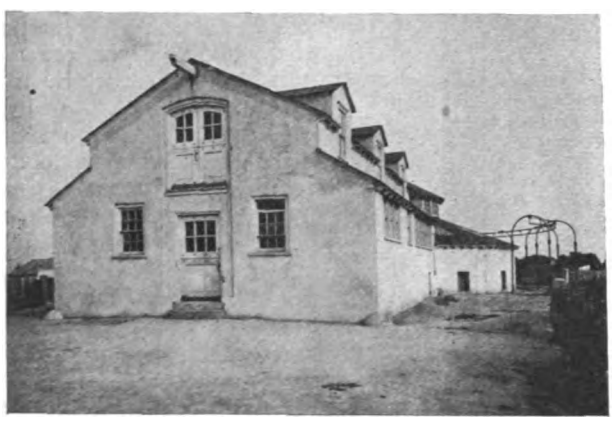
HEACOCK and HOKANSON, Architects

ONE requisite of the modern hog house is to have plenty of sunlight, together with adequate artificial heating for cold weather, and plenty of ventilation at all times.



Improved hog houses have helped to eliminate disease and put the stock-raising business on a better paying basis than ever before. It is now a well recognized fact that hogs, especially expensive prize stock, require careful attention in the winter as well as other live stock; their better treatment results in better prices.

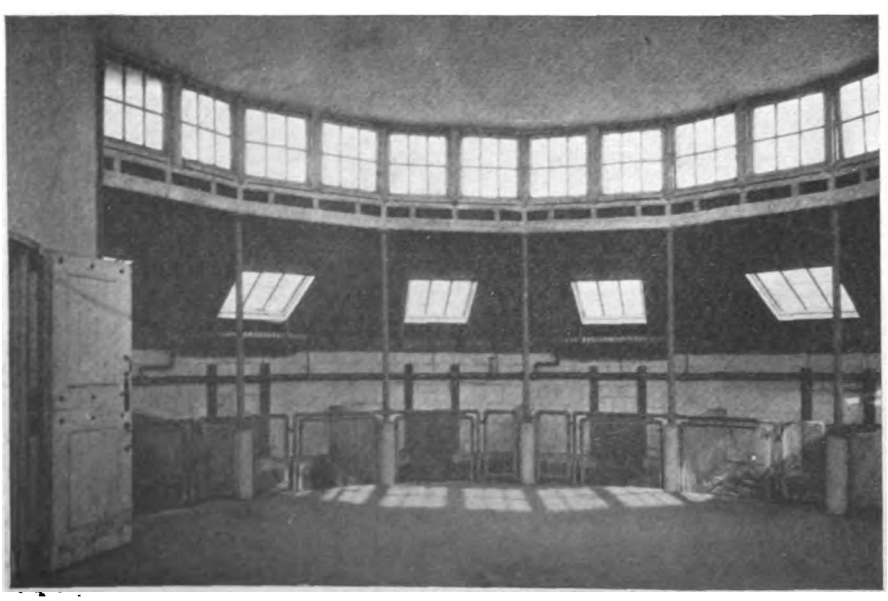
The pictures and plan shown herewith illustrate a modern piggery erected for Mr. Joseph R. Grundy at Croyden, Pa. This unique building was erected by Mr. Yardley Stradling, building contractor of Oxford Valley, Pa., from plans prepared by Messrs. Heacock & Hokanson, architects, of Philadelphia, Pa.



These buildings were built of hollow tile covered with Portland cement stucco. Perhaps the most interesting feature is the circular end; it is really a fourteen-sided figure.

A concrete floor was laid in this hog house, having a removable plank floor in each pen. Everything has been installed with the idea of keeping sanitation foremost so that the valuable prize stock is well taken care of.

The pens are divided by solid partitions and the interior division rail is of wire mesh, supported on pipe frames.



Plan

View of Modern Hog House

The Circular Sunlight End

Interior View of Circular End

Windows in the roof directly over each pen allow an abundance of sunshine, and a radiator over every other pen furnishes an abundance of heat in the coldest of weather. The top monitor windows afford plenty of light and ventilation while preventing cold drafts on the stock.

Each pen is provided with an outside door so that the pigs can have the advantage of the run. The fencing for these runs was not installed at the time our photograph was taken.

Observe the frame work supporting the litter carrier; this provides for easy cleaning and bedding. This is a piece of equipment that is really a necessity on the modern farm where time counts. Building contractors should be familiar with the different forms of equipment and the proper methods of installing same.

Spoiling *the* Beauty *of* Brick Work

Unfortunate Practice Reduces the Value of Buildings

By GEORGE W. REPP

WHAT dreams of artists, architects, engineers and town planners have passed before us in the last decade in endless procession! And the fruitage of these plans, evidenced by actual improvements in most every community, bear witness to the progressive spirit of our people.

Cities and villages throughout the country "point with pride" to their parks, boulevards, monuments, public buildings and utilities, and to their plans for the future. Civic bodies, commercial clubs, art commissions, real estate boards and other organizations composed of progressive citizens, are constantly devoting their time and efforts to the furtherance of the City Beautiful.

But while all these plans concern the community as a whole and should influence each individual in making his own improvements, be it commercial or home building, it is to be regretted that quite often the individual gives little thought to the part his construction plays in the building of a City Beautiful. The citizens can not always point to their own property with the same pride they may justly take in their city and its accomplishments.

Frequently home owners fail to think of the importance of well designed exteriors to their homes. Or even if they use a fairly acceptable design, they too often commit the grave fault of making the front pretty while neglecting the sides and rear. They are glad enough to have an attractive street, but seem oblivious to the ugliness as viewed from the garden on the side or rear. They are very much like the man who thinks himself well dressed with a dickey shirt front.

Many a real estate operator or contractor in our cities also commits this fault. Building homes for speculation, either for the sake of lowering the sale price or for the larger profits possible, he forgets his obligation to the larger community by skimping on the materials and design of the house, except of course the front. He knows there must be some attractiveness about the house, to make a selling appeal, and so he puts it

Fig. 1—Face Brick Used for All Four Sides of This Bungalow—Beauty at Small Cost

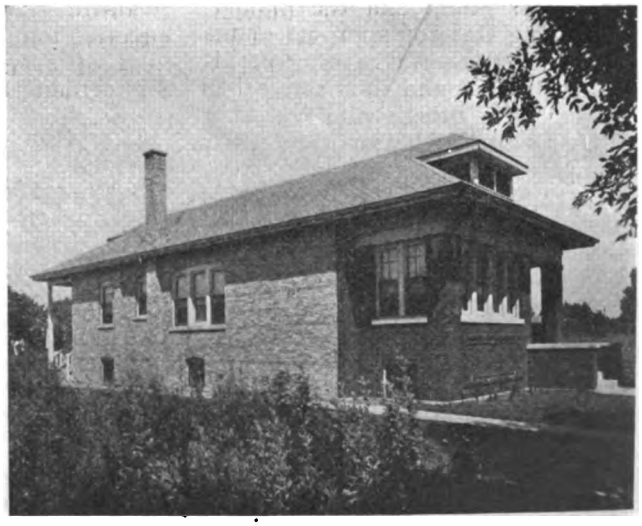

Fig. 2—Poor Appearance Obtained by the Mistaken Notion of Saving a Little Money

Digitized by Google

on the front where it first catches the eye. He fails to see the short-sighted absurdity of such a course, and resembles the small boy, who reluctantly washes his face, leaving his neck and ears dirty. The boy, under protest, cleans as little of his anatomy as possible, and the builder reduces the attractive area of the house exterior to the minimum. He, so to speak, washes the face of the house for the sake of appearances but fails to clean its neck and ears.

Unfortunately, however, such houses sell because the public find no better ones; and the builder, mistaking this for approval of his operations, continues the pernicious practice and thus sets a bad example for others who fear that if they build better than their competitors, the advanced costs will prevent ready or profitable sale. They have not recognized the fact that there is an inherent love of beauty in everybody, so that the public are constantly demanding not only better buildings, but more beautiful ones as well.

To take a specific example. In some communities there are whole sub-divisions built up of poorly designed homes, with face brick fronts and common brick sides and rear, that resemble the walls of cheap factory buildings in vogue years ago. Whether built on wide or narrow lots, the sides of these houses are, more or less, visible from the street, making a discordant note, and giving the effect of pretty masks on ugly faces.

It is hard to estimate how much it would mean to the occupants, and the whole neighborhood, if the builder had carried the face brick around the entire sides and rear, when fully exposed, or returned it on the sides, at least a suitable distance, when partially exposed, so that none of the discordant common brick sides would be visible. Beautiful things have a vague but effective influence for good on the lives of everyone wherever they are introduced.

Every builder or owner of a house should feel obligated to help in making his own town as beautiful as possible. He thus not only gives himself satisfaction but enhances the value of his neighborhood and raises the general tone of the whole community.

A comparison of the bungalow in Figs. 1 and 2 will strikingly illustrate this point. In Fig. 1 the walls of the house all around are of face brick, while in Fig. 2, where the house is almost identical in design, the owner or builder decided to save a little by using common brick on the sides. The pictures speak for themselves.

The cheap and incongruous effect is at once obvious. Nothing need further to be said except that these houses were built in a section of a city where the lots are wide and where no possible excuse existed for such treatment of the exterior. Of course, the excuse is cost, but this is only specious.

Let us see, approximately, what the added expenditure would be to carry face brick around the building. Assume that the side-wall is 40 feet long and 12 feet high, giving an area of 480 square feet, from which 10 per cent., or say 50 square feet, should be deducted for openings, leaving 430 square feet to be faced with brick. At 7 brick per square foot, this would amount, in round numbers, to 3,000 brick. With face brick such as used in the building shown at $34 per M., and common brick at $18, the difference of $16 per M. would mean $48 extra to supply the face brick for one side. Counting the rear at about half the area of the side, the added material cost for the two sides and rear of face brick would be $120, to which is usually added an extra labor charge for laying the face brick, but should not be great, as the common brick laid in the face of a

Fig. 3—Face Brick on Part of Side a Step Far in Right Direction But Not Far Enough

Fig. 4—A Little More Face Brick Used on Side of Apartment House Would Have Added to Its Beauty

Digitized by Google

wall must be laid with care. A few steel lintels for level heads to the windows and cleaning down the walls would increase this amount approximately to a figure between $150 and $175. A small sum indeed compared with the total cost of the building.

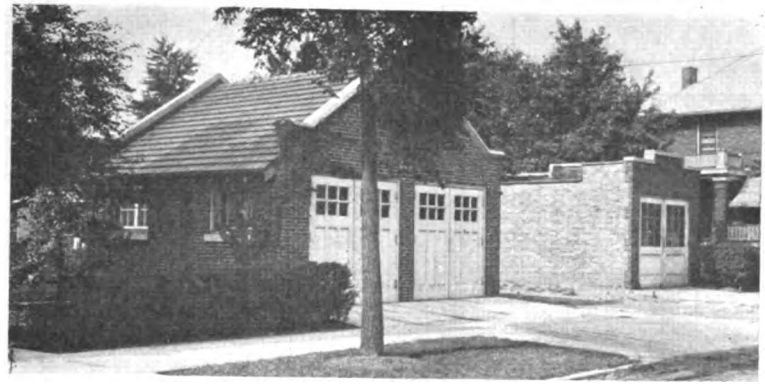

Fig. 5—Two Garages That Speak for Themselves

Yet the builder proceeds along the old conventional lines which he believes fixed, afraid to strike out and build better. Let him try it out, however, and see how the public will respond, rather than wait until they demand it. Certain improvements have been made along this line, but they have failed because of a lack of artistic sense on the part of those responsible for the design.

We see examples where the material of the front has been carried around on the sides a certain distance and stopped when it was thought that it had gone far enough, without considering where the junction between the face and common brick would fall in relation to the design. Frequently the face brick is stopped at the edge of a window or at the middle of a pier between two windows instead of at some natural break in the surface of the building, such as a chimney projection, a bay, or an angle in the wall.

In Fig. 3 the face brick was stopped at such a natural break in the wall. This is a step in the right direction and should be encouraged. When exposed, this division between face and common brick on the side is an architectural monstrosity, but of course it is presumed that another such building will be built alongside, hiding the common brick from the street except from a point directly between the two buildings, where it will always remain as an eyesore to those who daily enter the building. Perhaps, some day, we will not be content with this and will demand that the view from the court windows be upon beautiful walls.

An example of the common treatment of the side walls of an apartment building is shown in Fig. 4. The face brick in the building on the left, it is painfully evident, returns only a few inches, thus exposing the common brick to view alongside of a very attractive face brick building. Had the face brick been carried back ten feet, at least, it is doubtful whether the increase in cost would have been much over fifty dollars, and it is certain the street appearance of the building would have been greatly improved.

Note, for example, in Fig. 3, the pleasing effect of the face brick side of the adjoining building. As the cost of improving the side walls is so small an item, there seems no excuse for the ugly exposed wall. If the public would awaken to the fact that the City Beautiful depends a great deal on their individual effort, this abuse could be done away with.

Because of its insignificance, perhaps, the garage is another example where design and material are too often forgotten. We see the atrocious frame or corrugated iron garage behind a beautiful brick residence. And when they are built of brick, the sides and rear are too often of common brick with the inevitable false face brick front. Does not the garage which is seen from all the surrounding buildings deserve to be in character also? Notice the difference in the two garages shown in Fig. 5. The one in the foreground is well designed, and built all around of the same material, while the one beyond is not only a poor design but, with its incongruous face and common brick, detracts from the appearance of the street.

It would better be of common brick all around, if money must be saved, rather than to have face and sides of different kinds of brick. The sum of the whole matter is, the attractiveness of many buildings, and in consequence, the artistic values of a community, are greatly reduced from an entirely mistaken sense of economy. The consistent treatment of a building in design and use of materials, might involve a little added initial cost, but would invariably advance the economic worth of the structure both for the owner and his neighbor besides the passerby.

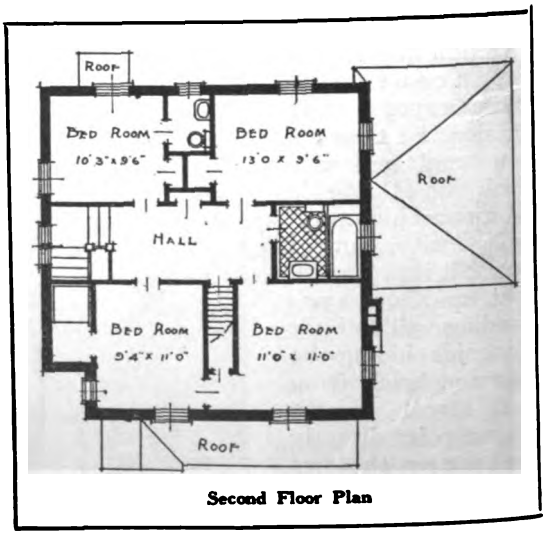
First Floor Plan

Picturesque Hollow Tile House

WALLACE & WARNER, Architects

SET on the terrace, this house presents a dignified appearance from road. The various details of its exterior suggest the Dutch Colonial, which is rather appropriate, as this house is located at Narbeth, Pa., in the section which gave us our Dutch Colonial style of architecture. This house was erected under the architect's direction by E. J. Hedden, building contractor, of Philadelphia.



The architects have succeeded in embodying a pleasing exterior to what is practically a square box. The little break at the left-hand side of the building removes the monotony of the absolute square, while the porch on the opposite side gives distinctiveness to the right side. The large bay window in the living room forms a pleasing feature of the front. The hood over the doorway is carried out in true Dutch Colonial style, and joining this is the hood over the bay window.

The construction of this house is of stucco-covered hollow tile set on a local stone foundation, the joints of which were pointed up in white mortar, this contrasting very nicely with the green of the lawn and the stucco above it.

The rooms have been very conveniently laid out. They are of good size and particular pains have been taken to have them so placed that communication between all is easy. One enters a vestibule in which one side is taken up by a coat closet. The reception hall has rather an artistically laid out staircase, sufficient headroom for which has been carefullv allowed by having a slope in the bedroom closet above. The two platforms, besides making a pleasing appearance, also make ascent easy.

A door leads directly from the hall to the kitchen and the cellar is reached by stairway underneath the main stair from the kitchen. The sink is placed directly under a mullion window, which gives ample light. Entrance from the dining room to the kitchen is had by means of the pantry. As some folks desire the washtubs upstairs, the laundry has been made into what would be a rear entry; serving the purpose of both.

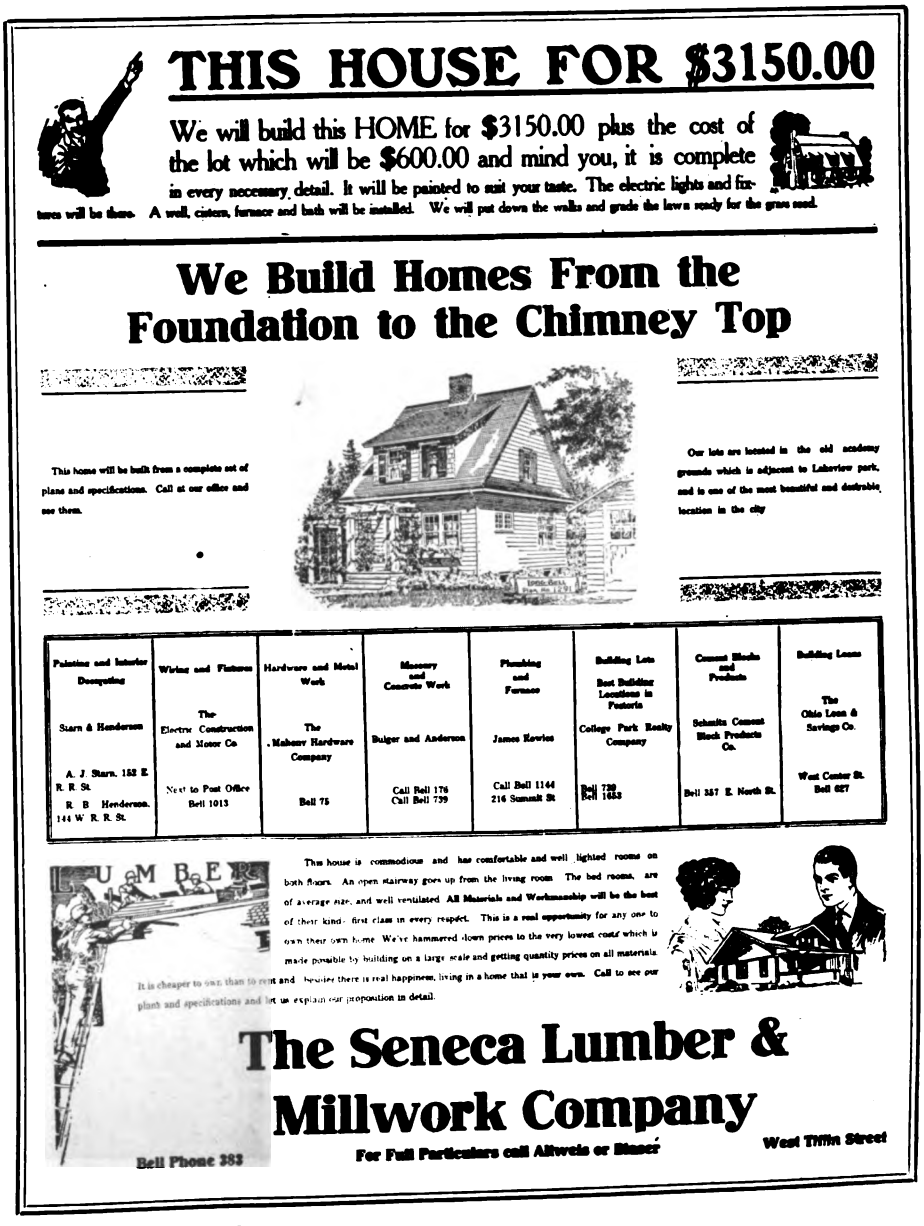
BUSINESS GETTING METHODS

Ideas that have worked for others

An Example *of* Co-operative Advertising



How an Enterprising Lumber Concern and Different Contractors Combined to Secure More House Business

FROM time to time the question arises with the progressive building contractor how he can best advertise so as to secure some desirable contracts for building homes at a reasonable expense.

He feels, and it is certainly true, that if he secures a customer other people will get a large share of the money involved and they do nothing towards creating the order.

As has been discussed in previous issues of BUILDING AGE, and The Builders' Journal, co-operative advertising is what is needed. Usually, every progressive builder has one favorite firm from whom he purchases his lumber and likewise he also has different favorite sub-contractors, men on whom he has learned to depend by years of experience. Now, all would profit by new building jobs and one way to get them is by advertising.

A move in the right direction along these lines has just been started by Mr. B. M. Altweis, the general manager of the Seneca Lumber and Millwork Co. of Fostoria, Ohio. They have taken the lead in that city by advertising in full page space in their local paper. We give opposite, a small size reproduction of one of their advertisements. Note particularly that the different contractors each have taken part of the space. If the same idea was carried out in different localities, it would certainly result in more and better business for all concerned.

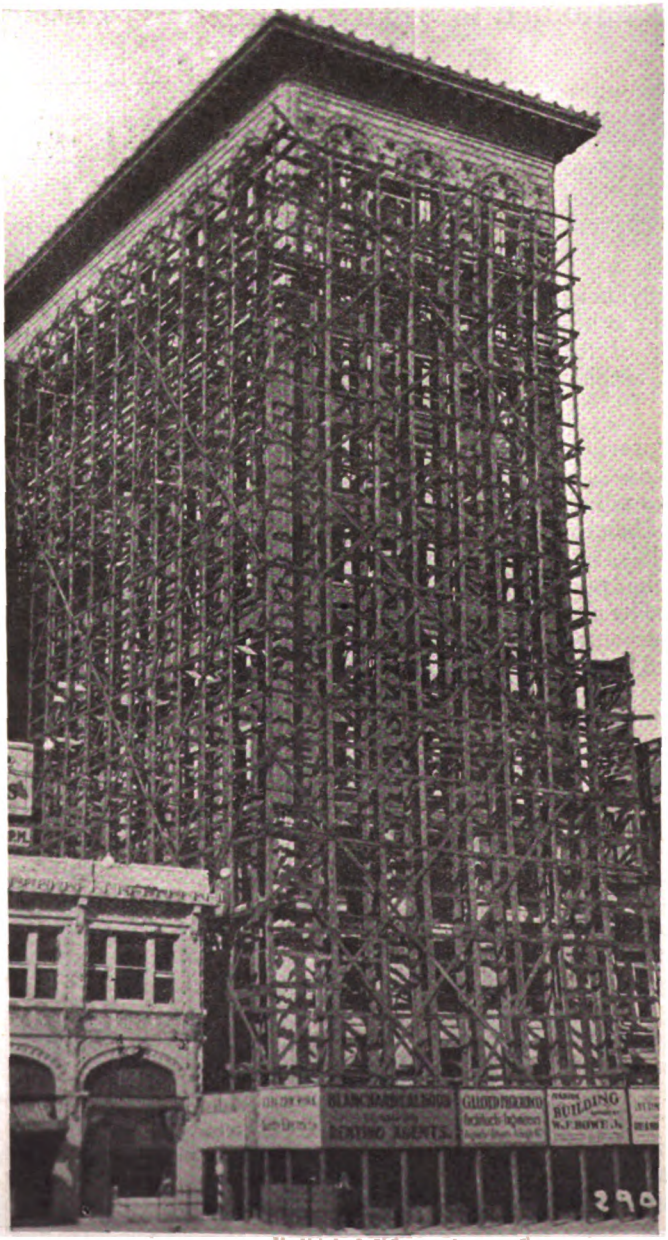
CONTRACTING EQUIPMENT

Reliable Information on Time and Labor Saving Devices

Proper Scaffolding

A Few Points to be Considered for Safety and Economy



CONSTRUCTING proper scaffolding is not only a humane provision, but a good business investment as well for the contractor. When workmen are able to work with an assurance of safety they are able to do better work.

It is a curious fact that there are a larger number of accidents (in proportion to the men employed) on smaller jobs than on large construction projects.

In this article we show a few examples of scaffolding work. One is a small cottage. Here just a few planks and uprights have been carelessly "tacked" up, and it is on such unsafe systems of scaffolding that the majority of accidents occur.

Our other two illustrations show two large buildings in which particular attention has been paid to proper and safe scaffolding. A careful inspection of each picture will reveal the care that has been taken for safety.

The first illustration shows the scaffolding erected around a building on Broad Street in Augusta, Ga. This scaffolding was erected around this building for repairs to the exterior, the entire interior having been gutted by a recent fire. Notice particularly how the braces have been run so there will be no swaying. The sidewalk has been covered by a shed. The other illustration is that of a building under construction at 57th Street and Madison Avenue, New York City, the contractors on the job being Cauldwell & Wingate.

Scaffolding Erected for an Augusta, Ga., Skyscraper

Observe how carefully sidewalk shed has been erected. This job is for a building about 200 x 100 feet in size and shows the application of scaffolding work on a large low job, while the previous illustration showed that for a high job. Safety in both were secured.

It is interesting to note that in the Cauldwell & Wingate job use was made of an improved timber clamp, which enables the erection of scaffolding to be done in less time, without the cutting of any timber. It is surprising to note the holding power which these timber clamps have.

In a recent test, two pieces of 4 by 4 scaffolding uprights were spliced with two of these clamps and they held a weight of 9,120 pounds before the timber cracked.

Digitized by Google

Note particularly in this job that the uprights extend above the working platform and a guard rail is placed around. Also a toe board has been made use of. This serves a twofold purpose, protecting the workmen and preventing any material being shoved off the platform.

A move in the right direction is being made by the Department of Labor and Industry of Pennsylvania. They have just prepared some rules on the proper erection of scaffolding, and below we give a few extracts from these regulations, for they are of considerable interest:

The erection, alteration and removal of scaffolds shall be done under the direction and supervision of men thoroughly experienced in scaffold work.

Lumber used in the construction and erection of scaffolds shall be of long leaf Yellow Pine or the equivalent thereof in strength (Hemlock prohibited), and shall be sound, well seasoned and free from strength reducing defects.

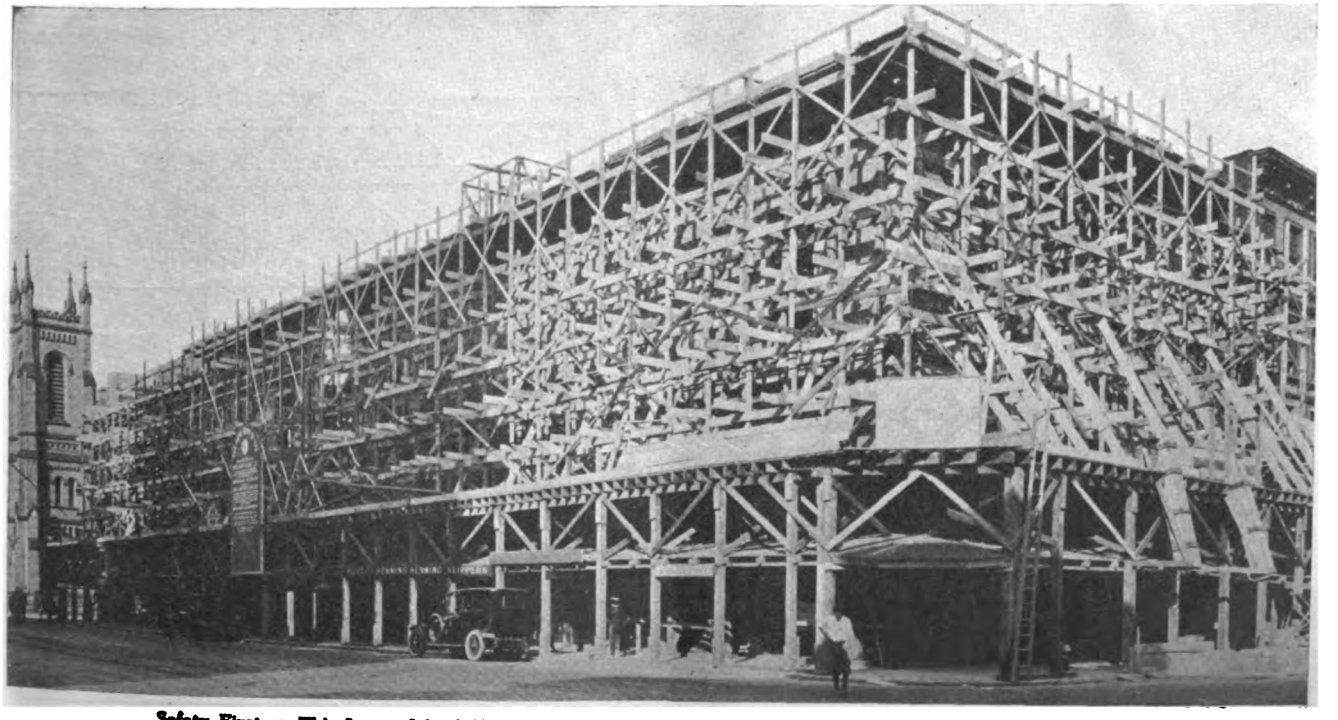
Planks used for flooring shall be of uniform thickness, so as not to cause unevenness, and in laying same care shall be taken that "traps" are avoided.

Poor Type of Scaffolding

Guard rails and toe boards shall be provided on the outer edges and ends of the platforms of all types of scaffolds ten feet or more above the ground (including rails across window openings which extend more than thirty-four inches above the scaffold platform), except riveters' outrigger scaffolds, and shall be securely fastened to the uprights on the platform side.

Guard rails shall be the equivalent in strength of wood rails one and three-fourths by three and three-fourths inches, dressed, and shall be not less than thirty-four inches in height. They shall be secured to uprights at intervals of not more than eight feet.

Toeboards shall project not less than six inches above the top of the platform planks and shall be erected so as to leave no space between the platform planks and the toeboards. (For safety of men below and on platform.)



Nails of proper size (minimum—10 penny), of ample length and of the best quality shall be used at all times. They shall be driven full length, especially in braces, and the bending over of partly driven nails is absolutely prohibited.

Where it is necessary for workmen to crawl out on thrustouts or projecting beams, life lines and safety belts of approved design shall be worn.

The principal members of scaffolds shall be rigidly and securely sway braced to prevent their displacement in any direction.

For carpenters' bracket scaffolds, the platform boards shall be laid tightly together and shall overlap the brackets by at least four inches, but not more than six inches. The boards shall be heavy enough to prevent springiness.

Brackets shall be spaced at intervals of not greater than four feet. There shall be at least three brackets underneath each board.

CARPENTRY

Good Practice in Frame Construction and Finish

How to Frame a Roof of Unequal Pitch

By RICHARD M. VAN GAASBEEK

School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

LAYING out the valley rafter in our problem will be described in this issue. The length of the valley rafter is determined in the same manner as the preceding hip rafter. Take the run from the lay-out, Fig. 1, measing from the return on the facia line to the butt joint against the hip rafter, A-T, Fig. 14, or 13⅝ in. Press the fence firmly against the top edge of the stock to be used and produce the facia line or first plumb line to the extreme right, A, Fig. 14.

Slide the fence to the left and measure on a level line from facia line A, the run of the hip, 13⅝ in., and produce plumb line T, Fig. 14, the extreme length of the rafter forming the butt joint against the hip rafter.

To simplify picking up the bevels, top cut, and other measurements required in laying out the valley rafter, draw in a section of the valley and plate, full size on the lay-out, Fig. 1, as shown in the section, Fig. 15, which is a section through S-S, Fig. 1.

Where the center line of the valley rafter intersects the facia line, square a line across at right angles to the center line, intersecting both edges of the valley as at A-A, Fig. 15. Also where the outside edge of the valley intersects the wall line, square a line across at right angles to the center line, until it itersects the ceter line as at 3, Fig. 15.

To complete the lay-out of the lower end of the valley, measure in on a level line, the diagonal distance of the projection, A-B, Fig. 15, from facia line A, on the side of the rafter, or 2½ in., locating wall line B, Fig. 14. Square this line across the bottom edge of the rafter and locate the center point.

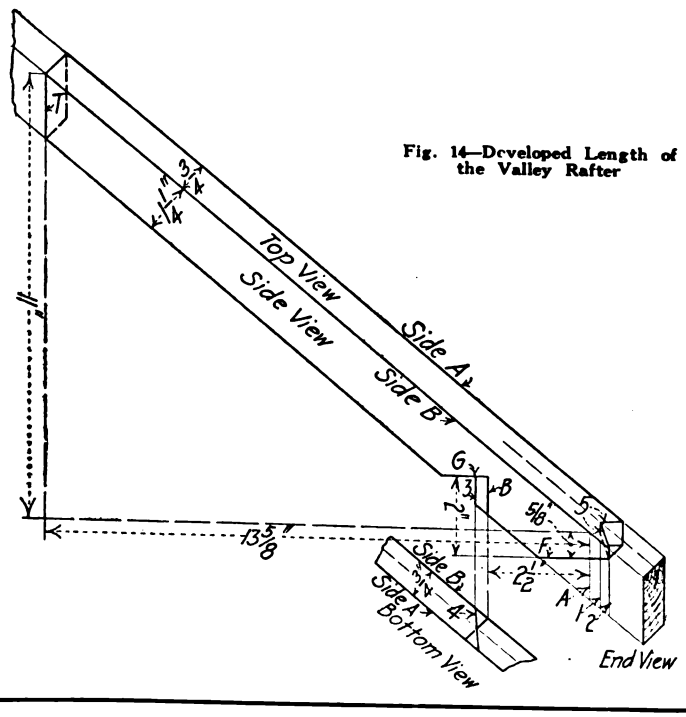

Fig. 14—Developed Length of the Valley Rafter

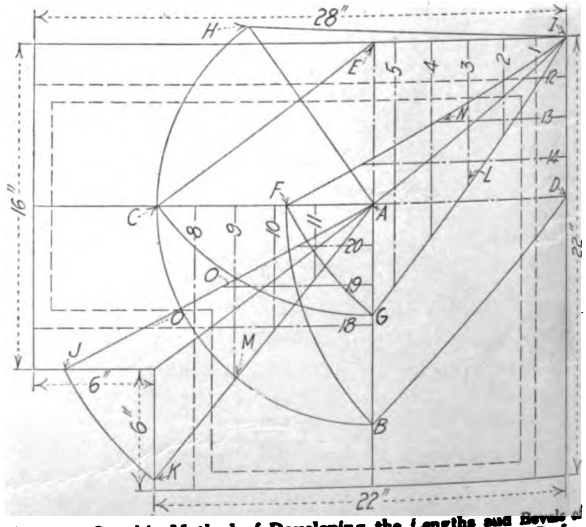

Fig. 15—Graphic Method of Developing the Lengths and Bevels of the Various Rafters Used in Framing an Unequal Pitch Roof

Digitized by Google

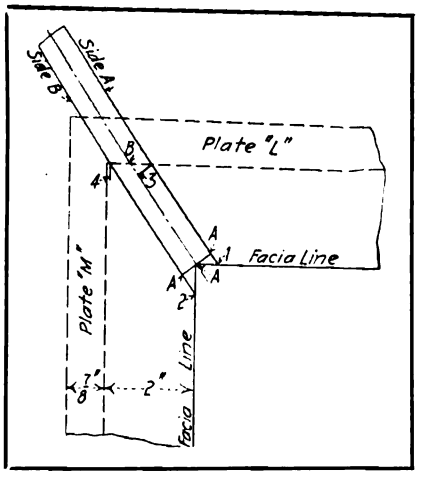

Fig. 15—Full Size Section Through S-S, Figure 1, Showing Interection of the Valley Rafter, Plate and Fascia Line

To make a fit against the wall at the proper angle, measure in on the side of the rafter from wall line B, the distance B-3, Fig. 15, and produce plumb line 3, Fig 14. Connect plumb line 3 through the center of plumb line B, on the bottom edge as shown at 4, bottom view, Fig. 14.

To complete the birdsmouth measure down on facia line A from the top edge of the rafter, ⅝ in., the width of the facia and produce the plancher level F. Measure up from plancher level F on a plumb line 2 in., locating plate level G. The valley rafter crosses plate L, the same plate upon which the long common rafters rest, therefore the distance between plancher level and plate level is the same for the long common jack and common rafters and valley rafter

To make the return on the facia line at the corner of the building, measure forward on side A of the valley rafter from facia line A, the distance A-1, Fig. 15, and produce plumb line 1, Fig. 14. On side B measure forward on a level line from facia line A, the distance A-2, Fig. 15, and produce plumb line 2, Fig. 14. Square facia line A, across the top edge of the rafter and locate the center point. Connect plumb lines 1 and 2 on the side of the rafter with the center point on the top edge as shown in the top view at 5, Fig. 14. Cut on bevels 5 on the top edge and plumb lines 1 and 2 on the side of the valley for the facia, on line F for the plancher level.

On line G make a square cut and on line 4 on the bottom edge of the rafter a bevel cut for the birdsmouth and on line T for the butt joint against the hip rafter.

To Lay Out the Ridges

The run of the ridges is taken from the lay-out, Fig. 1. For ridge C, measure the extreme length from the facia line to the intersection of the center line of the hip and valley rafters and ridge. From this length deduct one-half the thickness of the valley rafter measured on the line of ridge C, or one-half the diagonal thickness of the valley T-W, Fig. 16, and locate the center on the top edge.

Set a bevel square on the lay-out to the angle formed by the intersection of the valley and ridge C. Apply the bevel on the top edge of the ridge and draw a line through the center point thus obtained.

For ridge D, measure the extreme length from the facia line to the intersection of the center line of the hip and valley rafters and ridge. From this length deduct one-half the thickness of the hip rafter measured on the line of ridge D, or one-half the diagonal thickness of the hip T-W, Fig. 16, and locate the center point. Set a bevel square on the lay-out to the angle formed by the intersection of the hip and ridge D. Apply the bevel on the top edge of the ridge and draw a line through the center point thus obtained.

To Assemble the Roof

Assemble the rafters as shown in the model (June issue). Set up and fasten the hip and valley rafters first. The center line of both rafters must intersect at the apex. Set up ridges C and D, securing them in place at the proper height by a pair of common rafters. The top edge of the ridges is kept flush with the top edge of the common rafters. This drops the ridge out of its normal position, and prevents the need for backing the ridge and thus throws the top edge out of alignment with the top edges of the hip and valley rafters.

Both ridges are not on the same level. One ridge is lower than the other, owing to the steeper pitch. If the ridges were backed to the pitch of the roof and the lines of the common rafters were continued to the extreme point, all lines would terminate in alignment with the extreme high point formed by the intersection of the hip and valley rafters.

The roof boards continue these lines up so that when the roof is completed all roof surfaces are in alignment. The exact location of the ridges where they intersect the hip and valley rafters may be determined by their location with reference to the butt joint of the hip and valley.

Draw in a section of the hip, valley and ridge, full size, on the lay-out, Fig. 1, as shown in the section Fig. 16, which is a section through V-V, Fig. 1. Square a line across at right angles to the center line of the hip at the intersection of the hip and valley rafter as at R, Fig. 16, thus establishing the butt joint between the two rafters. The distance R-S, Fig. 16, gives the distance between the butt joint and the long point of the bevel of the ridge on the side of the rafter.

Development of the Rafters on the Plan

Fig. 17 will serve to illustrate and prove the lengths and bevels and will explain in a graphic way how they are obtained.

A to B is the rise of the long common rafter.

A to C is the rise of the short common rafter.

A to D is the run of the long common rafter.

A to E is the run of the short common rafter.

B to D is the length of the long common rafter.

C to E is the length of the short common rafter.

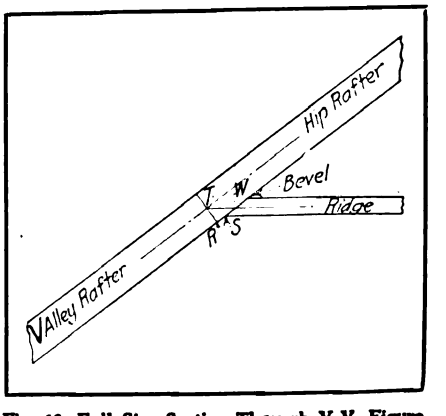

Fig. 16—Full Size Section Through V-V, Figure 1, Showing Intersection of the Hip and Valley Rafters and the Ridge

Digitized by Google

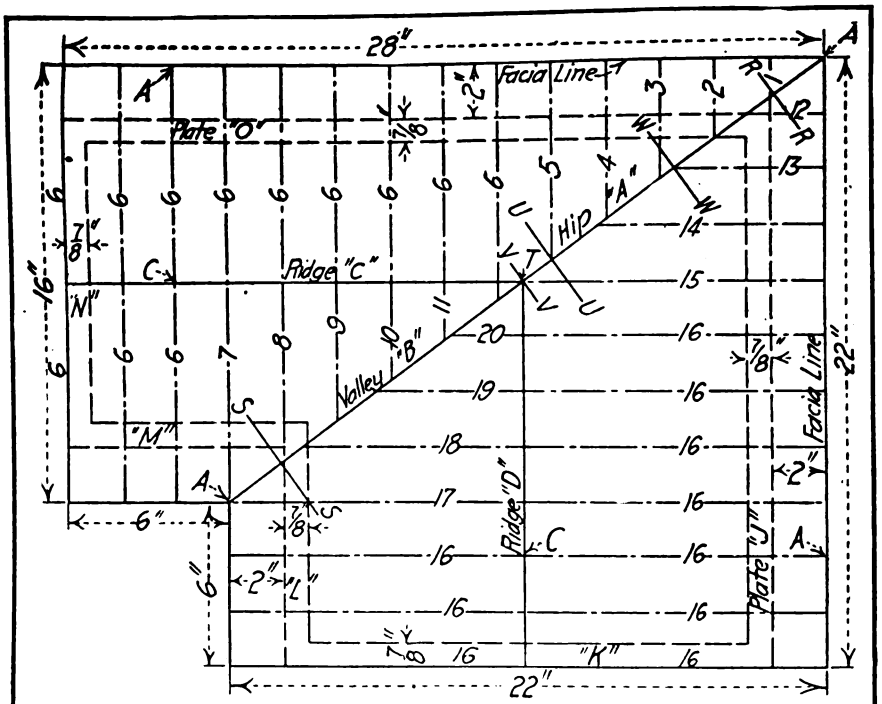

Fig. 1—Plan of Hip and Valley Roof of Unequal Pitch. Repeated for Reference.

D to F is the developed length of the long common rafter.

E to G is the developed length of the short common rafter.

A to H is the rise of the hip and valley rafters.

A to I is the run of the hip and valley rafters.

H to I is the length of the hip and valley rafters.

F to I and G to I are the developed lengths of the hip rafter.

A to J and A to K are the developed lengths of the valley rafter.

Angle L gives the top cut for rafters Nos. 1, 2, 3, 4 and 5. The lengths measured on the center lines of the jacks from the facia line give the developed length of each rafter.

Angle M gives the top cut for rafters Nos. 8, 9, 10 and 11. The lengths measured on the center lines of the jacks from the center line of the ridge give the developed length of each rafter.

Angle N gives the top cut for rafters Nos. 12, 13 and 14. The lengths measured on the center lines of the jacks from the facia line give the developed lengths of each rafter.

Angle O gives the top cut for rafters Nos. 18, 19 and 20. The lengths measured on the center lines of the jacks from the center line of the ridge give the developed lengths of each rafter.

Runs and Lengths of the Rafters

The following table is prepared to assist the reader in checking up his work. It is intended that the framer will take his runs from the lay-out and develop the lengths with the steel square and fence, using the tables only as a matter of information, giving him the assurance that he has taken the proper runs and determined the correct lengths of the rafters.

The measurements listed in the table are the extreme lengths on the center lines. Make allowances where rafters intersect a ridge, hip or valley rafter for the cutting lengths. It is suggested that the reader frame a model of the roof for practice, building it to the same scale as the lay-out, 1 in. to the foot. In using the table to check the model, read feet as inches; for example, rafter 1, the run would read $1\frac{5\frac{1}{4}}{12}$ in., and the length $2\frac{5\frac{1}{4}}{12}$ in. The square being laid out in twelfths of an inch, it is an easy matter to check the work up accurately.

Figures to use on the steel square: Long common rafters, 12 in. on the tongue and 12 in. on the blade. Mark on the tongue for the plumb cut and on the blade for the level cut. Short common rafters, 16 in. on the tongue and 12 in. on the blade. Mark on the tongue for the plumb cut and on the blade for the level cut. Hip and valley rafters 9 8/12 in. on the tongue and 12 in. on the blade. Mark on the tongue for the plumb cut and on the blade for the level cut.

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

How We Find Actual Cost *of* Building

By LEWIS BOWMAN

CONTINUING from the August issue a description of how to determine the actual cost of a building we give here a few more of the forms we use for the simplification of our work.

With the present greatly increased prices of materials and labor, this method will undoubtedly receive favor among a number of architects and builders doing smaller work as it is already the basis for figuring much of the larger type of commercial and civic work today.

Anyone in the competitive building business today realizes that the cut-throat competition now existing is at fault and all have witnessed the builder or sub-contractor who gobbles up everything in sight at ridiculous prices and who evidently hopes to "make it up" on some slip of the plans or specifications finally blows up in smoke leaving behind a batch of poorly executed buildings and a number of irate owners—while his competitors in the game have worried themselves over trying to meet his prices and have unconsciously placed themselves in a position to offer inferior work to meet this wayward business anarchist.

From our experience, I feel that by standardizing one's cost by some intelligent method of producing a bid this fault in the prevailing system can be corrected, for if an architect secures five bids from supposedly respectable builders and upon opening them finds that four of them have submitted about the same price and the fifth one was submitted way below—he is naturally suspicious and if he is a good business man will reject the foolish proposal or ask the builder for a re-consideration.

I do not believe that such an estimating system as we ourselves have used will act as a sure preventative for the odd turns and peculiar things that happen but it will greatly help to give one self-assurance concerning the bid submitted.

A copy of the form, shown in Fig. 3, is given to the owner, and it gives him a comprehensive idea of his building from a business point of view.

As the average man of today who has amassed the young fortune that is necessary to build his ideal of a house is a good business man, he will greatly appreciate the business ability of his builder in having such a system.

We have long felt that the public is entirely too unappreciative of the business end of the building business and often seems very surprised at the detail that goes on in the office of a progressive building contractor of today. They only too often believe that all that the builder needs to construct a house with, are complex looking piles of lumber and materials, a gang of men whom they collectively call "laborers" irrespective of their skill or trade, and a few blueprints.

By advertising and practising business methods and showing a man how the "wheels go round" you can very often secure much better co-operation than the average builder usually achieves with his client.

Business methods on the part of the builder are very necessary for making a favorable impression. Confidence is an asset that is hard to obtain, but, when secured, it means much for any sort of business, and especially that of the building contractor.

To give a prospective home owner an estimate merely written on your office stationery does not carry the weight of a printed form that is neatly filled out by typewriter.

Some sort of printing on the top, such as "John Jones, Progressive Builder, Des Moines, Iowa," produces a good effect. Your local printer will turn these out for a few dollars, and you only need a few hundred on hand; but, on the strength of your estimates going out in this form, you can safely add $10.00 more on your bid and be sure of getting the order. Style counts.

There is a psychological effect in having good stationery, and if you carry this through all the way on your business forms you will find that the confidence of which we have already spoken will be strengthened so much, indeed, that people will be willing to pay a little more because they feel that they are in the hands of a man doing business along business-like ways.

Nowadays it is not even necessary to go and print up the common forms, as these can be secured already printed by some firms making a specialty of this line of business.

For a builder to accurately total his costs in a bulk on any particular job is a comparatively easy task—all he need to do is charge the items in the mason work or carpenter work or to whichever branch or branches of the building that he does himself and does not sublet to another contractor. But to be able to charge accurately the time and material spent on each item of the mason work or carpenter work etc., is the all important thing for him to know in estimating.

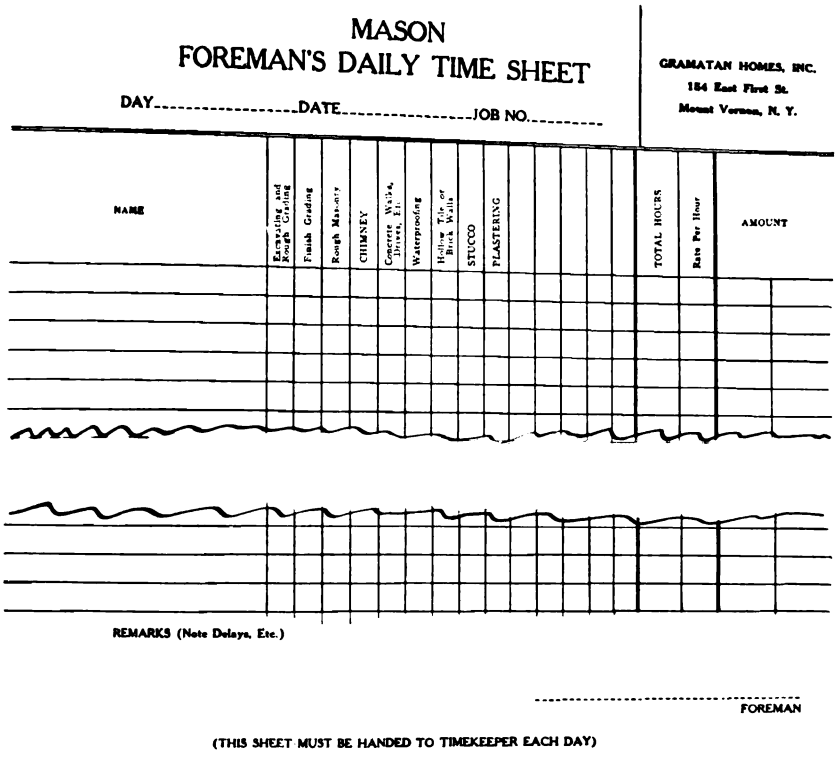
Fig. 6

Only two classes of builders can do this—one the small-scope builder who is "foreman" on his own work and can watch the men and make out his own cost distribution, and the other the business-like builder who has his time sheets so systematized and his purchase orders and shipping tickets so properly made out, that with small additional office help the cost record is so automatically kept that it gives him the requisite total for any item of the work.



This is particularly true of mason work, where nearly everything is measured in square or cubic yards and feet. As the unit cost is the most essential knowledge for an estimator to know, this part of the system, mainly the unit cost should be the most carefully kept record in the office, with the possible exception of the total of the time and the material expended on the job.

As the varied working condition of the job make such a wide difference in various branches of the work, these subsequent conditions in the unit cost should be taken to account. For example, a unit cost based on excavating loamy earth should not be used, where to one's full knowledge the ground is full of clay or gravel, and unit costs of stone work that are based on the use of easy spliting ledge rock of the sandstone variety used where a cross-grained igneous stone such as granite is to be used in the wall and foundations.

Of course much of this is entirely superflous to a time-tried and experienced builder—but as the losses in building operations are in great evidence there must be some indulging reason, and the reason is plainly one of faulty estimating, for a builder who estimates his work properly and figures a definite amount for profit cannot fail. The main object of the following description of cost record keeping however is not to suggest methods of estimating for the average builder can do that, but to get in proper form the data that a man may well know today but forget tomorrow.

The sheets given in the illustrations are not made for the builder's knowledge of the work but as a receptacle for that knowledge after it is obtained and so averaged that it can be referred to at a moments notice and all the data placed on a few concise pages. It is the "bookkeeping" of a builder without being the ledger itself.

MASON
FOREMAN'S DAILY TIME SHEET

GRAMATAN HOMES, INC.
184 East First St.
Mount Vernon, N. Y.

DAY_____DATE_____JOB NO._____

NAME | Excavating and Rough Grading | Finish Grading | Rough Masonry | CHIMNEY | Concrete Walks, Drives, Etc. | Waterproofing | Hollow Tile or Brick Walls | STUCCO | PLASTERING | TOTAL HOURS | Rate Per Hour | AMOUNT

REMARKS (Note Delays, Etc.)

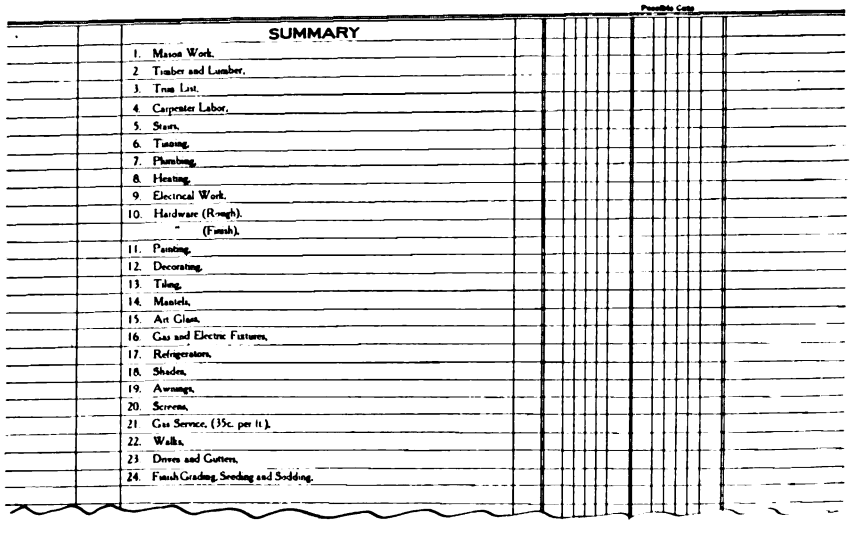
FOREMAN

(THIS SHEET MUST BE HANDED TO TIMEKEEPER EACH DAY)

Fig. 7

Fig. 4 gives an example of a mason cost record sheet; Fig. 5 a carpenter work sheet and Fig. 6 a painting sheet; these being the three branches of construction that our concern performs. In spite of all our careful planning before having these sheets printed, some additional sub-heads come to light occasionally and space has easily been found on these sheets as all of the columns are scarcely filled.

To explain the working of the system we can take as an example the mason sheet. The mason foreman on a certain job hands into the office at night a time sheet containing the names of all men working under his department on that particular job (the time sheet is shown in Fig. 7). The time is distributed according to the kinds of the work multiplied by the rate of each man per hour and the total amount in money placed in the column. This is done by the foreman and checked over by one of the clerical staff for verification as each man's pay is made up according to the number of hours he worked during the week. This sheet then goes to the office man who keeps the cost record book and he takes off the total of the cost for the day—on the foundation, chimney etc.—and enters that total daily in the column marked "Labor." The sheet then goes to the bookkeeper and he enters the cost total for the day in his ledger but not attempting to sub-divide it.



Material shipped from the yard and purchased outside in the same manner is distributed in the columns marked "material" instead of marking the name of the material we give the ticket number for each in entry and in case a question arises, this ticket is found in the files. The ticket also goes to the bookkeeper and is entered in his ledger. The bookkeeper naturally has nothing to do with cost distribution but merely charges labor and material in bulk, but he does make the separation according to the departments. A summary of the entire job is made on the form shown in Fig. 8.

By this system there is a way to check the cost record by the ledger if both are kept up-to-date. We have found that the above system has worked as easily as any office system that has come under our observation and in offering the explanation of it, I am merely giving a practical example that has been of great use to ourselves.

Many builders doubtless have one system that has worked for them, but the strange thing about the business end of the building business is that there seems such a scarcity of official efficiency organizers such as are available for other kinds of business and professions that can give a builder help when he wants to systematize his business.

I can truthfully say that this system is the product of the experience of men at the heads of our estimating and construction department and was compiled from their suggestions and was arranged in a manner to give them the greatest benefit as a record.

A knowledge of actual costs of a job is of vital importance to the building contractor. He cannot afford the risk of not knowing just exactly where he stands regarding the profit or loss on each job.

Possible Cost

SUMMARY

1. Mason Work.

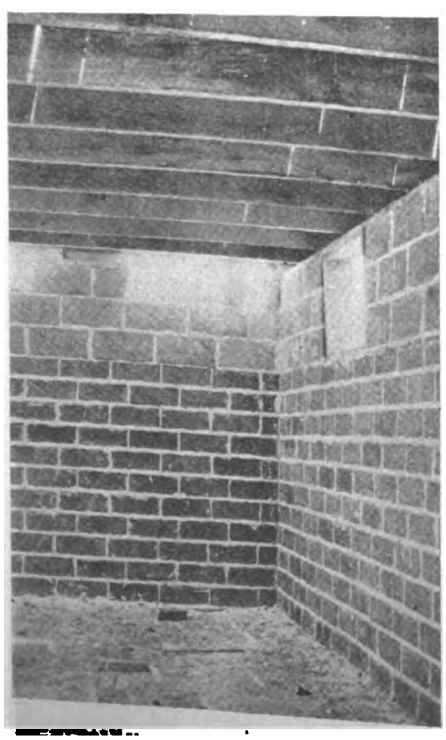
Correspondence Department

If you want help in any branch of building construction, just write to the BUILDING AGE *and* THE BUILDERS' JOURNAL *Correspondence Department. We will be glad to answer all your questions without charge.*



All readers are invited to discuss the questions and answers published.

A Good Basement Wall

THE concrete block has its drawbacks as a material for basement walls. Its strength and rigidity, and its lasting qualities as well as its cheapness, all favor its use. But one outstanding fault is that it is not immune to moisture conductivity. Concrete blocks, due to the way in which they are made, are semi-porous and it is this characteristic which causes them to fall down when posing as an ideal material for basement walls.

Tile blocks, on the other hand, because they are more dense and more nearly insulated, score higher than the concrete block. But tile is not so desirable for a foundation wall above ground as is the concrete block. Due to its unfinished appearance the tile blocks, even when glazed, have a sort of rough and ready look that mars a smooth consistency of good looks.

But by using tile from the bottom of the basement to the ground line, or slightly below, and then concrete blocks above this, the effect is all that is desired and the wall will not show up any bad traits later on during a wet season. Such a wall is shown in the photo and it will be seen that the two materials work very nicely together.

This is but a suggestion which one contractor has found quite valuable, as it provides a waterproof wall below ground and an attractive wall above. Of course, the tile could be extended to the sill and the exterior coated with stucco or a cement wash, but this is more expensive.—**Dale Van Horn.**

Are Customers Unwelcome?

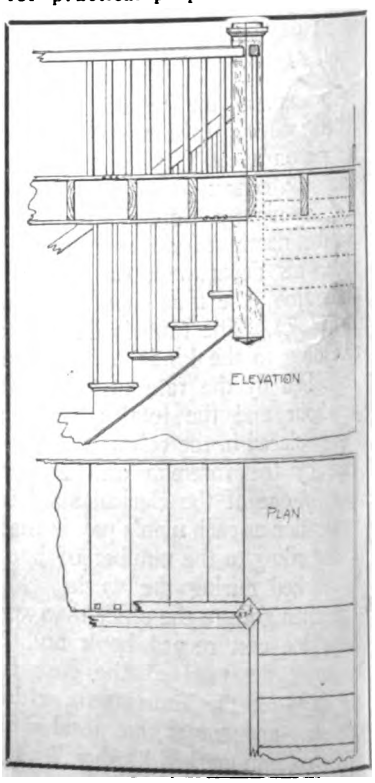
WHY do some architects have such forbidding looking offices? Recently I called on a firm of architects and the reception room was a narrow 3 by about 10-foot passage. You could see nothing of the office, but I could hear different individuals talking. A push button bell was put there to attract attention. I rang this a few times, but no attention was paid.

One man came out while I was standing there, through a double swing door, which reminded me of the old saloon days of anti-prohibition time, but he was too busy to more than glance my way.

I called at this office in response to some matter that they were interested in. I was a little amused at first, in the lack of method they had. Finally, after waiting for about fifteen minutes, I became disgusted and departed.

It would take a crowbar to have me go back to that establishment again.

Both architects' and builders' offices should be open enough so that when a visitor calls, he will at least receive attention.



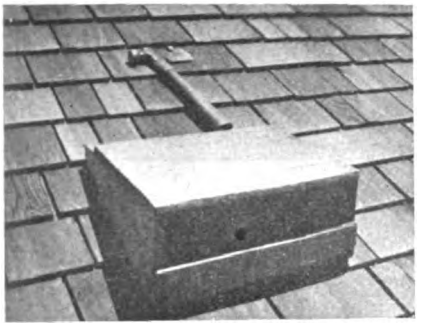
One's office entrance should be attractive, not repellant to possible customers.—**A Builder.**

Setting Newel Post

I AM sending you a drawing of an arrangement of a stair of which I promised you some time ago.

In so arranging the post at landing it does away with cutting of short balusters under the well hole, placing the post on an angle receives all of the rails with plenty of room for the hand to pass the well skirting board, and does away with cutting the rail off at winder, making a better looking job with less material and less work in erecting.

I have used the arrangement for a number of years with satisfaction. It will work on iron stairs also, doing away with a double newel. I think the drawing makes the plan clear enough for practical purposes.—**A. P. Stone.**



Digitized by Google

Shingling Seat

BY finding a far better way to stick to a roof while shingling it than by toe clips, I take time to explain a simple plan to those who are interested.

It saves driving any nails in the shingled roof which might cause a leak, and besides you can always have a position that is convenient for nailing. Though you see in the picture that it is very easily made, I will give just a few words to explain.

Take a couple of one by six-inch boards and cut them the same pitch as the heel of the rafter so that when they set on the roof they will make a level seat. Now take two wide shingles and nail the thick end of one on one of the one by sixes and the thin end on the other, and the other shingle nail it on just opposite, then brace the seat out on the end with two narrow shingles as shown in the picture.

Now to make it stick to the roof get some six penny box nails and drive them in about an inch apart on the edge that sets on the roof, leaving about a half of an inch sticking out, then crook them over, leaving just the sharp edge of the head sticking out.

You now have a seat that is safe to shingle with on any roof, even to that of a half pitch.

By using this means of sticking to the roof and by shingling with a hatchet gage as seen in picture on hatchet, you can take from six to nine rows of shingles at a time, and be in a convenient nailing position for all.—**Loy E. Owen.**

Estimating Brick Work

IN a recent number of the BUILDING AGE is an article by Mr. Wm. Carver, Architect, on "How to Estimate Brickwork." He advances some good suggestions for taking off quantities but seems to be misinformed as to the labor required per sq. ft. of wall. If I understand his figures correctly he would have a bricklayer lay 1,000 brick in less than seven hours in "Ideal" wall.

My opinion is, that the average contractor who figures on that basis on residence work would want to figure in all the openings, figures the corners twice and then add a substantial percentage or find himself headed for the bankrupt's court.

I have had a little experience with the all-rolok wall, a wall where there was no cutting required and the conditions being good to get the best results, pressed brick laid in lime and cement mortar with the joints struck on both sides of the wall, the bricklayer's time averaged 10¼ hours per 1,000 brick. You might say that the work was done by incompetent mechanics, or that there was a lot of loafing on the job, but that is not the case.

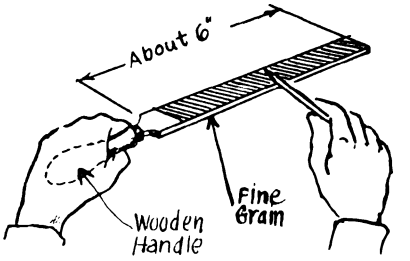
On residence work with the usual angles, piers that require chipped brick and other difficulties it would require more time.

For ten-inch hollow walls on residence work a bricklayer is doing well if he can average 100 brick per hour and if there are soldier courses, brick sills or fancy bonds, 50 brick per hour is sometimes too many to safely figure on, and even that number is entirely too many when they are under the watchful eye of some of the more exacting architects.

As to the "Ideal" being the only type of masonry wall where furring can safely be omitted we are not convinced, there being too many practical examples to the contrary.

There are several houses in this section constructed with ten-inch hollow walls plastered directly on the brick, they are all in exposed locations; exposed to the weather on all sides yet there is no trouble whatever with dampness, they are warm in Winter, cool in Summer and giving entire satisfaction to the owners and tenants.

We also have some hollow tile buildings that are plastered directly on the tile with stucco exteriors that are equally satisfactory, the cost being practically the same as for a ten-inch common brick wall.



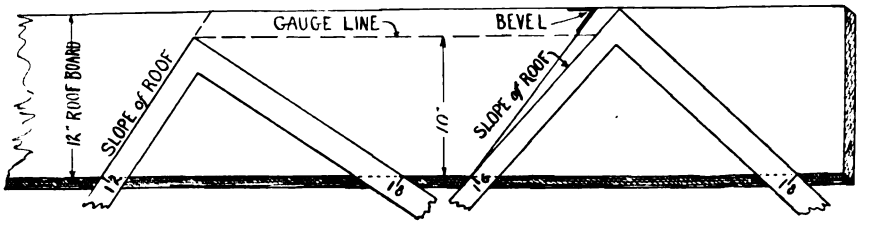
Although I would increase Mr. Carver's labor costs, I still agree with his statement that the average brick house can be built with a very small increase in first cost over that of frame construction.

William H. Welch.

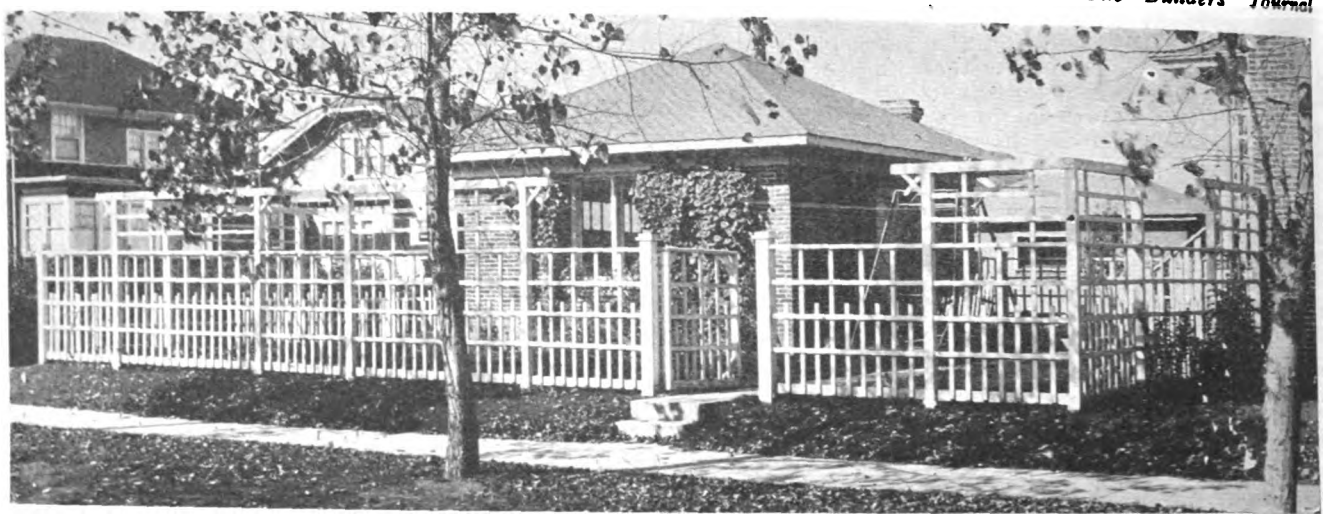
A Pointer on Sharpening Pencil Points

IT is the common practice of draftsmen in making layouts, to sharpen their hard lead pencils on sand-paper pads. I wish to point out that the use of a small fine metal file as illustrated below is a simple and vast improvement over the sandpaper pad practice. Fine sandpaper will wear the lead smoothly but will not last long; the coarse sandpaper will endure but will not wear smoothly and with difficulty.

On the other hand the metal file's fine, firm grain will wear the hardest lead smoothly and quickly and needs but occasional dusting to remove its lead deposit; and, of course, it will outlast ten sandpaper pads. By a piece of string attached to its handle, the file may be conveniently suspended from a tack in the table edge in the usual way.—**C. Nye.**



Cuts for Roof Boards



FINDING the cuts for roof boards in a valley formed by the joining of two roofs of different pitches is not such a difficult matter if one could see it, as it really is.

Here is a way to find such cuts with a steel square applied directly upon the roof board to be cut. The square laid on 12" and 18" shows a 3/4 pitch and the square on 16" and 18" shows a 9/16 pitch, and this solution shows how the roof boards laid on the 3/4 slope are cut to line up the valley. To find the bevel for opposite side of this valley this same method applies by changing figures accordingly. Here is the analysis or explanation:

This 12" roof board laying on the rafters of the 3/4 pitch roof has a 10" rise as shown by the square which indicates that pitch. Now draw a guage line from the corner of that square as shown and again apply the square, this time on 16" and 18" and the 16" line is the pitch of this 9/16 roof and the guage line just drawn shows where the 12" roof board must reach with its upper, or longer edge. It now but remains to square up from this point so as to get this point on the upper edge. Now draw the correct bevel as shown and this is also the cut of hip shingles on the 3/4 pitch side of the valley.—**C. A. Doner.**

Artistic Back Yard Fences

BEAUTY can be secured even in such a prosaic thing as a back yard fence. The above picture shows an easily constructed but very artistic fence. The picture below shows where a pergola has been erected in the rear of a back yard so as to form a background.

There is nothing elaborate about this. It is simply and easily made, still it is quite artistic. The diagonal lattice work at the rear of the pergola is likewise carried out in the side fences. The floor of this pergola is cemented and blocked off into squares.

Here is a type of construction to go after for fall business. If no contracts for houses can be secured, there are plenty of contracts that can be secured for this type of work if the proper suggestion is made to the owner.

What the Editor Thinks

Fall Building

SEPTEMBER, in the past, has been the month of finishing up the jobs on hand and getting ready to lay up for the winter period. September now means one of the best months of the year for securing new contracts.

It is a good month to go actively after business and for the majority of small home operations you can give the promise that the owner will spend his Christmas and New Year's under his own roof in a brand new house that contains all the modern improvements.

Do not overlook the opportunity of getting Fall business!

Uncertain Plans

ONE of our readers calls to our attention, the note found often enough on plans "contractor to verify all measurements on plans before building." Here is a state of an architect not being sure of himself. Of course, we are all human and liable to make mistakes, but it is hardly the square thing to put the blame for our mistakes on another. The architect should shoulder his own responsibilities and so should the builder.

The habit of making pencil drawings only should be discouraged.

Inking a tracing takes a little extra time, but when done it results in better blue printing and will tend to prevent mistakes.

Will High Prices Cause a Building Depression?

IN a recent letter to different trade associations, Franklin D. Roosevelt, President, American Construction Council, says that if we are to keep construction activity steady and stable for the next five years, in view of the volume of work that should be done, we must constantly avoid periods of skyrocketing either in price of materials or wages.

While the demand for the moment may make possible inflated prices in wages above the regular scale, it will only prove a boomerang if the public decides to stop buying again.

Isn't it better to forego temporary advantage, if by so doing the industry is kept moving at a steady, stable, healthy pace continually?

A New Line for Builders Work

THE automobile has worked many changes in our daily life. Quite a number of families when they are out on the road in their car make a habit of buying their fruits and vegetables direct from the farmer. This has caused the farmer to display his produce by the roadside.

The farmer or some member of his family sits by the roadside waiting to make their sales and in a few instances use a sun shade or rough shed for protection from the sun.

The next step in this roadside merchandising will be the erection of decent-looking market buildings. Structures of this sort should not only be convenient with respect to the handling of products displayed, but also present an artistic appearance—something that will not be an eyesore along the road, but on the other hand will attract the passing automobilists to stop.

Our Cover Design

THE scene on our front cover this month is one that will strike home to every builder. The owner and his wife come out to inspect how the work is getting along. The builder is explaining different points of the construction. The lady is all attention to what is being said, it is *her* home. It is the wise builder that caters to the ladies, their recommendation is worth while having. This picture is reproduced from an original oil painting prepared especially for us by the well-known artist, Mr. David C. Hutchison.

More Cellar Windows

OUR cellars do not receive enough daylight. There is no reason why they should be dark, in fact, on the other hand, it is far better that they be light. The little single windows of the present and bygone days should give way to double or triple windows.

It is up to the builders to sell this idea of better lighted cellars to the owner. It has just simply been a case of following what our ancestors did.

Today, when metal sash and frame cellar windows can be had so cheaply, very few owners will hesitate about adding a few extra windows as the cost is so small. "Let there be light."

Finishing Trim to Match Furniture

IN an article in this issue on staining and finishing trim, different methods of finishing are described. There is nothing that mars or enhances the appearance of a room so much as proper finish of the trim.

It is but a simple matter to ask the owner, before you order the trim, just exactly what the finish is to be, as in that way you can give them more satisfaction. The difference in cost between certain woods is so very small when compared with the total cost of the building that it practically amounts to nothing and it means so much to do a good job. The owner will be more than satisfied and pleased and that is the best advertisement any builder can have.

Suppose a party has a handsome Circassian walnut bedroom suite and you finish off the trim in the bedroom where this is to be placed, in mahogany stain, one will scream at the other and no one will be satisfied.

A little thought on this subject will produce satisfaction all around. Select the proper woods for the desired effects.

Mortising Machine

THE making of a mortise by the old hand method is too slow and expensive in these days of high wages, therefore the device made by the Colgan Machinery & Supply Company, 801 Hayden Building, Columbus, Ohio, will be of interest to every builder.

It is a low-priced device that is quickly operated and a descriptive circular will be gladly sent to any of our readers who may be interested.

Efficient Power

ON the job and in the shop, there are many uses for power, and a very efficient and compact gasoline engine is made by the New-Way Motor Co., Lansing, Mich.

It is specially useful for operating portable machinery, as it is light in weight and easily transported. Their circular, C20, fully describes this engine, which is made in different sizes from 2 to 5 H.P.

Artistic Roofs

THE Blue Ridge Mountains are famed for their beauty, and slate from this region has a deep, lustrous, blue-black tone. This is now being used for coating asphalt roofing, and the result is a handsome and striking roof.

A sample and descriptive literature about this roofing may be obtained by any of our readers who may be interested by writing to the Blue Ridge Slate Corporation, Esmont, Virginia.

Smaller Registers

SPACE and money can be saved by using the H. E. Floor Register. These are described in folder "J" just issued by the Hart & Cooley Co., Inc., New Britain, Conn.

To secure strength the webs of the old-time cast-iron hot air register were necessarily quite thick. With the pinched-up fretwork used in this new style register, the same heating capacity is obtained in about half the space.

Weather Strips

FOR Fall business, it is a good idea to talk weather strips, and many a builder can secure desirable orders by going after this line of business.

A complete description of metal weather strips and details of attaching them, may be obtained from the Diamond Metal Weather Strip Company, Columbus, Ohio.

Metal Ventilator

RATHER interesting is the descriptive circular issued by the Danzer Metal Works, 123 West Lee street, Hagerstown, Md.

This describes their rose top ventilator, which is built like a chimney on the open stack principle with a top and side rim to exclude the weather without interfering at any time with the maximum air discharge.

Useful Catalogs

ON this page we give short descriptions of some very interesting catalogs, etc., that have just been issued by different manufacturers.

They will be sent free on application to any of our readers who are interested, but should you prefer to write us, give the date of this issue and title of the catalog desired, and we will have them sent to you.

Pipeless Furnace

VERY interesting is the 6-page descriptive catalog issued by the Co-operative Foundry Co., of Rochester, N. Y., describing their Red Cross Empire Pipeless Furnace. Some very useful information is given, together with a table of sizes and capacities so that the selection of a proper size heater can be easily determined. It is certainly worth while sending for this useful publication.

Clothes Dryer

THE builder who wishes to make a complete job of his residence construction, whether it be a small bungalow or a large apartment house, will consider supplying the means of adequately drying clothes. This is another of those little things that will help please the lady folk and will give a good name to the contractor. A very interesting booklet is issued by the Hill Clothes Dryer Co., of Worcester, Mass., which they will send to any builder on request; it contains illustrations and descriptions of different types of clothes dryers.

Brick Houses Easily Constructed

BY the use of the Fisklock hollow building bricks, a wall is rapidly constructed, as a unit is 8 inches thick and it is laid up as readily as a single brick. This makes for speed in construction. A very interesting folder containing details of this economical form of construction will be sent to any reader interested.

Ventilation of Buildings

NOTHING is of so much importance as the proper ventilation of schools, theatres, churches, halls, etc. Builders can obtain some very good information on this very important subject by obtaining the catalog of B. F. Sturtevant Company, Hyde Park, Boston, Mass.

Water Heater

CONTRACTORS who are on the lookout for new devices to please customers will be interested in the Economy combination boiler and gas water heater. This does away with the separate heater so often in the way when attached to a boiler in a small kitchen.

An interesting catalog describing such a heater has just been issued by the Economy Heater Company, 108 South La Salle street, Chicago, Illinois. The thermo valve control, which is a feature of this heater, insures an automatic supply of water at a desired temperature.

Plumbing Chart

AN interesting chart is published by the Copper & Brass Research Assn., 61 Broadway, New York City. It is a complete diagram of the plumbing of a typical residence. All the different water and drain pipes are shown in perspective form. It will be a handy thing for builders to have in their office, as it will be quite an aid in explaining to possible customers just how plumbing should be installed.

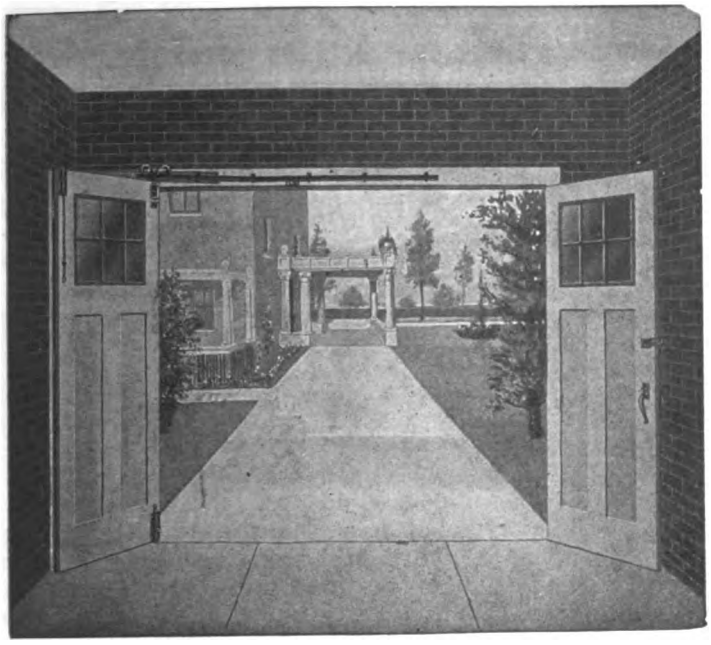
There are some convenient tables printed with the chart which gives sizes, etc., that will be very useful for reference. A copy of this chart will be sent to any reader of Building Age and The Builders' Journal on request.

Casement Hardware

THE builder who has a job of installing casement windows will find the work a good deal easier if he will refer to the interesting booklet just published by the Monarch Metal Products Co., St. Louis, Mo., as it contains a number of detailed drawings of exactly how to attach hardware to both inward and outward opening casements.

The booklet will be sent to any of our readers who are interested in this line of work.

Warm Houses



THEY are easily secured if one installs a proper heating system. Besides efficiency, economy is another very important consideration.

A very interesting booklet, edition "B," has just been issued by the Sills Stove Works, Rochester, New York, describing their Sterling Furnace, which is an improved type of the ever popular pipeless furnace.

Lathing Material

HOW the use of Clinton Welded Sheathing will save upward to 60% on plastering jobs as compared with the cost of wood lath and plaster, is interestingly set forth in the descriptive catalog issued by the Wickwire Spencer Steel Corporation, Worcester, Mass. They will also send a sample of their metal sheathing.

Set No. 805 includes:

No. 29 Latch
1 Swivel Hanger
6-foot Braced Rail
Jap No. 505 T. P. Butts
No. 820 Chain Bolt
No. 830 Foot Bolt
No. 5 Pull
1 Pair No. 40 Padlock Eyes

This view shows how snugly the doors hug the inside walls when open—allowing maximum space in the garage.

When Every Inch Counts—

In designing and hanging garage doors there is no room to waste. Limited to narrow confines, the builder must choose a proper door hanger, rail and other accessories to the end that a maximum amount of room may be provided for passage of the car.

That's why National Sliding and Swinging Garage Door Sets No. 805 are so often specified!

In addition to allowing ample entry space, doors hung with these sets can be opened and closed just as easily in the winter as in the summer—no jamming by ice or snow.

These doors are easily operated, are weathertight, adaptable and require but a small space.

Remember—**National Garage Sets Safeguard the Reputation of the Builder.**

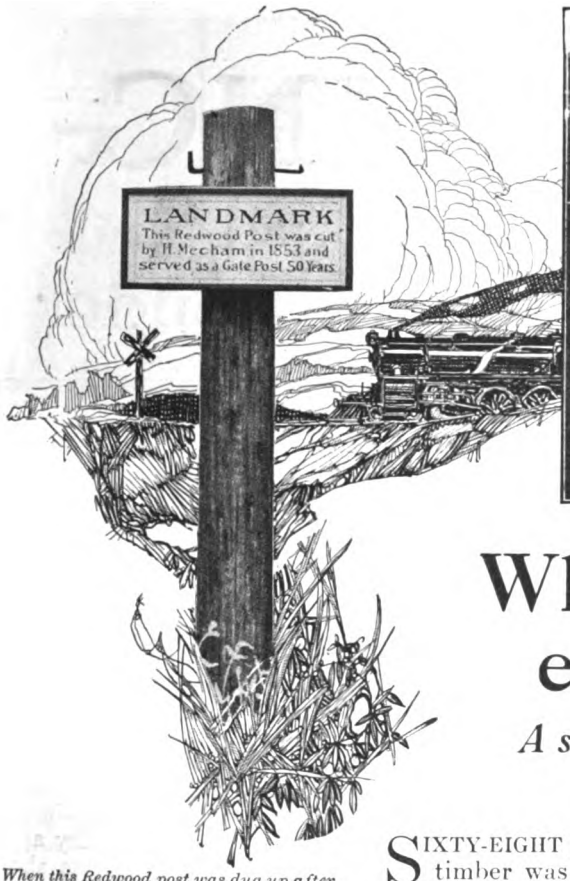
SHOPWORK *and* FURNITURE

Designs for the Finish Man



Convenient Kitchen Cabinets

THE lady of the house is, of course, anxious to have her kitchen arrangements as convenient as possible, and one demand is for adequate cupboard space; therefore it will be interesting to examine this picture. A sink with drainboard on each side is well placed under a window, and for night illumination an electric light has been placed above it. Drawers on one side and cupboard on the other lend themselves as convenient places for storing away the different kitchen utensils. An innovation is the hood over the gas range, which has been let into the ceiling and extends up in the attic space above in this bungalow; thus there is no metal hood projecting in the kitchen and all the hot atmosphere goes out through this space, affording adequate ventilation.

When this Redwood post was dug up after fifty years, it was still free from decay, proving that worms, insects and moisture, earth acids and salts do not destroy Redwood.

Residence--Highland Park, Illinois. Robert Seyfarth, Architect, Chicago. Exterior of Redwood Sawn Shingles.

What other wood can equal this record?

A striking example of Redwood's special fitness for Residential Building

SIXTY-EIGHT years ago a Redwood timber was installed as a gate post on a western ranch. It gave fifty years of service before it was dug up to let a railway through. Now it is a landmark which perpetuates the name of a pioneer ranchman. Sound below ground and above ground, this post offers convincing testimony of Redwood's remarkable resistance to rot and decay.

Why Redwood resists rot

A *natural*, odorless preservative permeates every Redwood fibre during the growth of the tree. This prevents the propagation of fungus spores which cause rapid decay in most woods. It also protects Redwood against wood-boring insects and worms. No artificial preservatives are needed.

Where Redwood should be used

For siding and porch work on which climbing vines retain moisture and foster the development of mould and decay, for shingle roofs shaded by trees so that they dry out very slowly, for eaves and gutters—wherever moisture lodges—Redwood can be specified with perfect assurance that decay producing fungus will not make early replacement of these parts necessary.

The same natural preservative that protects growing Redwood against wood-destroying agencies during centuries of growth protects Redwood lumber and lumber products.

Why Redwood should be used

In addition to its rot-resisting properties Redwood is free from pitch and other highly inflammable resinous substances, therefore reduces the fire hazard wherever used. Being unusually free from knots, splits, checks and other defects, there is little waste in Redwood lumber. The builder's time is saved in working with Redwood. Having a close grain and smooth texture, Redwood takes and holds paint well. In a Redwood house, repair and up-keep expenses are reduced to a minimum.

Redwood should be specified for

Exterior Construction
including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish
Natural, stained or painted. Wood block floors.

Industrial Uses
Tanks and vats for water, chemicals and oil—Factory roofs and gutters—Wood block flooring.

Wood Specialties
such as—Caskets and burial boxes—Incubators and ice cream cabinets—Cigar and candy boxes—Furniture manufacturing, etc.

Railroad Uses
such as—Railroad ties and tunnel timbers—Signal wire conduits and water tanks—Car siding and roofing.

Farm and Dairy Uses
such as—Silos, tanks and troughs—Hog feeders and implement sheds—Wood block floors, etc.

"The Western Wood for Eastern Homes"

Practical Points of Interest to the Builder

Some Notes on Wood Finishing

By A. ASHMUN KELLY

SOME persons think of the term "weathered oak," as relating to one particular shade, whereas, there are at least thirty. And the same holds good regarding the term "English oak," of which there are some fifty different shades. These latter shades range all the way from a bright umber tone to a color that approaches green. Weathered, Mission and fumed oak are sometimes classified under one head. Weathered oak is obtained by the act of staining, while Mission and fumed oaks derive their coloring from the process of fuming. Their finish is effected with either shellac or lacquer, the final finish being wax.

The difference in finish between early English oak and weathered oak is very little, the former not being filled, while the latter is filled. In the latter case apply a a light coat of shellac before filling, and dull-rub for a finish.

The best results with English oak are obtained by first applying a stain, then a thin coat of white shellac; after which apply the filler, then a coat of white shellac, followed by a coat of varnish, which is to be rubbed to a dull finish. Or the varnish may be omitted and two or three coats of shellac may be applied instead, this saving much rubbing.

Butler oak once meant a grayish-brown sort of color, but now there is no standard color for this finish, the choice of color resting in the finisher, who may choose what he likes, and it will still be butler finish. One may see shades of color on this oak finish running from a grayish-brown to a red, or even to a greenish-cast. After staining the work was allowed to stand about thirty minutes, then the high lights were wiped out with a rag; the idea was to simulate the dirty effect seen on ancient oak, the result of much handling. Such realistic effects, we are glad to state, have now gone into the discard. Moreover, the process is much simpler now, no rubbing is now done, the staining is uniform, and the finish is simply two coats of shellac, one coat each of shellac and varnish. In cheap grades of furniture the color is rather brownish, something on the umber order, the finish being effected without a filler. Adam brown stain has an umber tone, with a slightly red undertone.

There are many shades of silver gray, and any of these shades may be obtained with the following formula: Mix together 1½ oz. powdered iron sulphate; 4½ oz. sulphate of soda, and ¾ oz. black Nigrosene aniline dye; dissolve all together in 6 quarts hot water. It is then ready to apply. After its application let it become dry and then give it a coat of white shellac.

If there is danger of dampness where this wood is to go, then apply a thin coat of shellac varnish, the white or bleached variety. On this apply two coats of banana oil. For a wax finish add a little dry zinc white to the wax, which is to be rubbed into the wood, then rubbed off so that none remains excepting that in the pores of the wood.

Kaiser gray is simply a darker shade of silver gray. Both are made from the same materials, but one is darker than the other. First stain the wood, and if a fine flake effect is desired apply a thin coat of shellac; when this is dry apply the white filler and rub as above indicated.

WOOD finishers differ in many important matters concerning the wood finishing art, but the directions given here will prove generally acceptable to most workmen and even to others.

Very expert wood finishers will be found who fill mahogany with oil stain the first thing; we think better results might be had by using a very thin coat of shellac instead of the oil stain. But be this as it may, one thing we will agree on, and that is, the wood should be dry in order to get a satisfactory and durable finish on mahogany wood. In mahogany filler benzine must not be used, as it will injure this wood, or at least the color of the wood. It seems to act as a bleach, and has the same effect on red and most bright colors. Benzine in the filler turns the pores of the wood gray, and by looking at the filled wood at a certain slant this effect is very plain. Some think damp lumber causes this, but while it is true that damp lumber injuriously affects the color finish, yet even with dry wood you will see the bleaching where benzine has been used.

For Beautiful Interiors

Enameled Woodwork is the "Last Word" for interior decoration. The secret of a fine enameled job is in the under-coat—it's like the foundation to a building—everything depends upon it.

Johnson's PerfecTone Under-coat is a perfect foundation—it is elastic, durable, non-porous, has great covering power, works freely under the brush and dries hard in from 18 to 24 hours.

Johnson's PerfecTone Under-coat will not run, sag, lap, chip, check, crack nor peel. It has wonderful smoothness and opacity—and will not absorb the Enamel.

JOHNSON'S PERFECTONE ENAMEL and UNDER-COAT

Products You Can Depend On

To Build Up Your Reputation

Johnson's PerfecTone Enamel is very elastic—it will not fade—chip—check—crack nor peel. The stock shades of Johnson's PerfecTone Under-coat and Enamel are White, Ivory and French Gray.

Won't you try Johnson's PerfecTone Under-coat and Enamel at our expense, so you can see for yourself what beautiful effects may be procured? Use the attached coupon.

WHAT'S NEW

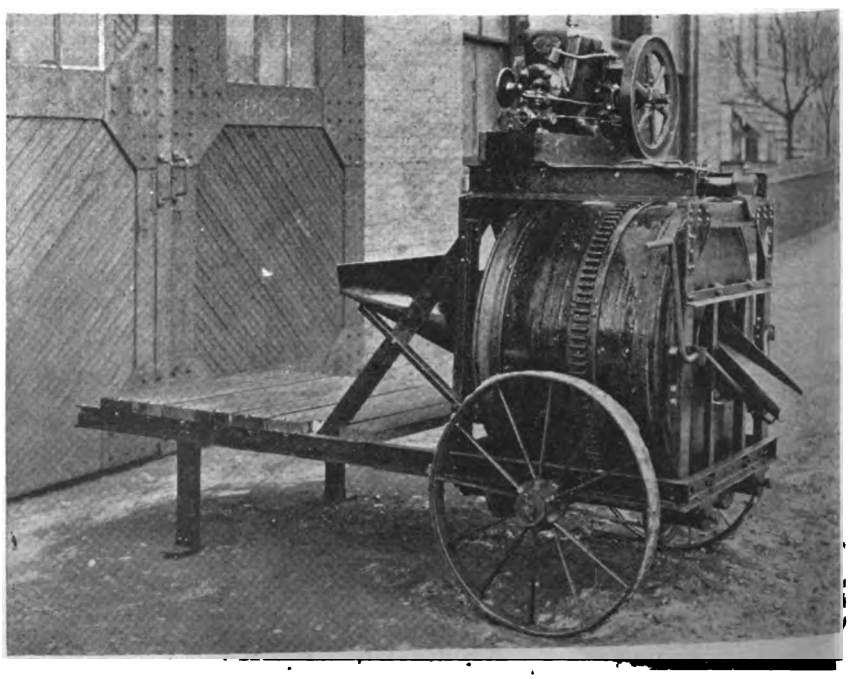
New Materials and Equipment that Keep Your Work Up to Date

Woodworking in Variety Easily Accomplished

FOR the variety of work that must necessarily be turned out in the shop of the average contractor, quite an equipment of machines would really be necessary, and therefore it is of interest to see samples of the work accomplished by one machine called the Master Woodworker as manufactured by the Woodworker Manufacturing Company, Detroit, Michigan. This machine can be either used in the shop or taken on the job. It is operated by electric motor and of course can only be used conveniently where electric current is obtainable.

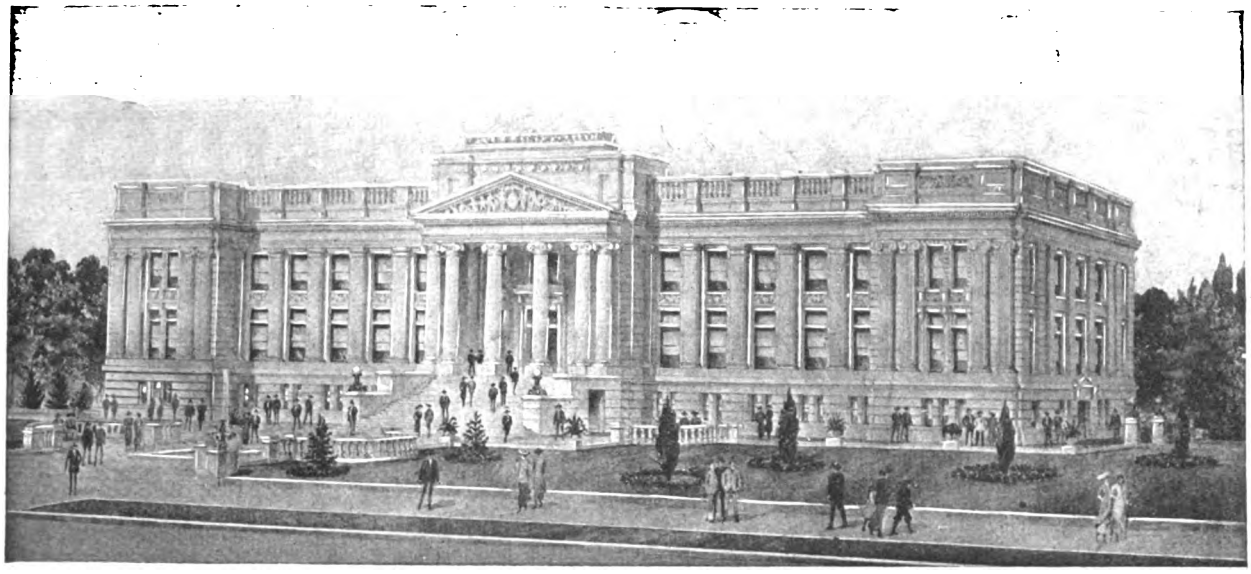
This machine is practically twelve machines in one. It is simple in construction, has but few parts, and the drive from motor to saw spindle is direct. The overhead saw is carried on a slide pivoted to swing for cutting at any angle and allowing the saw carriage and motor to be drawn back and forth, which is a desirable feature for cutting rafters, etc.

The machine is equipped with a graduated dial to cut compound mitres in one operation; this was specially designed for making jack rafter cuts. Besides cutting, boring, routing and mortising can be accomplished, as there are special devices to do this work.



Our illustration shows a number of varieties of work that is easily accomplished by the use of this woodworker. This variety of work is accomplished because of the different appliances on this machine. Ripping at any angle and joint is possible on account of the tilting table, which is easily operated.

Improved Form of Concrete Mixer



THE use of a concrete mixer even on small jobs is economical practice, and we show below a new type of a small mixer that has a capacity of 3 cubic feet of wet concrete per batch. This is the new Archer Junior made by the Archer Iron Works, Chicago.

It was specially designed to meet the need among contractors for a batch mixer that could be handled by a small crew—that is absolutely dependable, simple to operate, easily portable and low in operating cost—also, and very important, low in first cost. It is operated by a 1½ H.P. gasoline engine.

With this mixer the materials are wheeled onto the low loading platform and dumped directly into the hopper. In many cases the mixer can be backed up to the forms and the mix spouted directly into place without the labor and expense of first transferring it in wheelbarrows.

Keystone Copper Steel used for sheet metal work.

SHOULDERING the burden of your sheet metal problems is part of our daily work. More than that—we are prepared to furnish products that will help keep them solved. This is evidenced by our development of Keystone Copper Steel—the alloy which has established a new measure of service for building construction, and sheet metal work.

KEYSTONE COPPER STEEL

Keystone Copper Steel is an alloy made by the addition of a certain percentage of Copper to well made Steel, thereby greatly increasing its lasting and rust-resisting qualities under actual service conditions. It has been scientifically developed and tested—and its use is strictest economy.

The high reputation of our products is recognized wherever sheet metal is used. Each brand of our manufacture has behind it a service—the scope of which has a tangible value to every builder and sheet metal worker. This service begins with the planned care and skill in the making, which is carried through to the thorough system of distribution which keeps these products obtainable in every part of the country. For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use Keystone Copper Steel Galvanized Sheets and Roofing Tin Plates—best for both roofer and property owner. Sold by leading metal merchants, and used by leading roofers and contractors.

OUR views on the following stated case are asked by an Illinois general contractor:

When Contractor Is Delayed in Performing Contract

He entered into a contract to erect a bank building; the agreement being written on standard form No. 4, as adopted by the Illinois Society of Architects. One clause provides for perfect completion of the work, ready for occupancy on or before October 15, 1921, provided that the contractor be given possession of the premises on or before July 15, 1921, and subject to extensions in accordance with Article VII of the contract. $10 a day for each day's delay in completion was agreed on as liquidated damages for any delay.

Article VII provides that should the contractor be obstructed or delayed in the prosecution or completion of the work by the owner or the architect, etc., the time for completion should be extended for a period equivalent to the duration of the delays; on condition, however, that claim in writing be presented in writing to the architect within 24 hours of the occurrence of the delay, and that the duration of the delay be certified to by the architect.

Article VIII binds the owner to provide all labor and materials not included in the contract, in such manner as not to delay progress of the work, and to reimburse the contractor for any loss resulting from breach of this condition. Reciprocal provision appears for reimbursing the owner for any loss caused to the owner by the contractor's delaying material progress of the work. It is also provided in this clause that the architect shall fix the amount of damage payable to either party thereunder.

Article IX makes the architect's decision on any dispute binding on the parties, excepting as to certain matters which do not appear to be here involved, as to which provision is made for arbitration.

Article II provides for furnishing supplementary drawings and explanations necessary to illustrate the work to be done.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

The building was occupied by the owner-bank, February 8, 1922; the contractor having been delayed 117 days in waiting on plans, details, and other workmen employed by the owner. The architect was notified in writing of the delays and the reasons for the delays.

The architect states that he will not extend the time for finishing the building, and that the contractor is expected to make good the damages resulting from the delay in completing the work.

"My opinion," says the contractor, "is that the owner and the architect are liable to me for the damages for the following reasons:

1. They failed to give size of opening for vault-door until October 15, the day the building was to be completed.

2. The architect changed positions of the windows by revised floor plan, which change made it necessary for the contractor for cut stone to get out more stone of other dimensions to fill the places where the windows were changed. This revised floor plan was made and dated October 15.

3. They delayed the work of plastering 21 days, on account of the architect not having completed the details on ornamental work.

4. The owners caused a delay of 38 days in setting the vault door, fixtures, etc., and in doing work on the floors.

To the extent that completion of the work was delayed by the owner and the architect, and their own independent employees, we are of the opinion that the contractor is exonerated from liability for the agreed daily damages agreed on, and is, on the contrary, entitled to reimbursement for damages sustained by him in consequence. This assumes that proper notice of delays was given, and that the delays by the owner in giving vault opening dimensions, etc., were the direct cause of delays in completing the building. No personal liability against the architect appears, in our judgment.

From a practical standpoint, the only thing that this contractor can do is to place his interests in the hands of some dependable local attorney, and let him fight the thing out, if the owner refuses to make a satisfactory adjustment. As throwing some light on various angles of the subject, we summarize below some well-established rules of law:

A contractor is entitled to credit for time during which performance of his agreement has been excusably delayed by fault of the owner, the architect or a co-contractor employed by the owner to do independent work. The courts have implied such conditions in cases where no express provision covering the point has appeared in contracts. And in an Illinois case (187 Ill. App. 426) it was decided that delays caused by requiring extra work are to be allowed in favor of the builder.

But the courts have recognized the validity of clauses requiring, as in this case, the contractor to give notice of delays caused to him, and have denied credits for delays where such clause has not been complied with by the contractor and not waived by the owner.

And reasonable discretion is vested in the architect, under such a contract as that before us, to determine the duration of delays for which credit is to be allowed to the contractor. But such a

25 Broadway - New York

"Copper Roofing," a manual for architects, is out in a second edition and will be mailed upon request.

Digitized by Google

clause does not give the architect powers of a czar. For example, in the case of Murphy vs. Orne, 39 Atlantic Reporter, 959, the Pennsylvania Supreme Court decided that a clause in a contract before that court did not invest the architect, to the exclusion of the courts, with power to determine the questions, what delay there was in completing the work, and whether it was caused by acts or orders of the owner, or was attributable to the contractor, in which latter case, as here. the contract required a certain amount for each day of delay to be paid the owner as damages. The clause involved in that case provided, in effect, that changes might be directed by the owner and in case of any such addition, such further time should be allowed for completion of the work as the architect should deem reasonable. It was further provided that if any question should arise during the progress of the work, or in the settlement of accounts, it was to be referred to the architect, whose decision should be binding.

We give the following citations to cases where it has been decided by the appellate courts of Illinois that a builder is not chargeable with delays resulting from the owner's failure to do certain work required on his part and necessary to be done before the builder can do his work: 79 Ill., 181; 75 Ill., 540; 160 Ill., App., 554; 116 Ill., App., 159; 110 Ill., App., 510; 110. App., 200.

For cases on the proposition that ordinarily a builder is not liable for delays caused by being required to do extra work see the following Illinois cases: 227 Ill., 613; 85 Ill., 546; 160 Ill., App., 554; 57 Ill., App., 515.

"The owner is liable in damages to the builder, for a delay in performance on his part, or caused by some act of his or his representative, unless the particular provision of the contract relied on as a ground for recovery is intended to absolve the builder from liability for the delay, or unless the builder is himself the cause of the delay, or the owner stipulates against liability for delay caused by his agents. In case of a delay caused by the owner, the builder is not obliged to abandon the work and sue for damages, but he may proceed to complete the work and then claim damages. The owner is also, in the absence of any stipulation in the contract exempting him therefrom, liable for damages from delays caused by the failure of other contractors to perform work which they have undertaken to do for the owner, and which, as regards the former contractor, the owner is under obligation to do; but the owner may, by express stipulation in the contract, exempt himself from liability to one contractor for delays caused by other contractors." 9 Corpus Juris, 790-791.

Illinois cases will be found under the text above quoted.

Insofar as any of the questions in this controversy may be affected by provisions in the contract for arbitration, those provisions should be carefully examined by the contractor's counsel in the light of recent statutes and decisions in Illinois relating to agreements to arbitrate. Those statutes and decisions favor the validity of agreements to arbitrate disputes.

Third Parties' Rights Against Owner on the Contractor's Defaulting

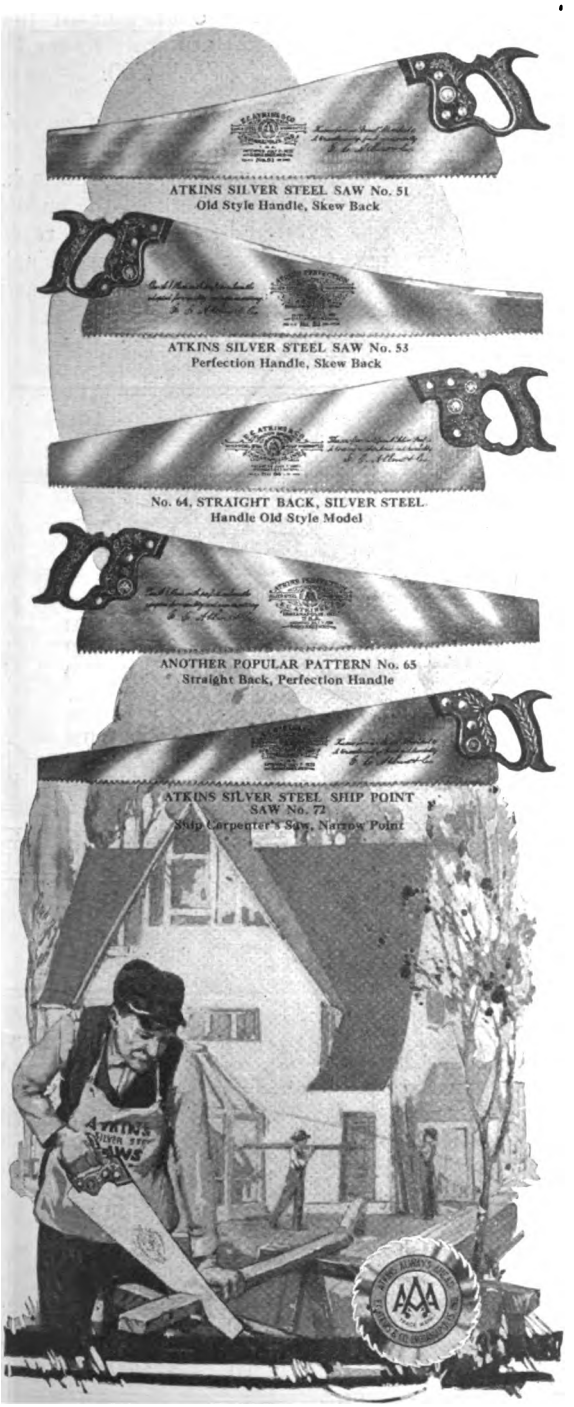
WE are asked to discuss the legal rights of an owner under the following stated circumstances: A contractor for the erection of a house sublet the plumbing and masonwork. The second payment due him was promptly paid, but, instead of paying his carpenters and the subcontractors, the contractor went on a spree and practically abandoned the job. The carpenters, subcontractors and a lumber dealer, who furnished materials for the work, demanded payment from the owner; the contractor having agreed to pay them on receiving the second payment from the owner. The owner has assumed charge of the work, completing it by day's work and through small contracts. The lumber dealer removed various materials from the site, which he had furnished for the job, but which had not yet been used. These had practically been paid for by the owner, through an overpayment to the contractor on the faith of his expressed intention to pay the third party claimants. Carpenters have filed liens for their work.

What position is the owner in? Is he liable to the contractor's workmen? Has the plumber a valid claim against him? Had the material man any right to remove the material? Has the mason subcontractor any claim against the owner for work or material? All of these men received payments on account when the first payment was made. The contractor is financially irresponsible and makes no effort to straighten out matters.

Since no one of these third persons appear to have any sort of agreement direct with the owner, having furnished their work and materials as subcontractors or employees or materialmen of the contractor, the owner is not personally liable on any of their claims. If they have any right, as to the owner, it is to enforce liens against the property.

Assuming that this is a New York transaction, that the contractor has been paid all that will be due him under the contract, and that no notice of lien was given before payments were made by the owner to the contractor, we are of the opinion that no valid lien claims can be enforced.

The New York Lien Law (sec. 4) provides that "if labor is performed for, or materials furnished to, a contractor or subcontractor for an improvement, the lien shall not be for a sum greater than *the sum earned and unpaid on the contract at the time of filing the notice of lien, and any sum subsequently earned thereon.* In no case shall the owner be liable to pay by reason of all liens . . . a sum greater than the value or agreed price of the labor and materials remaining unpaid, at the time of filing notices of such liens, except as hereinafter provided."



Interpreting this section, the courts of New York have decided: The object of the law is to reach in the hands of the owner *any balance owing by him to the contractor.* If nothing remains due the contractor when lien notices are filed the liens are unenforceable. An owner cannot be compelled to pay any greater sum for the completion of the work than he has agreed to pay, where payments have been made to the contractor in good faith and before filing of lien claims. Where the contractor defaults and the owner completes the job, the lien of a laborer or subcontractor or materialman attaches only to the difference between the cost of completing the building and the amount of the contract price unpaid when the lien is filed. In these respects it will be noted that the New York law differs from that in force in many other states where the effect of the mechanics' lien statutes is to entitle subcontractors to liens filed within stated times, regardless of payments which may have been made to the contractor by the owner. It is held by the New York court that, under section 7 of the Lien Law, it is only when an owner makes payments under a contract before they are due, and then for the purpose of defeating the lien rights of subcontractors, etc., that the liens may be enforced against him, when not filed before such payments were made.

It seems that the lumber dealer, having delivered materials on the site for use in the building, had no right to reclaim them merely because his chances of recovering their price against the contractor, to whom they were sold, failed. However, it seems that title to the materials remained in the contractor, because they had not been incorporated into the building; and if the contractor obtained possession of them on fraudulent misrepresentations concerning his financial condition the dealer was entitled to reclaim them. We do not believe that the owner had acquired such right to the materials as gives him a right against the dealer, unless by reason of agreement between him and the contractor it was understood that title to all materials brought by the contractor on the job should vest in him. If there was such understanding, however, and if the dealer sold the materials on open credit, we do not believe that the dealer had a right to repossess himself of the materials, and the owner would have a valid claim against him for their value.

This is a case where the owner was unfortunate enough to select an irresponsible contractor who made a low bid with the idea of obtaining as much as possible before quitting.

Review of the Building Situation

BUILDING statistics for July just published by F. W. Dodge & Co. show that the volume of contracts awarded is about 2 per cent. increase over that of June and about 65 per cent. increase over that of July, 1921.

It is greater than any previous monthly total, excepting that of April and May of this year.

There was a considerable increase in the amount of contracts awarded in the Middle West district, which shows that the building revival has hit our Middle West States, but unfortunately it is not up to the average maintained by the Eastern States for the past seven months of this year.

The July figures bring the total of the seven months of the year up to the immense sum of $2,041,065,000! The total is 60 per cent. greater than that for the corresponding period of 1921, which surely indicates that 1922 has been the biggest year the building industry has enjoyed.

It is sincerely to be hoped that there will be no lasting bad effects from the coal or railroad strikes.

Although residential construction still maintains the lead there is a decline in this class of construction over that of the June figures. There was a considerable increase in industrial and public works construction, the figures for industrial plants totaling $31,882,500, which is 9 per cent. of the month's total, and the largest for this class of construction since November, 1920.

In residential construction the New England district showed a slight increase, as did the Pittsburgh district. There was a noticeable decrease in those States in which the coal strikes were in progress and no doubt the spirit of industrial unrest held back a great many building projects.

A good sign of the times is that an immense amount of money is being spent for schools in all districts. While, of course, there has been some lessening of the amount of money spent on this class of construction over that of June, still the total amounts to the immense sum of $40,690,200.

In looking at the figures for contemplated projects, we certainly see a most healthy outlook. That the great bulk of the buildings are needed in the East is revealed by these figures. A surprisingly large amount of residential construction is still required.

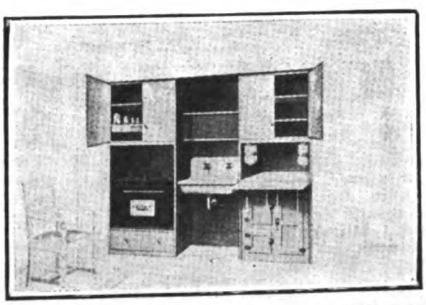
NORTH SIDE HOTEL, EVANSTON, ILL. (Suburb of Chicago)
Equipped with Type AP Bisk Kitchenette
Robert G. De Golyer, Architect

BUILT-IN STEEL KITCHENS

were used in this apartment hotel, permitting the most economical use of space obtainable, accompanied by maximum beauty in appearance of the room.

Bisk steel kitchenettes come in all styles and combinations of units, adaptable to every size and location of space available.

The units are built on the idea of sectional book case, permitting the use of few or many units as desired.



For instance, our assembled stock cabinet AB-1 Ventilated, recommended for general use, is equipped as follows:

1. **Two steel cabinets 18 inches deep, 30 inches wide, and 82 inches high. One containing a three-burner gas range with broiler burner in large oven. The other housing a substantial refrigerator with 50 pounds ice capacity, and large food compartments.**
2. **Standard sink and special drain shelves over it.**
3. **Polished nickel zinc covered sliding work table over the refrigerator.**
4. **Glass jars for coffee, tea, salt and pepper, as well as large swinging bins for flour and sugar.**
5. **A cutlery drawer in each cupboard section, and a large pan drawer under the stove.**

Contractors and Builders

If our stock units are not adaptable to your space, submit your problems with necessary details and measurements, and our Service Department will gladly furnish expert recommendations. Better still, if you send blueprints of floor plan.

Bisk sectional kitchen cabinets are made entirely of auto body steel electrically welded and finished in sanitary white enamel baked on. No bolts or screws used.

All units are air-tight, vermin-proof and dust-proof.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

BUILDING MATERIALS

Complete Your Catalogue Files

Builders, contractors and architects can be up-to-the-minute on all products and services rendered by manufacturers in the building industry by referring to and writing for the catalogs listed in our "Selected List of Manufacturers' Literature," appearing on pages 86 to 96 of this issue. They may be had without charge, unless otherwise noted, by writing to us or by writing to the manufacturer direct, mentioning this publication.
In ordering, use either the title or the number appearing before the name of each catalog.
BUILDING AGE & THE BUILDERS' JOURNAL, 920 Broadway, New York City

"THE STANDARD"

Low Charging Concrete Mixers

Increase Production—Cut Costs

Speedy, thorough mixing and continuous, satisfactory performance are essential features of a good mixer. The Construction of "THE STANDARD" and its reliable power, guarantee these features to the user. It can be used successfully as a mortar mixer, which makes it adaptable to all building projects.

"THE STANDARD" line also includes Hoists, Pumps, Air Compressors, Wheelbarrows, Engines, Block Machines—a complete line of contractor's equipment.

Send for Catalog M-8 and specify kind of equipment in which you are interested.

News, Notes and Comment

Jumbled Cities

AVOIDANCE and correction of the present topsy-turvy arrangement of so many American cities, the cause of millions of dollars' loss, is the object of "A Zoning Primer" issued by the Division of Building and Housing of the Department of Commerce, according to an official announcement recently made.

The enormous waste in American cities from scrapping good buildings on account of the blighting of districts has long been apparent, and for years has levied its tax on the American people.

Random crowding of stores among private dwellings, the elbowing of factories and noisy smelly garages into the rightful domains of neat retail stores or well-kept apartment houses, and the construction of tall, bulky office buildings so closely crowded that the lower floors are too dark for human use and consequently seldom occupied, is part of the present stupid, wasteful jumble which proper zoning will prevent and gradually correct, in the opinion of the Advisory Committee on Zoning of the Department of Commerce.

The pamphlet describes the object of zoning, the need, the health and property protection afforded, and its effect on the cost of living. Legal problems, with an outline of what some cities have accomplished, and a zoning program are also included among other subjects. Copies are sold by the Superintendent of Documents, Government Printing Office, Washington, D. C., at five cents each.

Novel Building System

IN recent issues we have published descriptions of the Building project of the Metropolitan Life Insurance Co. The contracts for the $6,500,000 worth of apartment houses have been let and work is already under way.

Something new in the method of assembling these fifty buildings in four block groups will be worked out under the guidance of Robert Glenn, construction superintendent under the general contract, which the company made with Henry C. Irons & Sons. It will be a checkerboard system, leaving a vacancy between each house above the grade floor, which vacancies will be utilized as work floors for the houses to be finished on either side.

Mr. Glenn, who devised the system, is confident that it will result in a considerable advantage and ultimate saving, as it will afford space for the storage and, incidentally, minimize the handling and preparation of the materials.

Potential Reconstruction Markets

AN estate in an eastern city had to spend 30 per cent of 1921 income from $300,000 worth of homes on repairs because proper maintenance had been neglected for three years. If such work had been budgeted each year from one-third to a half of the total expense could have been saved.

Government Whitewash

MANY requests reach the College of Agriculture at the Ohio State University for the recipe of Government Whitewash, one that is whiter than most such mixtures, that spreads so evenly that a pint covers nearly a square yard, and that lasts well when used on outside jobs. This is the standard recipe: Slake one-half bushel of fresh lime with boiling water, covering the receptacle to keep in the steam. Strain the liquid through a fine sieve, and add 7 pounds of fine salt, previously dissolved in warm water; 3 pounds of ground rice, boiled to a thin paste and stirred in; 1 pound of white glue, soaked first in cold water until swollen, then carefully melted over fire. To this mixture add five gallons of hot water and let it stand covered for a few days before using.

Book Notices

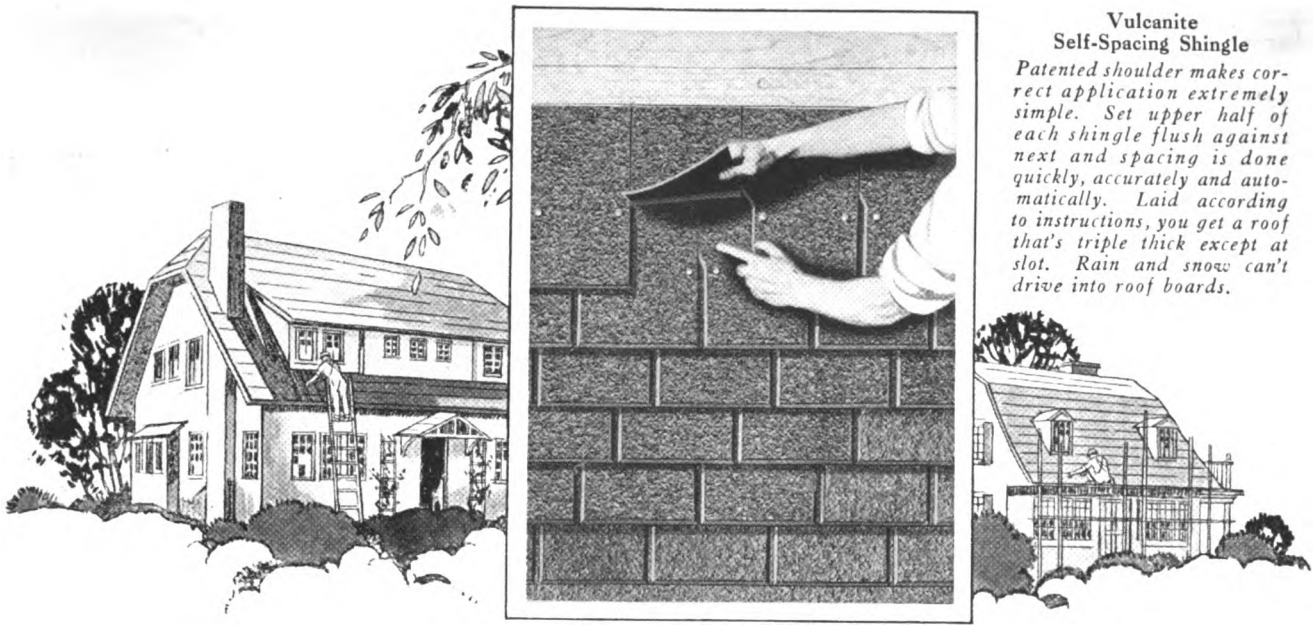
Materials of Construction, by H. E. Pulver; 318 pages, 6 x 9; 110 illustrations; price $3.00. Published by McGraw-Hill Book Co., New York City.

This book has been designed as an elementary text book on the types, manufactures, properties and uses of building materials. While it was especially prepared as a text book for the University of Wisconsin, in which the author is a professor, it contains enough practical pointers to make it of general interest to any earnest student of building construction.

* * *

New Building Estimators' Hand Book, by William Arthur; new revised edition; 1,000 pages; gilt edge; price $6.00. Published by U. P. C. Book Co., New York.

But little need be said about this valuable hand book as it has been before the building fraternity for many years. In the present edition much new information has been added and revisions made so as to bring the text up to date. All matter has been entirely reset, so that the book is really new from cover to cover.



Information is given on the measurements, erection and cost of all the different forms of work met in constructing modern buildings. Needless to say, this new edition forms such a valuable aid to the contractor that it is money lost not to have a copy.

* * *

Practical Accounting for General Contractors, by H. D. Grant; 254 pages; price $3.00. Published by McGraw-Hill Book Co., New York City.

The proper keeping of accounts is of vital importance to the contractor and in this book the author gives some practical hints on the subject that will be a help to every contractor who puts them into practice. The author had charge of the accounting department in a large contracting firm and therefore has been able to embody in his book some very practical first-hand information.

Vulcanite Self-Spacing Shingle

Patented shoulder makes correct application extremely simple. Set upper half of each shingle flush against next and spacing is done quickly, accurately and automatically. Laid according to instructions, you get a roof that's triple thick except at slot. Rain and snow can't drive into roof boards.

Two Patented Vulcanite Roofings, Each Unequaled in Its Class

WITH Vulcanite Doubletite, the two patented specialties shown on this page give Vulcanite dealers three roofings, each of which is unapproachable for its particular use.

Think of the strategic position in which such a proposition places you.

And bear in mind that these three specialties are backed by a line that includes *a better roofing for every need.* Vulcanite is made in a varied combination of styles, weights and finishes, each suited to a special service and each of high quality and lasting dependability.

Another most important factor from your standpoint is this: *no matter where you are located, we can promise quick deliveries and low freight rates.* Factories at Albany, N. Y.; Anderson, Ind.; Chicago, Kansas City and San Francisco. Also conveniently located warehouses.

We will gladly have one of our many roofing experts call on you and explain the Vulcanite line in detail. Communicate with our nearest office. Full-sized samples on request.

Vulcanite Hexagon Slab

A distinctive Vulcanite design with unusual decorative possibilities. Highest possible quality. Considerably wider than ordinary slab shingle. Double thickness at every point. Patented design assures proper application. Can be applied directly over old shingles. Many dealers have developed profitable business in Hexagon Slabs for this use alone.

The Complete Vulcanite Line Includes

- Standard Individual Shingles
- Self-Spacing Individual Shingles (Standard and Jumbo Weights)
- Hexagon Slab Shingles (Standard and Jumbo Weights)
- Doubletite Slab Shingles
- Four-in-One Slab Shingles
- Slate Surfaced Roll Roofing (Standard and Jumbo Weights)
- Smooth Surfaced Roll Roofing (Talc, Mica and Sanded Finishes)
- Ornamental Roll Roofing
- Vulcanite Built-up Roofing

Our line of deadening felts, cements and roofing paints is also complete and includes an item for every use.

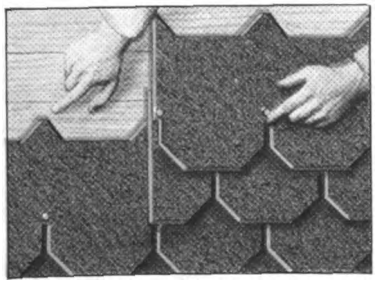
BEAVER QUALITY

VULCANITE QUALITY FOR BETTER ROOFS



Digitized by Google

STUDY THIS X-RAY FOR A MINUTE

Doubletite is the widest 4-in-1 slab shingle made. Easy to handle and automatically spaced.

A shingle is cut away to show how patented triangular projection gives double thickness in slot where other medium-priced slabs have only single thickness.

A GLANCE at this X-Ray shows why Vulcanite Doubletite builds a roof with double thickness, double wear and double weather protection at every point. Also triple thickness at vital points.

No other medium-priced slab shingle gives this important advantage. *It's patented.* So no other shingle is made like it or *can* be made like it.

Doubletite is the widest 4-in-1 slab shingle on the market —12 inches. It's the heaviest, too.

Lies perfectly flat. Won't curl in any climate.

Extra thickness and unusual octagonal shape give Doubletite an expensive Italian tile-like appearance. Extremely popular among owners of fine homes.

Automatic spacing makes it absolutely impossible to go wrong in laying.

Write us for full-sized sample and detailed Vulcanite proposition. If you specify, sell or lay roofings, it will surely interest you.

ASH HOISTS—See also Hoists

ASH RECEIVERS
Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.
7. *Catalog E.* Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.
8. *Catalog F.* A book for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with tables of dimensions for installation. 8 pp. Ill. 6 x 9¼ in.

BALANCES, SASH
Caldwell Mfg. Company, The, Rochester, N. Y.
9. *Suggestions for the Present-Day Architect.* Booklet, 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.
10. *Catalog* describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS
American Saw Mill Machinery Co., Hackettstown, N. J.
11. *Catalog No.* 22 describing a general line of band saws of various sizes.
12. *Technical Data.* Four-page folder, 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires. Proper size for filling.

Crescent Machine Co., Leetonia, Ohio.
241. Descriptive 144-page Catalog.

BAR BENDERS AND CUTTERS
Koehring Company, Milwaukee, Wis.
13. *Four-page folder,* giving illustrations and sizes of Koehring Bar Benders and Cutters.

BATHROOM FIXTURES
Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.

BEDS
Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.

BOILERS—See Heating Equipment

BOOKS
American Technical Society, 58th and Drexel Blvd., Chicago, Ill.
Architectural House Planning Service Co., 20 So. 18th Street, Philadelphia, Pa.
Arrow Book Company, 347 Fifth Avenue, New York City.
U. P. C. Book Co., 243 West 39th Street, New York City.

BLUE PRINTS
Peerless Blue Print Co., 347 Fifth Avenue, New York City.

BRICK
American Face Brick Association, 110 South Dearborn Street, Chicago, Ill.
15. *The Story of Brick.* Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Sent free.
16. *A Manual of Face Brick Construction.* The history of brick making, types of face brick, showing details of construction for walls, chimneys and arches. Details of use of tile and brick construction and different types of bonds are given. A series of plans and elevations of small brick houses, descriptions, useful tables and suggestions are illustrated and described. Size 8½ x 11 in. 116 pp. Price $1.00.
17. *The Home of Beauty.* A booklet containing fifty prize designs for small brick houses submitted in national competition by architects. Texts by Aymar Embury II, Architect. Size 8 x 10 in. 72 pp. Price 50 cents.
18 *Architectural Details in Brickwork.* Three series of beautiful half-tone prints of brickwork detail, contained in closed folders suitable for standard vertical letter file. The three series contain 124 prints in all. Size 8½ x 11 in. Price $1.50 per set.

Common Brick Manufacturers' Association of America, 1309 Schofield Bldg., Cleveland, Ohio.
19. *Brick—How to Build and Estimate.* 3rd edition, 32nd thousand, a manual of solid brick and Ideal wall construction. Contains data on the strength of brickwork, on mortars, bonds and joints and equipment, and contains complete estimating tables for quantities of brick, mortar, material and approximate mechanics' time for various thicknesses and square foot areas of solid and Ideal wall. 8½ x 11 in. 72 pp. Price 25 cents.
20. *Brick for the Average Man's Home.* Book, 8½ x 11 in. 72 pp. Color plates. Book of plans for bungalows, houses and apartments for which working drawings are available. Price $1.00.

Fiske & Company, Boston, Mass.
245. Tapestry brick, other grades of front brick. Manufacturers of "Fisklock" Brick.

BUILDING CONSTRUCTION—See also Garage Construction
National Manufacturing Co., Sterling, Ill.
Truscon Steel Company, Youngstown, Ohio.
21. *Truscon Floortype Construction.* Form D-352. Contains complete data and illustrations of Floortype installations. 16 pp. Ill. 8½ x 11 in.
22. *Truscon Standard Buildings.* Form D-398. Describes Truscon Standard Steel Buildings, with diagrams, illustrations of installations, descriptive matter and list of users. 48 pp. Ill. 8½ x 11 in.
23. *Truscon Building Products.* Form D-376. Contains a brief description of each of the Truscon Products. 112 pp. Ill. 8½ x 11 in.
24. *Modern School Construction.* Form D-395. Contains illustrations of schools, with typical elevations, showing advantages of Truscon Products for this construction. 16 pp. Ill. 8½ x 11 in.

Better Business for Builders

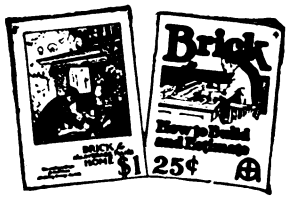
"The biggest thing in construction in years"—that's what many say of the Ideal All-Rolok Wall idea!

Most people want and admire brick homes. In the past the extra cost has forced them to be satisfied with frame.

Now you can offer them the beauty and permanence of brick—*at no greater cost.*

Why This Means Profit

People expect brick to cost more. You can ask and get better prices for your Ideal Wall homes. And still buyers will wonder how you can sell them so cheaply.



That builds reputation for you—reputation that will keep you busy when others think business is dead.

How Ideal Wall Saves

All the advantages of solid masonry, at a saving of ⅓ in cost. This reduction is realized by the saving of ⅓ in brick, ½ the mortar, ¼ the labor, and the saving in furring and lathing.

Any standard brick may be used. No special shapes required. The brick are laid on edge into walls 8, 12 or 16 inches thick. Ideal walls may be laid in any bond or pattern.

These Books Get Jobs

The Ideal Wall is thoroughly described in "Brick, How to Build and Estimate"—a 72-page manual of real information for contractors and builders. It contains 30 tables, 9 full page detail drawings and other information of great assistance in estimating costs quickly and accurately. Only 25 cents postpaid.

A wide variety of brick house designs is shown in our interesting book—"Brick for the Average Man's Home." Here you will find all kinds of homes illustrated and described, with much helpful information which will help you interest prospective home owners—thus helping you to land jobs. The nominal price of $1.00 is to cover printing and distribution costs only.

And you can get from us complete working drawings and specifications for any house shown in this book. These working drawings are complete, with many full size details of great value to you.

$1.25 brings both books. Address The Common Brick Industry of America, 2133 Cleveland Discount Building, Cleveland, O.

"I Have Tried it Out!"

FRANK C. KITSON · MECHANICAL ENGINEER · SAN FRANCISCO · CALIFORNIA

HOBART BUILDING

Oct 8th 1921.

The Common Brick Industry of America,
Cleveland, Ohio.

Gentlemen:-

The idea of the IDEAL wall is the finest thing that has come to lovers of brick construction in years. Now we can have our long wished for brickwork at the cost of frame construction.

I have tried it out thoroughly merely to satisfy myself and now that the trial is over, I am more of an enthusiast.

Have you some standard details that you recommend? I am particularly interested detail showing where the floor joists rest on walls for small two story dwellings.

Yours very truly,

FCK/CR

This Trade-Mark Stands for—

"Color Harmony"—*the Newest Opportunity in Floors*

"If you plan to build," we are saying to the public through the magazines which present this newly published book, "you should consider the color harmony of your floors as carefully as that of your walls or tapestries, drapes or furniture."

Thus we are arousing interest in a subject which will be discussed by the clients of architects, engineers, contractors, builders. The possibilities of color harmony are illustrated in this book by twelve photographic color reproductions, with reading matter which brings out the distinctions and differences between Maple, Beech and Birch for floors. It develops another usefulness of these woods, which have long held the record for wear because of their toughness of fibre and tightness of grain.

Are you prepared to discuss this subject with those who come to you? Your judgment will undoubtedly be sought by many, and those who have not already seen the book will appreciate your bringing this new opportunity before them. With this book you will have information as definite as actual samples of the waxed or varnished woods.

Let us send you a copy or copies of "Color Harmony in Floors." The book will be mailed you with our compliments if you write.

MAPLE FLOORING MANUFACTURERS ASSN.

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

"Everything burned but the Sheetrock"

KING LUMBER COMPANY

Kansas City, Mo.,
May 9, 1922

UNITED STATES GYPSUM CO.,
205 W. Monroe St.,
Chicago, Ill.

Gentlemen:

We recently suffered a fire loss which practically destroyed our entire plant, and it occurs to us that you will be interested in the fact that Sheetrock gave a wonderful example of its fire proof qualities.

On February 23rd we finished unloading a car of Sheetrock in our warehouse at 4:30 P. M. That evening fire broke out in an adjoining lumber shed and before fire apparatus arrived the yard was in flames. The warehouse containing the Sheetrock burned to the ground and all other merchandise in it was completely lost. But the Sheetrock was still in good shape.

This car of Sheetrock was subjected to the most intense heat imaginable—tons of water were poured on it, and now, two months later, we have salvaged and sold within 3200 feet of the full car. We have seen several jobs on which this very board was used, and after decoration had been applied, it was impossible to find any traces of fire.

Very truly yours,
KING LUMBER COMPANY
(Signed) Walter J. Wood, Secretary

The whole story of Sheetrock's fireproof nature is told in Mr. Wood's letter. Sheetrock won't burn because it is a rock product—not wood or pulp. To make sure of your customer's satisfaction use Sheetrock in new construction, alterations and repairs. It goes up fast and saves waiting for plaster to dry. Let us send you a sample of Sheetrock and a tested plan that is helping hundreds of builders get more Sheetrock jobs. Tear off and mail the attached coupon today!

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

U.S. SHEETROCK

Reg. U. S. Pat. Off.

The FIREPROOF WALLBOARD

UNITED STATES GYPSUM COMPANY, *General Offices:* Dept H, 205 W. Monroe St., Chicago, Ill.

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WATERPROOFING—See also Dampproofing
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
206. *Science and Practice of Integral Waterproofing.* Pocket size. 33 pp. Illustrated. Contains full specifications for waterproofing MASS Concrete, stucco and Cement Plaster Coat. Entire chapter devoted to "Practical Application of Waterproofed Cement Plaster Coat."
207. *Technical Pamphlet No.* 8. Booklet. 4 x 7 in. 28 pp. A discussion of why concrete requires waterproofing and the properties an integral waterproofing must possess to operate effectively with the natural properties of concrete.

WATER SUPPLY SYSTEM
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WEATHER STRIPS
Allmetal Weatherstrip Co., 126 West Kinzie Street, Chicago, Ill.
239. Six-page illustrated circular, describing the product as used for Hotels, Residences and Institutions.
Diamond Metal Weatherstrip Co., Columbus, Ohio.
242. 34-page illustrated catalog. 8½ x 11¼ in. Containing blue prints of the various styles and sizes of Weatherstrip.
Monarch Metal Products Co., 5020-26 Penrose Street, St. Louis, Mo.
210. *Cause and Effect.* A series of pamphlets describing Monarch Metal Weather Strips, which are made of bronze, brass and zinc. They differ from all other strips in that they are applied in spaces around doors and windows as elastic fillers and not over the space as covers. Each 4 pp. 8½ x 11 in.

WEATHER VANES
Danzer Metal Products, Hagerstown, Md.
E. G. Washburne & Co., 207 Fulton Street, New York, N. Y.
211. *Descriptive Catalog in Colors.* Showing two different designs of weather vanes, lightning rods, ventilators, etc.

WINDOWS—See Also Doors and Windows
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
280. BOCA steel sash. (E-22). A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.
Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.
Hope & Sons, Henry, 103 Park Avenue, New York.
212. *Catalog.* 12¼ x 8½ in. 30 pp. Illustrated. Full size details of outward and inward opening casements.

WINDOW CASEMENTS
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
281. BOCA steel sash. (E-22.) A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.

WINDOW HARDWARE
The Bridgeport Chain Co., Bridgeport, Conn.
266. *Interesting catalog* describing Sash Chains, Hooks and Sash Chain Attachments.
Casement Hardware Co., 250 Pelouze Bldg., Chicago, Ill.
The Kawneer Company, Niles, Mich.
213. *Kawneer Semplex Windows.* Catalog. 8½ x 10½ in. 16 pp. Illustrated. Complete information, with measured details, of Kawneer Simplex Weightless Reversible Window Fixtures, made of solid bronze. Shows installations in residences and buildings of all sorts.
214. *Detail Sheets and Installation Instructions.* Valuable for architects and builders.
Monarch Metal Products Co., 5020 Penrose Street, St. Louis, Mo.
282. 16-page illustrated catalog, 4 x 9 in., on Window Casements.
National Mfg. Co., Sterling, Ill.
Pullman Mfg. Co., Rochester, N. Y.
Samson Cordage Works, Boston, Mass.
Catalog. 3½ x 6¼ in. 24 pp. Illustrated. Covers complete line.
Sargent & Co., New Haven, Conn.
Stanley Works, New Britain, Conn.

WOODWORKING MACHINERY
American Saw Mill Machinery Co., Hackettstown, N. J.

Why Kellastone Is Weatherproof

THERE has long existed a belief that the water and weather resisting properties of stucco eventually deteriorate through chemical re-action after application. But this is not true of ***Kellastone,*** and it is conclusively proven in laboratory experiments and every day practice and in long immune ***Kellastone*** construction.

Kellastone is an all-mineral oxy-chloride cement of the highest quality. It contains no so-called water-proofing ingredients, depending solely on density to resist water. When exposed to weather, the oxy-chloride gradually transforms into a magnesium hydrate, with a basic magnesium carbonate both being resistant to moisture and the ravages of weather.

The weather resisting qualification of any stucco is dependent upon the quality of the oxy-chloride which in turn is governed, in character, by the quality of the calcined magnesite employed and by the exacting correctness of the calcining process. Thus, a truly high grade oxy-chloride cement or stucco, can only be produced through perfection of manufacturing details and the consistent control of all ingredients and processes.

The National Kellastone Company is distinctive in that it controls the production of its magnesite, and possesses highly efficient manufacturing facilities and maintains the most skillful and authoritative technical personnel in the industry.

KELLASTONE INTERIOR PLASTER is also a product of magnesite and oxy-chloride base, marvelously plastic, immune to internal shrinkage stresses, works easily and freely and is much lighter and more durable than lime or gypsum.

WE ARE REVISING OUR AGENCY LIST—CUTTING OUT THE NON-PRODUCERS OF BUSINESS. THIS LEAVES SOME WONDERFUL TERRITORY OPEN.

The Birth of a Weather Strip

To those of us of advanced years there comes to our mind the picture of our grandmother as she stuffed rags and papers in the cracks around the doors and windows to keep out the cold, and just as she had the cracks of the doors all nicely filled, in walks grandfather and all her work had to be done over again. This got monotonous, and so along came a clever genius with strips of wood to which was fastened a piece of felt or rubber which when first put on proved fairly good, but soon became worn and inefficient, to say nothing of being unsightly. However, for years they were applied every winter until a man out in Kansas conceived the idea that a piece of metal, so formed that it would fit snugly in a groove forming a wind stop, and at the same time allowing the windows to slide up and down was a better way. This invention took the place of the wood and rubber or felt device, and for years past has been used for the purpose intended. However, the discovery was made that windows warp and shrink and the metal weather strip, being a one-piece, rigid type, did not allow for the shrinking, swelling and warping of the windows, and when a cord broke or the sash had to be removed for any purpose, it was difficult to remove the Metal Strip to make repairs.

People put up with these conditions for years, and lots of them do to this day because they did not know of any way to overcome these defects. They found that when the swelling and warping occurred they could not raise their windows, they worked hard or could not be raised at all. Then one day a carpenter who, noticing these defects, studied out a way to overcome them. Thus was born the DIAMOND FLEXIBLE METAL WEATHER STRIP, so made that it would slide easy at all times, and allow for shrinking, warping and swelling and at the same time allow its removal (for repairs) quickly without damage to sash frame or strip. This was naturally a decided improvement over the rigid type of metal weather strip and immediately became very popular. This strip is made of pure commercial zinc, so it is rust proof, and when once installed will be there when the sash has rotted away. It not only is a permanent improvement, but its first cost is its only one and will make a saving of 20 to 40% in the fuel bills, as it eliminates the cold air from coming in as well as the dirt and storm, at the same time allowing you to control ventilation, as to the amount and when and where you want it. This decided improvement in Metal Weather Stripping is made exclusively by the DIAMOND METAL WEATHER STRIP CO. of COLUMBUS, O., and is sold only through the practical sales and installing agencies which have been established in all of the principal cities of this country. A complete line of strips are made to meet all kinds of window and door requirements and thousands of homes, public buildings, schools, office buildings and hospitals in all sections of U. S. and Canada have been equipped and are ready to testify as to their efficiency.

OHIO Repeats on Jaegers

Jaeger
A MIX A MINUTE

THOROUGH satisfaction with a product invariably brings repeat orders.

Several years ago Ohio standardized on Jaeger Mixers for her road work. After careful tests she found that this sturdy outfit handled her highway concrete work ***quicker, better and at less cost than any other make of*** mixer. And since that time, each year—in open competition with other mixers—Jaegers have always been chosen in Ohio.

This year, as before, competing with practically every standard make of mixer, Jaeger again was selected by the Buckeye Commissioners as the mixer for Ohio. They placed an initial order for 14 Jaeger Mixers.

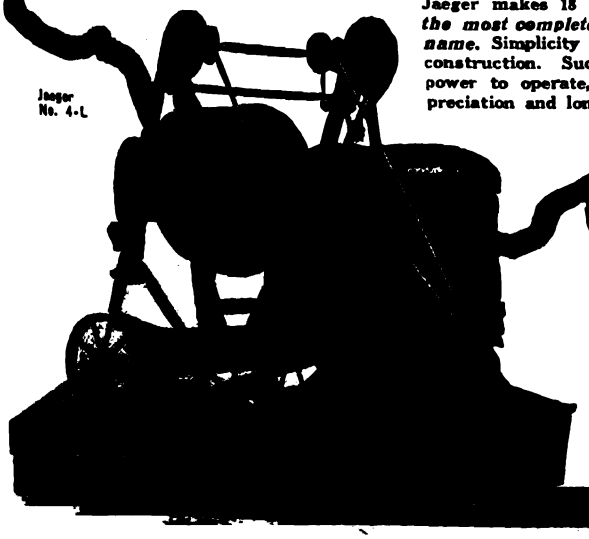
"JAEGER" Means Tilting Drum

There's coming to be a country-wide preference for the Jaeger "Mix a Minute" Mixer for road work. Especially for cold patching work is it admirably adapted. Its tilting drum discharges the sticky material as easily as it does the wettest concrete. In fact, a tilting drum mixer is ***the only practical mixer for cold patch work. It saves labor, saves material—does a better job.*** For quick, low-cost work on culverts, abutments and the like, it is unexcelled.

And this same tilting-drum feature is one of the big reasons why more than 13,500 building contractors prefer the Jaeger to any other mixer. On the largest skyscraper or the smallest sidewalk job this sturdy tilting-drum outfit will ***turn out the concrete faster and at lower cost*** than any other mixer in its class.

If you want a mixer that will work its way to profit on every concrete job you do—***you want a Jaeger.***

THE JAEGER MACHINE CO.



216 Dublin Ave. Columbus, Ohio

Jaeger No. 4-E

Jaeger makes 18 different mixer outfits—*the most complete line offered under one name.* Simplicity is the keynote of Jaeger construction. Such simplicity means less power to operate, small upkeep, low depreciation and long life.

Jaeger No. 4-L

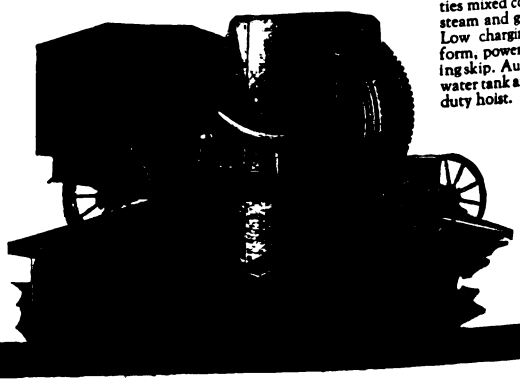
—yet it is within the price range for light mixers



THE Dandie is a light, easily portable mixer for concrete footings, culverts, floors, and has also proved suitable for mortar mixing.

It is a Koehring mixer—Koehring designed and constructed—and this means that dependability and long service life are the first considerations, not lowest price. No it is not the lowest priced mixer, but is well within the price range for light mixers, making it the greatest *value* in light mixer field. It sets a new standard of efficiency and value for light mixers. Big production, standardization in every part, and automatic shop equipment keeps the price down!

Send Today for Catalog D 4

Get the details of construction—the liberal drum dimensions—double gear drum drive—the drum roller construction—universal bearings, mixing action—the two side discharge control—trouble-proof power—dust-proof housing. Get these details and you will see why the Dandie offers a remarkable value. Write for catalog D 4 today.

4 and 7 cu. ft. capacities mixed concrete, steam and gasoline. Low charging platform, power charging skip. Automatic water tank and light duty hoist.

THE MEASURE OF QUALITY

THE old armorer was tempering and retempering the blade. His apprentice impatiently urged that it was already better tempered than most steel. "Yes," was the answer, "but no blade I make can be short of the best, for no one knows which blade may stand between man and death."

OUT from the Atlas Mills in a never-ending stream, millions each month, go bags of Atlas Portland Cement. Some destined for giant locks or bridges, some for the crowded city, some for the open country —no one can possibly foretell in the making where the finished cement will be used.

The Atlas Portland Cement Company has the same problem as that old time armorer—and there is only one answer. Every sack of cement that leaves an Atlas plant must be of quality unquestioned.

For over a quarter century Atlas Portland Cement has been tested in every type of modern construction. For over a quarter century it has been deservedly known as "the Standard by which all other makes are measured."

THE PLAN BOOK You've Been Waiting For!

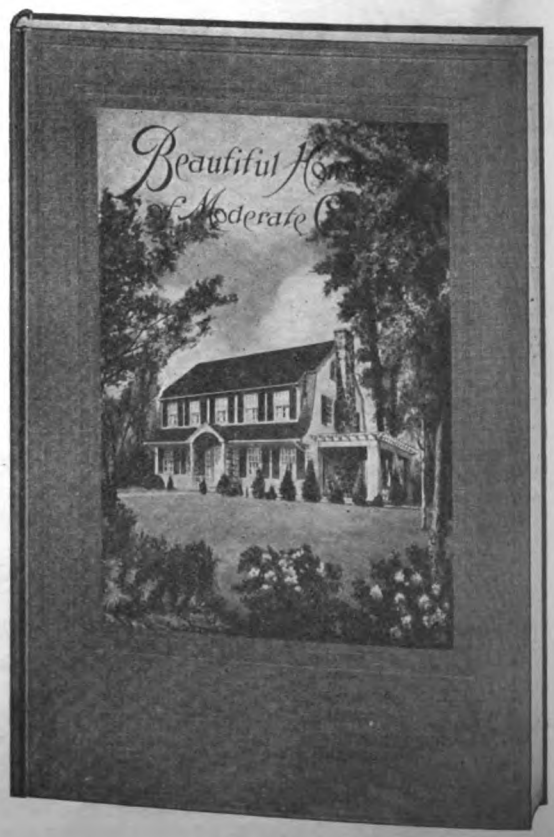
A book no builder or contractor can afford to be without

Here is a plan book which is entirely different from existing plan books. Every design, whether it is of the simple frame dwelling or the larger residence has been designed so as to secure beauty and convenience.

Builders and contractors can use "Beautiful Homes of Moderate Cost" **to create more business.** Just show this book to your prospects and let them pick out the home they like best. Every home illustrated in this book will be a credit to the community where it is built and to the builder.

The designs include bungalows, one-family and two-family houses; frame, brick, hollow tile, stone, stucco and combination of these materials.

Complete Blue Print Plans, ¼" Scale, and Specifications for each design are available at small cost.



The book also shows Garages, Pergolas, Garden Furniture, Gates and Fences, Kitchen Arrangements, desirable Built-in Features, and articles on Financing, Carrying Charges, Landscaping, Wiring, Furnishing, Decorating, House Building Materials, Roofing, Heating, Plumbing, etc.

A book of exceeding importance to every prospective home owner, and, consequently, just the book for every builder, draftsman, lumber dealer, real estate operator, and mortgage and building loan organizations.

Published to complete our service to the industry and so priced very nominally—$1.00 the copy, heavy paper covers; $1.50 in cloth covers.

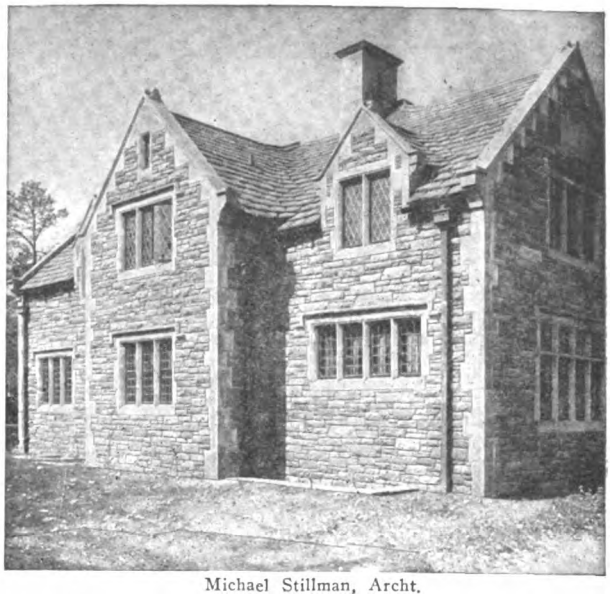
The VENDOR SLATE CO.

DARK and COLORFUL ROOF VALUES



THE color of weathering, the color of shadows, of texture, of atmosphere; subtle, dignified, yet color: all this is offered through a special study of the architectural possibilities of Pennsylvania slate made by the Vendor Company's Department of Architectural Slate.

Service is free including advice, approximate cost, etc. Drawings and the governing conditions, if any, are the only preliminaries. Let us work with you.

We design roofs and supply material of every kind and color from every slate district without preference.

On receipt of blueprints we will promptly describe an appropriate slate roofing (including its cost) based on our knowledge of available slates and how to work them. Such service is under professional direction. Have we also your address for our occasional literature on roofing slate?

Remember Today's Home Buyer Is Yesterday's Apartment Dweller

"And it has a Kernerator just like the one in our apartment," declares the housewife as she chalks up another point in favor of the house they are planning to buy.

In building houses today, to sell or to rent, don't forget that many of your prospects have lived in apartments. To be sure, they are looking for a yard, trees and a private laundry but they also want the conveniences to which they have become accustomed. And the house that is Kernerator-equipped has a big advantage.

Each day this modern system for disposing of household waste saves time and steps. There is no accumulation of garbage in the kitchen or of inflammable refuse in basement or attic. Thus the Kernerator is more than a convenience—it also promotes health and lowers the fire hazard.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse — rags, sweepings, wilted flowers, broken crockery, tin cans, garbage. Non-combustibles are dried and sterilized and later dropped into the ash pit. It costs nothing to operate because no commercial fuel is required. The Kernerator should be specified in the plans before construction begins.

Write for our interesting literature, giving complete information regarding the Kernerator. Also see page 1906, *Sweet's* 1921 *Catalog.*

When You Build a Home
Start Right

Compare the daylight area of a Truscon Steel Basement window with a wood window of the same size and you will find there is a gain of 50% to 80%, depending upon the size of the window. This is one reason why home-builders are using them to build daylight into their cellars.

Truscon Steel Basement Windows won't stick or warp. They are always easy to open and close; they lock automatically. Double contact weathering effectively keeps out wind, rain and snow. They are easy to install.

In making comparisons remember that Truscon Basement Windows come complete with the Sash accurately fitted to the frame and heavy hinges and lock attached.

Building supply and hardware dealers practically everywhere carry Truscon Steel Basement Windows in stock for immediate delivery. If your dealer does not handle them send us his name and ask for complete information.

You will find this name on every window

Groton High School.
Groton, N. Y.

C. W. Clark, Architect,
Cortland, N. Y.

Kelsey Health Heat For School Buildings

The new Groton High School, as well as the old High School just in the rear, are equipped with batteries of Kelsey Warm Air Generators, with forced or blower circulation. They meet the requirements of the New York State law, regarding heat and ventilation, the two batteries of four heaters each supplying 34,000 cubic feet of fresh warm air per minute.

An exhaustive test of different heating methods was made by the architect and officials of the Board of Education, and the Kelsey Warm Air Generator was selected on the following points:

1. Adequate heating capacity under all weather conditions. Large volumes of warm (not hot) air delivered at high velocity to all parts of the building, at uniform temperature.
2. Exactly the right amount of moisture, automatically controlled by the Humidifier.
3. The removal of vitiated air through specially designed vents at the floor line.
4. Remarkable showing in fuel economy.
5. Exceptional durability, proved by long service in public buildings.
6. The plan of installation of the Kelsey system, giving great flexibility of control.

Our Engineering Department will furnish detailed plans and specifications, insuring satisfactory installation.

Send for pamphlet, "Pulls School Coal Bills Down" and any other information you desire.

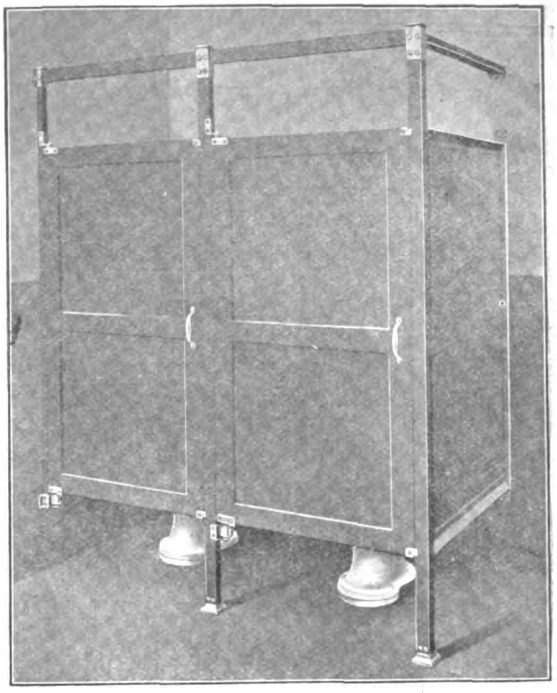
Are
Replacing
Wood, Marble
and Slate

More enduring than wood, and more sanitary, because they do not absorb odors.

Cheaper and better than marble or slate, because they do not flake or break; being of lighter weight, shipping cost is less; and they can be set in a fraction of the time it takes to set marble or slate, therefore saving much on labor cost.

Made with or without doors. Doors when desired can be hung on the right hand or left hand uprights.

Removable backs make access to piping easy.



Details are shown in the drawings and specifications which we'll gladly furnish—write!

DAYLIGHT INCREASES
The Value of Every Building

Daylight costs nothing—yet it is the greatest improver of store interiors. Daylight makes merchandising easier, faster—more satisfactory. Every store building planned should have its interior daylighted by—

3 WAY-LUXFER PRISM TRANSOMS

the only satisfactory way to project daylight

Built up of 4-inch Prism Tile of Lazalite Glass, that does not turn pink or purple, these transom panels improve both the interior and exterior of the store.

Be sure—in order to get full adylight value—to specify and order 3 Way-Luxfer Prisms

Herringbone spans 16 inches and therefore is particularly adaptable for the regulation frame building.

The Ceiling Danger

If you build for permanence and beauty, be sure to use a metal lath on your living room ceiling, and thus eliminate the danger of cracked plaster.

Consider also the fire risk. Protect the ceiling and you protect the floor. This is particularly important over the furnace room. "Herringbone"—designed to span regulation sixteen inch joist spacing—is ideal for this use.

The increase in cost is but a small fraction of the increase in value.

Send for illustrated literature

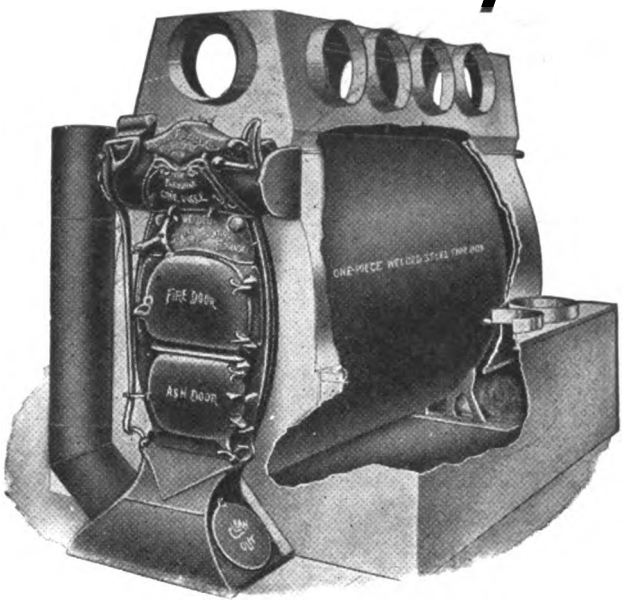
Digitized by Google

JERSEY CITY, N. J., July 23.—After taking some friends for a ride today, Arthur M. Welsh drove his automobile into the garage, closed the door, climbed into the tonneau and fell asleep, the engine still running. Four hours later he was found dead.

Physicians attributed his death to carbon monoxide poisoning.

FarQuar Facts —and What They Mean



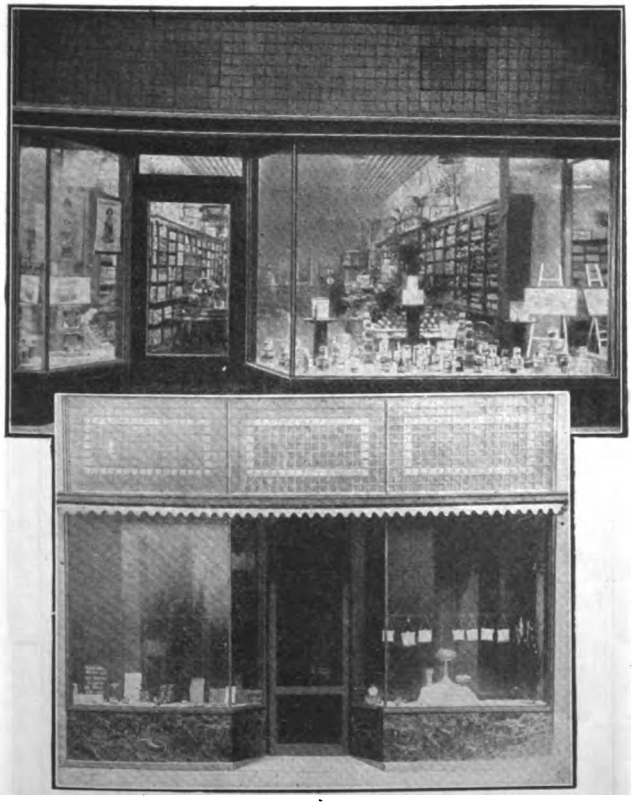
Carbon monoxide gas,—a product of combustion,—is equally as dangerous when generated by the furnace as when it comes from the automobile. Protection from poisonous gases should be a first consideration in the installation of a heating plant. When a furnace leaks at the joints or is made porous from heat, it is dangerous,—unfit for use.

Positive protection against fire poisons is a distinctive feature of

THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM

The fire-box is made of Keystone Copper Steel, electrically welded by a special process into one piece, without seams or joints, making gas leakage impossible.

Other important features are:—the large grate area, insuring slow combustion and fuel economy; the automatic control, actuated by the fire-box itself, which positively protects against over-heat and its consequent dangers and makes necessary only one firing every twenty-four hours; the FarQuar Vent and Return System, which insures a uniform distribution of heat to all rooms, regardless of weather, and provides a constant supply of pure, fresh air, gently warmed to the proper temperature.



Why FarQuar Results Pay

When you sell the FarQuar System your customers get healthful heat of the proper temperature, volume and velocity, at a minimum fuel cost. Although never a "price" job, it is remarkably practical and efficient, thereby making it extremely economical, accomplishing results entirely impossible with any other method of heating.

These facts—easily proven—explain why FarQuar Dealers enjoy an exclusive advantage. Write today for attractive Dealer Proposition.

OAK FLOORS
(For Everlasting Economy)

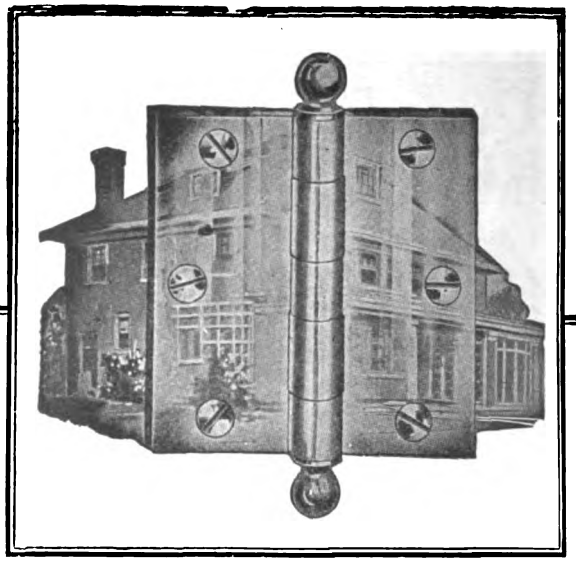
The Georgian Terrace Apartments
Atlanta, Ga. *Oak Floors*

Builders Are Educating the Public

An owner putting up his first building may not fully appreciate his Oak Floors the day his building is turned over. But a few years teach him their constantly increasing worth to him.

The average real estate value of Oak Floors over other floors is conservatively estimated at 25%. When the owner comes to sell or lease his building he finds that the Oak Floors you recommended mean just so many extra thousands of dollars in his pocket.

So that besides their general advantages of beauty, cleanliness and durability Oak Floors offer the owner an investment as good as a bond.



And builders, by enlightening the public to the truth about Oak Floors, are bringing about an era of better floors in all types of buildings, from cottage to coliseum.

Our three free booklets, in colors, contain much accurate and valuable information for your office files. Mailed free to builders and contractors upon request.

For general specifications, see Sweet's Architectural Catalogue and The Modern Hospital Year Book.

NORMAN, OKLAHOMA

Victor L. Phillips Company,
Oklahoma City, Oklahoma.

Norman, Oklahoma,
May 29th, 1922.

Dear Sir:-

Attention Mr. W. R. Wilson.

We believe that we have established a record in pouring Curb, on our Norman Oklahoma Job, with a Wonder 7 Mixer.

On May 17th, we poured and finished 2,666 feet of curb in 8 hours with your machine, using 36 men. We also have poured over 60,000 feet of curb on this job to date, with an average of 1,800 feet per day and have experienced no delay on account of Mixer trouble.

Being especially pleased in the way this Mixer handles both our base material, which is dry, and the top coat, which is wet, with no loss of time, we take this opportunity to state that we are glad to say a good kindly word at any time for the Wonder 7 Mixer.

Yours very truly,

M. R. Amerman, Paving Contractor.

Level and Plumb With Your Own Instrument

$5.00

BRINGS IT TO YOU

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

KNAPE & VOGT Garment Carriers

FOR THE CLOSETS OF MODERN HOMES

KNAPE & VOGT Garment Carriers are made in all lengths from 12 to 60 inches. They will fit any and all closets in old homes and transform disorderly clothes racks into modern garment cases.

In new homes—or homes about to be built, as much as 15 per cent in construction costs is saved when Knape & Vogt Garment Carriers are planned for in advance, because this modern system permits smaller, space-saving closets, which reduce the over-all dimensions of the building without reducing the size of the rooms. And yet these smaller closets will hold more clothing, create order, cleanliness and lengthen the life of the garments. Architects and builders who do not know the Knape & Vogt Garment Carrier System are not giving their clients the benefit of the latest developments in home conveniences.

Write for prices and details of simple installation.

Get This FREE Pamphlet!

Practical information on the most popular home improvement—

Fenestra Steel Basement Windows

Mail This Coupon Now!

Detroit Steel Products Company
2385 E. Grand Blvd. Detroit, Mich.

Gentlemen:
Kindly send me a copy of "The Hows and Whys of Fenestra Steel Basement Windows". This incurs no obligation on my part.

Name.....

Address.....*City*.....

Do you know how much easier it is to install a Fenestra Steel Basement Window than an ordinary wood basement window?

Send for a copy of the pamphlet illustrated above, and learn how you can save time, labor, and money on each installation.

Find out how you can use these new steel windows in any type of basement construction —brick, concrete block, brick veneer, poured concrete, tile, or field stone.

See for yourself the advantages of using a window that comes complete—sash fitted and hung, hardware in place, and the priming coat of paint applied at the factory.

Home owners have been waiting for a *steel* window. The durability, strength, and trimness of steel is recognized. And when you can install a steel window for no greater cost than an ordinary wood window, there is no question about the choice between the two.

Thousands of these windows have been installed. They are now a standard basement window installation. You will want to use them in the next house you build.

Don't wait until one of your customers asks you to put in Fenestra Steel Basement Windows. Get this pamphlet today and be familiar with the simple methods of installation. This places you under no obligation, whatsoever.

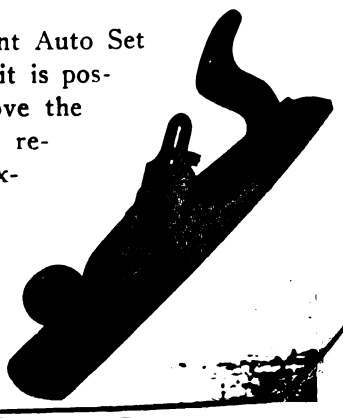
SARGENT



Use the Sargent Auto-Set Bench Plane

You will find it all you can ask in a plane—and more than you've found before. It is handy—you can remove the cutter for whetting and replace it in exactly the same position without readjustment. The cutter is thin —making sharpening easier and preventing chatter, even in the toughest, hardest wood. The clasp and cap are in one part. Adjustment for coarse or fine cuts is simple, quick and positive. There is plenty of handle room. Made in six sizes. Send for the Sargent Book of Planes. It describes the Auto-Set and other Sargent Planes.

SARGENT & COMPANY
53 Water Street New Haven, Conn.

In the Sargent Auto Set Bench Plane it is possible to remove the cutter and to replace it in exactly the same position.

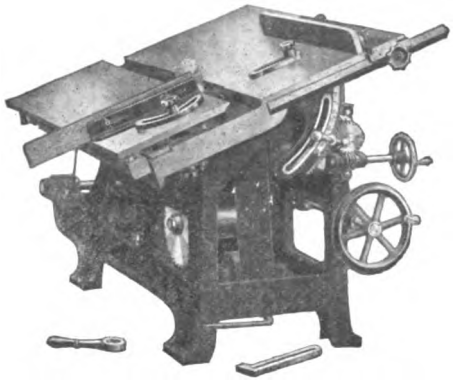
A Huther Brothers Dado Head Insures The Lower Production Cost Necessary for Reduced Prices

Huther Bros. Dado Head

Huther Brothers Dado Head possesses advantages unknown to similar types of saws. There are two reasons for this: First, because we were the patentees of this type of saw. Second, because the full knowledge gained from fifty years' experience in manufacturing saws is applied to the manufacture of every one.

A Huther Dado Head will greatly simplify intricate cutting and grooving. It consists of two outside cutters and as many inside cutters as required. Cutters may be used singly or in pairs.



Huther Bros. Hollow Ground Saw

Huther Brothers Dado Head is sold under an ironclad guarantee. We will cheerfully send one on approval to any responsible party. If not satisfactory in every respect it may be returned at our expense.

Write for illustrated catalogue showing complete line of Huther Brothers Saws.

What Customers Ask *About Wall Board*

Does it take any decoration? Compo-Board does. It takes any of the popular coverings—wall paper, burlap, canvas; or it may be painted or kalsomined.

Does it require panels? Compo-Board does not. **Compo-Board Filler** is especially prepared to fill the joints and nail heads.

Does it keep out the dampness? Compo-Board is practically impervious to moisture, and its wood core makes it one of the best insulators known against heat and cold.

Will it crack or warp? Compo-Board will not crack, crumble, shrink, warp or buckle.

CompoBoard
Trade Mark
The Wood Core Wall Board

is the only wall board that has ALL of these advantages.

Clinton Mortar Colors used in this attractive residence at Elkhart, Ind.

Houses that are Homes—

Any house sells twice as fast if it looks "homelike." Clinton Mortar Colors make little cottages or big mansions harmonious and inviting. They are inexpensive, but so effective that they add many times their price to the value of the property.
Ask the nearest dealer who carries Clinton Mortar Colors. Write us for full information.

THE CLINTON METALLIC PAINT CO., Clinton, N.

Clinton Mortar Colors

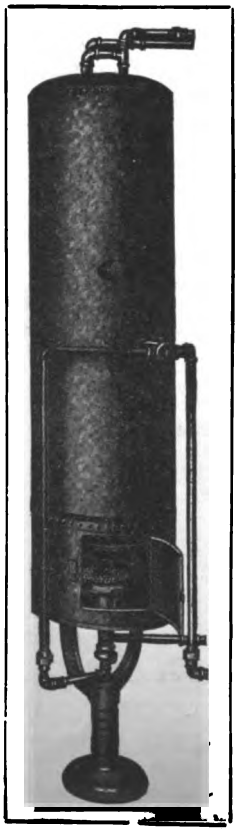
Nature's Permanent Colors *Made Since 1887*

The **FIRMNESS, DURABILITY** and **ATTRACTIVENESS** of **AMERICAN BRAND SCREEN WIRE CLOTH** will appeal at once to the architect, home builder, or screen manufacturer who desires to give maximum Fly Screen satisfaction.

AMERICAN BRONZE: This grade is made of best hard drawn wire 90% copper, 10% non-corrosive alloy, principally zinc. **BRONZE** should last as long as the house in most sections.

Avoid copper substitutes as these are too soft.

GALVANOID: This grade is heavily electro - zincked **after** weaving, then varnished. It is the recognized leader in its field—the **best** grade of zincked cloth made.



We also make
PAINTED, GALVANIZED, COPPER, KOPNIK, MONEL
and many special grades of wire cloth. Samples and descriptive literature sent upon application.

Order from your Hardware Jobber or Dealer. If he cannot furnish, advise us, and we will see that you are supplied.

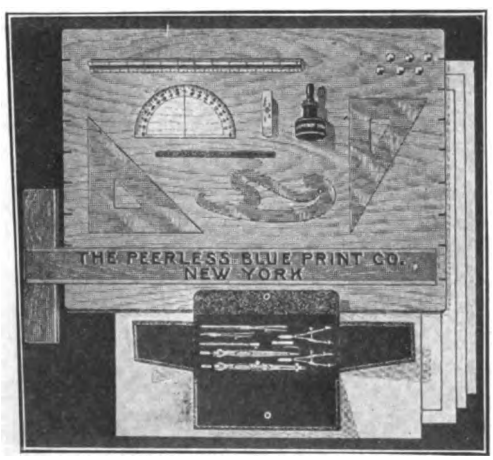
Smoky Fireplaces

The installation of an Apex Throat Damper with smoke chamber lining, will positively produce a clear burning fireplace, without smoke trouble at all times; if the chimney is (8 inches by 16 inches), and carried well above roof peaks.



A throat damper is no prevention against a smoky fireplace; a smoke chamber is. We are doing our part. Do yours! If you can afford a fireplace, you can afford to install a proper smoke-eliminating device, or better not build a fireplace at all.

Get the mechanism blueprint and find out about the most ingenious device ever created in the fireplace line. Simple! Effective! Perfect! Designed by a successful fireplace builder.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

280 Madison Avenue, New York
[Cor. 40th Street]

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

EDWARDS

Embossed Metal Ceilings and Side Walls

Are Sanitary, Durable, Fire-proof, Germ-proof. Made from sheets of specially prepared steel and stamped into ornamental designs. Each plate re-squared after stamping; easily erected by any mechanic.

Can be applied on new or old buildings; no danger from falling plaster, no re-papering necessary.

Send us a rough sketch of rooms showing all off-sets, etc., and we will prepare, without any charge, a drawing showing how the ceiling will look when erected, and forward same together with a lump price for materials delivered f. o. b. your railroad station.

Our large Catalog showing our complete line of Ceilings and Walls sent free on request.

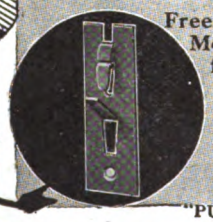
New Tape Hook Makes Pullman Sash Balance



The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

Cardboard Model No. 102

Show Your Customers Models as Well as Plans and They Are Sure to Build

People like to know what their homes are going to look like before they build. Show them models as well as plans and you make easy sales of your contracting or building services.

The plan book, "Small Homes of Character," contains 50 examples of 4-, 5-, 6- and 7-room houses. Plans, specifications and bill of material are available for each house built of frame, brick or stucco. We furnish a cardboard model for each house, scale ⅛" to the foot, done in colors to show attractive color combinations. The models can be obtained without buying the rest of the service.

Use our plan service to get business and our plans to build from.

Send only $1.00 for the book, "Small Homes of Character," and make a start toward increased business.

Contractor-Agents Wanted

YOU MAY BE FOLLOWING a trade already or perhaps looking for a new one. Whichever it may be, install Allmetal Weatherstrip and have a real income.

We have a proposition to offer good live men that will put them on the road to success—$5,000 per year income is common among weatherstrip men.

Buildings are well under way now. They will soon be ready for the weatherstrip contractor. Just as soon as you get the new ones equipped, start after the old ones. Owners of old buildings are easy to sell. They are tired of big coal bills, draughty windows, dirty floors, etc.

It costs you nothing to enter the Weatherstrip business. We co-operate with you to land sales.

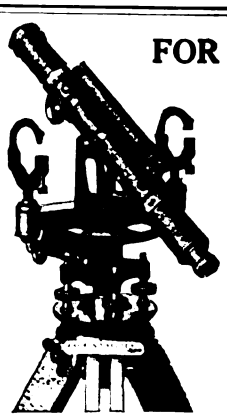
CALDWELL SASH BALANCES
HAVE STOOD THE TEST OF TIME
UNIFORM MORTISES

Patent Pending

For use in all classes of new work
Box frames unnecessary

Mortises cut at mill reduce cost of installing. They counterbalance sashes at any given point and outwear ordinary weights and cords. Unaffected by atmospheric conditions.



Cheapest method for modernizing old windows, as alterations in sashes and frames are not necessary. Sashes should be weighed before ordering.

A Better Mortise Easier and Quicker

Make a smooth, clean-cut job in any kind of wood; hard, soft, knotty, cross-grained or end wood; through dowel pins or panel ends with perfect ease. A perfect mortise with straight sides and uniform depth—and made ten times faster than by ordinary method. Specially adapted for use on doors, sashes, screens, cabinet work, etc.

The Champion Mortiser

easily makes 100 perfect mortises per day without the use of brace and bit or chisel. Quickly adjusted from round hole to 6¼ in. slot. Accurate and automatically regulated. Has 3 speeds for working in different woods. Simple to operate. Any workman can cut 100 mortises per day. Uses ¼ in., ⅜ in., ½ in., ⅝ in., and ¾ in. bits; special sizes up to 1¼ in.

Fully guaranteed. You take no risk. Money back if not satisfied, after 10 days' trial. Price includes any two bits. Additional bits $1.50 each. Send today.

Price $35.00

Colgan Machinery & Supply Co.
Dept. B-9, 801 Hayden Bldg.
Columbus, Ohio

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

BE A FLOOR SURFACING CONTRACTOR

MAKE $5,000 to $15,000 OR MORE—YEARLY

New, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

BUILDING CONTINUES OVER U. S.

Building is booming all over the country. There are innumerable opportunities for those equipped to handle work of floor surfacing. The American Universal Machine is essential to hustlers. Get in on the ground floor—get the machine now. It will earn more than the original investment in this busy season.

Resurfacing Old Floors

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need resurfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect.

Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.

21 Years without Repairs

~ Plumrite Record at the St Regis

Piece of pipe referred to in the accompanying letter. Note full threads and full thickness of the wall throughout the length. Also the softness of the pipe as evidenced by the crushing of the sides with the pipe tongs when removing it. The roughness on the inner surface is a slight scale formation and not corrosion.

CABLE ADDRESS "SAINTREGIS NEW YORK"

Hotel St. Regis
Fifth Avenue and Fifty-fifth Street

New York March 27, 1922

Bridgeport Brass Company
Bridgeport
Conn

Gentlemen:

This is to confirm that I have given today to Mr. William H. Spelman a piece of original brass pipe put in by him 21 years ago, as contractor of the plumbing work in the St. Regis Hotel. This pipe was removed as part of an alteration on the thirteenth floor. Up to the present time we have had no trouble with the original installation. No repairs have been made.

Very truly yours,

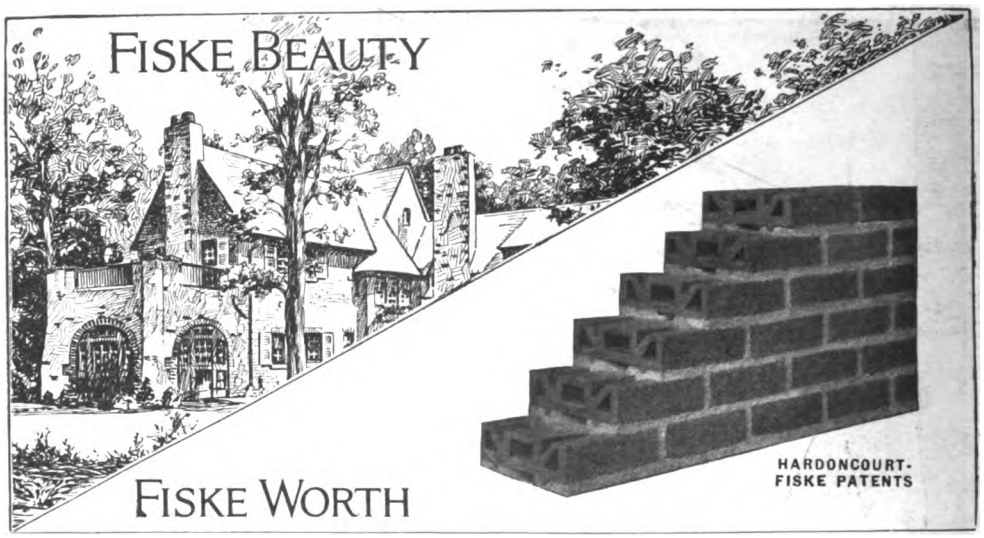
"Bridgeport" BRASS CO. TRADE MARK

When you specify Plumrite, it means more than calling for so many pounds of brass pipe. It means that you have provided for a constant water supply as long as the building stands—that a system has been installed which can be forgotten insofar as repairs are concerned.

One of the many cases substantiating this point is that of the St. Regis hotel in which Plumrite Brass Pipe was installed for all water lines. That was 21 years ago and, as indicated by the manager's letter, "No repairs have been made."

The picture of the pipe shown is part of the one referred to in the letter. There is no evidence of corrosion; pipe threads are sharp and clean and the pipe body, tough but yielding—that is Plumrite even after 21 years of service.

BRIDGEPORT BRASS COMPANY, Bridgeport, Conn.



Bridgeport Plumrite The Improved Brass Pipe

If you are at all interested in the subject of water service piping, we shall be glad to send you, when issued, a copy of our book, "Brass Pipe and Piping." It deals with corrosion, its theory and prevention; discusses the advantages and disadvantages of the various pipe metals; and gives instructions for handling brass pipe, laying out installations and figuring costs. Copies will be supplied gratis on request—use this coupon.

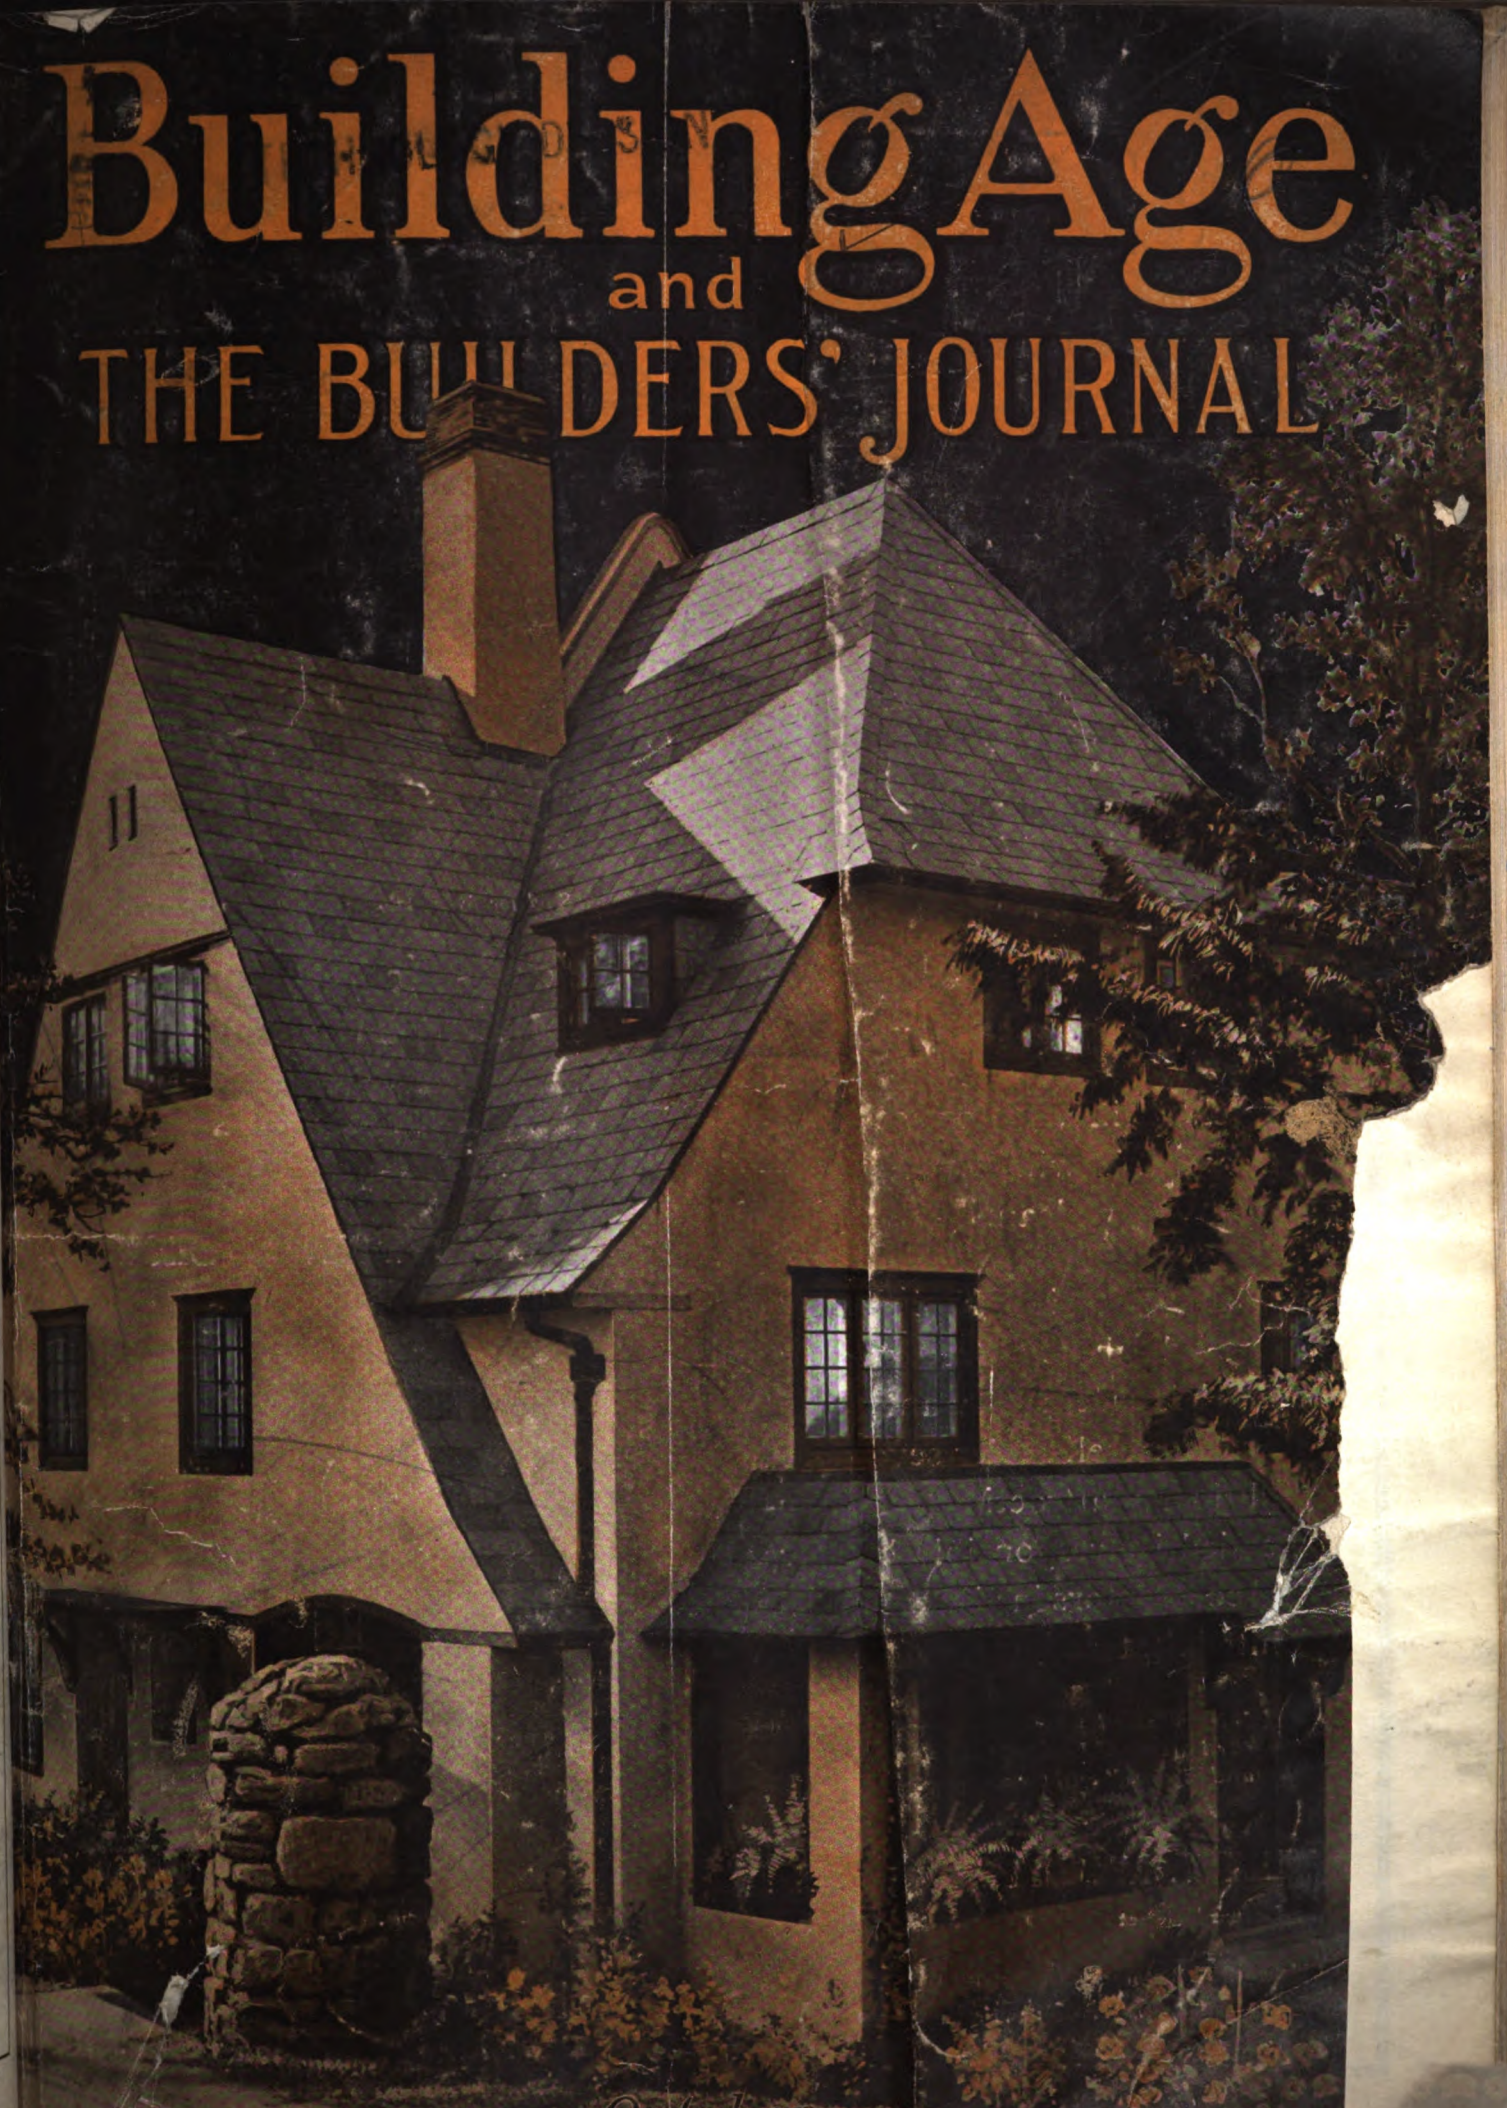
Fiske Beauty and Fiske Worth for New Homes of Brick

OWNERS rejoice the more in the outward beauty of homes of brick if they also have inner worth.

The charm of homes built of "Fisklock" Brick in the rich blends of color made famous for nearly a generation by Fiske & Company under their trademark "Tapestry," is enhanced by the comfort, health and economy of such homes.

Air, imprisoned in the walls in "Fisklock" construction, is the source of these advantages. Walls thoroughly insulated by means of a multitude of cells insure a dry, warm house, while the double depth of this lighter brick permits rapid and therefore comparatively cheap building.



A "Fisklock" brick house, maintenance considered, is the most inexpensive, as well as the most beautiful type of construction for homes.

FIRST FLOOR

Five Room Bungalow No. 628

SECOND FLOOR

Designed for the Service Department of The American Face Brick Association

177 Designs for Face Brick Homes

Complete Working Drawings and Masonry Material Surveys available for each design.

THE number of jobs a contractor secures, and his profits, depend very largely on the worth of the house designs—"the samples"—he can show. Considered from the standpoint of architectural correctness, convenience of arrangement, and their adaptability in size and cost to purchaser's requirements, the contractor will never find a better selection of plans than is incorporated in the following books.

Bungalow and Small House Plans: A set of four booklets presenting ninety-two attractive face brick houses in interesting, diversified architectural styles, ranging in size from three to eight rooms. Booklet B-1 contains 14 three and four-room designs; B-2—30 five-room designs; B-3—30 six-room designs; and B-4—22 seven and eight-room designs. Single booklets are 25c, the set of four is $1.00.

The Home of Beauty: A 72-page book showing the fifty best designs for small six-room houses submitted in a country-wide architectural competition. These designs are by the best architects for small house work in the country. These homes will be a lasting credit to owner and contractor. Price, 50c per copy.

Manual of Face Brick Construction: This 116-page book contains thirty-one attractive house designs by Dean & Dean, well-known house architects. The varied designs afford a fine selection. This manual, as the name indicates, gives complete technical information on brick construction. Price, $1.00 a copy.

You can order these books of plans separately or you can secure the entire series for $2.00. Address Dept. B. 10.

Get This Sample Shingle

A Winthrop Tapered Asphalt Shingle will be sent you on request. See this shingle before you decide on any roofing material.

As soon as you handle a Winthrop you will recognize it as a superior asphalt shingle. The "quality feel" of a Winthrop is the best indication of its ability to combat the elements, to "stay put," and to last for years.

The big butt, formed by the taper gives thickness where thickness is needed to make a roof that will be temperature, storm and fire resisting.

Send for a sample shingle and full details of our liberal dealer proposition.

Window Glass Grading Depends on Standards

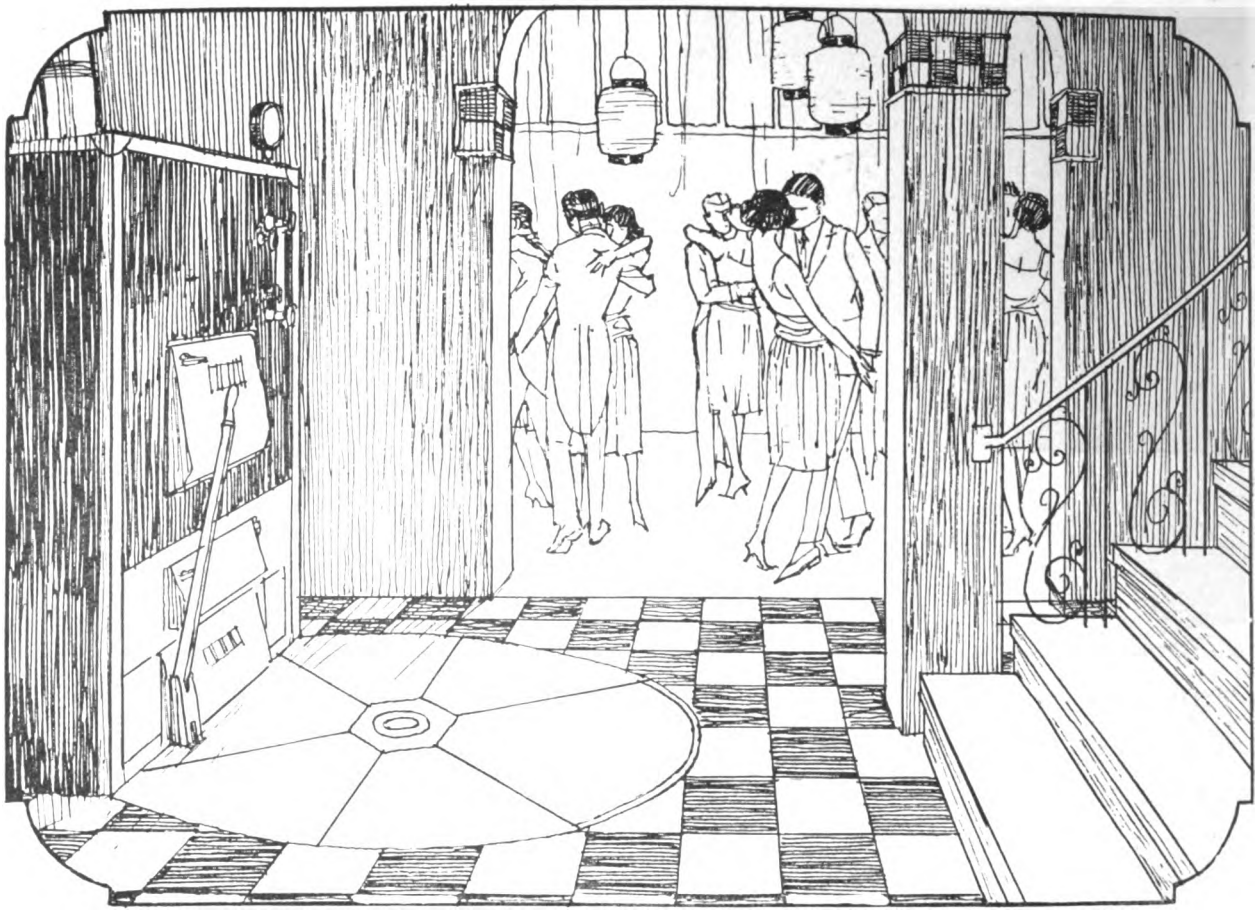
FIRST, second and third quality are relative terms which depend on the standards used in grading.

The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

Keep Out Wintery Winds

PROTECT the home against the searching winds of winter; frost does not form on windows fitted with storm sash. The double panes keep the cold out and the heat in, and quickly pay for themselves in the saving of fuel.



Storm sash can be installed to match the windows of your house, and clear vision as well as comfort is assured if you make sure that the finest glass obtainable is used.

THE CELLAR
Without Ashes or Cans

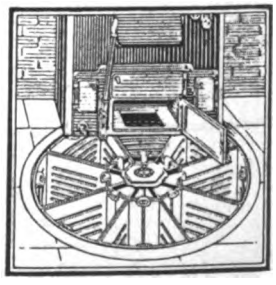
SEE OUR CATALOGUE IN SWEETS

Nowadays with homes so thoughtfully planned and artistically decorated, careful planning, even in the basement, is important.

First, with a view to making it attractive and useful.

Second, to eliminate that most unpleasant of household tasks—shovelling dirty, dusty ashes.

The Sharp Rotary Ash Receiver



is fulfilling its purpose today in thousands of homes, where it keeps the basement dust-free, clean and useful.

Many architects and builders who have installed this practical device in their own homes, and know what it means to have the ashes always out of sight, and never to lift a shovelful, regard it as the best piece of equipment in their homes.

There's nothing complicated about the device. It's easily and quickly installed with any size or style heater. Once installed it's permanent. It is built with five, eight or twelve cans, mounted on a revolving steel frame, in a concrete pit beneath the heater. One can is always under the ash pit.

Contractors and Builders: Send for Specification book, prices and discounts.

The Cellar as clean as The rest of the house

The Sharp Rotary Ash Receiver consists of a set of five, eight or twelve cans mounted on a revolving steel frame, installed in a concrete pit, under the ash pit of any size or style heating plant. There's nothing to get out of order.

SHARP ROTARY ASH RECEIVER CORPORATION

217 Bridge Street **Springfield, Mass.**

Patented design of Hexagon slab automatically determines exact location and weather exposure to each shingle. Can't go wrong in laying.

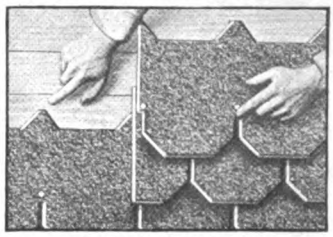
Each Hexagon slab must lie evenly and tightly against the one next. Regular and even design—always.

A mighty good job—right over the old roof

MANY dealers have developed a profitable business in Hexagon Slabs for this use alone. Right over the old wooden shingles, Hexagon will give a flat, even-lying surface—one that's double thick at every point.

Hexagon Slabs are automatic spacing. They can't be incorrectly applied. There is always a double butt exposure that casts a heavy shadow. This adds to the attractiveness of the distinctive hexagonal tile pattern.

Hexagon is of the highest possible quality. It is one of three great and exclusive Vulcanite Roofing Specialties. The other two are Vulcanite Doubletite and the Vulcanite Self-Spacing Shingle shown at the right.



These popular leaders are backed by a line that gives any dealer *a better roofing for every possible need*—shingles, rolls, ornamental effects and built-up roofings for every conceivable use. Also roofing cement and roofing paint.

And consider this: No matter where you are located, we can assure *quick delivery and low freight rates.* Our warehouses blanket the country. Factories at Albany, N. Y.; Anderson, Ind.; Chicago and Kansas City. You know what that means.

If you desire, we will send one of our large force of roofing experts to explain the Vulcanite line and proposition in detail. Also, we will gladly furnish you with full-sized samples of any Vulcanite roofing. Communicate with our nearest office.

VULCANITE ROOFING DIVISION
The Beaver Products Company, Inc.
Administration Offices, Buffalo, N. Y.
District Sales Offices: Albany, N. Y.; Cincinnati, Ohio; Chicago, Ill.; and Kansas City, Mo.

Two Other Vulcanite Patented Shingles

Vulcanite Doubletite
Patented triangle projection on each slab underlies slots in second course above, giving double thick roof at all points. Handsome—won't curl—automatically spaced. The widest, heaviest and best medium-priced 4-in-1 shingle made.

Vulcanite Self-Spacing Shingle
Laid according to instructions, Self-Spacing Shingles build a roof with three thicknesses everywhere, except at slot. Each shingle fits snugly against shoulder of next one. Rain and snow can't drive into roof boards.

"Bridgeport"

Avoid this by specifying Plumrite in the beginning

This picture illustrates what can and does happen regularly when brass is second thought. The investment of a few hundred dollars extra in the beginning to install Plumrite would have saved thousands. In addition there would have been no torn-up building.

The building in the picture was erected 17 years ago. Now the original water supply pipe is being replaced by Plumrite—and the total replacement cost estimated at $12,000, while the original use of Plumrite brass pipe instead of wrought iron would have involved an extra cost of only $647.

It is remarkable that where original piping installations have failed, almost invariably brass is specified for the replacements. And Plumrite, because of the improved methods used in its manufacture, offers more than the usual "brass pipe."

BRIDGEPORT BRASS COMPANY, Bridgeport, Conn.

Bridgeport Plumrite The Improved Brass Pipe

2334

If you are at all interested in the subject of water service piping, we shall be glad to send you, as soon as it is off the press, a copy of our book, "Brass Pipe and Piping." It deals with corrosion, its theory and prevention; discusses the advantages and disadvantages of the various pipe metals; and gives instructions for handling brass pipe, laying out installations and figuring costs. Copies are gratis on request—use this coupon.

Smith: His Roof

Smith is that kind of a man about everything. When he gets through doing something, he wants it to be a monument to his good taste, good sense, open-mindedness, shrewd purchasing ability.

He isn't one of those know-it-all gents, exactly, but he has enough mental restlessness to make him a poor pal for people whose first objection always is "It's never been done." Smith once told a man that said that to him, "You'd be one of those that sent Daguerre to the insane asylum for saying he could print people's faces on tin."

When Smith was talking roofs with the architect he had selected to build his new house, the architect wanted to use colored slate or stained split shingles. Smith wanted zinc.

The architect couldn't see it at first. He never had used zinc shingles. He'd heard about them. Thought they were good for some things—unequalled wear, favorable first cost, absolutely no up-keep, fire, water, and lightning proof, wouldn't warp, rot, crack, split, etc., but—

"Well," said Smith, "but—in the name of But—but what?"

"They," said the architect, "they are not artistic."

And then Smith said something no owner should say to his architect, (but who doesn't?): "How do you know? Let's see. I like all I know about zinc, and all you've said about it simply confirms my opinion."

So they looked, and when they saw how, through ingenious designing, this perfect material had been made into a shingle with a butt end just like a heavy slate, and how all the peculiarities of zinc's qualities had been provided for and capitalized, Smith had his way and got an Illinois Zinc Shingle Roof that he is proud of.

And fifty or a hundred years from now, if you are still around and the rest of Smith's house is still standing, there you'll see sure enough, Smith's roof as good as the day it was laid, and as good looking too.

Good architects and builders keep ahead of the Smiths of the world. Do you *know* all you should about Illinois Zinc Shingles.. or are you waiting for Smith?

Since this shingle was introduced two years ago, thousands of inquiries have come to us from architects, builders, metal workers and others who are always on the lookout for ways of enhancing their reputation and giving their patrons more value for their money. May we send you details?

The FarQuar
the Furnace Supreme, and the Media through which the FarQuar Message is reaching millions.

What Every Dealer Should Know

Anyone who sells or installs a heating equipment, should insist on satisfactory answers to the following questions:

Does it provide for a proper change of air to keep the atmosphere fresh, and vitalizing? In other words, does it include automatic ventilation without the necessity of opening doors and windows?

Does it heat with hot air, or with gently warmed fresh air? Does it absolutely eliminate the dangers of escaping gases and fire poisons?

Does it provide a complete and uniform distribution of heat to all parts of the house,—no hot and cold spots,—and accomplish all this with the utmost economy of fuel?

Every home owner is entitled to complete answers to these questions and every dealer should insist on having those answers furnished him. And that is exactly what you can have with—

THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM

The Answers are found in these several important features which are exclusive with the FarQuar System:

A special design which insures the required volume of gently warmed fresh air.

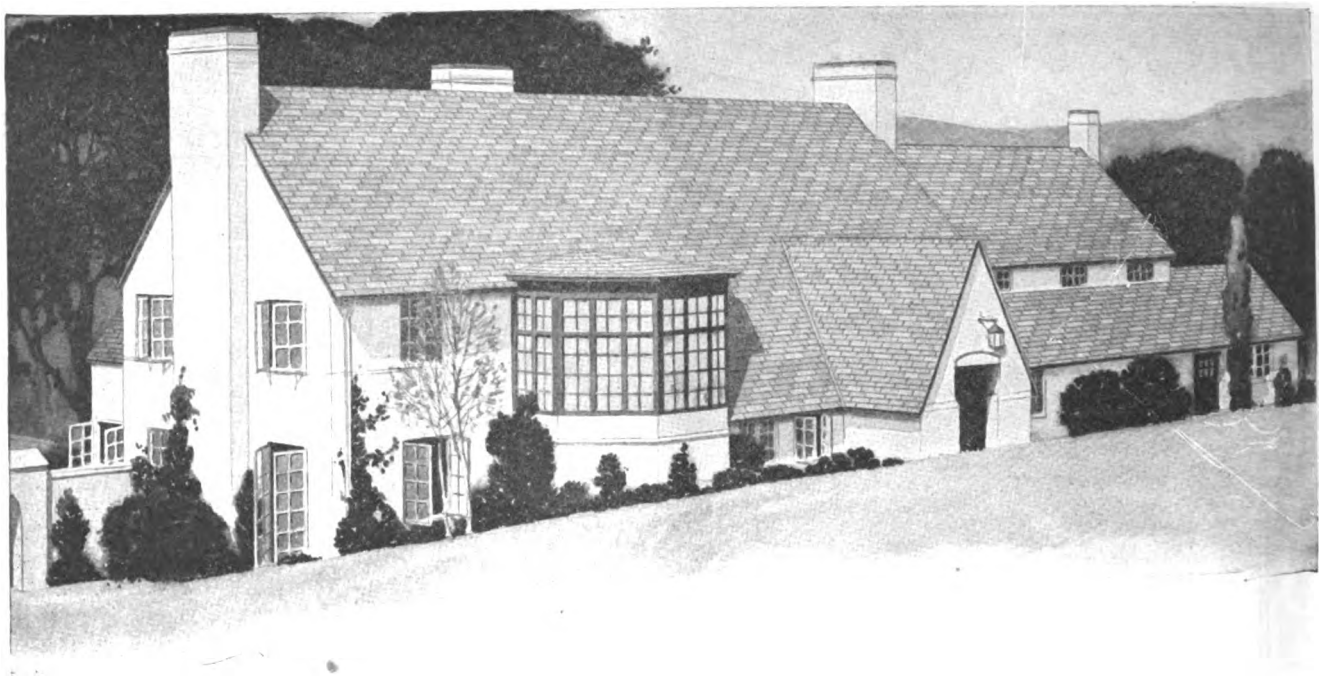
A copper-bearing steel fire-box, electrically welded into one piece without seams or rivets, absolutely preventing escape of gases and fire poisons.

A grate area of sufficient size to insure complete combustion of fuel.

The FarQuar Vent and Return System which keeps the rooms supplied with pure, fresh air, gently warmed, while also removing the stale, devitalized air contaminated by the occupants.

An automatic control actuated by the fire-box,—positive in operation and giving perfect control of fire with utmost economy of fuel.

These, and other exclusive FarQuar Features, can easily be proven by the thousands of FarQuar Systems in use. Such facts constitute a definite protection to both Dealer and Home Owner.



Our Free Booklet,—"The Science of House Heating,"—contains many interesting facts of vital importance to Dealers, Contractors, Builders and Home Owners. Write for a copy today.

Several desirable distributor territories offering unusual profit possibilities, are still open;—an excellent opportunity for Responsible Dealers. Write for particulars.

Weathered Brown Flex-a-Tile For a Multi-Tone Roof

Your roof will help sell your house—especially when you can offer the many beautiful combinations of color made possible by the new Weathered Brown Flex-a-Tile Shingle.

Here is a new color from the Richardson slate quarries at Flex-a-Tile, Georgia—a rich, mellow, fadeless brown that instantly appeals to home builders and home owners.

Here is a strong, sturdy shingle, manufactured in a new Super-Giant size (10″ x 14″)—half again as heavy and twice as stiff as standard individual shingles.

And consider economy of application, as shown by the following figures:

	Standard Shingles	*Super-Giant*	*Per cent of Saving*
Shingles per square	424	273	(labor) 35%
Nails per square	848	546	(nails) 35%

The super-giant size of this Flex-a-Tile shingle makes it economical to apply; while its extra thickness and weight give added durability. Its size (10″-x14″) is the same as that of standard roofing slates

RICHARDSON Product

Further, only in Flex-a-Tile can you obtain asphalt shingles in four different colors—the new Weathered Brown, Flex-a-Tile green, red, or blue-black. Two or more of these colors may be combined in a multi-tone roof to produce effects that never before have been possible.

And every contractor, builder or dealer who recommends Flex-a-Tile appreciates the value of a product backed by Richardson's fifty years of experience in the manufacture of felt—for this experience guarantees the quality of the fabric that gives asphalt roofing its strength and long life.

Flex-a-Tile can be laid equally well over old shingles or new sheathing—a fact that makes it an ideal product for re-roofing jobs. The new Weathered Brown Super-Giant is an added product in a line that includes a wide variety of individual shingles, shingle design rolls, slate-surfaced and smooth-surfaced roll roofing, Viskalt roofing and waterproofing materials.

If you wish to take advantage of our exceptional ability to serve you and your customers in this record year of building activity, write today for samples and prices.

"Sheetrock saves in plastering costs"

W. B. SWINDELLS
Architect and Builder

Hamilton, Md.
July 1, 1922

UNITED STATES GYPSUM CO.
205 W. Monroe St.,
Chicago, Ill.

Gentlemen:

I am pleased to inform you that I used Sheetrock throughout my own home and have used it in several others, including a fine bungalow which I am now trimming out. I also specify it whenever possible in the many plans I draw for suburban homes. Sheetrock and I are old friends. I figure that it saves me in plastering costs and makes a far superior job besides.

Yours very truly,

(Signed) WM. B. SWINDELLS

Sheetrock is fitted like lumber and goes up fast, yet it gives the owner the satisfaction of rigid, permanent plaster walls and ceilings. It will pay you, as it does Mr. Swindells, to use Sheetrock in both new construction and remodeling. It is sure to widen your reputation as a dependable builder and to increase your earnings. Fill in and mail the attached coupon today. It will bring you a sample of Sheetrock and details of our plan to help you get Sheetrock contracts.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

The HESS WELDED STEEL FURNACE

Letters like these—from everywhere—come to us daily

"I have a letter from L. S. Tracy of ——, Idaho, regarding a heater for his house. Having used one of yours several years. I have written him that I am very much pleased with the results. I think you can sell him without any trouble. The Hess Furnace 'delivers the goods.'"

J. R. HANSEN, (Idaho).

"I had a steel heater in use which gave me good service for 17 years. Put in a cast iron two years ago and it burned out." (Now he buys another steel furnace.)

JOHN AUKERMAN (Ohio).
April 4, 1922.

"You have the best furnace in the market; most economical and most even heater, and if I was building or putting in a new one, nothing but yours would interest me."

HENRY L. WILDER, M.D. (Vermont).
Dr. Wilder ordered another Hess Furnace June 19, 1922.

Twelve thousand Chicago users are the main source of a large local business, for satisfied customers are good advertisers.

Hess Furnaces *Burn Anything:* Deliver all the Heat

Especially interesting, in view of a probable shortage of fuel

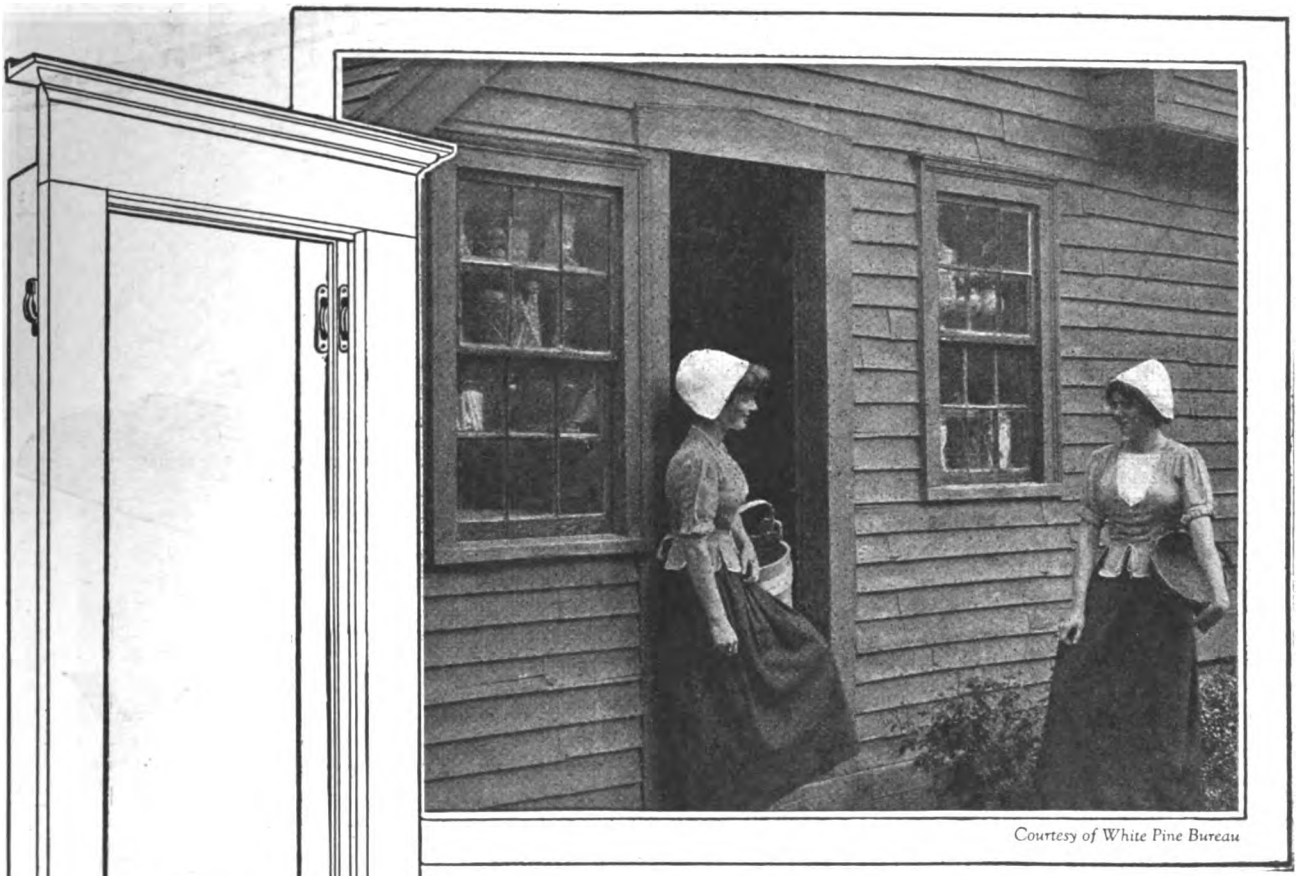
Plan the garage entrance with winter in mind

WHEN the snow-drifts pile in front of the garage the home owner will appreciate your suggestion of an entrance that opens *inside the garage.*

Let us send you our book, "McKinney Complete Garage Sets," for reference every time you are asked to decide on a garage entrance. It illustrates and describes several types of sliding-folding and around-the-corner doors that meet any problem of space allowance or entrance width.

It illustrates the hardware used to erect each door. And it shows simple plans for the use of the McKinney Hardware Set used with each entrance. If the purchase of the hardware is left to the home owner always specify the number of the McKinney Set that fits the type of door to be erected. Then you will be sure of getting all the hardware needed because each set is packed in a single box which is plainly numbered.

Make the McKinney Booklet a third member in the planning conferences between you and the home owner. The results you want to achieve will be pictured for their understanding in this little book.



McKINNEY
Hinges and Butts and Hardware

Also door hangers and track, door bolts and latches, shelf brackets, window and screen hardware, cabinet hardware, steel door mats and wrought specialties.

Frames that Endure for Centuries

ANDERSEN Standard White Pine Frames are built to endure the test of time and weather.

In America's oldest homes White Pine has for centuries demonstrated its ability to withstand all weather conditions without warping, rotting, cracking or shrinking. All exposed portions of Andersen Standard Frames are made of White Pine.

Andersen Standard Frames are accurately made. That's the result of specialization. Each part is machined so that it fits exactly the part for which it is intended. There's no trimming or fitting when assembling Andersen Frames. That's why windows fit snugly yet run easily in Andersen Frames.

From a stock of only 11 standard Andersen Frames, the dealer can promptly supply 121 different sizes by simply interchanging widths and heights. Thus immediate delivery can be made of a large number of frames for a wide variety of uses.

Each frame is packed in two compact bundles containing seven units. These seven units complete with pockets and pulleys in place can be nailed up in ten minutes.

BUILDING AGE
AND
THE BUILDERS' JOURNAL

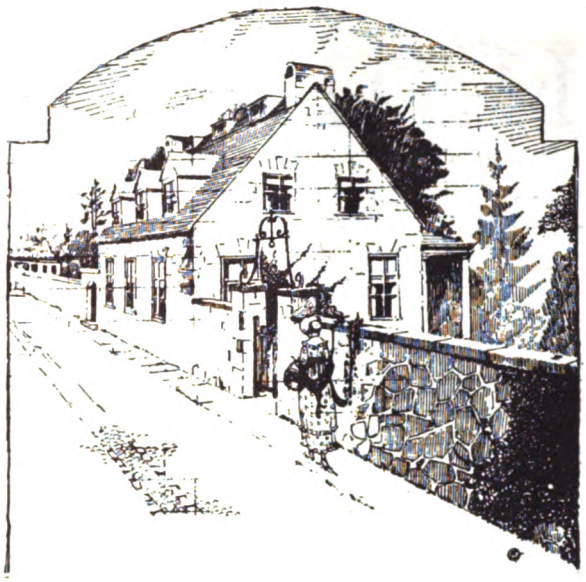
NEW YORK, OCTOBER, 1922

The Garden Wall as Part *of* the House

IN certain parts of Europe the traveler is surprised to find that many of the houses and gardens are secluded from view by high walls. Sometimes an opening with a grilled gate gives the passerby a glimpse of the homestead within. In other cases, a solid wood or metal door is used, assuring the occupants of the house the utmost privacy.

In America, however, the tendency has been to have one's house stand in the open and bid a welcome to all. Sometimes to frame in the garden, a fence or wall has been constructed around some portions of the plot.

There has been a tendency of late years to combine the



old European garden wall idea with that of the American plan house, and the result has been a combination of house with attached garden wall which together form a better looking picture than when each is left standing alone.

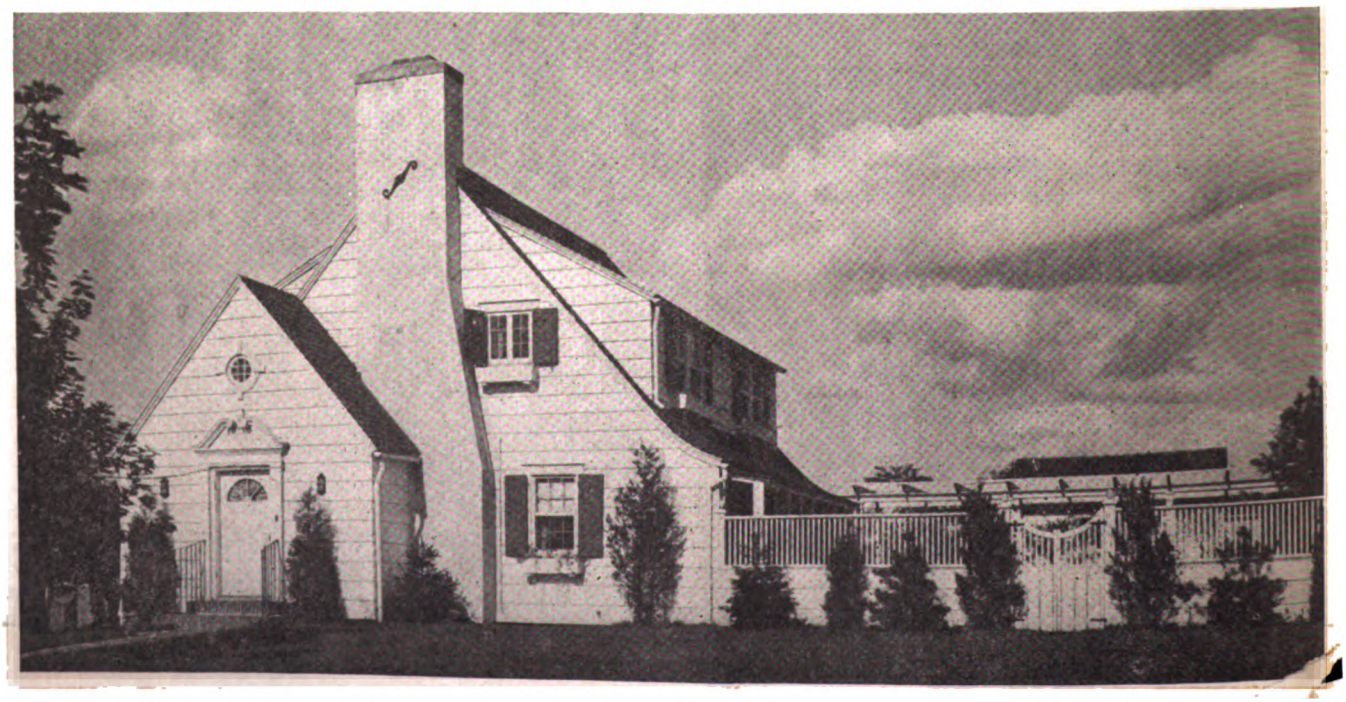
To the occupants of the house, it gives privacy for certain parts of the garden making this portion really an out-door living room, while the house itself still retains its welcome appearance.

An arrangement of garden wall and house is very practical in taking care of a hilly site as there is a chance of effectively handling the terraces so that they form

Digitized by Google

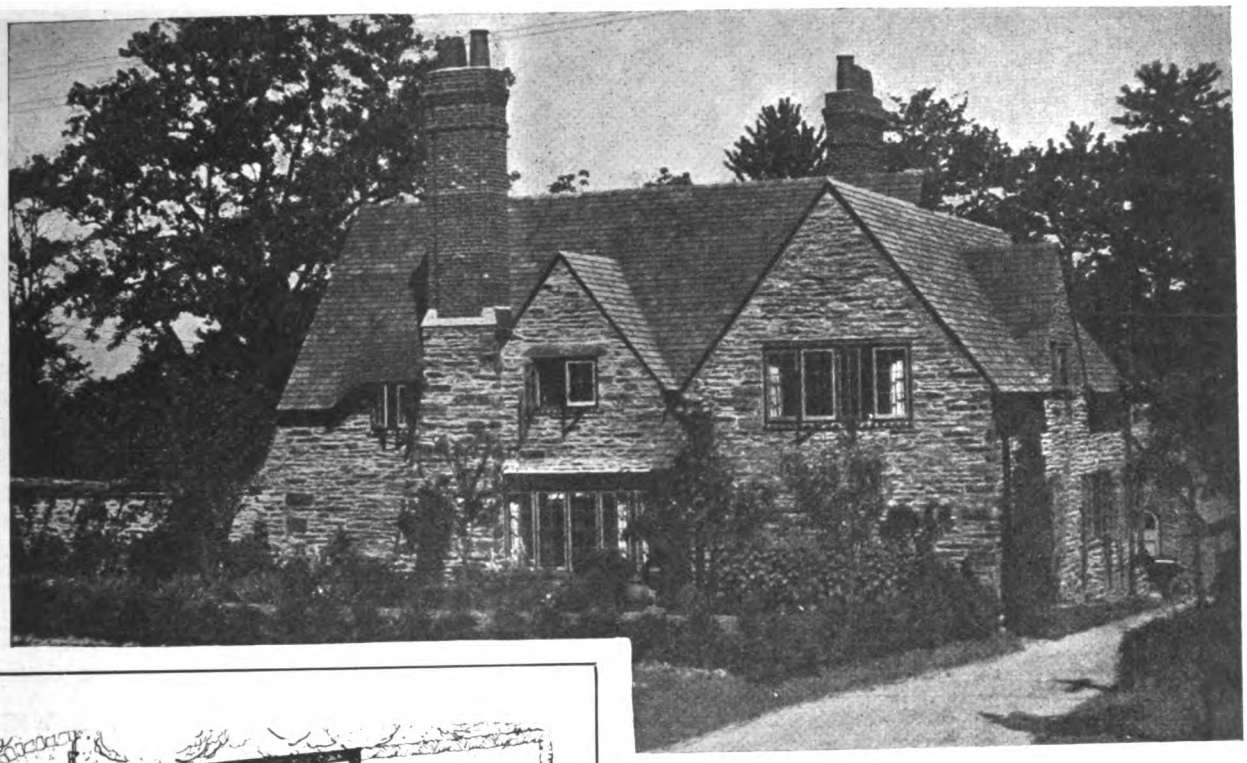
pictures rather than disfigurements. In the few illustrations shown here, a few suggestions are offered of what may be accomplished by careful planning.

The first illustration shows a brick house covered with stucco and the garden wall is made of the same material. The coping on top is a layer of brick on edge, and here and there some face brick appears as quoins which add a dash of color to the stucco walls. The garden wall here is in line with and forms a continuation of the front of the house which is set back a fair distance from the road. A handsome garden is planted in the front that in no way makes the house look prison-like, while the occupants can enjoy the outside and still have privacy. This interesting home is located at Larchmont, N. Y.

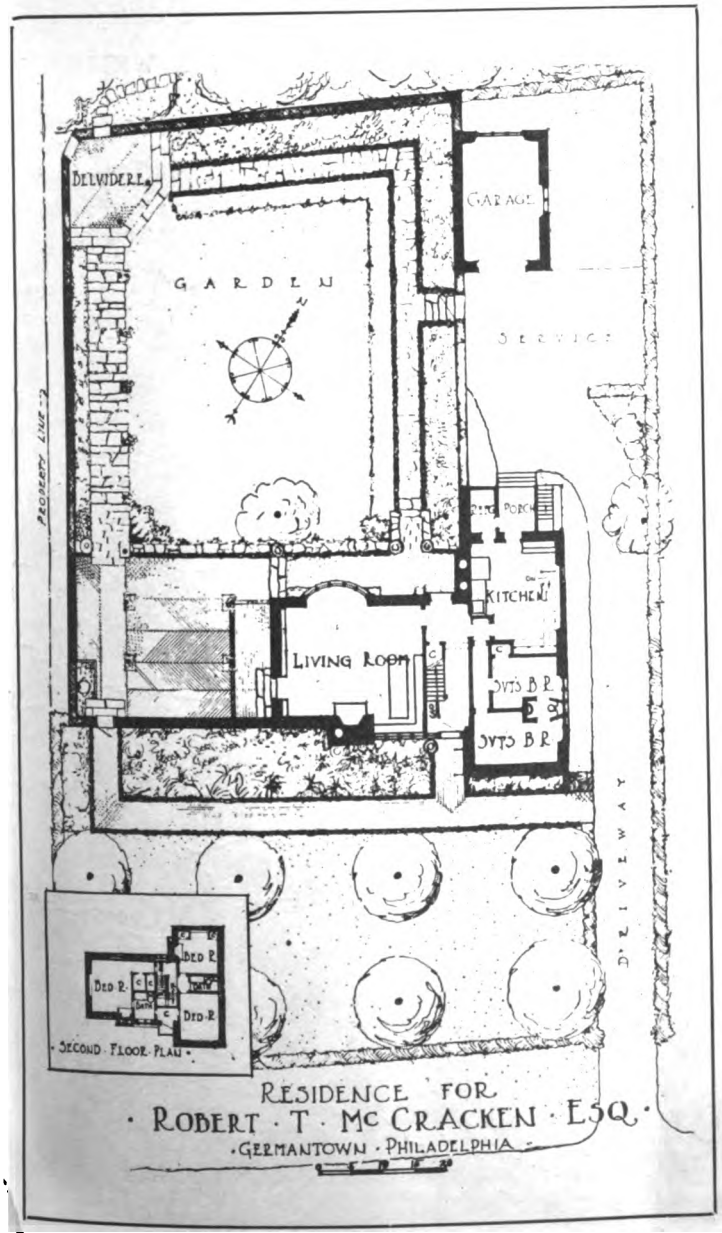


The next illustration shows a rather careful handling of a hollow tile house and wall. Here the wall is combined with a gate with a hooded top. The wall does not extend very high, but on top is a wood rail which is finished in natural cypress, stained brown. Such a treatment with the stucco work gives rather an interesting appearance when viewed in combination with the green of vines and shrubs. This little detail was designed by Patterson & Dula, architects, of New York, and the house is located at Hartsdale, N. Y., being built for Frederick I. Kent.

The reason more of this kind of better building has not been done is simply because it has not been brought to the attention of home owners.



The third picture shows quite an interesting treatment of a rubble stone house and wall. This is a little detail conceived and sketched by Mr. Ernest Flagg, architect, of New York. It shows the possibilities of combining beauty and utility with a house set directly on a road.



The fourth picture shows a very interesting example of a wood garden wall. The lower portion of this wall is shingled the same as the house and the upper portion is of square bars with a rail on top. This house is set back from the road a little distance and an ornamental gate gives access to the inner enclosed garden with its simple pergola, giving the occupants the privacy of an outdoor living room and still not disfiguring the house or landscape, but rather enhancing the beauty of all. This house was built at Larchmount, N. Y., for Mr. J. E. Sample, from plans prepared by Chester A. Patterson, architect, of New York.

Builders are many times called upon to build a fence around a house and the appearance of many a place is marred by some sort of an ugly contraption serving as a fence. Even on a very small plot of land, it will be well to extend certain portions of the house so as to include a little well designed fence or gate to fill out the lot width rather than spoil the appearance of the front with something that has **no merit.**

Charming Stone Home Design

MELLOR, MEIGS & HOWE
Architects

IN locations where stone can be had, it forms a very good material for home construction, but it must be handled with a master hand to produce an artistic result.

In the house pictured here a charming result has been obtained by having an appropriate design. It is something that suits the location. Little bits of color have been introduced by the use of brick for sills and top of the chimneys. The grouping of the windows is worthy of particular note; all these windows are of the casement type, which is now becoming so very popular.

The stone work has been laid up in random rubble, with the mortar joints in white, and the roof is of slate of different shades, so as to give a handsome blended effect.

A stone wall forms an attractive part of the entire scheme and this extends from the front of the house down one side across the back and joining with the garage, thus forming a complete enclosure for the garden and, besides, serves as an admirable background for the different shrubs and plants.

Advantage was taken of the natural slope of the land to introduce terraces and steps at different points, while some portions are covered with pergolas.

NEW HOMES FOR OLD
MODERN ALADDIN

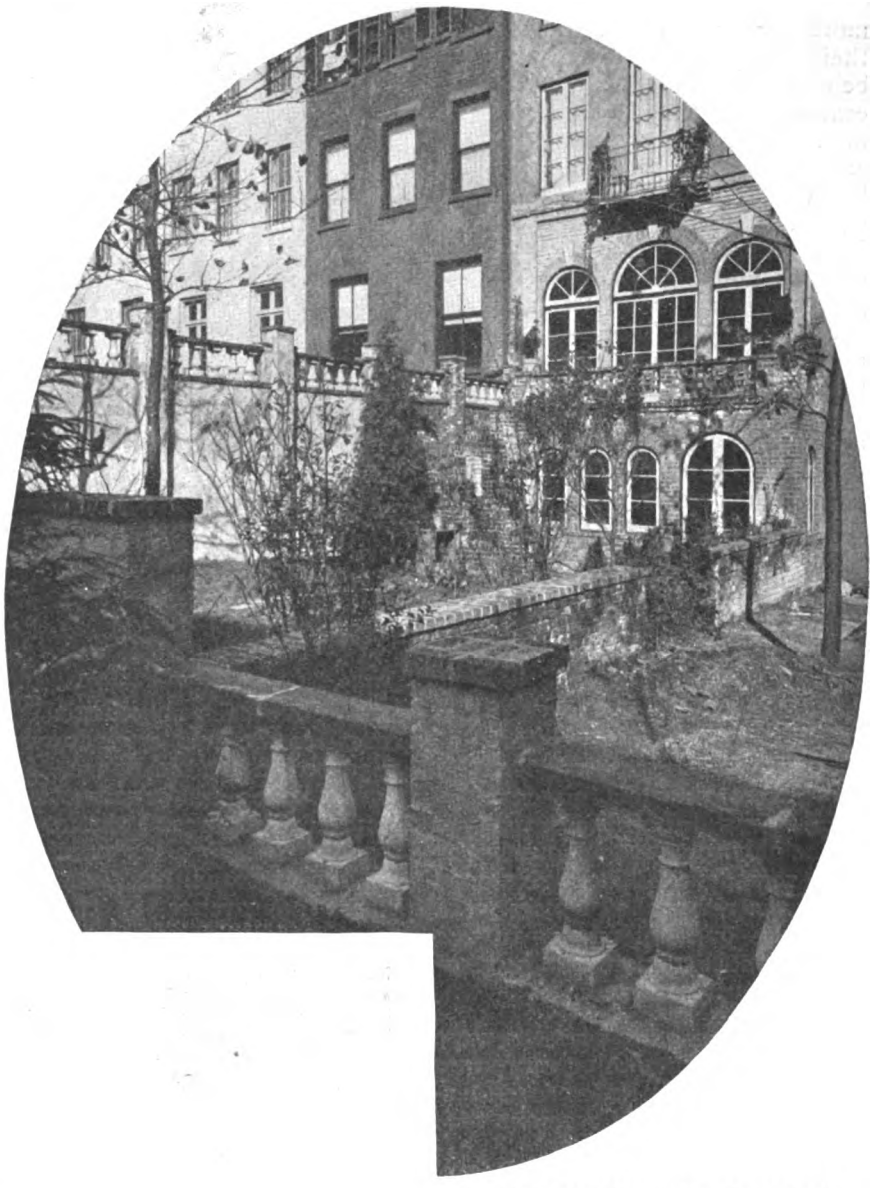
FRATERNITY HOUSE
Dartmouth College

LARSON & WELLS
Architects

FANCIFUL as the tale of "Aladdin and His Wonderful Lamp" may be, it has its counterpart today in the modern remodelling of buildings. Aladdin's cry of "New lamps for old" can be paraphrased to the builder's cry "New homes for old." With the old house at one's command, the Genie of design and skill will produce wonderful effects for its master.

Looking quickly at the upper illustration on this page, one would never think that it is the same building as the lower illustration, still it takes only a little comparison to prove that it is. Truly, a remarkable transformation has taken place with this building. It is certainly a new home for an old one.

The old building pictured here is a good example of the well constructed house of about fifty or sixty years ago. Sound timbers and good workmanship produced a substantial building that will last for many more years. To our modern ideas of taste, however, it is wholly lacking in style; in fact, we now-a-days would term it an ugly looking building.



The exterior of this building has been overcoated with stucco. The second floor and gable ends have been treated with English half timber work in a neat and pleasing arrangement. The hipped gables of the main roof and

Digitized by Google

FOR OLD By ALADDINS

dormers have been changed to plain gables and the fancy scalloped verge board has been eliminated and a plain rafter substituted. The fancy chimney tops have been removed to the great improvement of the entire design.

The "stoop" has been replaced by a good, wide porch with balcony above. This porch is built of brick and concrete and a wood railing extends around the balcony. French doors replace the window and old front door on first floor. The square bay window has been retained, but the other sloping bay window attached to the wing has been removed, and a triple mullion window substituted. On the second and third floor double mullion windows have been substituted for the single windows in the front. The other windows remain with the exception that new

TURTLE BAY GARDENS
BOTTOMLEY & DEAN
Architects

divided sash has been substituted in place of the two light sash of the old home.

This building is the Sigma Phi Epsilon Fraternity house of Dartmouth College, Hanover, N. H. This remarkable remodelling job was the work of Messrs. Larson & Wells, architects, of Hanover, N. H. It is certainly a most interesting example and shows what can be accomplished by a modern Aladdin.

Every city abounds in a number of old fashioned private

Digitized by Google

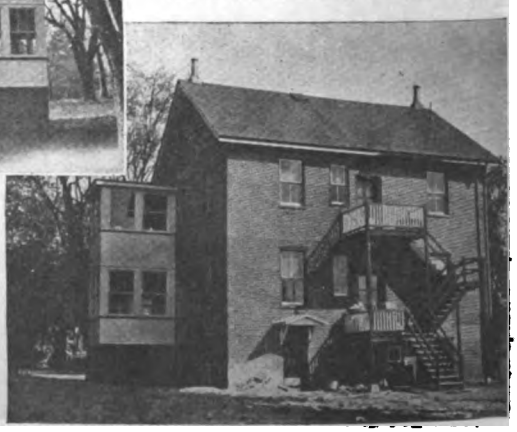
dwellings that have more or less outlived their elegance. They belong to an older generation and they were in their day the best examples of comfortable homes. In East Forty-eighth street, New York, there was a row of such buildings and a corresponding row in the rear facing Forty-ninth street. These old residences were all purchased by a syndicate and Messrs. Bottomley & Dean, architects, of New York, were commissioned to prepare the designs and look after the remodeling work.

The entire development is called "Turtle Bay Gardens," which name was taken from the old designation of the water front of the East River in that locality. The street view of this development shows, on both sides, the type of the old brown stone houses that were remodelled. The high stoops of all the remodelled houses were removed—one still shows in our picture as this was taken just before this was removed..

The old fashioned cornices were removed and something more in a conformity with Italian architecture used instead. Casement windows have been substituted in all cases for the double windows that appeared in the old house. Little flower boxes and ornamental balconies, together with the iron railing and front, besides painting the old brown stone, has changed the entire appearance of the street front of this row of old fashioned houses.

The back yards of these old-time mansions really were a rather ugly group. Each lot was finished off with a wood fence about seven or eight feet high that was always kept carefully painted. There was usually an oblong central grass plot with a blue stone path all around it and a flower bed about two feet wide between the path and the fence.

The center lawn was ornamented at each corner with wash poles and usually on Monday mornings, the whole row would look like an animated laundry. This was the rear view that greeted the occupants of these wonderful homes, for truly they were wonderful, in that they represented the best that could be had at the time they were erected.



In the remodelling all the fences were removed and a large formal Italian garden laid out. The rear of the houses were slightly altered, different windows substituted, balconies added and then the planting that looked good as a whole and not only in individual spots. Low railings divided off portions of the yards, while high masonry walls marked the east and west ends of the development.

The very interesting construction work was undertaken by Thomas T. Hopper Co., building contractors, of New York.

SOMETIMES alteration jobs do not turn out well and as an example we show the remodelling of a small school house to a two-family house. Everything in this little alteration job was practical, but it lacks design.

Left Picture Shows Original School Building. Above Is How It Looks After Being Remodeled to a Two-Family House. Right—A Rear View of Remodeled House.

THERE are many good buildings that only need a little alteration to turn them into modern structures again. The field of remodelling is large and quite often shoring, etc., is needed; an article on this follows.

Digitized by Google

Shoring, Needling *and* Bracing

Their Uses and Application in Altering and Remodelling Buildings

By OWEN B. MAGINNIS

SHORING for the practical purposes required by builders might be termed methods of temporarily supporting and sustaining any parts or portions of walls, floors, piers or other details of buildings already erected for alterations or changes thereon.

In this connection the remodelling of many buildings in towns and cities, their change of occupancy from dwellings into stores and places of business necessitate the employment of shoring, bracing and needling in their various phases; so that a knowledge of these methods of procedure should be possessed by every builder, especially those in communities where there are no firms or men who make a business of furnishing these necessary appliances.

To clearly explain the actual value of "shoring" let readers note the first photograph, Fig. 1. Here they perceive a series of shores or large timber uprights resting on heavy timber blocks called "sleepers" which carry on their top ends short lengths of steel "I" beams, singly for light 8 and 12-inch brick or stone walls and doubled, tripled or quadrupled for heavy 16, 24 and 36-inch heavy and high walls according to the weight which must be supported.

In this example there are six sets or series, safely supporting six piers which were pierced or cut through with drills and cold chisels with square holes under a straight course of brickwork at the level of the floor window sills.

These operations permitted the removal of the first story front wall and allowed the building of the new brick piers with bond stones to the right, left and in the middle and placing of the longitudinal steel girder which must in future fully, safely and permanently carry the upper walls, which it is shown doing in another remodelling job shown in Fig. 2, where the shoring has been removed. Note the holes wherein the needles were inserted and note again the working detail Fig. 3, which will convey the method employed in placing shores. For front walls the shores are slightly sloped or as technically expressed, "battered," in order to counteract any tendency of the walls to buckle or kick out. This may be observed in Figs. 1 and 4. In Fig. 4, we see also how a front wall may be supported by this method at the second or any of the upper stories or floors. If possible all shores, either those of the simplest such as simple spur or raking shores, ought to batter so as to push inward, thus resisting the tendency of walls to buckle or spring outward. Figs. 4, 5, 6 and 7 show several views of beams, needles and shores for heavy walls.

It may be well to state here that there is no fixed rule that can be laid down for this class of work, nor can any be given except that derived from personal practice and experience, as the nature of the work is so varied that it would be impossible to give any standard list or set of timbers, etc., necessary for the needs of the house shorer. His plant generally consists of all sorts and conditions of materials, ranging from a cold chisel to hoisting engines.

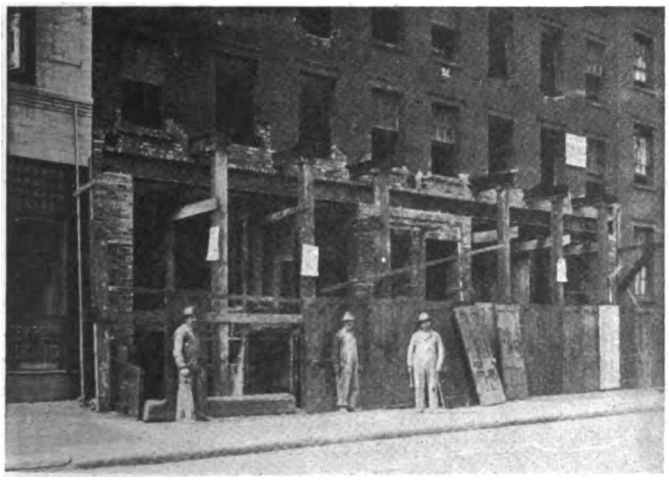


Fig. 1—The Proper Shoring and Needling Needed in Converting Two Five-story Tenements Into Stores. Observe How the Steel Breast-runner Girder Is Placed to Carry the Four Upper Stories

Fig. 2—A Partly Remodeled Front Wall Changing Two Twenty-foot Dwellings Into One Store. Observe Original Form of Front to the Left of This Picture

Generally speaking, it might be said that it requires all and every sort of timber listed, especially of the harder and heavier kinds, for bearing and carrying purposes, such as oak, yellow pine and spruce. These are the most reliable for long shores and needles, the spruce being most popular on account of its cheapness, toughness and lightness, although yellow pine is more adaptable for very heavy work, such as for brick or masonry structures, such as churches, halls, etc.

All timber must be of the very best quality, and second-hand building timbers have been found from experience to be most reliable, as years of exposure or use

Digitized by Google

have tried their qualities and guaranteed their capacities.

Regarding sizes and dimensions, I might state that for spruce they may run from 2x2-inch scantling to the largest sizes, yellow pine from 6 or 8x8 inches, also up to the largest sawn. All may be of lengths increasing in feet, sawn square and smooth. Out of wind or twisted timbers are useless not only by reason of their liability to fracture, but also by their loss of strength through warping or distortion.

In connection with the timbering come the wedges, which are even more reliable than pump screws. These powerful instruments are sawn out of the hardest and best seasoned oak, being 3 inches wide, 1½ inches thick at the butt and tapering to 1/4 inch. Two, as shown in the various pictures, are always used, and when placed as represented, they constitute the best means of tightening or raising walls, girders, beams, etc., known to scientific builders. The most careful shorers and movers prefer them to the screws, on account of

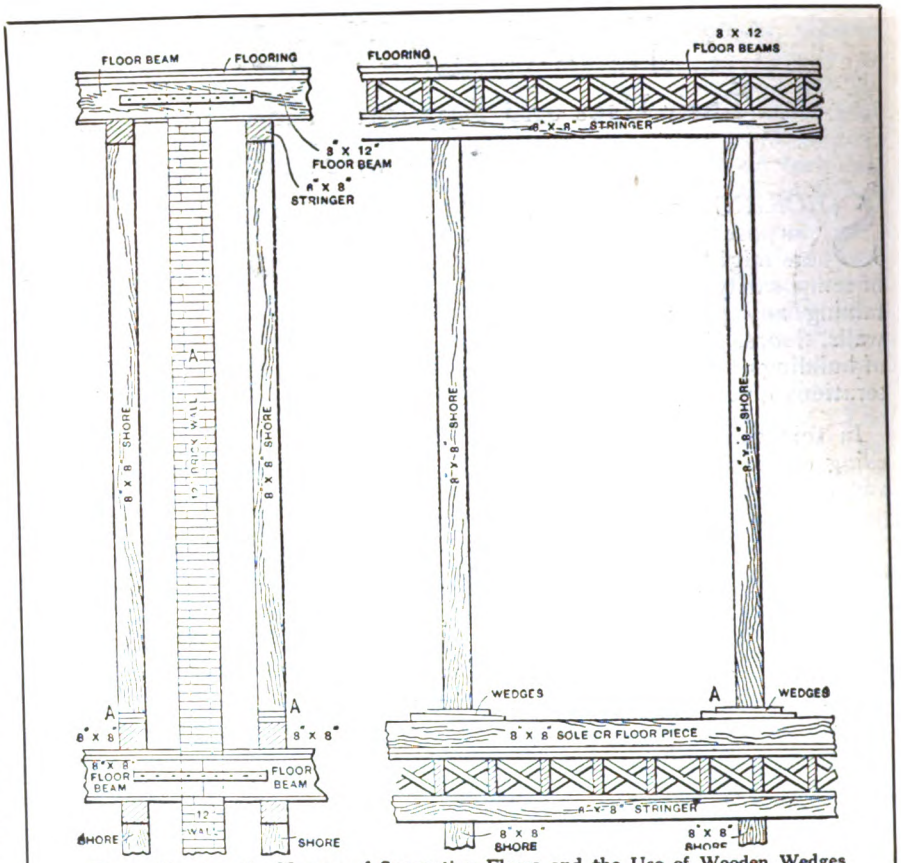

Fig. 3—Showing the Manner of Supporting Floors and the Use of Wooden Wedges

Fig. 4—Showing a Front Wall Shored and Needled at the Level of the Second Floor

security, but they are not always applicable to horizontal timbers in corners, or where it is not possible to deliver a blow, for it must be remembered that each wedge must be struck with equal force, or one will be forced past its fellow and the two rendered useless.

If the upright shores placed inside the walls do not reach down to the cellar or basement floor or to solid reliable ground, then the first tier of floor beams must have shores placed to support them as in Fig. 3 or blockings of heavy timbers may be built up from cellar floors or the floors may have ranging timbers placed under the beams and jack or pump screws screwed up tight to prevent any possible subsidence under the pressure of shores and weight above.

Gable or party walls may either be retained safe and unbuckable by raking shores, base plates, and wedges or if the site be small or narrow as shown in Fig. 7, where, as it was desired to keep site clear for building operations, the methods of "fly" shoring was adopted which simply consists in setting long timbers or "spreaders," as

Digitized by Google

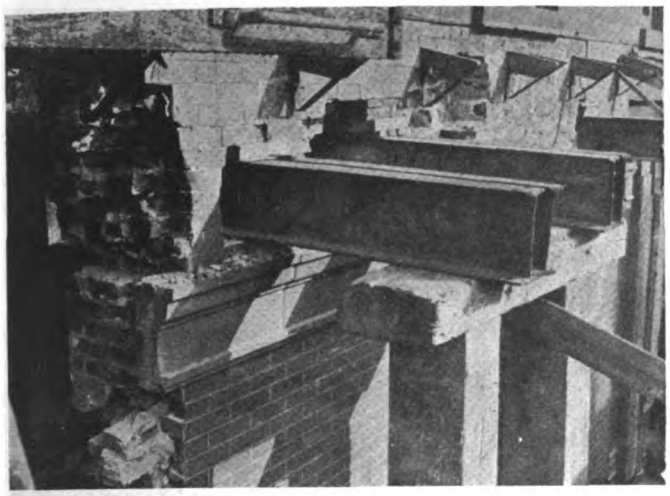

Fig. 5—Proper Arrangement of Shoring Timbers and Needles for Sustaining Heavy Piers by Coupling Them Together in Pairs

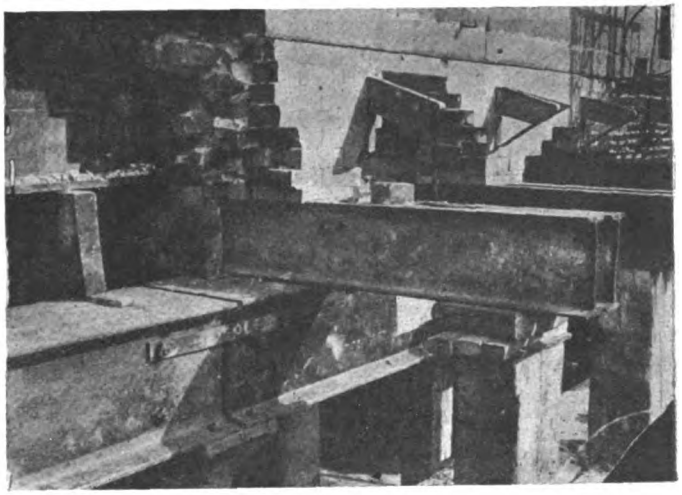

Fig. 6—Basement Wall Needled with Beams Set in Pairs. Steel Beams for Support of New Wall

they are technically termed, from wall to wall across the site, these ends thrusting against thick timber bolsters.

These shores are usually cut in tight without wedges and if made up in two lengths they are cleated or joined by side timbers which are well bolted and act as reinforcing pieces to stiffen each shore.

These "fliers," as some term them, are either placed from the floors of the old building as it is being demolished or else lowered or raised from the adjoining roofs and set by means of ropes or ladders.

They need not of necessity be set level, but must be so tight as to be immovable, made so by being hammered in place with heavy sledge hammers.

Where the distance between the walls is considerable, diagonal braces at each end will prevent the sagging of the spreaders.

Usually no timbers less than 8x8 inches are used for the spreaders and the timbers against the wall should not be less than 3x8 inches.

Where diagonal braces are necessary, these should be framed under the spreaders and spiked securely in place.

Flying shores are superior to raking shores because their thrust is immediately opposite the disturbing force.

Where one of the buildings is a good deal higher than the other, the flying shores are placed in an inclined position with a raking strut and braces securely spiked together so as to prevent sagging.

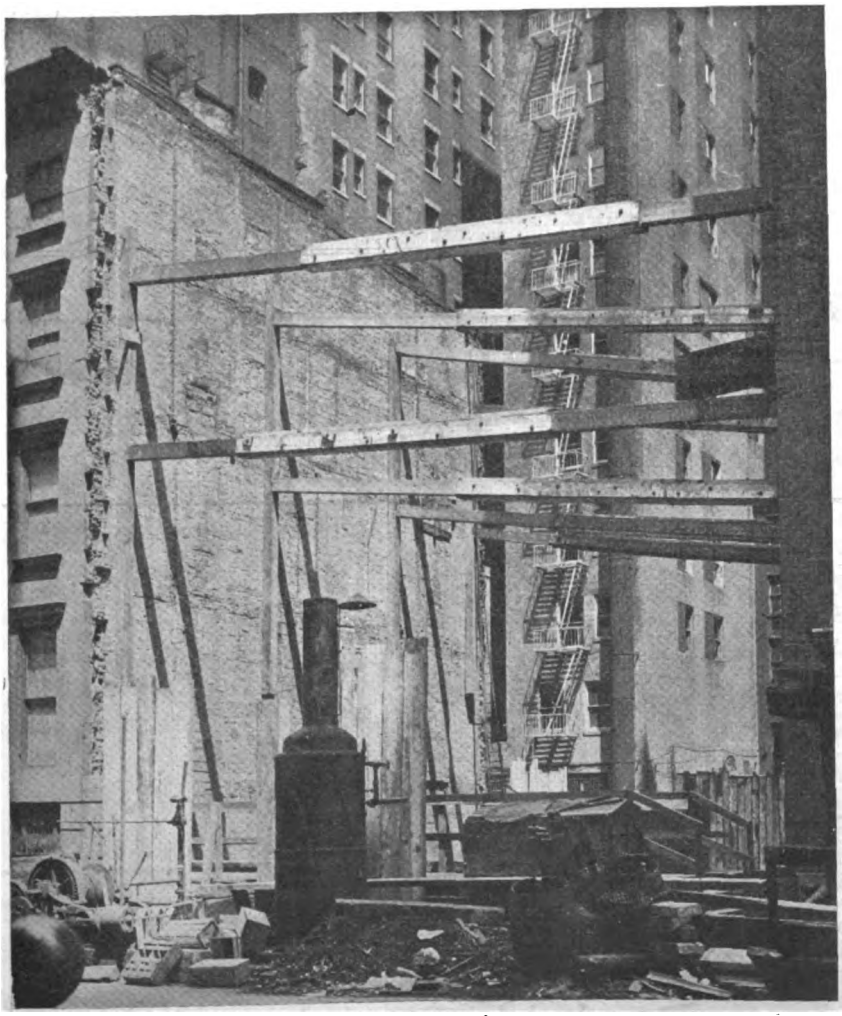

Fig. 7—Illustrating the Employment of Flying Shores or Spreaders

Each particular job will have certain details that will have to be worked out by the man on the job, no directions for meeting all sorts of conditions can be given, but the principles can be applied to all cases.

There is no part of alteration and remodeling work that calls for so much practical skill as the placing of proper shoring where certain portions of the walls are removed. In an early issue further details will be given of carrying out this very important building operation, also some hints on the removal of an entire building or part of it as is sometimes necessary on a remodeling job.

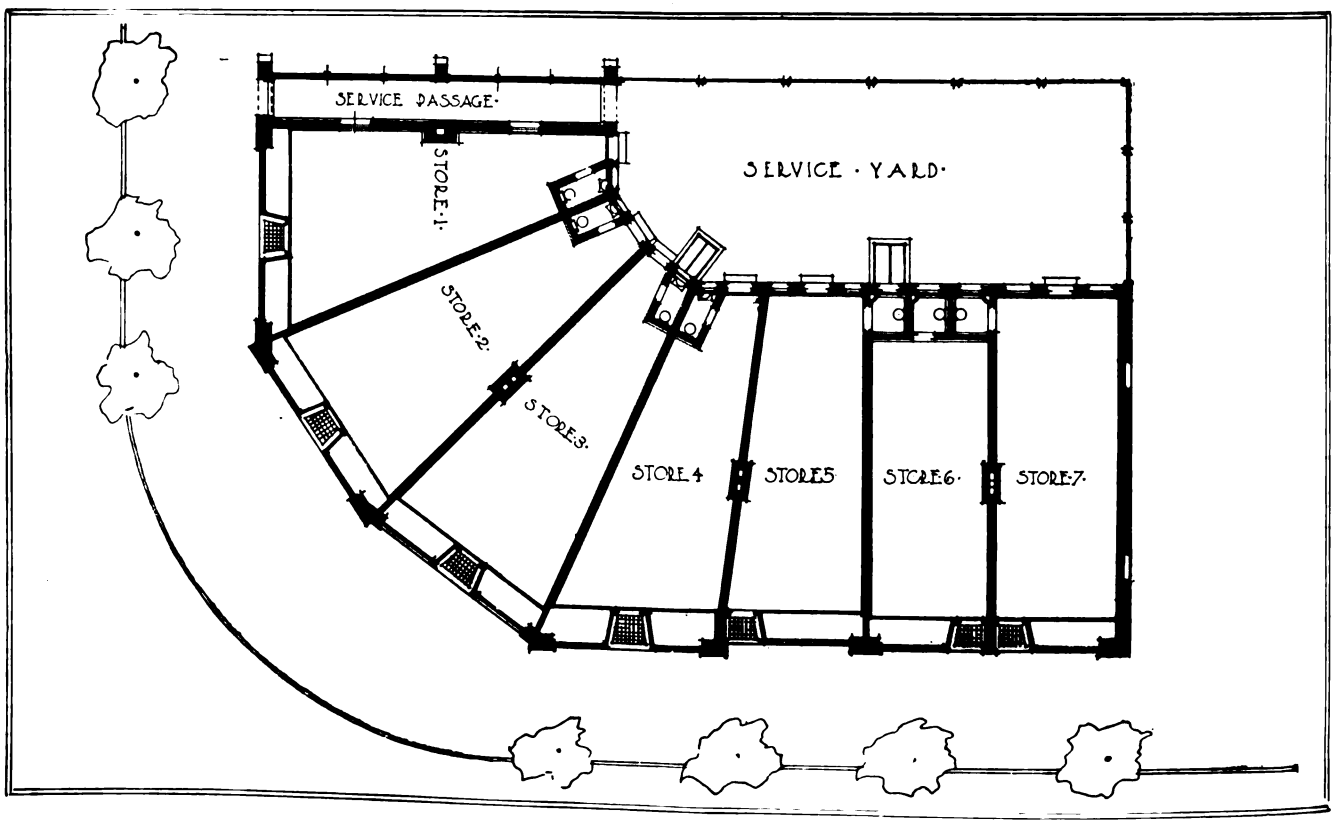
Creating Better Store Architecture

CLIFFORD C. WENDENHACK, Architect



ONE of the blots of our domestic architecture is that of the almost universal ugliness of our store buildings.

An enterprising but unartistic gentleman thought it would be a good investment to develop a piece of property he owned at Montclair, N. J., with a row of stores, and his original plans called for the regular type of ugly construction.

As there are many fine houses in the neighborhood, the residents strenuously objected. Among these was Mr. Wendenhack, and he offered his services for the good of the community and produced a plan that would cost no more to erect than the contemplated ugly structure. The owner agreed to this proposition and the result is shown in the picture.

Here we have an artistic grouping of seven stores and one peculiar feature of the design is that technically there are five corner stores in the lot and more rent was secured for these stores.

The erection of these shops is an interesting example of what builders could accomplish if they would go after a client in the right way when he proposes to erect an ugly looking building—show him that something artistic can be erected for the same amount of money.

The Troublesome Problem *of* Extra Work How Conducted and How Paid For

By the Standardization Committee, K. H. PRATT, Chairman
General Contractors' Association of Cleveland

IT has been common experience that the matter of charges and credits for additions to or omissions from plans and specifications for a building project are apt to be a source of controversy between the contractor and owner. Unfortunately, it is very seldom the case that a building is put up without some alterations or modification of the plans, which involve a change in the contract price or the work, and there has been no standard practice in adjusting these differences, so far as we can determine. Therefore, your Committee has gone into the problem of trying to determine fair and equitable relations between contractor and owner where such changes are involved, and has formulated certain very definite recommendations.

Alterations or deviations from the original plans and specifications are a source of expense to the contractor, whether the change be in the nature of an omission or in the nature of an addition. All such changes are apt to interfere with the progress of the work, delay the completion of the work as a whole, cause the contractor additional expense on other work in progress on the job which is affected by the changes, and make demands not only on the contractor's field organization but upon his main office organization out of proportion to the amount of work involved. It is evident that there should be a charge to the owner for the services so rendered, regardless of whether the work is an addition or omission.

Recommendations

This leads to our first set of recommendations:

a. That all charges for additional work take into account the contractor's overhead in addition to the actual cost of the work and the contractor's profit.

b. That all omissions take the same items into account, and, to accomplish this end, we recommend that allowances for omissions be based upon the actual estimated cost of the work without any allowances for the contractor's estimated profit on the operation involved—it being our thought that such estimated profit should be retained by the contractor to compensate him for the additional expense involved in deviating from the original plans.

c. Accurate written records should be kept and all transactions relative to changes should be confirmed in writing between the contractor and owner.

Interpreting Plans and Specifications

Where work is considered by the contractor as additional to his contract price, such additional work may arise from a disagreement as to the interpretation of the plans and specifications, or it may be an addition to the plans acknowledged by the owner.

There work is considered by the contractor as additional to his contract price, such additional work may arise from a disagreement as to the interpretation of the plans and specifications, or it may be an addition to the plans acknowledged by the owner.

We recommend:

1. That all contractors prohibit their field organization from proceeding with any additional work to the contract, whether acknowledged or not by the owner, without specific instructions from the contractor's main office or his authorized representative.

2. Where the contractor proceeds with work in dispute as to whether or not it is extra, it should be a matter of written record from the contractor to the owner as to the contentions involved and as to the basis on which the work is being done.

3. Where there is no dispute involved, the work should only be done on the written authorization of the owner or his agent.

4. An accurate record of all labor and material used in connection with extra work should be kept on a separate extra work report sheet, with provision made thereon for the signature of the duly authorized agent of the owner directing the work to be done, and charged to the owner.

Lump Sum of Time and Material

Where work is performed additional to the contract, it may be handled in two ways. Either on a basis of an agreed lump sum charge or on a basis of time and material plus a percentage for contractor's profit.

We highly recommend that all work which can be intelligently priced and handled on a lump sum basis be so handled, and that the lump sum be agreed upon prior to the execution of the work, with proper acknowledgement of the work and amount involved.

Where it is impossible either through the nature of the work or the time element to definitely arrive at a lump sum price, we recommend that the work be performed on a time and material basis plus percentage for contractor's profit.

Charges for Extra Work

In the absence of any definite agreement in the contract, we recommend that charges for extra work performed on a time and material basis be billed to the owner in accordance with the following:

General Items of Cost

The general contractor shall be reimbursed in the manner hereinafter described for such of the actual expenditures in the performance of the work as are included in the following items:

a. Wages of workmen, material, supplies, tools and appliances (as distinguished from machinery and equipment listed hereinafter), and cartage and freight required for the completion of the work in question, either as shown by the revised plans and specifications, or by written instructions, and for the installing, equipping, operating and dismantling of temporary works, plant, machinery

Digitized by Google

and equipment, sheds, offices, commissary and hospital.

b. Sub-contracts placed by owner or general contractor for material or labor or both.

c. Rental, or its equivalent, beginning with shipment and concluding with arrival at return shipping point, at the rates set forth in attached schedule, for the general contractor's machinery and equipment, and rental actually paid by the contractor for other machinery and equipment, or parts thereof, as used in the prosecution of the work, cost of loading, unloading, shipping charges to and from the job, and ordinary repairs and replacements during use and shipment for all machinery and equipment. Rental on machinery and equipment in place at average rental and maintenance charge per schedule assigned by Associated General Contractors or general or main contract.

d. Premiums for bonds and fire insurance, fee of Building Trades Employers' Association, expenditures for telegraph and telephone service, expressage, postage, field office supplies, permits, deposits, royalties, and other similar items incidental to the execution of the contract.

e. Salaries of superintendents, foremen, engineers, timekeepers, clerks, expeditors, watchmen, waterboys, and all other employees in the field office of the general contractor to be pro-rated over the total number of workmen's hours daily and the proper proportion of the suerintendent's, timekeeper's, watchmen's, waterboy's, etc., time charged to each item of extra work. If any of these men are giving an overdue amount of their time to any or all items of extra work then their exact time given to the extra work is to be charged.

f. Slary allowances proportionate with time actually applied to this work for employees dividing their time between this and other work, transportation and incidental traveling charges to and from the work for the necessary field forces required in the economical and successful prosecution of the work in the procuring of labor, and in expediting production and transportation of material and equipment, and for other employees or officials of the general contractor actually incurred in connection with this work.

g. Compensation, public liability and contingent insurance on all wages and salaries. We recommend a charge of seven per cent of the payroll to cover these items, together with the uncovered risk.

h. An allowance to compensate the contractor for his overhead expense. We recommend a charge of 10 per cent on the total cost of work to the contractor to cover this item.

Credits to Owner

The owner shall receive from the general contractor the following credits:

1. Rebates to the amount of 50 per cent of the original billed price for all lumber and material used in this work and delivered in good and serviceable condition to and accepted by the general contractor.

2. Rebates to the amount of 50 per cent of the original billed price for all perishable tools and appliances used in the work and upon completion of the contract returned in good and serviceable condition to and accepted by the general contractor.

3. The full returned amount of any refundable deposit made and charged against this work.

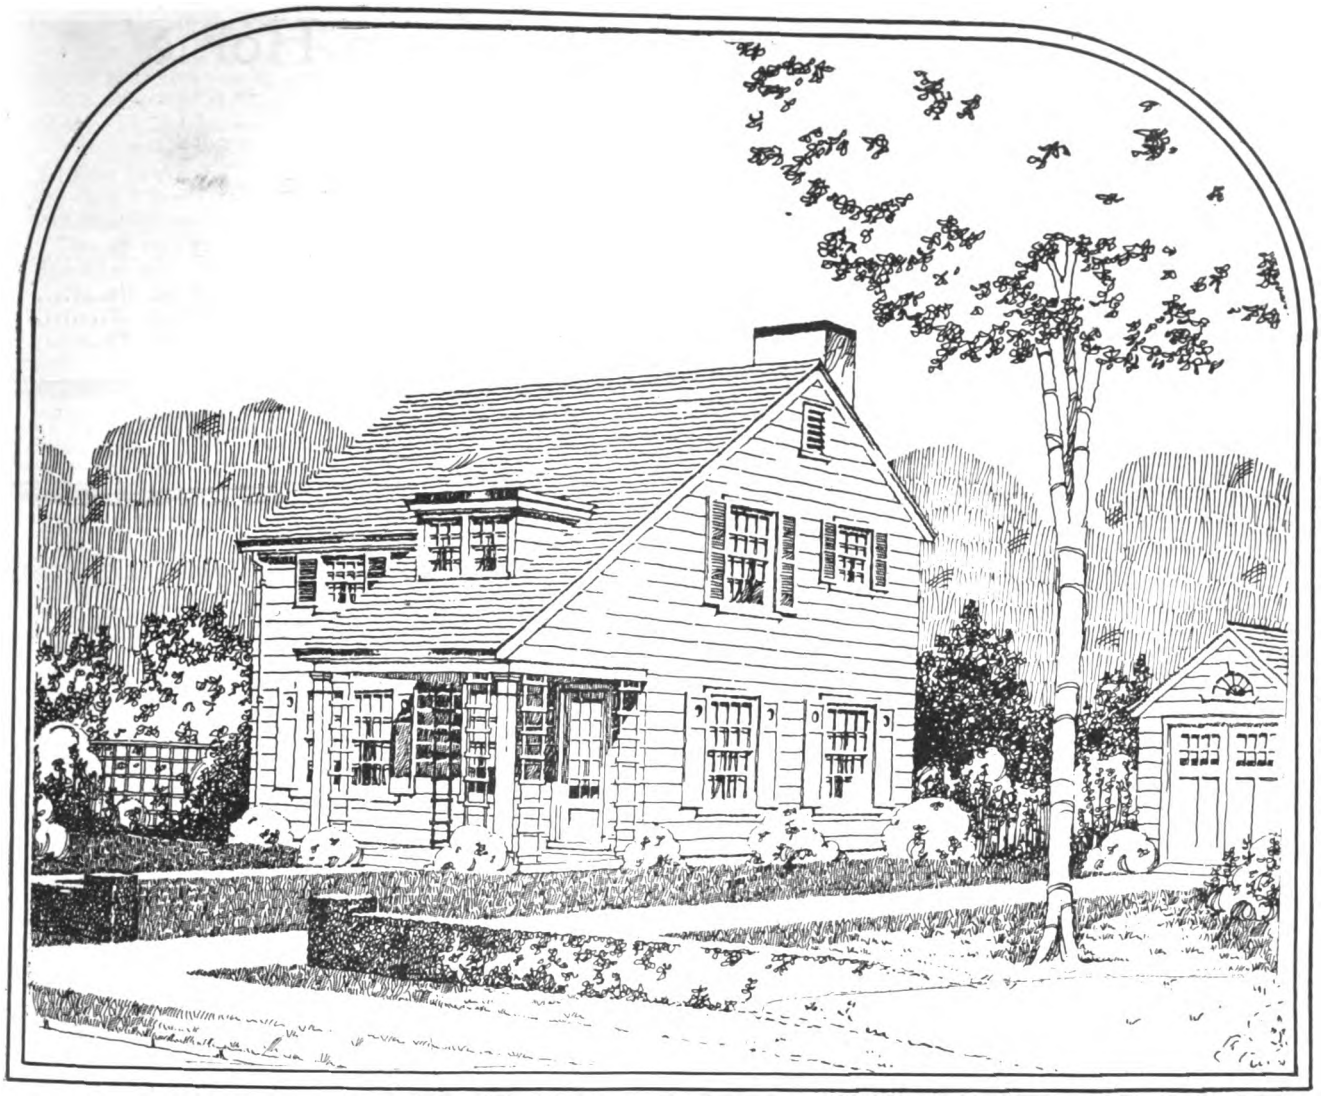
To the sum of the items enumerated above, after proper credits have been given, a percentage is to be added for contractor's fee. We recommend a charge of 10 per cent to cover this item.

Payments for extra work should be made monthly on or before the tenth of the month following the month in which the extra work is performed. Extra work invoices should be paid in full, no percentage on same being retained by owner.

What About Our Future Lumber Supply?

OUT of 822 million acres of virgin forests in the United States there are 137 million acres left. This remainder is being cut at the rate of 5½ million acres yearly. In twenty-five years our supply of virgin timber will be exhausted. There is no way of adequately meeting the timber shortage that will then inflict hardships on the country. This hiatus will continue until new trees can be grown.

The New York State College of Forestry is cooperating in presenting these facts to the people. The public should demand the most sensible, early remedial measures. The impending wood famine should be mitigated as far as lies in the power of scientific forestry and public effort.



This movement for the relief of the forestry situation, just gaining headway, is at least twenty-five to forty years too late. In spite of everything we may do there will be a gap of 25 to 40 years between the period of exhaustion and the time when a new supply of timber can be grown in which this country will suffer severely from a scarcity of wood.

Gifford Pinchot, formerly forester of the United States, declares that there are no longer any inexhaustable supplies of forests anywhere. Each nation needs all its forests and more. Today the freight on lumber from coast to coast is boosting the price of lumber nearly 25 per cent., so it is easily seen that the cost of importing lumber from overseas would be almost prohibitive. The importance of the forestry question is second to none among our industrial problems in times of peace, but it would be vital to our safety in war.

The college urges a wide, comprehensive policy on the part of the state and nation in reforestation, forest protection and the utilization of the forests. Such a policy should become effective in 1922, and the people should get back of the movement without delay.

A shortage of wood will cause the adoption of other materials to take its place. Iron in different forms, clay products, cement, hard rubber, etc., will be used for framing, siding, and trim to a greater extent in future buildings.

Practical Six Room Home *of* Beauty

THE ground area of this house is small, and the plan is nearly square, with no breaks or extensions. This means marked economy in the cost of construction.

This house measures but twenty-five feet, six inches front, by twenty-two feet, six inches deep, yet; the plan arrangement allows the three main rooms of the first floor to be of good size, owing to the economical use of all available space.

But, the real feature of this house is the second floor plan; here are three good bed rooms, a bath and plenty of closets, all provided over the very modest size of the first floor, and the rooms are not small, and have full ceiling height.

Specially Designed for
BUILDING AGE
and
THE BUILDERS' JOURNAL

by R. C. HUNTER & BRO.
Architects New York

Then too, the roof extending out over the porch to the first story gives the house a broader appearance that is well proportioned to its height, and it allows the house to be placed on a very narrow lot.

Small houses that are full two stories in height usually appear too high for their size, since whether the house be large or small, the ceiling heights vary but little. Small houses should be of the cottage type for the best effects, but room cannot be sacrificed on the second floor, and this is why a successful small house is hard to find. Generally small houses are either artistic and impractical, or they are practical but ugly.

The little house shown herewith combines the practical and the economical with the artistic.

Note the hall and stair arrangement, not an inch of waste space, yet the arrangement is artistic as well as economical. All of the rooms will furnish well. Cost of construction about $5,000.

Quantity Survey *of* Six Room Home

Shown on Preceding Page

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are not areas to be covered, with no allowance for waste, matching, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protection, scaffolding and general equipment and supplies have not been included.

Such items as are marked "Unit" are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	160	cu. yds.
Excavation for footings	11	cu. yds.
Excavation for areas	4	cu. yds.
Excavation for trench walls	7	cu. yds.
Excavation for leader drains and dry wells	6	cu. yds.
Backfilling around walls, etc.	28	cu. yds.
Leader drains and dry wells.		
Field stone for dry wells	5	cu. yds.
4 in. salt glazed tile drain pipe	18	lin. ft.
4 in. elbows	3	

Masonry

CONCRETE WORK

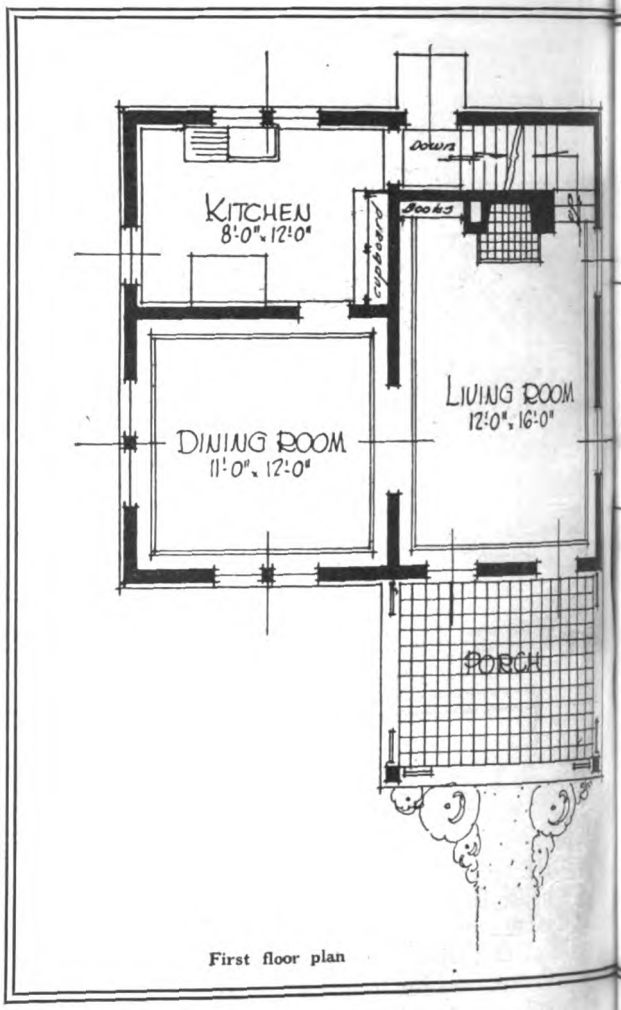
Concrete for cellar walls	610	cu. ft.
Concrete for footings	142	cu. ft.
Concrete for trench walls	87	cu. ft.
Concrete for area walls	84	cu. ft.
Cellar floor (3 in. concrete and 1 in. cement finish)	425	sq. ft.
Area bottoms (brick and sand)	20	sq. ft.
Porch floors (12 in. cinders, 3 in. concrete and 1 in. cement finish, colored and blocked off)	129	sq. ft.
Concrete forms	1800	sq. ft.
Pointing cellar window sills	14	lin. ft.

Brick Work

Common brickwork for chimney (or 3.3 M.)	162	cu. ft.
Face brick for hearth and jambs (or 84 brick)	12	sq. ft.
Fire brick for fireplace (or 75 brick)	15	sq. ft.
8 in x 12 in. T. C. flue lining	56	lin. ft.
3 in. bluestone chimney cap (1 ft. 10 in. x 2 ft. 8 in.)	1	

Mason's Iron Work

Fireplace damper (2 ft. 6 in. opg., with throat, etc.)	1	unit
C. I. ash dump	1	unit
C. I. cleanout door for ash pit (16 in. x 12 in.)	1	unit
C. I. cleanout door for boiler flue (8 in. x 8 in.)	1	unit
Thimble for boiler flue (8 in. dia.)	1	unit



Plastering

Three coat Patent plaster on metal lath, gross (Net 420 sq. yds.)	485	sq. yds.
G. I. corner beads	72	lin. ft.

Tile Work

Tile work for Bath Room.

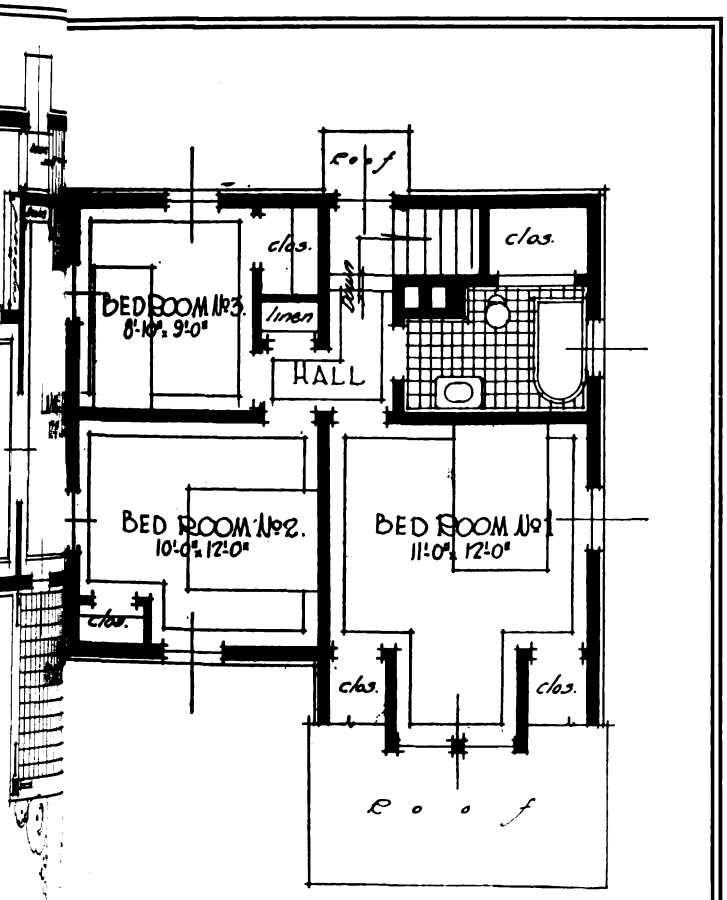
Floor (1 in. hex. white)	42	sq. ft.
Wainscot (3 in. x 6 in. white wall tile)	104	sq. ft.
6 in. sanitary base	26	lin. ft.
Moulded cap	26	lin. ft.

First floor plan

Sheet Metal Work

Tin roof on dormer	75	sq. ft.
Copper flashing for roofs, etc.	13	lin. ft.
Copper flashing for column caps	2	caps
Copper flash and counter flash for chimney	14	lin. ft.
3 in. copper leaders	47	lin. ft.
Bends for leaders	8	
Gutter thimbles	4	
3 in. x 4 in. G. I. gas range vent	22	lin. ft.
Cap and thimble for same	1	

Carpentry



TIMBER

All No. 1 common stock, hemlock, rough unless noted.

Cellar stairs, 12 risers, 3 ft. 0 in. wide, box pattern, wall hand rail, etc.	1	flight.....

General Conditions

Add for permits, fees for water and sewer connections, etc., insurance and general overhead charges. Allow for general work not listed, such as grading, planting, etc. Include sub-bids: Hardware and applying same; painting and decorating; plumbing and gas fitting; heating and electric work.

Horizontal *vs* Diagonal Sheathing *for* Stucco Houses

IN many sections it has been common practice for years to place sheathing boards for stucco houses diagonally over the studs. The principal argument for placing sheathing boards in this fashion was that it acted as diagonal bracing for the frame work and gave a very stiff structure.

The full size stucco panel tests conducted by the Bureau of Standards have apparently proved that horizontal sheathing is preferable to the older diagonal form. The following is an extract from the report of the Committee on Treatment of Concrete Surfaces of the American Concrete Institute:

"When sheathing is used, it should be laid horizontally and not diagonally across the studs. The stucco test panels erected at the Bureau of Standards in 1915 and 1916 have demonstrated conclusively that diagonal sheathing tends to crack the overlying stucco by setting up strains in the supporting frame.

"This result is undoubtedly due to the shrinkage of the sheathing, and whatever benefit might be anticipated from the more effective bracing provided by diagonal sheathing appears to be more than offset by the shrinkage effect. Diagonal sheathing is also less economical than horizontal sheathing, both in material and labor."

Of course, when sheathing is laid horizontally adequate diagonal bracing should be provided at the corners. A good form of bracing is a piece notched into the back faces of the studs, each brace being continuous and having no joints.

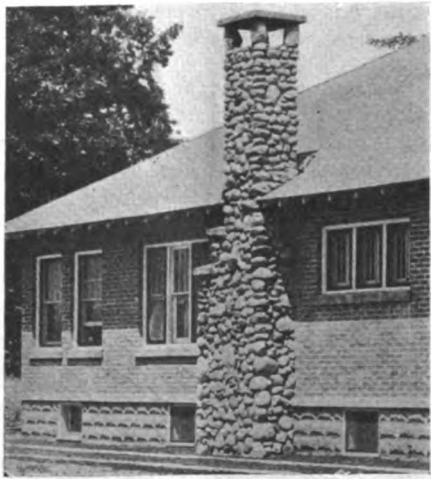
MASONRY
Practical Information on Materials and Latest Construction Methods

Some Hints *on* Cobble Stone Work

By JOHN UPTON



JUST the proper way to use cobble stones depends somewhat on the size and shape of the stones and the work for which they are to be used. If one could see the stones and get an idea of the work he could then give more exact details but I will try and give a few ideas which may help.

Where the stones are as large as a man can readily lift, they are laid up as is the case with squared and dressed stone, using a line and plumb bob, except that they are usually allowed to project more beyond the line so as to bring out the projections more prominently. The less there are the more they project, that is, where there is only a little cobble stone work on a house, as the porch piers or chimney foundation, it must be made conspicuous but where there is a lot of it this feature should not be over done.

Where the stones are mixed, large and small, the larger ones are placed at or near the bottom of the work and the smaller ones used higher up. For these smaller stones one may use a sort of form. Guides may be set up for the corners and loose boards put in between and moved up as the work proceeds.

If the work is to go to a considerable height it may be well to use forms from the start. These are partly to keep the work true to line and partly to hold them in place till the mortar sets, though one can not rely entirely on the mortar to hold them, as each stone, must be so placed that it will stay in without depending entirely on the mortar. As the mortar must not come to the face of the wall or at least not beyond the face as far as the stones, it is well to fill the outer edge of the form with sand which will fall out when the forms are removed. This is done by laying the stone first in mortar and then putting in the sand.

This cobble stone work is generally battered, that is made larger at the bottom than at the top. There are two good reasons for this. It is more stable, looks better and last can be more readily built this way as it would be difficult in some cases to carry the work up plumb. But it can be gradually drawn in and even though it may not exactly come to the line no harm is done nor is the difference noticeable.

Cobble stones make artistic chimneys

A good rule to remember is to start large enough at the base and then draw in as needed. Do not make any attempt to put the stone in courses. When you lay a large one place a smaller one next. Do not have the mortar too wet, and when the work is finished the joints will need to be raked out and pointed with a richer mortar, which must be kept well back from the face of the wall.

The color of the mortar may be varied by using a different brand of cement, or coloring may be used if desired. Next to the frames for doors and windows it will be necessary to use more mortar and this may need a narrow form to hold it till set.

At the top of the wall where it is to be made level for a sill or cap stone it may be well to use a form, or if there is a cap of concrete it should be built in place.

In this work one should use care in bonding the stones, as much as with dressed stone or more. All stone should lie on the natural bed. There should be headers and stretchers as well as through bond stones, and the mortar must be of good quality to do its part in making the work stable. It should have a large proportion of cement, if lime is used.

The corner stones should be large and long, to form a bond to tie the two walls together. These may need some dressing to make them fit. While the use of spalls or chips for blocking and levelling may be all right to some extent, it must not be overdone.

FINANCE and REAL ESTATE

Helpful Data for the Builder Who Builds to Sell

Financing Home Building

THE desire of every man and woman is to own a home of their own. Home ownership calls for an investment usually beyond the reach of the man or woman of limited income. Premiums, commissions and high interest rates are inclined to be a burden difficult to surmount. By the time this load is carried there is nothing left to apply on the principal, so the actual ownership of the home always stays in the distance.

Builders realize this and if some methods can be used to make the financing easy, more homes would be built. Today we see any number of earnest, industrious workmen who want to own their home, who are paying more for rent than would carry a house of their own. The trouble is that they haven't enough cash on hand to make a first payment of the amount as demanded by lending institutions. Paying high rent keeps them with their nose to the grindstone and they just cannot help themselves.

In cases of this kind, the plan of the United Home Owners of Washington, D. C., is of interest, as one member helps the other in acquiring the ownership of their homes and they in turn help each other.

That, in short, is the story of this plan which has been in operation for many years. In the article on page 60 of the July issue of the BUILDING AGE and the BUILDERS' JOURNAL certain features of the plan were not explained fully, the following notes clearly show some of the other advantages offered:

Any person desiring to secure a loan with which to buy or build a home simply makes application on the regular form which is dated, showing the exact time the application is made and which determines the exact order in which they will be entitled to secure a loan.

With the application one begins making monthly payments of 1% of the amount one desires to borrow. Upon receipt and acceptance by the United Home Owners of the application, a contract is executed.

The contract is a specific agreement in which all the terms and conditions are fully and plainly set forth. All questions are settled by reference to the terms of the contract.

CONTRACTS are placed in series totaling substantially $500,000, face value each. Every series operates independently, the contract holders thereof creating their own funds.

As soon as the accumulation in the loan fund, from its monthly contributors, monthly repayments on loans and other sources of accumulation, has reached the amount desired by the borrower, he is entitled to receive a loan equal to the amount of the face value of his contract.

All loans are secured by mortgages on real estate and are repaid at the rate of $7. per month per $1,000, face value of contract, with interest at the rate of 4% on the yearly unpaid balance.

IN approximately 11 years' time the borrower repays the loan, owns his home and during all this time has never paid out any more in any one month than what would ordinarily be paid as the rent.

There are four main features of the United Home Owners' plan, namely, the long time, easy repayment plan, the extremely low rate of interest, six months' grace in case of sickness or disability, and fourthly, the privilege of paying the entire amount.

There is also an investment feature of the plan, and in order to explain it we assume that when a contract matures for a loan the owner of the contract has changed his mind and decided not to buy or build. He has acquired a valuable borrowing privilege which has a market value and is in great demand. He notifies the trustees of the United Home Owners and they, through their fiscal agents, the Prudential Homes Company, of New York, will sell that borrowing privilege, the sale of which easily brings a premium of from $100 to $150 per $1,000.

At first glance this premium may appear to be an excessive one for a home owner, but when it is added to the total rate of interest charged and spread over a period of approximately 11 years, the total cost is considerably less than the rate usually charged. For instance, it is shown that the interest on $1,000 under the plan of this organization, covering a period of nearly 11 years, cannot exceed $210.41. If $150 premium is added the total charge is only $360.41.

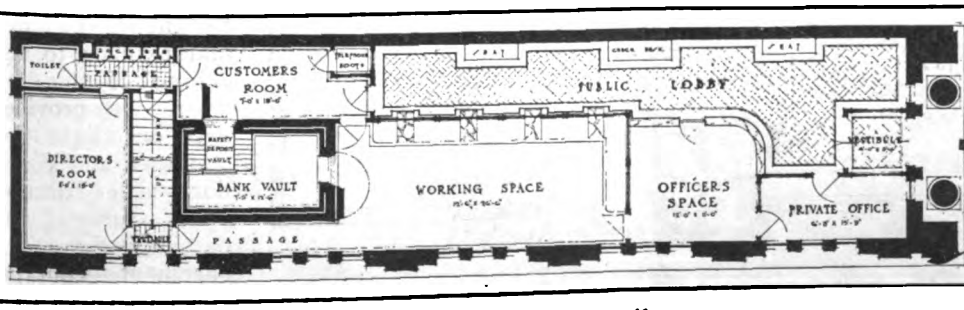
Dignity *and* Convenience Features *of* This Bank

THE LYTLE COMPANY,
Architects

Dignity shown in Exterior Design.

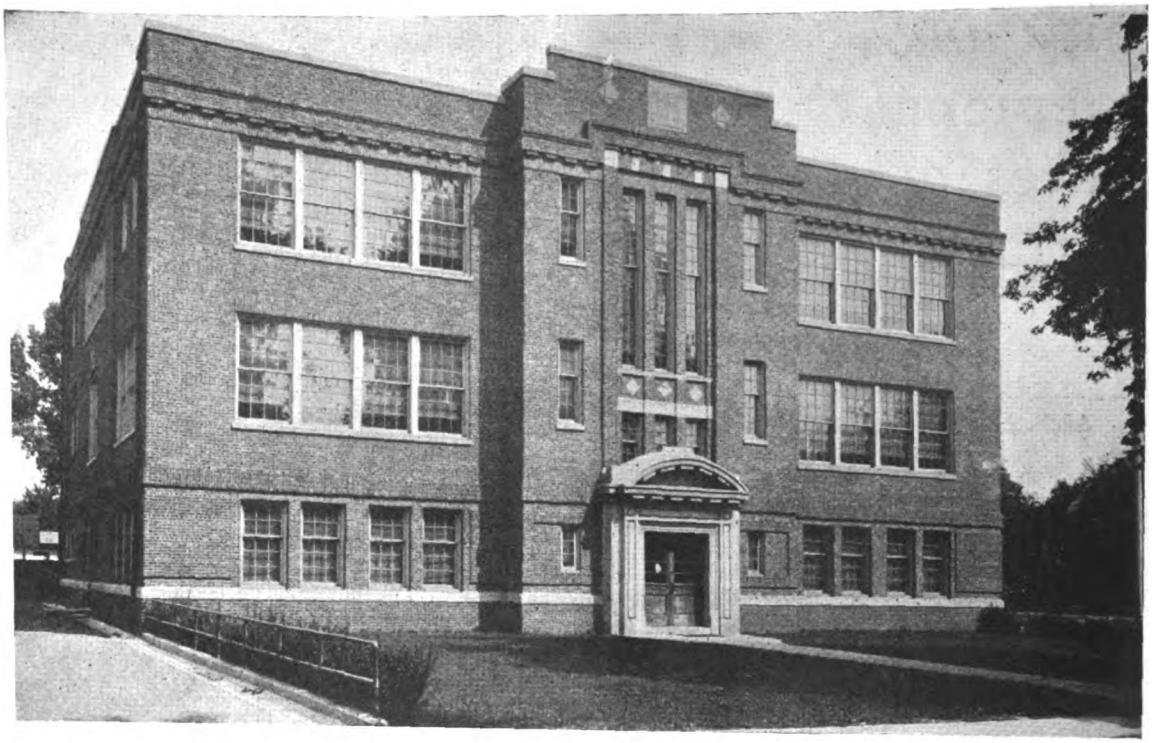


Interior view from entrance.

CORNER locations seem to be the favored ones for a bank and sometimes the frontage of these lots is quite narrow. To design a narrow building that will have a good appearance is quite a problem and calls for careful design.

In the building shown here, the width is only twenty-two feet with a depth of ninety feet. It was erected for the First National Bank at Iowa Falls, Ia. The building is faced with blue-black tapestry brick trimmed with cream colored terra cotta, with base of granite.

The interior, as our picture shows, has a very dignified appearance. The counters, etc., are of green veined cream colored marble with the woodwork of Tabasco mahogany. The front door is of bronze as well as the gratings in the different partitions.



The ceiling and walls are ornamented with plaster beams and cornices with relief work, all of which was decorated in harmonious colors and produce a very rich looking interior. The floor in the public space is laid with Mosaic tile and the balance of the floors are covered with a quarter-inch thick composition flooring. The customers are provided with a room from which they can enter the safe deposit vault which is partitioned off from the main bank vault. Taken as a whole, both exterior and interior combine to form a bank building of beauty and convenience.

FLOOR PLAN

Exceptionally well arranged working and public space has been provided in the floor plan which also retains the desirable feature of the central entrance.

Brick School *of* Attractive Design

HEACOCK & HOKANSON, Architects

REPORTS of building activity show a number of schools now being erected in different parts of the United States. This is an exceedingly good sign of the progress of the times, and, better yet is the report of the number of school buildings contemplated. It seems quite certain that builders will have a good deal of school work to do for the next few years.

The rather interesting school design shown here was built at Riverton, N. J., from plans prepared by Heacock & Hokanson, of Philadelphia, the general contractor on the job being Mr. John Tait, of Camden, N. J. A plan of the first floor is shown. Note that there are entrances both at the front and rear with a very wide corridor between on which the class rooms open. The second floor is divided into class rooms similar to that shown for the first floor.

The second floor arrangement is similar to this first floor

The building is built of brick with trimming of limestone. The lintels are of brick, the majority being laid perpendicular in soldier courses and for others a flat arch has been formed. This, together with the soldier belt courses produce a very interesting study in brick work.

The high perpendicular triple window over the main entrance is an unusual feature of the design. This, of course, is on one of the upper landings and extends to the ceiling of this top floor. It provides excellent light for stairway and corridor besides forming the feature of the outside design. [illegible] basement cont[illegible] play rooms, etc.

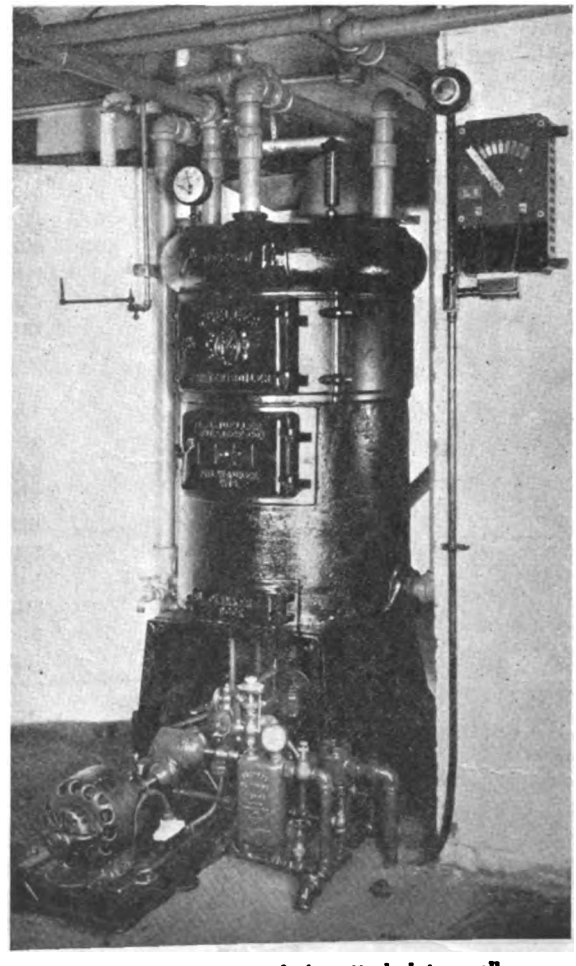
The Coal Crisis Creates Popular Interest in Heating Small Homes by Oil

Builders Giving Attention to Automatic Working Heating Plants That Eliminate the Dirt and Work of Coal and Ashes

By A. V. HUTCHINSON

EVERY home builder's ambition is to discover some way of having his home heated to a comfortable temperature, without the exertion required to shovel in coal and shovel out the ashes, as well as to eliminate the dust and dirt accompanying these operations. His wish, to just push a button and have heat, can be gratified now, thanks to skill of engineers, who have attained their objective in perfecting oil burning equipment for small house heating plants.



Just imagine being able to lie in bed and know that the house will be at a temperature of 70 deg. in the morning without any effort on your part, or that just the throwing of a switch in the bedroom will start the burner immediately. Many reasons can be found for the impetus given fuel oil burning devices beside coalless days, shortage due to strikes and transportation and high prices.

The advantages that recommend fuel oil for domestic use are its cleanliness, uniform temperature and flexibility in meeting weather change, efficient and smokeless combustion, the fact that it is not affected by weather conditions, that less labor is required for operation, ash removal and minimum space needed for storage.

The present styles of oil burning devices are in the nature of attachments to existing types of coal burning boilers and furnaces, which can be quickly and economically changed for attaching the oil burner. The most important items are the installation of the oil storage tank and piping, which are governed by the fire underwriters' rules and local ordinances. Four distinct types of burners have been developed, and each has a big following in its particular section.

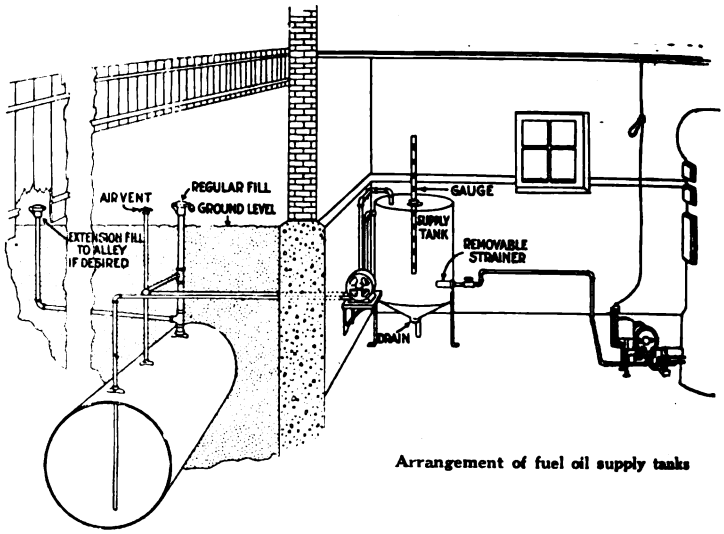
One of the first places to use oil for heating the home was the Pacific coast, and special burners for California crude oil were made. Oil burners also have made their appearance in the Middle West and East, and are adapted for the kind of fuel oil available. These have withstood the severe test of actual service for several years with entire satisfaction to the owners both from a service and cost standpoint.

Where the winter weather is severe, burners that are automatically controlled are popular, while in the far west, where intermittent service is all that is required, rotary burners are in the leading position. They burn a heavier grade of oil than the other types found farther east. In recommending which is the right burner for a house heating plant the builder should consider the following factors: Is service or economy desired? What will be the nature of the service required? Is fuel oil easily obtainable? What is the best type of burner?

Automatic oil heating device attached to small steam heating boiler

For ideal heating the two governing factors are efficiency and economy, and when oil is used as the fuel these two conditions rest to a large extent upon the burner. Efficient service requires that the burner must be positive in action, able to operate over long periods without attention and convert the oil into such form that the greatest amount of heat will be realized from a given amount of oil, without noise or dirt.

A vaporizing type of burner is designed for round steam and hot water boilers rated up to 500 sq. ft., warm air furnaces with fire-pot diameters of 18 to 26 in., and in a different arrangement for square sectional end boilers. The burner is held in the fire-pot on a standard, the goose-neck of the manifold resting on the fire-door ledge. Oil from a cellar tank flows under pressure to the vaporizing tube or generator, from which the vapor flows through a hand-controlled needle valve into the manifold to the burner heads. The height and volume of the flame are controlled, and there are no moving parts to get out of order. To start the burner either a gas flame or an alcohol primer is used. The cellar storage tank is fitted with an air gauge and



Digitized by Google

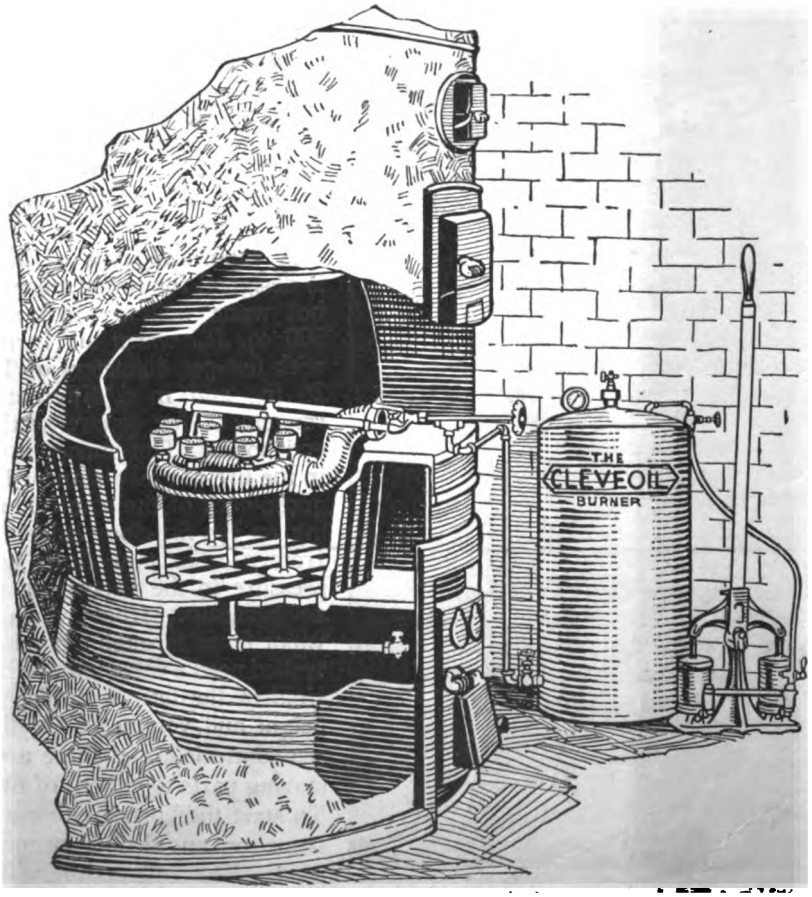
motor driven air compressor or hand pump if electric current is not available. Little attention is required by this burner, it being necessary to regulate the flame about twice a day, the air compressor being automatically controlled.

Automatic Working Systems

Three burners atomizing the oil mechanically and operating under thermostatic control are the Nokol, Aeroil and Williams. A uniform temperature of 70 deg. or any other desired temperature can be maintained, and the home owner need never worry about going home to tend to the fire.

Nokol consists of a thermostat and electrical control box attached to a blower or atomizer, a combustion chamber with constantly blowing pilot light and oil storage tank. Oil flows to float chamber, where needle valve maintains proper level. Action of thermostat starts blower, causing fine spray of oil to be fed in combustion chamber, where pilot light ignites it. Safety devices will shut off oil if pilot light fails, if dirt interferes with needle valve action the machine will stop, failure of current will cut off oil, so that every precaution has been provided. Nokol is made for steam and hot water boilers and warm air furnaces, and has received approval from the National Board of Fire Underwriters.

Arrangement of fuel oil supply tanks



Aeroil is a burner made in four sizes to handle house heating boilers rated from 500 to 10,000 sq. ft. of radiation. A motor driven blower and oil pump are mounted on standards directly in front of the feed door, and the oil and air line enters the fire chamber, turn downward and discharge the flame against a special deflecting plate resting on the grate. When the thermostat acts the oil lights from a constantly burning pilot light, the burner operating until the home is raised to the proper temperature.

The Williams burner is automatic, oil being delivered to an atomizing chamber, where it is mixed with the correct amount of air supplied by a blower driven by an electric motor. A special control switch and thermostat complete the equipment, which will handle house heating systems rated up to 10,000 sq. ft. of steam radiation.

Atomizing by Steam

Oil for the Caloroil burner is atomized by means of steam, a generator being mounted on the base plate located in the firebox of the heater. An oil tank supplies the oil nozzles automatically, water is supplied from the city main to the steam generator, and the steam escapes from specially designed nozzles and combines with the required amount of oil and air for proper combustion. A gas or gasoline primer is provided for starting the burner, and the control is by means of a thermostat if desired.

All of the rotary types of burners are hand-fired, as they are used in communities where intermittent heating is required. The intense flames made by these burners make it necessary to brick-up the fire-pot of the heater for best results.

Oil burner installed in hot air furnace with hand operated air compressor

Digitized by Google

The Ray burner is a very compact unit, consisting of a totally encased motor with extended hollow shaft to center of which worm gear is fastened, and with blower and atomizer at opposite ends. It is made in a number of sizes for boilers and furnaces, for either direct or alternating current. The burner is fastened to the ash-pit door hinged so that it can be swung out of the way.

Atomizing by Centrifugal Force

In the Johnson rotary burner the oil is atomized by a centrifugal device and is made for heating plants rated up to 10,000 sq. ft. of steam radiation. The fire is started by closing the motor switch, turning on the oil regulating valve and holding a light in the fire box. Thermostatic action will turn off the burner when the proper temperature is reached. Johnson burners are made for either direct or alternating current, are hinged to the ash-pit door and are made with or without oil pump.

An oil burner for boilers as small as 250 sq. ft. rating are the Fess types. Oil is atomized by rotary action and mixed with the right amount of air supplied by a blower. Air and oil are carried by separate lines, and a novel burner construction produces an intense but soft flame.

Efficiency of House Heaters

Experience and tests have shown that the efficiency of house heaters had been raised by 15 to 20 per cent. when oil fuel is used. Quicker response from the heater is possible and greater efficiency is obtained from fuel oil. It must always be remembered, however, that a heating plant with an oil burner attachment is only as efficient as the boiler or furnace to which it is attached even though all of the heat units are obtained from the oil.

What Will It Cost?

One of the particularly pertinent questions that will be brought up by the home builder will be, "What will it cost to heat with oil?" This cannot be answered for the whole country by one statement, but an outline of some of the factors entering into the selection, installation and operation of oil burning units should be considered, and will give a basis for accurate judgment. First is character of building; second, style, condition and efficiency of heater, amount and cost of coal consumed, labor and cost of ash removal and firing of coal, dirt and inconvenience involved.

It has been found that 100 gallons of oil will do the same work as 1 ton of high-grade coal when good operating conditions exist. The oil used in the various burners ranges from 26 to 38 Baume, so that by getting the price of the kind used it is easy to figure how it will compare with coal in cost. Tank wagon delivery for New York is about 8 cents per gallon.

Figures on Oil Consumption

A Chicago installation, with an automatically controlled mechanical atomizing burner, operating for 151 days during the 1920-21 heating season, in a steam boiler supplying 475 sq. ft., consumed 1,485 gallons of oil, or an average of 3 gallons per hour, to maintain a constant temperature of 70 deg. As the maintaining of a uniform temperature with coal is possible only when constant attention is given the heater, and, as this is infrequent with the average home installation, it is safe to assume that when coal was burned in this house during the night, when the fire was banked, that the room temperature was around 50 deg. for some hours. This might mean that a little more than 100 gallons of oil was used to a ton of coal, though no figures are available. However, the owner feels satisfied that the comfort derived more than compensated for the few extra dollars.

With the average house construction and to be on the safe side figuring an oil consumption of 100 to 120 gallons of oil equal to a ton of coal would be good practice. The vaporizing burners will show a lower fuel consumption than the mechanical burners, and these figures can be beaten if thermostatic operation is used only in severe weather.

Study of Fuel Oils

Some knowledge of the properties of fuel oil are desirable, for the oils from the different fields vary in content, but vary slightly in heating value. Fuel oil is a refinery by-product resulting from the distillation of crude petroleum. It is heavier than the crude from which it comes, and will not burn readily until atomized or vaporized and mixed with the proper amount of air. A blazing stick or live coal will die out before it will ignite the oil.

The questions of oil supply and storage are of vital concern when considering its use for heating. Present production and consumption, though very large, will not exhaust available supplies for many generations, and in this country large untouched shale areas promise much, according to Geological Survey reports. Present pipe line transportation methods from oil fields to refineries insures a continuous supply in all kinds of weather, so that in areas adjacent to refineries and distributing centers plenty of fuel oil is assured.

Storage of Oil

The reserve storage tanks, recommended by burner makers to house owners, range from 250 to 1,000 gallons capacity, depending on the estimated consumption. On the Pacific Coast as much as a month's supply in reserve is often provided.

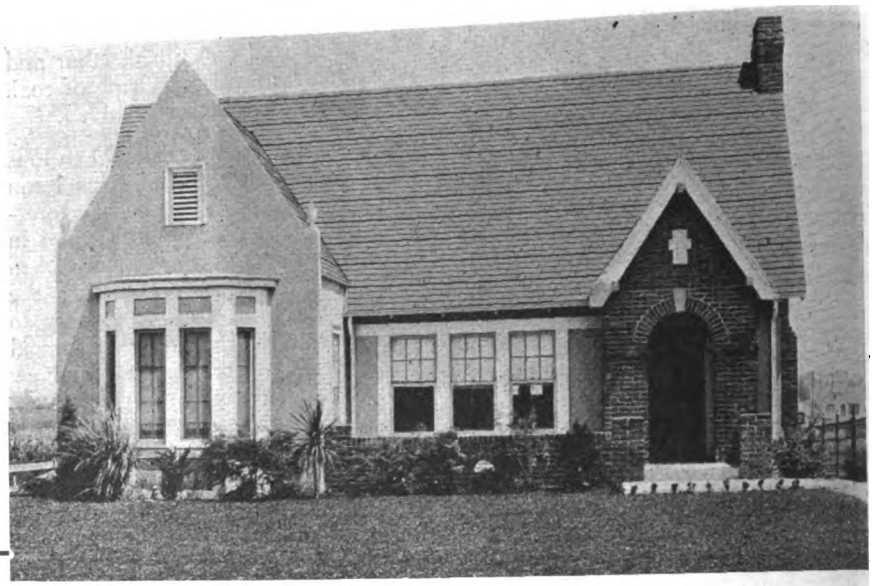
Underwriters' rules and local ordinances govern the storage of oil in homes, and the burner manufacturers have met these specifications in designing their apparatus. Pumps, air pressure, hydraulic, gravity (where permitted), and other patented systems are used and have been perfected and simplified.

Less Space Needed

In addition to the cleanliness and other advantages of uniform temperature, ease of control and minimum attention required when oil is burned, the home builder can figure to use the basement or cellar for something more than a rough storage space.

With a little space necessary for oil storage plenty of room is available for a billard room, playroom, maid's room or something of the kind, which would be impossible when coal is used, because of dust and dirt and the room it requires for its storage—about 45 cubic feet per ton.

Advantages to Builders



Also there is the commercial side, for the builder who sells his house. If an oil system with its many advantages is installed an exceedingly good sales and service argument is available, and the house will command a better price with but little extra initial cost. There are many places where oil can be successfully used for heating the home, but care should be exercised so that perfect satisfaction will be assured.

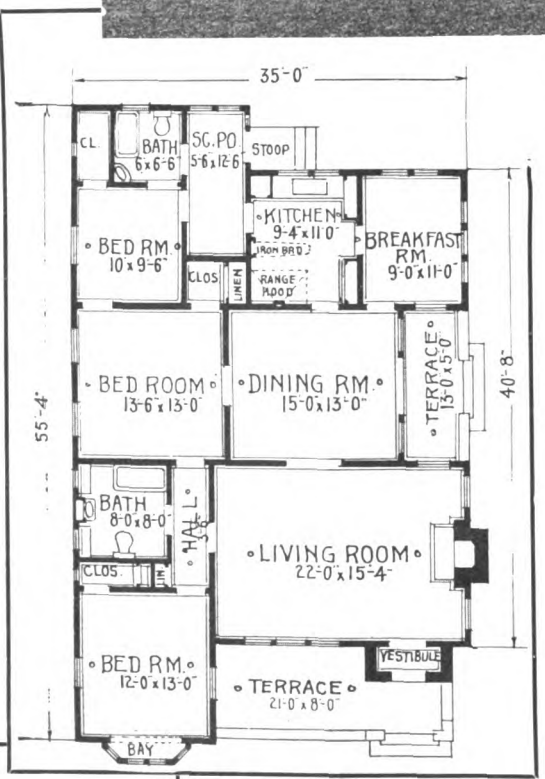
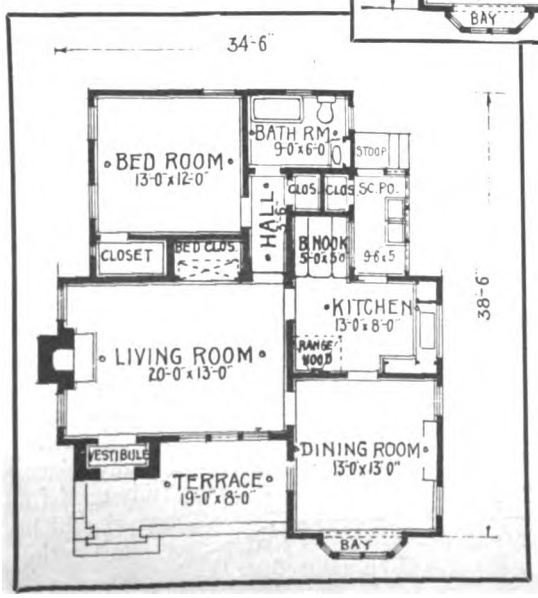
English Design Bungalow



With Two Floor Plans



By CHARLES ALMA BYERS

THE bungalow shown here, patterned after the quite popular English-cottage style, constitutes a home of which almost anyone might justly feel proud. The street view of it is, in fact, unusually attractive. It is also of a style to make it uncommonly satisfactory for duplication in any climate.

Interesting and enhancing outside features of this house that deserve especially to be brought to attention are the little vestibuled front entrance, the wall-enclosed and cement-paved terrace on the front, the street-presented bay of windows, and, further, as it is here actually planned and built, the small secluded terrace or porch on the side, off one end of the dining room.

The front doorway to the vestibule, incidentally, is here designed as but an open arch, but it could be, of course, for cold climates, provided with a door to enable its being closed. Even the effect accomplished in the steeply pitched roof, by the doubling of each fourth course of singles, adds much to the house's general attractiveness.

The walls of this house are of frame construction with an exterior finish of cement-stucco, in very light gray. The walls of the entrance vestibule, however, as well as the terrace enclosure and the chimney on the side, are of dark red brick. The liberal amount of wood trimming is painted white, while the front door is of dark-finished oak. The shingled roof is painted greenish gray, and the front and side terraces are floored with white cement, like the paving of old walks. The main foundation is of poured concrete.

Two floor plans, of materially different sizes and arrangements, are offered for creating the same front appearance, the small one, however, being a reversal of the other. The house here is built on the larger scale, which is comprised of living room, dining room, breakfast room, kitchen, three bed rooms and two bath rooms, besides the usual kitchen-entry porch. The back bed room, directly off of which is the smaller bath rooms, is, of course, primarily intended as a maid's room. The other plan, it will be seen, contains but one bed room, while adjoining one corner of its kitchen is a little breakfast nook. The living room in this case is equipped with a closet bed, to enable its being used as an emergency sleeping room.

Both plans are liberally provided with built in conveniences. Bed rooms naturally possess large clothes closets.

The house has neither basement nor furnace, but the one or the other might have been provided, with a stairway leading thereto from the kitchen-entry porch. It is equipped with gas radiators built into the floor for heating, and with all other modern conveniences. It is built in Los Angeles, California, and was designed by E. B. Rust, of that city.

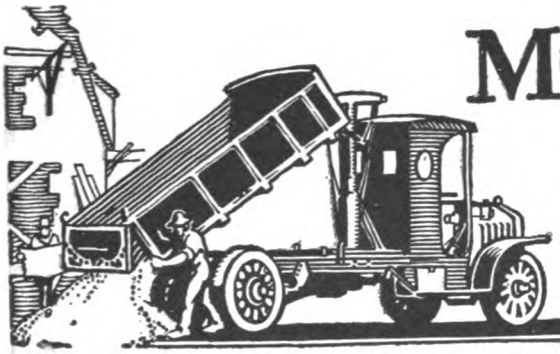
Round Barn Design

INDICATIONS point to prosperity on the farms and, therefore, it is to be expected that there will be a good deal of building activity in the rural sections.

The operation of the Federal Farm Loan Act will furnish the means whereby farmers may finance any desirable improvement, hence builders can obtain many good contracts by getting in touch with the farmers in their locality.

The builder should be ready to talk on any part of farm building. He should have on hand quite a number of designs of different sorts of barns and out buildings; also the interior equipment, as that



is also of much importance to the farmers. By way of interesting contrast, we are publishing this month two pictures of a round barn as this design has many features that commend itself to the farmer. Many are loud in their praise of its convenience.

A silo is, of course, the beginning of the round barn; it is located in the center and the ensilage is taken directly from the bottom doors and placed into the mangers with the least amount of carrying. A narrow concrete alley extends all around the silo and this enables the attendant to easily reach every manger.

Hay storage space is provided above and this is dropped through convenient chutes into the feed alley. The stalls and outer alley are of concrete and a gutter is formed in same at the back of the stalls. This arrangement makes cleaning very easy and that is why this form of barn finds many advocates.

Plenty of windows all around provide an ample amount of sunshine and ventilation; both are so necessary for the well-being of the cattle. Plenty of light, as arranged for in this barn, enables cleaning and the milking to be more easily performed as one can see all operations.

MOTOR TRUCKS

Efficient Methods in their Use and Upkeep

Hauling: When, Why, and How

By PHILIP L. SNIFFIN

MOTOR trucks, varying in numbers and capacities according to the size and scope of the building contractor's business, have come to be indispensable features of the building field. More and more emphasis is continually being placed on the factors of promptness and dependability in transporting materials to the scene of operation.

It is consequently of substantial importance that the contractor consider as specifically as possible the ways and means for accomplishing the most efficient results at a minimum of maintenance and operating cost. The use of motor truck equipment for general hauling purposes seems a relatively simple matter, but there are a good many unique phases which are well worth considering, both because they are keenly interesting to study and because they present many opportunities for reducing costs and for increasing the quality of the service obtained.

Selecting the Right Equipment.

The first consideration is the matter of selecting the proper number of vehicles to allow a maximum of service at a minimum of waste. Largely, a careful selection of equipment involves consideration of the kind and size of motor car installed as well as the type of body best adapted to the builder's requirements. For most purposes in this business, where the problem is one of transporting lumber and material to the building site, a light model car of open type body, satisfactorily answers the purpose. However, where other phases of hauling are involved, such as excavation contracts and hauling heavy or bulky material, the problem is somewhat more involved, since larger and more substantial equipment is frequently needed to handle the work. Here, too, it is especially well to make a careful study of body types, since much time and money can be saved in loading and unloading and in more efficient carrying capacity, if the body is best suited to the work it is to do. There should be a body design to meet each concern's individual requirements, have it made if needed.

Pay Attention to the Motor

At any rate, it is well to consider in buying a motor truck, that the heart of the truck is the motor and for that reason the motor should be given the greatest amount of attention. A truck may have exceptionally good appearance, its construction may be of the strongest and its price may be attractive, but if the motor is inferior or faulty the other points are of little value to the user. In maintaining a motor truck, fully 80 per cent. of the cost of repairs may be traced to the motor. Consequently, the motor is the first determining standard of judgment. "First cost" in installing such equipment is far from being the most important cost.

THE successful truck purchase is one that renders efficient service per unit of delivery per mile, over a period of years.

Trucks or Horses?

Gradually, but certainly, the delivery phases of the contractor's business are trending more and more toward complete motorization. The reason for this is twofold—greater speed and economy for most general purposes. Furthermore it is true that the motor truck enables the builder to reach an area that it would not be possible for him to reach with horse-drawn equipment. This, of course, is a matter of speed in covering distance and the freedom of the motor car from the somewhat definite limitations of the horse.

Where the horse and wagon is still being used to advantage, it is principally due to limited opportunities for expansion of the builder's business into more distant fields. In fact, there are many cases, usually with a small business, where wagons will answer the purpose at a cost lower than that of motor cars.

A good basis for determining which of the two methods is more economical is that of idle time involved. As pointed out above, a horse and wagon represents an exceedingly smaller investment than does a motor truck, and it is to this fact that its chief advantages are to be traced.

The items of fixed cost, such as interest on the investment and depreciation, being smaller, the cost of idle time is proportionately less. This idle time may be considered either as wasted time of the equipment when it is in the stable, or as standing time during loading and unloading periods.

Digitized by Google

Therefore, for deliveries particularly on short distances where the time spent for loading and unloading is greater than the actual running time, it is reasonable to assume that horse-drawn equipment is better adapted. Likewise, where delivery demands are unsteady, rising and falling at intervals and where the equipment would be unused for a considerable length of time, it obviously would not pay to invest heavily in motor units.

There are, however, certain advantages to be gained by the use of the motor car when used with a proper understanding of its possibilities. The first and most important of these is its ability to increase the scope of the contractor's business, by extending the delivery radius and taking in new territories, for which work it is more economical, more rapid, and as a whole, more satisfactory than horses.

The above does not mean that the motor truck is only adapted to long distance delivery. In a great many cases, provided there is a minimum of idle time, a light delivery truck will prove more economical than horses or even short delivery. It remains, therefore, for a careful study of the amount of idle time involved, to decide which of the two is adapted to the specific requirements at hand.

It may be said that many successful delivery systems combine both forms, the equipment comprising the maximum number of motor trucks that can be kept continually busy, supplemented by enough horse-drawn units to conveniently take care of shorter hauls and to use in rush seasons.

Systematic Maintenance

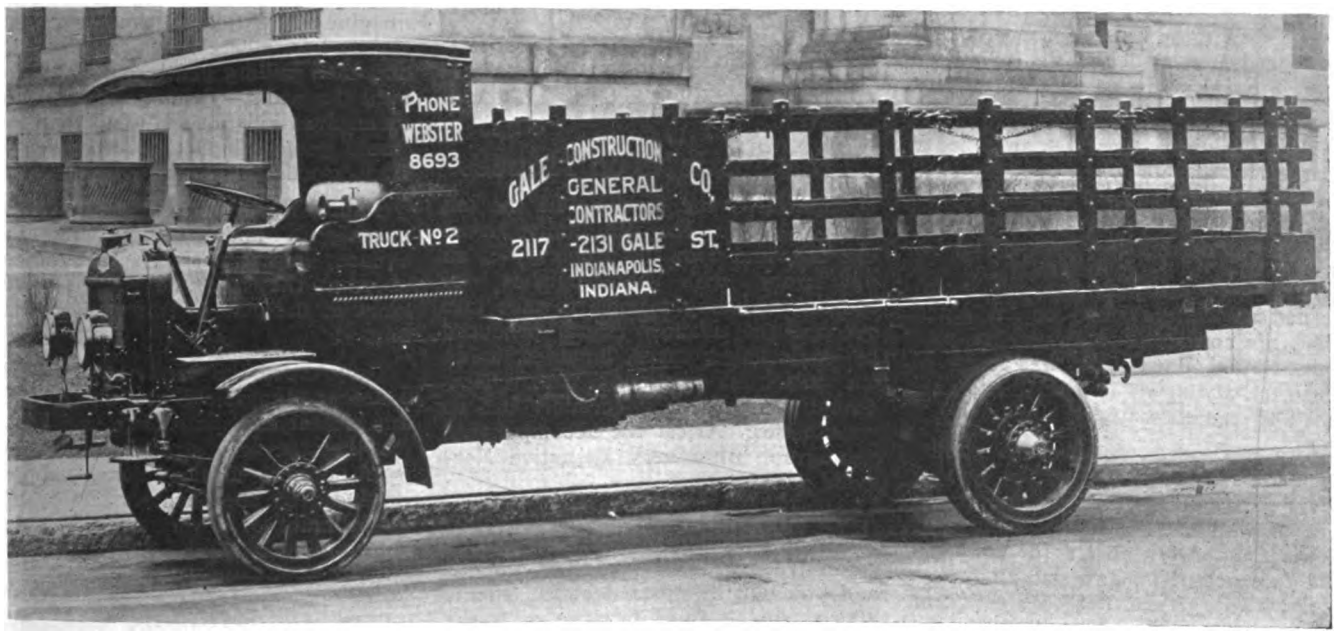
It is a surprising fact that few builders realize the economies that are available in motor equipment operation through providing careful, systematic maintenance of the vehicles. Regular inspection and regular attention to minor repairs will save much on the cost of overhaul and major repairs and in addition to this will add greatly to the productive life of each car. In this is included the item of lubrication and other attention, such as the care of the engine, radiator, battery, ignition system, etc.

Many concerns have been known to pay more per year for repair work than for gasoline, and this may be generally attributed to neglect in maintenance. The extra cost involved in better class drivers and proper supervision is considered justified regardless of how many trucks are operated, since the difference is made up in repair cost saving.

It is wise, therefore, for the builder to acquaint himself with the more important fundamentals of truck operation and maintenance so that he will be able to properly supervise the drivers.

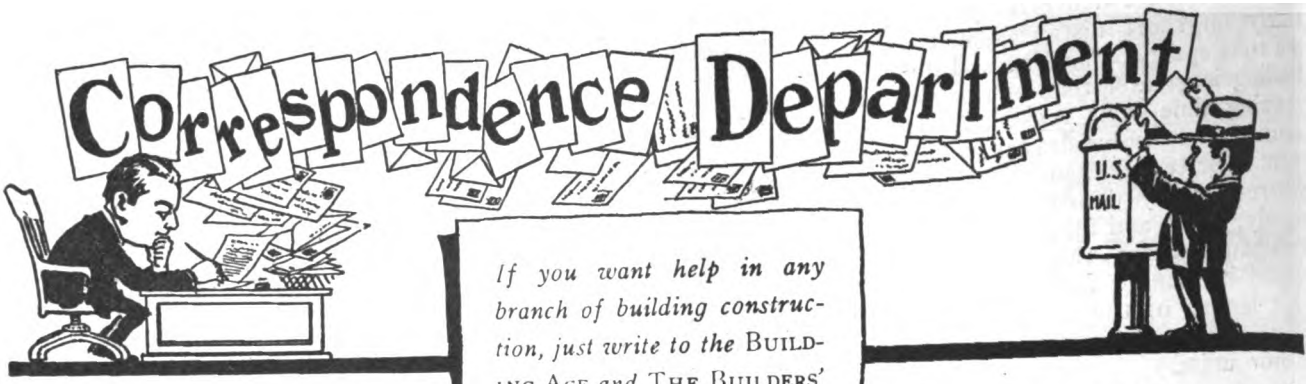
Fundamentals in Brief.

From the very broadest viewpoint, it is well to consider in summary, the more important fundamentals of successful motor car operation. The following five points deserve special attention since they represent the summarized experience of contractors who are successfully employing motor truck equipment.



"In estimating the number of trucks necessary, consider average requirements and not maximum requirements, but do not overlook a small surplus which will permit regular overhauling of the entire fleet."

"We select our trucks so that we can use their full tonnage capacity, with weight of goods given first consideration over bulk."



"We let actual conditions govern the use of our trucks rather than set, inflexible rules."

"We use trucks only when they afford greater advantages than any other agency of transportation available for that particular job."

"Always in the employment of trucks, we remember that depreciation, repairs and interest on the investment represent a large share of the cost of truck maintenance. Therefore, we plan constant utilization so that they may work as many hours as possible during their lives."

Kitchen Improvements

I SEE you ask for ways of doing work quicker, easier and better; so I will give a few hints on arranging a kitchen from a woman's standpoint:

The sink was set against a solid wall where the light was no good, making it hard to be sure all dirt, etc., was off the dishes, so I had a window put over the sink and also one to the right with an electric light over the sink.

Now the dishes were set on a board at the end of sink when brought back from the table and, in order to have it clean, it had to be scrubbed with scouring powder three times a day.

I had it covered with zinc which was turned up and fastened on back and side; the corner tilted up and the outside turned down. It was easy to clean, always sweet and no damp sour smell to call flies.

Also got tired of going to pantry each time I wanted a spoon or pot cover so I had a board fastened across side of wall back of stove; I obtained a wire pot cover holder for 20 cents and fastened it up and put all covers in it with large size next the wall and the smaller outside. I could easily get the cover wanted and they were always dry and never rusted.

Next put nails in board so I could hang spoons, strainer and even stewing cups up. It saved lots of steps, they were always dry and handy. Before I would knock down three or four articles trying to find what I wanted.

The kitchen table was too short for me to work at easily, so I had a hinged front fastened to the legs and the top covered with zinc, as it cleaned easily and on which I could set a hot dish right out of the oven, for it did not matter.

I had a cupboard for my kettles and cooking pans under the drain board by the sink and you would be surprised at the amount of work these few conveniences saved me. I think builders should give some attention to these small matters that mean so much to the housewife in her every-day work.—**Miss E. L. Hackett.**

Tree-Shadows on Houses

MAKING the dwelling fit the lot, —or fit the old, native trees one may find upon his property,—is an old story with home-builders, of course! Building a home to take into account the shadow effects produced by one's larger trees, however, is an art which is distinctly new. New though it may be, it certainly has its possibilities. Attest the accompanying photograph of a very attractive Norwood, Ohio, home.

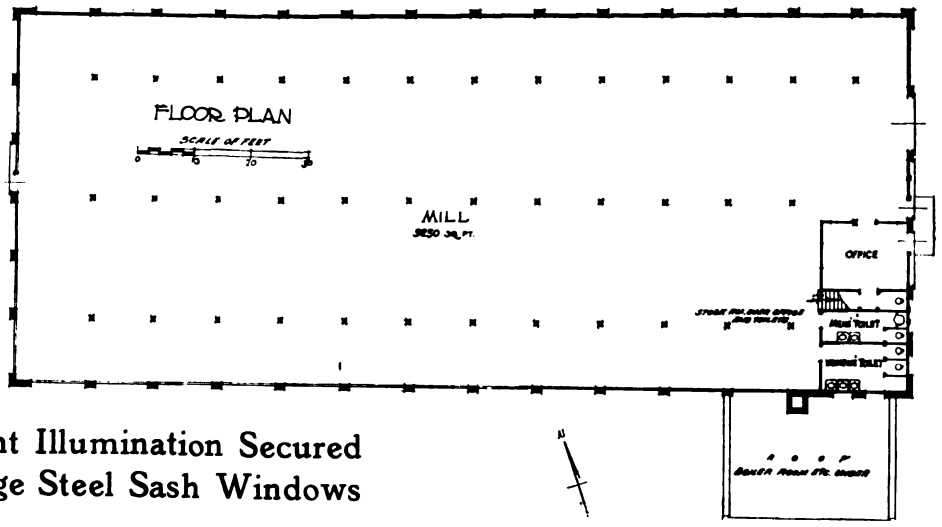
Slip down the first avenue on which this home is located in any season when trees are not in fullest foliage, and you will be amazed at the effects which tree-shadows produce with the immaculate gray concrete walls employed there. Basically, the exterior

house plan is simple. But, when the shadows cast by the big tree near fall longest, one gets a strange effect upon the eye, from this home.

The front corner, the exact angle where fore and sidewalls meet, seems to have been shunted gently outward, bottom foremost. If one could imagine some Colossus taking hold of the corner, where it strikes the earth, and then pulling gently out and away, until the walls,—yielding duly,—formed themselves into a semi-tent shape, one would get perhaps the best notion of what words fail exactly to portray.

Suffice it, people without number, passing in mid-street or cross the avenue, stop in their tracks, surprised at what they see and eager to learn more of the plan of this strange dwelling.

They cross the walk; approach for a nearer glimpse still and find, to their amazement and quite often their chagrin, that the very strange corner-work is an optical illusion alone, and this produced by the shadows cast by the major limbs of a very old tree, rising near.—**Felix J. Koch.**



Bridging

FROM time to time I read articles in yours and other trade papers about wood bridging being omitted and wire or band iron being used in its stead. An article in your August issue is on the use of wire for bridging and to my estimation wire or band iron is not worth the room it takes up. After the timbers are in place one or two years and are thoroughly dried out, the wire will be loose and of no value whatever. It is plain enough to see that where the wooden bridging tightens itself as the timbers shrink, the wire becomes loose and useless. It would be well, I think, to take this matter up in one of your future issues. —**Carl Van Walderveen.**

What has been the experience of other readers of BUILDING AGE and The BUILDERS' JOURNAL with wire or band iron bridging? Let us bring out some of the points for and against its use; we realize there are two sides to the question.—**Editor.**

Modern Weaving Mill Design

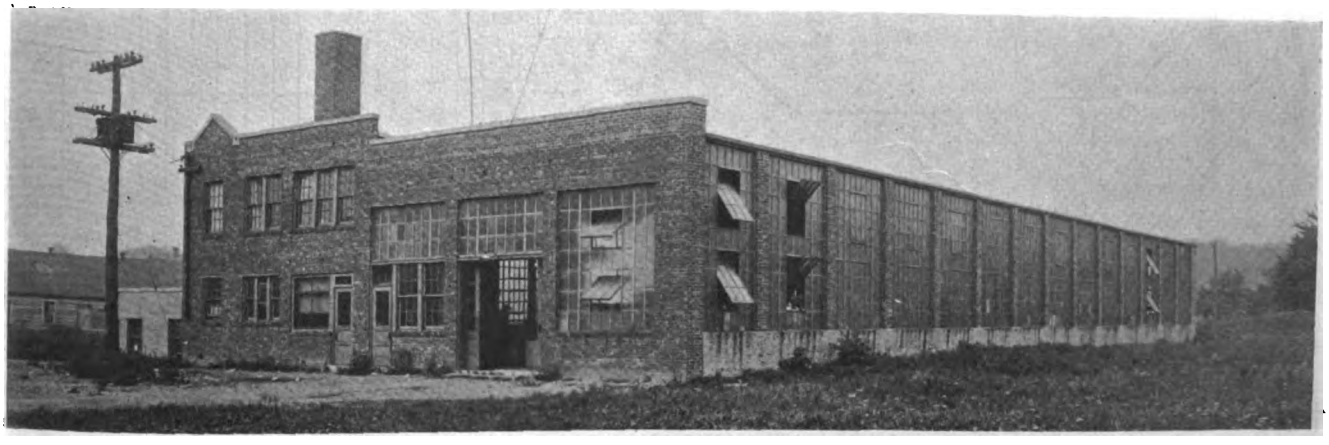
Plenty of Daylight Illumination Secured by Means of Large Steel Sash Windows

THIS mill presents a somewhat new departure in the design of weaving mills, especially as to the daylighting of the interior.

Heretofore, saw-tooth roof construction, deemed a necessity to get proper light on the looms, at least in buildings over thirty feet or so in width, has not been adopted. Nor have skylights been used. Flat skylights have never been considered ideal for mills on account of the "hot-house" effect produced by the sun's rays streaming directly into the interior, intensified in power by the skylight glass.

The saw-tooth roof, with the glass section facing north, has been much used for mills and has proved very satisfactory for lighting the interior, but, this type of roof is expensive to build and difficult to maintain in a weatherproof condition on account of the various snow pockets formed.

To get ideal light for the looms, an ideal roof that would cause no trouble, and these at the lowest cost; these factors decided the design in the mill shown herewith.



The building is sixty-four feet wide by one hundred and fifty-eight feet long. It houses ninety-two looms, provides space for the quillers, etc., and leaves ample room for packing. A comfortable office and the toilet rooms are also provided. A handy stock room occupies the mezzanine over the office and toilet rooms.

Taking advantage of the slope of the roof by pitching it toward the south, enabled the steel sash on the north side to extend up to the high point of the roof, thus giving excellent north light well into the interior of the mill, so no skylights were necessary. The sash were glazed with ribbed glass to diffuse the light and eliminate the glare, the ribs also served to carry the light into the interior.

The floor construction of the mill is of cinder fill laid on the ground, concrete bed and a double wood floor laid over sleepers. This gives a dry permanent floor, allows for securely anchoring the looms, and the wood finish floor does not "dust" as does a cement floor. The "dusting" of cement floors means disaster to fast revolving machinery, or high speed equipment of any kind; it eats up the bearings in a very short time.

The looms are driven by individual motors of the A. C. type. This keeps the interior of the mill clean, it is not cluttered with a wilderness of shafting and transmission as results from the old shaft drive system.

This mill was designed by R. C. Hunter & Bro., Architects, of New York and built in Tenafly, New Jersey, for R. M. Burch, and is used for the manufacture of cotton towels.

CARPENTRY

Good Practice in Frame Construction and Finish

Short Cuts to Rafter Bevels

Simple Methods for the Practical Man

By C. A. DONER

OF all the jobs a carpenter is required to do, none are the subject of more written instructions than rafter framing and none less understood.

Books have been published, tools designed and pages of building journals devoted to explaining these seemingly high-brow problems, and after all is said and done, the mind of the average carpenter remains unimproved, not that a practical understanding of rafter framing is beyond his mental range, but because he is obsessed with the impression that the subject is one for only those versed in geometry and higher mathematics. Begging your indulgence, I shall try to present a solution in a more simple form.

Figure 1 shows roof lines as they ordinarily appear upon blue prints.

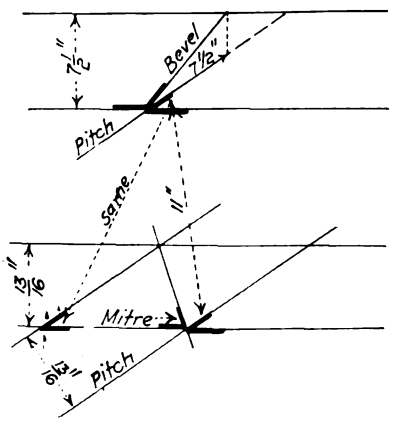

Figure 4

With this data the roof framer proceeds to "cut" this roof.

Figure 2 shows the same with the addition of lines indicating positions and length of runs of all rafters. This is valuable in checking off the pieces as framed. Now observe that the longest run of any common rafter is ten feet, hence a diagram for this portion of the roof will contain all the lengths and bevels in this roof. Accordingly, Figure 3 is submitted, and if it is competently drawn to a scale of one inch to the foot, the actual lengths can be scaled fairly accurately.

Exact lengths can be figured if preferred: If the rise is 6 inches multiply the total feet of run of common or Jack rafter by 13.64 and for hip by 17.93. For 8-inch rise: 14.42 and 18.76. For 10-inch rise: 15.62 and 19.68, and for 12-inch rise 16.97 and 20.78.

This roof being 8-inch rise, the longest common rafter is 12 feet, 1/5 inches and hip 15 feet, 7 3/5 inches. Rafters being spaced 24

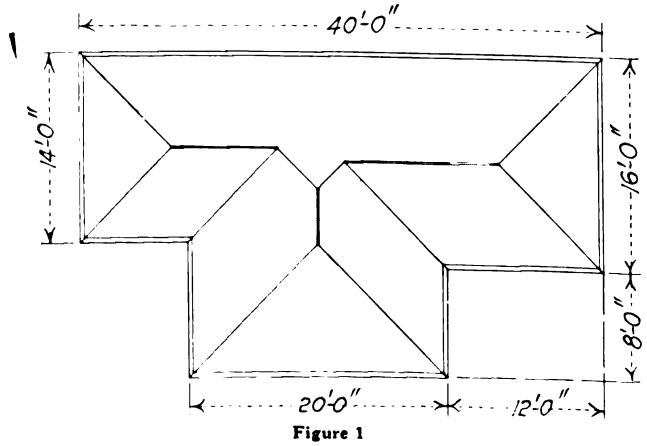

Figure 1

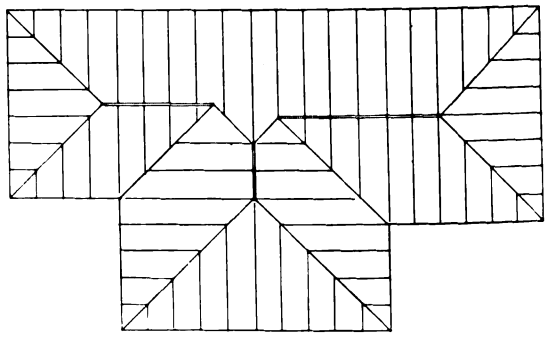

Figure 2

Digitized by Google

inches on centers their runs diminish 24 inches, hence lengths are shortened successively 2 feet, 4⅞ inches for common and jacks, and 3 feet, 1½ inches for hips and valleys, thus, figure these lengths and work them on the diagram, which now completes a working plan for the whole roof.

This simple method applies successfully to more intricate problems as revealed in the subsequent figures. Figure 4 shows what is perhaps the most simple and expedient way of getting hip cuts for roof boards and hopper lining.

In the case of flower boxes with sloping sides, the dimensions of these are usually within the width of common boards. In this case, it is but necessary to reduce the width of stock to proper width, dress top edge to present a level surface when set up, measure top line on top, bottom line on bottom, connect these uper and lower points for bevel on sides and apply common mitre square for bevel across edge. Any inclined wall with level top is mitred to a square angle with bevel set at one-half pitch, or forty-five degrees.

If a mitre cut is to put on the square edge, draw the lines across edge, same pitch of roof or wall of hopper, these lines separated the width of stock and bisect these lines on opposite corners of edge

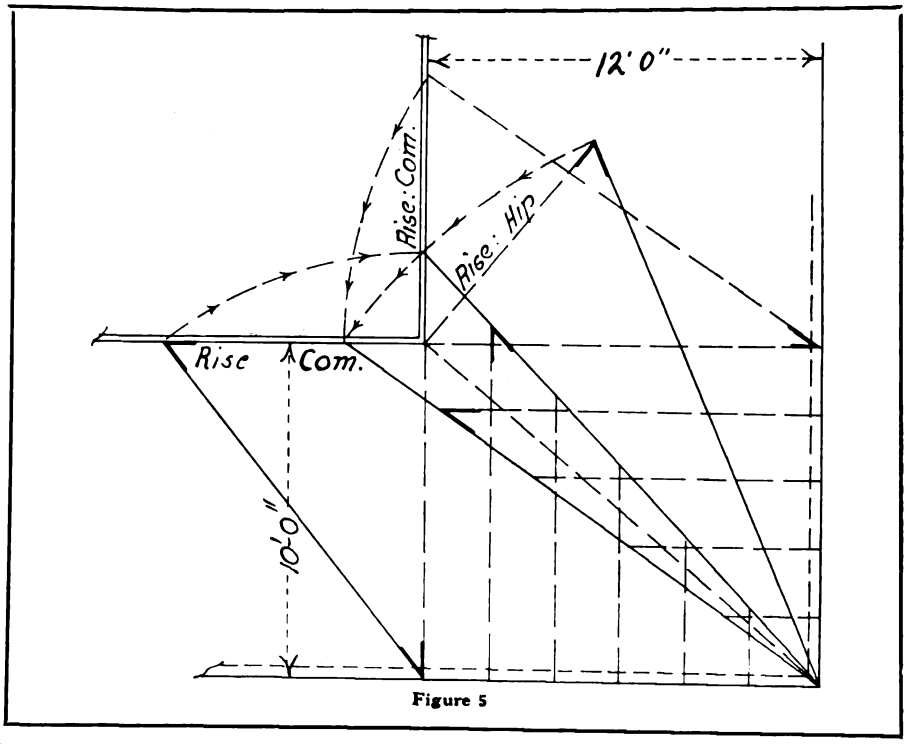

Figure 5

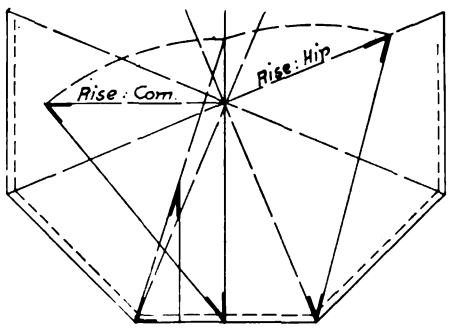

Figure 6

of board, as shown on lower figure. Any bevel or side cut is found by simply working pitch of roof on side of roof board. Measure on this line the width of board 6 inches, 8 inches, 10 inches, as the case may be, and from this point square to opposite side of board and work bevel as shown.

In Figure 5 will be recognized a continuation of the principles elucidated in Figure 3. This is a solution for the intersection of two different pitches. Cuts of roof boards on hip is formed by wall and hip lines as in Figure 3, but the convergence of three lines at this point prevents these bevels being shown.

Figure 6 shows the same treatment applied to an octagon. A block is usually set in the peak to butt rafters against, thus making a square cut. The bevel of jacks is also shown.

Much can be learned by practical experience and this will help to a correct understanding of these principles. Few wall lines are so true that properly cut rafters do not require to be recut at some place on the roof, and by the same token properly cut rafters will prove if the wall is true.

If everything is level and plumb all one would have to do is to lay out the work accurately and cut to the line and it would fit.

Homes *for* Cars

LEFT—A well-designed, two-car garage of frame construction covered with wood shingles and roof. There are two eight-feet-wide sliding doors.

RIGHT—A brick, two-car garage with an asbestos shingle roof. A four-section accordion sliding door gives a full opening of fourteen feet.

Public garages and service stations are now being made of attractive design. Here is a neat-appearing structure of brick. Ornamental designs have been worked in over the large doors and the other brick work has been laid in

English bond with the stretchers of a darker shade of tapestry brick. The coping is of concrete cast in place and finished in white which contrasts with the red brick and forms a very pleasing and ornamental combination.

Below is shown a novel four-car garage. It is placed in the rear corner of a corner lot. A driveway extends to each street. Built of frame with stucco finish and an asphalt shingle roof giving a neat appearance at but small cost.

Concrete blocks have been used for this convenient six-car garage. Three sets of double sliding doors give easy access to the interior. The roof is well covered with a tile stamped metal shingle which is painted red and harmonizes with the grey of the concrete blocks.

What the Editor Thinks

The General Contractor

FROM time to time, we hear about different schemes for eliminating the general contractor from the job for the sake of economy. It will be found, however, by experience, that while the sum total of separate contracts frequently amount to much less than the lump sum estimated by a general contractor, still the ultimate cost of the structure would far exceed the general contractor's bid.

The trouble is with the co-ordination of the work which the general contractor sees to—without his aid and guiding hand the extras pile up on the owner.

On a good many jobs that have no general contractor the different contractors quite often get into a squabble regarding the work. Each one wants to do his own, irrespective of the others' rights or troubles, and the result is quite often some very expensive extras. We have known of a plastering contractor that was miffed because the plumber did not have the piping completed, so he calmly went on with the plastering, which of course had to be torn out for the plumbing to go in place. Of course, the argument that ensued was not pleasant or profitable for the owner.

Yes, the general contractor is worthy of his profit.

Insecure Framing

IT is an unfortunate fact that many of the frame houses being erected today for more or less speculative purposes, are put up in such a hurry that not enough attention is given to properly securing the joists.

The writer has examined a number of recent buildings in process of construction and has found that trimmer joists are supported by the headers by means of only two nails! In other words, there is less than one-quarter of a square inch in cross sectional area of iron to withstand the shearing stress to which it is subjected. This is certainly an unfortunate state of affairs and is bound to result in a number of these buildings needing costly repairs at no very distant date.

This sort of shoddy construction should not be tolerated, but unfortunately a good deal of this sort of work is going on now in our larger cities where it is supposed adequate and efficient building departments exist.

We sincerely trust that the readers of BUILDING AGE will do all in their power to look after these small but very important structural points that means so much to the lasting qualities of the building and that can be accomplished in but very little additional time.

Our Cover Design

INTERESTING indeed is the view of the house shown on our front cover. This is an excellent example of clever designing.

It shows one of the two family houses planned by Bates & How, architects, of New York and is a portion of the development called "Oak Court Terrace," located at Bronxville, N. Y.

It certainly forms an interesting combination of timber work, stucco, slate and stone, while the casement windows give an added touch of beauty to the whole.

High Wages and Efficiency

MUCH has been written about the high wages paid to building mechanics holding back building progress. This is, in a way, true to a certain extent, but the great trouble is inefficiency. This not only applies to workmen doing the actual work, but to the office and field management as well.

Great progress will be made when we give more attention to better ways of doing work, rather than to more hours and less pay. No community or country can be prosperous unless the great majority of the people are prosperous, that is, earning good pay.

In some of the large corporations the man that is paid $50,000 per year is considered the cheapest man on the payroll. The reason is that he is efficient and is worth the money.

There are surely better and quicker ways of doing work than are now being used and if we put earnest thought and study to these, better progress will be made in cheapening the cost of construction while improving the quality.

We all know that today we are getting better goods and better material at less money than our ancestors, even though wages were so small then, that in our eyes today it would mean starvation. Modern inventions have changed this and the change is coming in the building industry quite rapidly. On even the smallest jobs now, we find in daily use labor saving devices. There are concrete mixers and power hoists, portable saws, etc., on nearly every job. A few years ago it was the ordinary thing for a carpenter to do all ripping by hand saw work on the job—who would think of it today on any fair-sized job? There are many other labor saving schemes that will develop if we would only put on our thinking caps and work efficiently.

Remodelling of Homes

THERE is rather an interesting article on this subject published on another page, several illustrations are given of recent jobs of remodelling that show what has been accomplished in this line.

Modern ideas of living require something better than were provided in the old-fashioned homes and to make these old homes a paying investment to-day, it is necessary to bring them up-to-date.

Builders should study this subject very carefully as this is certainly a very profitable field for work. In many cases the alteration job is small and it is up to the builder to make suggestions and show designs of what can be done.

The builder who is able to do this will be successful in securing many good paying jobs.

The Builders' Responsibility Concerning Defective Plans Prepared by Him

CONTRACTING firm asks advice concerning a case where they erected a house according to plans prepared by it for the owner. After the building had been erected and plastered, part of the structure over a large opening between two rooms settled on account of the partitions on the lower floor not being strong enough to carry the overhead load. This threw both floors out of level. The contractors are not licensed architects, but they honestly supposed that the building would be sound. The owner now refuses to pay a balance due under the contract, claiming that due to the contracting firm's fault the house is in bad shape. We are asked whether the balance is recoverable. The owner furnished the materials and there was no written contract. Regular charges for labor were made.

Reluctantly, the law editor of this journal comes to a conclusion that the firm could not enforce a right of recover in the courts.

We assume that the building did not cost more than $7,500, and that therefore, there has been no violation of the architects' registration law of the State—Illinois. That law (Illinois Laws 1919, p. 218) forbids "any person to practice architecture" without being registered. Section 2 declares that "planning" a building constitutes practicing architecture. The case before us does not seem to fall within the exception provided in Section 3, to the effect that the act shall not be construed to "prevent persons, mechanics or builders from making plans, specifications for or supervising the erection, enlargement or alteration of buildings or any parts thereof to be constructed by themselves or their own employes *for their own use,* provided that the work in drawings for such construction are signed by the authors thereof with a true statement thereon of their relation to such construction and that the makers thereof are not architects." However, it is probable that the case does fall within a further proviso of the law that the act shall not "apply to any building, remodeling or repairing of any building or structure within the corporate limits of any city or village, where the total cost of said building, remodeling or repairing does not exceed the sum of $7,500."

But, if the cost in this case did exceed $7,500, I believe that the contracting firm would be deprived of the right to compensation on the ground that in planning the building they violated the architects' registration statute.

Apart from the act above referred to, I am afraid that in case of a lawsuit to recover the balance claimed on the job there would be grave danger that a judge or jury would find that there was such error in judgment in planning the house as to deprive the firm of right to compensation.

It has been decided by the courts of several States, including those of Illinois (see 9 Corpus Juris, 752), that where an owner furnishes plans and specifications to a contractor for the latter's guidance, the contractor is not liable for defects arising from faulty structural requirements contained in the plans and specifications. This is specially so where the defects are not easily detected. However, there are other decisions holding that even where the contractor does not prepare the plans and executes those prepared by another he is chargeable with defects which are reasonably discoverable or obvious.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

But where a contractor undertakes to furnish plans to be executed by him it seems that he so far holds himself out as an architect as to become subject to the rules of law applying to architects' responsibility for defects in plans. The substance of those rules is that, although an architect is not an absolute guarantor against defects, he is bound to use the care and skill of those ordinarily skilled in the business. If he fails to measure up to this standard and defects develop he becomes liable for resulting damages and loses his right to compensation. And if litigation follows it becomes a question for a judge or jury to determine from all of the evidence adduced whether a reasonable degree of care and skill has been exercised, considering all the circumstances shown.

In this case it appears that the owner furnished his own material. Therefore, if it can be shown that the settling of the building resulted from defects in the material, and without fault on the part of the contractors, that would exonerate them from liability, excepting as the material was such that they should have known that it could not safely be used under the plans.

On a trial the judge would in all probability rule that the settling of the building would raise a presumption of defects in the plan. If so, it would be up to the contractors to show that they used due care and skill in preparing the plans.

It would be a pertinent inquiry in the case as to just what information the owner had concerning the contractors qualifications to plan a building. If they were not well qualified and the owner knew that fact, it would materially strengthen the contractors' case. However, if the owner had no special information on the subject, and the contractors undertook to prepare the plans without disclosing any lack of experience in doing that kind of work, the owner had a right to expect a reasonable degree of architectural skill.

And in filing suit it should be borne in mind that on a close question of fact as to whether there was lack of skill or negligence a judge or jury would be apt to give considerable force to the circum-

Digitized by Google

stance that defects actually developed in the building—a result not ordinarily to be expected where plans are carefully drawn and executed.

As a practical matter, the only thing these contractors can do is to place their claim in the hands of a good lawyer in their county and let him do the best he can toward securing the best possible settlement.

Breach of Contract Employing Architect

HAVE furnished plans and specifications for a family dwelling with the verbal agreement that I should supervise the work," writes a Pennsylvania architect. "There was no written agreement, but the owner has accepted the specifications, in which the 'architect's services' are fully described. Now the owner desires to go ahead with the work without my supervision. Please advise me what stand to take in this case."

From this brief statement of the facts of the case it is inferred that the architect has a valid claim for the agreed compensation for his services in preparing the plans and specifications, or the reasonable value, if there was no specific agreement as to rate or amount. It is also inferred that the circumstances are such as to give the architect a valid claim for damages for breach of the agreement to employ him in supervising construction of the building.

We suggest that if a satisfactory adjustment cannot be reached by direct negotiation the claim be placed in the hands of a local attorney, particularly if the architect will remain unemployed for the time that would have been covered by his employment under the broken contract. However, if he has all the work that he can do and can employ himself with substantially the same profit in doing something else, during the time that he would have been employed under this contract, his damages are only nominal. In that case litigation would seem to be undesirable.

Recovery on Bill Exceeding Estimated Cost

CONCERNING its right to recover compensation for constructing a garage under the following stated circumstances, a New York contracting company asks our views:

In submitting a rough estimate on the building, to have living quarters above, the company informed the owner that it would try to keep the cost within $6,100. No contract was made for this amount, however. Two small jobs had previously been constructed for the owner by the same company at costs running slightly over estimates previously given. Those bills were paid without question.

Before specifications on the garage were prepared by the company, no architect being employed by the owner, the contracting company mentioned that a saving could be effected by following a local custom of leaving the studding open on the first floor, using dressed timber. The specifications were drawn with this suggestion incorporated.

In the course of construction, the owner directed several changes to be made, and his directions were carried out. Before the work was completed the owner advised that he understood that the first floor was to be ceiled. He directed that the ceiling be done, stating that settlement of the difficulty would be made later.

The total cost was kept as low as possible, but, with several extras, including 4,000 sq. ft. of ceiling and painting outside trim, the bill amounted to $7,192.60. The bill has not been paid and we are asked for an opinion as to whether payment could be enforced by suit.

It is not disclosed what part of the whole bill is fairly apportionable to extras. But, assuming that the work originally contemplated was kept approximately within the estimated cost and that the fact that the total exceeded the original estimate by nearly $1,100 is to be largely accounted for in the extras which the owner ordered, there should be no difficulty in recovering the full amount of the bill.

The specifications show that the first floor was not to be ceiled, and unless the owner can show that, through mutual mistake or through fraud on the contractor's part, the specifications failed to call for ceiling mutually agreed upon, he is bound by the specifications as drawn.

But were the case to get into the courts there would be a strong chance that the contractor would be held approximately to his estimate on all work contemplated by that estimate. The facts that no sum was specially agreed upon, that an estimate of $6,100 was given, and that payments on the two previous jobs done by the contractor for the same owner had been made approximately in accordance with estimates, would probably be taken as indicating that the owner was led to understand that the cost of the garage would not materially exceed the rough estimate given, excepting as increased by extras.

There appears to be plausible ground for an argument that the estimate was only a rough one, permitting variation on the contractor acting in good faith to keep the cost as low as reasonably possible. But he should go into court prepared for a finding by the judge or jury that his estimate constituted an implied guaranty that the cost would not be grossly in excess of $6,100.

In the New York case of Weibert vs. Hanan, 136 App. Div. 388, 121 N. Y. Supp. 35, it was decided that a statement by a builder that the cost of work would be in the neighborhood of $1,500, but would not exceed that sum, did not constitute a positive agreement to do the work for that sum, but only an approximate estimate.

No agreement having been made, or estimate given as to the extras, the builder is entitled to a reasonable allowance for this work. So, if after deducting this reasonable allowance, the balance does not grossly exceed $6,100 the right to recover the amount of the bill as rendered appears to be clear.

The subject bears some close analogies to the right of an architect to commission for preparing plans for a building which cannot be constructed within a certain cost limitation, with the essential distinction that a builder's failure to keep within his estimate, approximately, merely limits his compensation to the estimate, approximately, while the architect's right to compensation is wholly lost unless he keeps reasonably close to the cost limitation or unless the owner waives his failure to do so. The law concerning architects has been authoritatively summed up as follows:

"Where plans are required for a building not to cost more than a certain sum, or are accepted on condition that it can be erected for a given amount, there can be no recovery by the architect unless the building can be erected for the sum named, or unless the increased cost is due to special circumstances, or to a change of plans by direction of the owner. But as this condition is intended for the protection of the owner it may be waived by him by any act which clearly shows such an intention, as where he accepts the plans with the knowledge that the cost of the building will exceed the sum originally proposed.

"Where an architect submits estimates of the probable cost of the building, he cannot recover for his plans unless the estimate is reasonably near the actual cost.

"Some of the cases, however, do not apply so strict a rule, but hold that an architect who prepares plans for a building pursuant to the order of the owner that the building shall not exceed a certain cost is entitled to his compensation if the cost is 'reasonably near' the proposed amount, and whether there is a reasonable approximation of the actual cost to the proposed cost is ordinarily a question for the jury, although if the excess is great the court can deal with it as a question of law." 5 Corpus Juris, 262.

On a survey of the whole subject, so far as presented, we are of the opinion that the contracting company in this case will have a good chance of recovering the full reasonable value of the work done.

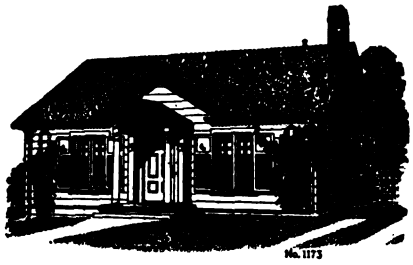
BUSINESS GETTING METHODS

Ideas that have worked for others

Using Plan Books to Obtain Jobs

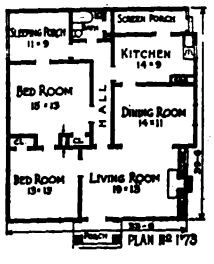
MANY builders make good use of plan books to aid them in securing building contracts. Nothing that you can show a prospective customer (except the house itself) is as good as a picture and floor plan.



By obtaining a number of these books the building contractor will have on hand a very valuable collection of home designs showing different forms of construction such as wood, (both clapboard and shingle) concrete (including stucco work), hollow tile, common brick, face brick, etc.

In the majority of cases, blue print plans and specifications of these houses may be obtained at a nominal sum, thus giving one's customers the benefit of the best architectural skill.

An effective way is to advertise in one's local paper and many exceptional advertisements have been prepared along this line. A good step in this direction was recently undertaken by the Southern Pine Association. They prepared a number of advertisements as suggestions for the contractor and lumber dealer to use in their local papers.



The idea in back of these advertisements is to create the desire for a home. A picture of one of the homes and a small floor plan, short descriptive matter that is terse and to the point, closing up with the line of "see us for free building helps," induces interested parties to call.

When a party is interested enough to inquire about a house and calls on you, then it is the right time to pull out your plan books and show a number of designs that about meet their wants. Being prepared with a collection of useful plans is certainly a big help in obtaining additional house contracts.

No. 1173

How Would a Home Like This Suit You?

HERE'S a convenient little home in which the architect has worked out a low building cost and at the same time maintained the utmost in good looks.

WE CAN FURNISH THE COMPLETE BUILDING PLANS FOR THIS HOME AS WELL AS DOZENS OF OTHERS EQUALLY ATTRACTIVE.

Win Good Will

with this simple installation

NATIONAL Garage Door Holder No. 810

Builders are winning favor every day by seizing opportunities to add the little, low-cost, finishing touches that make their structures stand out from the common run.

In garages, where the doors swing on hinges, there is no one item that pleases the customer more than the NATIONAL Garage Door Holder No. 810. **It locks the doors open and prevents injury** to the car when entering or leaving the garage.

Easily installed. Just a pair of rigid steel arms swivelled to fold back along the head jamb when the door is closed; sliding smoothly out and locking into two notches when opened—released by easy pull on chain.

SHOPWORK *and* FURNITURE

Designs for the Finish Man

Stairs *of* Unique Design

HERE is a picture of a stairway that is out of the ordinary in its design. This was built in the California home of Pauline Frederick, the well known movie star. The first four steps leading to the platform are quite wide being seven foot and this makes rather an impressive appearance in a residence. As our picture shows, this platform is wide enough for two doors that open from it. The next twelve steps lead to another platform from which additional steps lead to the second floor level on both sides. Instead of the ordinary balusters and hand rail, a rather wide bulkhead has been used which forms quite an interesting architectural feature of the hall. This bulkhead has been arranged in the form of panels which uniformly extend to the base or string, as the case may be. As shown in our picture, the wide cap of the bulkhead serves as a resting place for ornaments.

Redwood–and the permanent beauty of the white house

Redwood should be specified for

Exterior Construction
including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish
Natural, stained or painted. Wood block floors.

Industrial Uses
Tanks and vats for water, chemicals and oil. Factory roofs and gutters. Wood block flooring.

BUILDERS know all about the troubles some woods give before you can get even a passably good job of white painting.

When Redwood is specified, the most attractive and long-lasting painting job is assured. There's no pitch in Redwood to "bleed" through, nor hard and soft spots to mar the painter's work. Redwood's uniform texture provides surfaces which take and hold paint well.

Properly dried Redwood—painted, stained or unpainted—does not warp, shrink, swell or decay. It assures both permanence and beauty.

Our Redwood "Construction Digest" and our "Engineering Digest" contain much useful data for architects, builders and engineers, indicating the exceptional suitability of Redwood siding, shingles, trim, columns, mouldings, pickets, balusters, gutters, window and door frames—for all exterior construction work where resistance to decay-producing fungus, boring insects and the ceaseless warfare of the elements demands the most enduring wood.

Our Chicago or New York office will gladly send you these digests and any detailed information you may desire.

Redwood should be specified for

Wood Specialties
Such as—Caskets and burial boxes—incubators and ice-cream cabinets—cigar and candy boxes. Furniture manufacturing, etc.

Railroad Uses
Such as—Railroad ties and tunnel timbers—signal wire conduits and water tanks—car siding and roofing.

Farm and Dairy Uses
Such as—Silos, tanks and troughs—hog feeders and implement sheds—wood block floors, etc.

PAINTING

Practical Points of Interest to the Builder

Some Notes on Wood Finishing

By A. ASHMUN KELLY

FINISHING the interior woodwork of a house is a matter of considerable importance for its appearance and a few additional hints to supplement the article published in the September issue will no doubt be as helpful.

To give gum wood a figure it is necessary to quarter it; when this is done and the wood is properly stained, you have a very good imitation Circassian walnut. Lots of so-called Circassian walnut furniture is being sold, and bought by the public, that is entirely or partially gum wood.

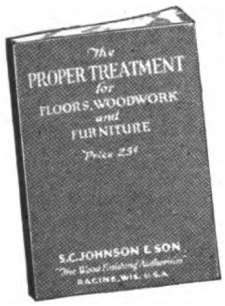
Of course, to get a perfect imitation one would have to do a lot of work, such as duplicating the figures or lines found in Circassian walnut, using a charcoal crayon and painting in with a pencil and stain. This would not do on cheap work, of course.

As Circassian walnut requires a stain that will not penetrate the surface deeply, the thinning agent used with the stain must be one that evaporates quickly, such as benzol, for instance, though varnish answers very well also. It must be something that will not in any manner affect the markings of the wood.

For finishing Douglas fir and other similar woods natural, apply two coats of raw linseed oil, which should be well rubbed into the wood, and for a flat finish give one coat of the oil as above, one coat of white shellac, and one coat of flat varnish. For a gloss finish give it one coat of raw oil, one coat of white shellac, and two coats of bright, hard varnish. For wax finish, give it one coat of raw linseed oil, two coats of prepared wax, well rubbed in with a cloth, or if for a floor use a weighted brush. If the wood is first to be stained use the stain instead of the oil. On a natural finish or light stain finish don't use orange shellac, as it is too dark.

OIL stains are very effective for some work, as they bring out the grain of the wood so well. In such cases apply a coat of penetrating stain; that is, a stain thinned with a very penetrating medium, such as benzol or turpentine, or even benzine. But benzol is best on all fir woods. After applying this stain wipe it off when it has set, using a soft rag. Often it is necessary to go over the work with a little color, to tone down parts that are too light, or to match darker parts with the light.

After drying for twelve hours apply a coat of white shellac, for light stain, or orange shellac for dark. When all is dry it may be rubbed down with fine steel wool, then dust off, and finish with a coat of rubbing varnish, rubbing off lightly and giving another coat of the rubbing varnish. The finish is with rubbing or polishing varnish, as may be desired, and which can be rubbed to a dull finish with curled hair.



To get a good gloss finish the foregoing varnish is left to stand 48 hours, then it is rubbed with fine pulverized pumice and oil, using a felt pad. Or for a polished finish, rub with powdered pumice stone and oil, using the felt pad, and polishing with powdered rottenstone and oil, with the felt pad as before. You get the best results in a dry atmosphere and at a temperature of about 70 deg.

To finish red cedar, apply a coat of good clear liquid wood filler, and finish with two or three coats of varnish. Rub down each coat but the last with steel wool, and, if desired, polish the last coat with rottenstone and oil. As cedar is easily marred or scratched one needs to handle it with care.

EXTERIOR wood finishing is different, as it must be made to withstand the weather; hence it is a good plan to get oil into the wood; after making the work smooth and clean rub into it plenty of pure boiled linseed oil, some adding a little japan driers, to hasten the drying and also help harden the oil, though boiled oil is a self-drier, driers being added to it in the process of boiling. This oil should fill the wood perfectly full, so that when the varnish is applied none of the liquids from it will escape into the wood. After giving the oil ample time for becoming quite dry apply two coats of good exterior varnish, rubbing the first coat with steel wool to dull its surface, then polishing the last coat of varnish with pulverized pumice stone and oil. If the wood is to be stained, do it first, before the oiling.

Concrete Mixing

VASTLY important in the economical placing of concrete is the selection of a proper mixer for the work in hand. Builders interested in this problem would do well to obtain the catalog just issued by the American Cement Machine Company, Keokuk, Iowa, which will be sent to any of our readers interested. It is well illustrated with different types of mixers and contains some very valuable data.

Home Decoration

BUILDERS desiring to make a good impression on their customers will turn over the house decorated in effective style. The walls and ceilings can be easily tinted with Muralite which is made in a number of different colors by M. Ewing Fox Company, 240 East 136th Street, New York. Interesting color cards showing all the different tints made by this firm, together with suggestions for combining the color to get effective decorative schemes will be sent to any of our readers.

Home Study

RATHER interesting and valuable is the booklet "How to Read Blue Prints" which will be sent free to any of our readers by the Chicago Technical College, Room 1038, Chicago Tech Building, Chicago, Ill. This also gives description of the different courses on architecture, drafting, superintendence and plan reading. As winter time offers a good period for study, interested readers can find out about home study by writing for information.

Using Steel Lath

FROM the Bostwick Steel Lath Company, Niles, Ohio, comes the interesting "Wall and Ceiling Hand Book." It tells about the use of metal lath in building construction and is certainly well worth while sending for. They also will send an interesting folder entitled "Whooping the Loop."

Switch for Narrow Partitions

BUILDERS are often confronted with the problem of how to have an electric switch put in narrow partition and they will be interested in the new device for this purpose made by the Arrow Electric Company of Hartford, Conn., who will send a descriptive circular describing this useful electrical device to any of our readers. Every builder should be informed about such items even though he has no immediate use for it. It is especially useful where thin metal lumber and lath partitions are used.

Useful Catalogs

ON this page we give short descriptions of some very interesting catalogs, etc., that have just been issued by different manufacturers.

They will be sent free on application to any of our readers who are interested, but should you prefer to write us, give the date of this issue and title of the catalog desired, and we will have them sent to you.

Orienting the House

THE proper placing of a house with relation to the sun's rays is interestingly described in a booklet issued by the American Face Brick Association, 180 North Wells Street, Chicago, Ill. The book is well illustrated and contains a chart of the sun's position at different times of the year so that one can figure out the right position for placing a house. It contains some very valuable information for builders so that they will be able to advise their customers on this important point.

Copper Roofing

INFORMATION on the proper way of laying a copper roof, illustrated by many detailed drawings is given in an interesting book just issued by the Copper and Brass Research Association, 25 Broadway, New York, and a copy will be sent to any of our readers who are interested.

Modern Plumbing Supplies

SELECTING the proper fixtures for bathrooms, kitchens, laundry, garages, factories, schools, etc., is one of the important things that is up to the building contractor. Help in this matter with many practical points can be obtained from the catalog "D" issued by the Bowman Supply & Mfg. Co., 886 Progress Street, Pittsburg, Pa. Besides plumbing supplies, the catalog also describes heating supplies as well and contains much useful data.

Applying Stucco

INTERESTING is the folder describing a hand operated stucco machine which has just been issued by the Master Rule Company, of 841 East 136th Street, New York. This will be of value to contractors who desire to apply a finish coat of stucco in the shortest possible time.

Contractors' Wagons

DUMPING a load quickly is a time saving feature for a contractor's delivery wagon, and a rather interesting folder comes from the Mandt Company, Keokuk, Iowa, describing their steel dump bodies that can be attached to any chassis. It will be of interest to many of our readers and is worth while sending for by any one.

Movable Stairways

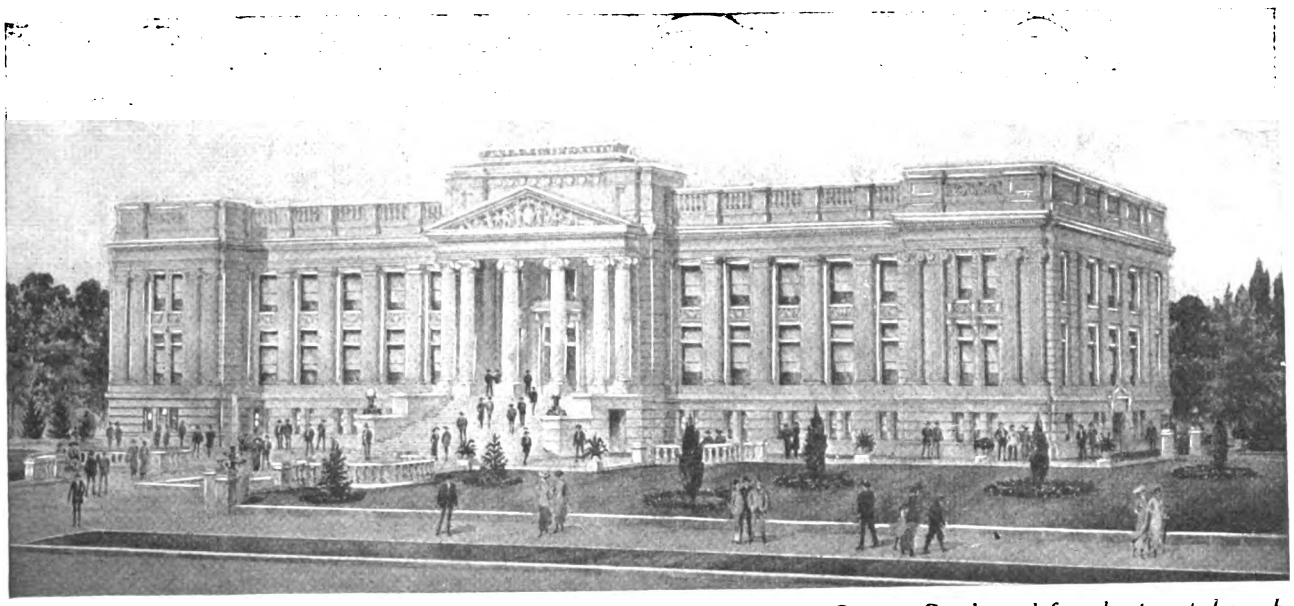
TO make use of attic space without giving up the necessary room for a stairway is interestingly described in the illustrated booklet issued by the Bessler Movable Stairway Company, Akron, Ohio. Much valuable data is given on how one can save space in new homes.

Use of Wall Board

FOR many purposes wall board is ideal and its use is interestingly described in a catalog issued by the Upson Company, Lockport, N. Y. This will be sent to any reader together with a sample of Upson Board. They are doing some extensive advertising in magazines of national circulation, calling attention to the use of wall board and this will create a good deal of work for builders.

Southern Pine

YELLOW Pine is largely used in building construction and therefore it is interesting to know what it is and what it may be used for. A handsomely illustrated book on this subject has just been issued by the Southern Pine Association, New Orleans, La., and a copy will be sent to any of our readers. Colored illustrations are given of popular finishes.



Floor Surfacing

RATHER interesting is the circular entitled, "It's Easy to Get Rich," just sent out by the American Floor Surfacing Machine Company, of 521 South St. Clair Street, Toledo, Ohio. This gives a number of testimonial letters from different contractors who have made money by using one of their machines for surfacing floors.

How Lime Is Made

INTERESTING indeed is the book "A Job That Took a Million Years" that has just been issued by The Ohio Hydrate & Supply Company, of Woodville, Ohio. Few people realize what an important part lime plays not only in the building industry but also in our daily life, and this interesting well illustrated book gives some decidedly helpful information and data especially for builders. It is certainly worth while sending for.

City and County Building, Provo, Utah.
Joseph Nelson, Architect.

Keystone Copper Steel used for sheet metal work.

WEAR and *rust-resistance* are qualities of first importance—particularly for sheet metal used for roofing and construction purposes. Keystone Copper Steel means better buildings. *It lasts.*

KEYSTONE
COPPER STEEL

Keystone Copper Steel is an alloy made by the addition of a certain percentage of Copper to well made Steel, thereby greatly increasing its lasting and rust-resisting qualities under actual service conditions. It has been scientifically developed and tested—and its use is strictest economy.

The high reputation of our products is recognized wherever sheet metal is used. Each brand of our manufacture has behind it a service—the scope of which has a tangible value to every architect, contractor and builder. This service begins with the planned care and skill in the making, which is carried through to the thorough system of distribution which keeps these products obtainable in every part of the country. For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use Keystone Copper Steel Galvanized Sheets and Roofing Tin Plates—best for both builder and property owner. Sold by leading metal merchants, and used by the leading contractors.

Review of Building Situation

BUILDING statistics for August, just published by F. W. Dodge & Company, show that the volume of contracts awarded for the past eight months of this year has either equalled or passed the total for all of last year. The total for August is only a little over 8 per cent. less than that of July.

The Middle West district which has been rather backward, is showing up more strongly and it is to be hoped that this will continue. There is also a healthy sign in this district of the amount of work contemplated.

Residential construction in practically all districts still leads and will continue to do so for many years to come. The demand for houses is still as keen as ever, there is a large fertile field here.

There has been a very noticeable increase in the amount of industrial construction both in contracts awarded and contemplated. A surprisingly large amount is being spent on new factories, etc., in the Pittsburgh district—the immense sum of $39,687,000 has already been awarded for this class of construction so that it is assured that builders in this locality will have plenty of work in this particular line.

Now that the railroad and coal strikes are settled, the delivery of building materials will soon be on a proper basis again. There, of course, will be some delay in certain districts as coal will, properly, have the right of way over every other freight.

It is encouraging to know that a good deal of money is still being spent on new school construction in practically all districts and a good deal of this type of construction is contemplated.

A very good sign of the times is that the figure for August of this year is 46 per cent higher than that of last year. Another good sign is that public works are going forward.

THE deficiency of skilled tradesmen in the building trades has been commented on again and again from one end of the nation to the other, but in spite of the comment, it is still there. The decrease in skilled labor in six various trades of the building industry during the last ten or twelve years is decidedly marked, while other classes of labor showed a decided increase over the same period of time, according to statistics from the United States Census for the whole nation. Covering the period of 1910-1920, structural iron workers show increase of 64.5 per cent; iron and steel laborers, increase 51.2 per cent; paint and varnish factories, increase, 40.8 per cent; elevator tenders (male), increase, 33.4 per cent; brick and stone masons, decrease, 23.6 per cent; electricians, increase, 77.2 per cent; carpenters, increase, 8.6 per cent; general building labor decrease, 28.4 per cent; painters building, decrease, 9.5%.

Beauty—More Than Skin Deep

NATCO XXX Tile unit showing dovetail method for gripping stucco on exterior and plaster on interior. Note moisture stop at end.

THE charm of this attractive home is not entirely visible to the eye. Its fire-proof and sturdy walls of NATCO Hollow Tile with their continuous air cells insulate the interior against the heat of summer and the cold of winter. The elimination of through mortar joints (an exclusive feature of all NATCO Hollow Tile) assures that it will remain perfectly dry within, despite frost, thaw or rain.

The beauty of NATCO Homes is *wall-deep*. They are as permanent as those constructed of solid masonry because the hard clay of the tile offers more resistance to decay than does stone. Moreover, NATCO Hollow Tile, having every advantage of solid masonry construction, is far more economical. The cost of a NATCO Home is little more than one of frame.

NATCO Hollow Tile is always a profitable investment. It assures satisfaction to the home builder and, therefore, prestige, good will and profit to architect, builder and dealer. NATCO literature covers the needs of all three and will be gladly supplied *free* on request.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

Selected List of Manufacturers' Literature

FOR THE SERVICE OF BUILDERS, CONTRACTORS, ARCHITECTS AND ENGINEERS

The publications listed in these columns are the most important of those issued by leading manufacturers identified with the building industry. They may be had without charge, unless otherwise noted, by applying on your business stationery to BUILDING AGE & THE BUILDERS' JOURNAL, 920 Broadway, New York, or the manufacturer direct, in which case kindly mention this publication. Either the titles or the numbers may be used in ordering.

Listings in this Department are available to any manufacturer at the rate of $5 per listing per month.

(See also Alphabetical Index, Page 116)

ARCHITECTS' SPECIFICATION HAND BOOK
Truscon Company, Detroit, Mich.
170. 52-page paper-bound, loose-leaf specification book. 8½ x 11 in.

ASBESTOS PRODUCTS
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
1. *Ambler Asbestos Shingles.* Catalog 5½ x 8½ in. 40 pp. Illus.
2. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 36 pp. Standard Purlin Spacing Tables.
3. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.
4. *Ambler Asbestos Building Lumber.* Catalog, 8½ x 11 in. 32 pp.
5. *Engineers' Data Sheets.* Catalog, 8½ x 11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

ASBESTOS ROOFING—See also Roofing

ASH HOISTS—See also Hoists

ASH RECEIVERS
Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.
7. *Catalog E.* Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.
8. *Catalog F.* A book for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with stables of dimensions for installation. 8 pp. Illus.

BALANCES, SASH
Caldwell Mfg. Company, The, Rochester, N. Y.
9. *Suggestions for the Present-Day Architect.* Booklet, 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.
10. *Catalog* describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS
American Saw Mill Machinery Co., Hackettstown, N. J.
11. *Catalog No. 22* describing a general line of band saws of various sizes.
12. *Technical Data.* Four-page folder, 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires.

Crescent Machine Co., Leetonia, Ohio.
241. Descriptive 144-page Catalog.

BAR BENDERS AND CUTTERS
Koehring Company, Milwaukee, Wis.
13. *Four-page folder*, giving illustrations and sizes of Koehring Bar Benders and Cutters.

BATHROOM FIXTURES
Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.
401. *Send for illustrated Folder*, "A Bath a Day Keeps You Fit Every Way."

BEDS
Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.
402. *Eight-page illustrated*, "How to Use the Murphy Bed."

BOILERS—See Heating Equipment

BOOKS
American Technical Society, 58th and Drexel Blvd., Chicago, Ill.
Architectural House Planning Service Co., 20 So. 18th Street, Philadelphia, Pa.
Arrow Book Company, 347 Fifth Avenue, New York City.
Chicago Technical College, 1038 Chicago Tech. Bldg., Chicago, Ill
U. P. C. Book Co., 243 West 39th Street, New York City.

Ideal Wall Withstands Rainy Season

Every day new and interesting facts about the success of Ideal Wall construction come to light.

Here's an extract from a letter by the Nance Construction Company of Los Angeles, California.

> "All of the houses which we have built using the Ideal System stood the rainy season perfectly, not one complaint from moisture coming through the wall. It may also interest you to know that we have now under construction a $35,000.00 residence using the 12 inch hollow wall, which is receiving favorable comment from builders who have seen it."

Scientific Tests Support Practical Results

A practical test to determine the degree of imperviousness of the Ideal Wall was made at Williamson Trade School, Delaware County, Pa., under the direction of Prof. Jos. Shisler in charge of the Masonry Department.

An Ideal Wall (8" thick) plastered on the inside surface ⅜" thick with 1:3 lime and sand mortar and finished with ⅛" hard white coat of calcined plaster and lime paste was subjected to a continuous running sheet of water. Measured showed 28 gallons per hour per square foot of wall surface.

After 3 days (72 hours) the bricks in the most saturated portion of the wall had not conducted enough water through the wall to even dampen wall paper on interior.

The headers had conducted water only one-half their length. When the plaster on the inside surface of the wall was removed it showed no evidence of moisture.

Tested by water, fire, loading, etc., Ideal Wall has proved its merit—the greatest development in years for builders.

Be Sure You Have These Helpful Books

Ideal Wall construction is fully described in "Brick, How to Build and Estimate," only 25 cents, postpaid. Send $1.25 and receive also that helpful book of house plans, "Brick for the Average Man's Home." Address, Common Brick Industry of America, 2133 Cleveland Discount Building, Cleveland, Ohio.

Ideal Wall Industrial Bldg., Laurel, Miss.
L. W. Duffee, Architect

IDEAL Wall is gaining more rapidly than any other type of construction in the big building boom. No new form of construction has ever caught the contractor's attention to the extent of the Ideal Wall.

Why ?

Ideal Wall saves—

⅓ the Brick
½ the Mortar
¼ the Labor
Furring and Lathing

What a boon to builders—especially when materials are scarce and labor is high.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

49. *Bulletins,* 8½ x 11 in. Containing details and specifications for Pyrobar voids for use with reinforced concrete joist floor construction; Pyrobar roof tile; and monolithic gypsum floors and roofs.

CONTRACT AND ESTIMATE BLANKS

L. Fink & Sons Printing Co., Laurel Spring, N. J.

166. *Samples* of contract sheets, estimate blanks, job tickets, time tickets, time sheets, wage receipts, etc., with prices.

CRYSTALS, MICASPAR

Crown Point Spar Co., 101 Park Avenue, New York.

276. *50-page descriptive catalog,* describing the advantages and uses of the Sparkling Micaspar Crystals.

DAMPERS AND ASH DUMPS (Fireplace)

The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

DAMP-PROOFING

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.

425. *Six-page folder,* describing the Nu-Tile 4-in-1 Shingle.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

426. *Send for catalog* on the advantages of the Asbestos Shingle.

Illinois Zinc Co., 280 Broadway, New York.

428. *An eight-page folder,* describing the roof that is always new.

National Sheet Metal Roofing Co., 339 Grand St., Jersey City, N. J.

429. *68-page book,* illustrating the "Shingles That Last."

Rocbond Co., Van Wert, Ohio.

430. *An eight-page folder,* entitled, "Fortifies Your Home Against the Element of Time."

F. C. Sheldon Slate Co., Granville, N. Y.

431. *A 16-page illustrated booklet,* describing "The Most Enduring and the Most Attractive Roof at the Most Reasonable Cost."

DOOR CHECKS

Park Manufacturing Co., Worcester, Mass.

50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS

The Bogert & Carlough Co., 30 Peach St., Paterson, N. J.

247. BOCA steel sash. (E-22). A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.

Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.

432. *A 32-page catalog,* describing "Window Walls," their cost and their advantages.

Henry Hope & Sons, 103 Park Ave., New York.

51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¾ x 18½ in. 32 pp.

Truscon Steel Company, Youngstown, Ohio.

52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.

53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill.

DOOR AND WINDOW FRAMES

Andersen Lumber Company, South Stillwater, Minn.

55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¾ x 10¾, 24 pages.

56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.

DRAFTING MATERIALS

A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.

433. *A 116-page book,* describing the advantages of "Direct-by-Mail" Buying.

Keuffel & Esser Co., Hoboken, N. J.

434. *A 486-page Bound Book.* This is the thirty-sixth edition of the catalog.

Peerless Blue Print Co., 347 Fifth Avenue, New York City.

Warren-Knight Company, 136 No. 12th Street, Philadelphia, Pa.

435. *36-page booklet,* describing the "Sterling" Transits and Levels.

DUMBWAITERS

Kimball Bros. Co., 1106 Ninth Street, Council Bluff, Iowa.

436. *30-page illustrated catalog,* describing the various models of Dumbwaiters.

Sedgwick Machine Works, 156 W. 15th Street, New York.

57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

ELECTRICAL DEVICES

Arrow Electric Co., Hartford, Conn.

ELECTRIC METER BOXES

The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

ELEVATORS

Kimball Brothers Company, Council Bluffs, Iowa.

58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.

Richards-Wilcox Mfg. Co., Aurora, Ill.

59. *"Ideal" Elevator Door Equipment.* Catalog showing elevator door hangers for one, two or three speed doors, also doors in pairs and combination swing and slide doors. Door closers and checks. 24 pp. Ill. 8½ x 11 in.

Sedgwick Machine Works, 156 West 15th Street, New York.

ENGINES—GASOLINE

New-Way Motor Co., Lansing, Mich.

437. *Write for helps and suggestions.*

FACTORY EQUIPMENT

The Edwards Mfg. Co., Cincinnati, Ohio.

60. *Edwards' Steel Equipment.* Illustrated catalog. Showing steel lockers and shelving for factories, offices, stores, schools and hospitals, together with illustrations and description of "Edmanco" steel office furniture and filing cabinets. Size 8 x 11 in. 32 pp.

FIREPLACES AND MANTELS

Apex Fireplace Co., Urbana, Ill.

503. *An interesting four-page folder* with blue prints attached.

King Mantel & Fireplace Co., Knoxville, Tenn.

Strait & Richards, Inc., Newark, N. J.

62. *Catalog* describing fireplaces, electric and gas logs, heating supplies, heaters, etc.

FLOOR HARDENERS

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.

61. *Agates and Its Performances.* Booklet. 8½ x 11 in. Describes the methods of hardening concrete floors by the application of a chemical which forms a new surface as hard as agate.

FLOORING LUMBER

The Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.

63. *The Perfect Floor.* Tells how to lay, finish and care for Oak Flooring. 16 pp. 14 Illus. 5½ x 7½ in.

Oak Flooring Advertising Bureau, 1014 Ashland Block, Chicago, Ill.

CLAMPS

James L. Taylor Mfg. Co., Poughkeepsie, N. Y.

408. *Descriptive catalog* of the various Clamps.

COAL CHUTES

The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

409. *An interesting folder,* describing the advantages of the Donley Coal Chute.

COLUMN AND BEAM COVERING

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

39. *32-page booklet,* 8½ x 11. Pyrobar Tile.

COLUMNS

Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.

233. *Catalog No. D-47.* 48 pages, illustrated. 7¼x10 in. Illustrating the Koll's Patent Lock-Joint Wood Columns.

CONCRETE APPLIANCES

Universal Cement Mould Co., No. Milwaukee, Wis.

41. *Illustrated Folder* describing mold for building hollow concrete walls for homes, garages, barns, silos, etc.

Van Guilder Double Wall Co., 77 South Avenue, Rochester, N. Y.

42. *A Catalog* describing the Van Guilder system of portable forms for the building of hollow concrete walls on the thermos bottle idea for the erection of homes, ice houses, barns, silos, etc. Walls are dry, as there is continuous air space around entire building.

CONCRETE MACHINERY

A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.

43. *Descriptive Illustrated Circular* of Magic Concrete Mixer.

The American Cement Machine Co., Inc., Keokuk, Iowa.

410. *An interesting 68-page illustrated catalog,* describing the "Boss" Labor Saving Construction Machinery.

Concrete Equipment Co., 535 Ottawa Street, Holland, Mich.

411. *Catalog No. 22* describes in detail the various products manufactured by this company.

Concrete Block Machine & Mold Co., 114 S. 2nd St., St. Louis, Mo.

253. *Catalogue No. 36.* Describes Building Block Machines. It is a 40-page book, 6 x 10 in.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.

412. *Bulletin No. 1* describes the Portable Saw Rigs.

413. *Bulletin No. 2* describes the Power Driven Pumps, Centrifugal, Pistons, Diaphragm, Triplex.

414. *Bulletin No. 3* describes the Hoists, Mortar Mixers, Material Elevators, Engines.

415. *Bulletin No. 4* describes the Tractor.

Ideal Concrete Machinery Co., 1334 Monmouth Street, Cincinnati, Ohio.

416. *A 100-page illustrated catalog,* describing the Ideal Machine and also data for manufacturing and curing Ideal Concrete Blocks.

417. *Catalog No. 37* describes the Ideal-Cincinnatus Batch-Mixers.

Jaeger Machine Co., 216 Dublin Avenue, Columbus, Ohio.

418. *A 40-page catalog,* well illustrated, describing the special features of a Jaeger Mixer.

419. *16-page folder,* illustrating a Jaeger for every mixer need.

Koehring Co., Milwaukee, Wis.

46. *Koehring Construction Mixers.* Booklet. 7¼ x 10½ in. Illustrated. 96 pp. Complete information on construction type concrete mixers.

47. *Koehring Dandie Mixer.* Booklet, 6 x 9 in. Illustrated. 24 pp. Illustrating and describing Koehring line of Dandie light mixers.

265. *"Built to Endure."* A beautifully bound booklet of 36 pages, 7¼ x 10 in., describing Comparative Examples of Notable Ancient and Modern Construction Embodying the Element of Permanency.

Little Whirlwind Mixer Co., 438 Gould Street, La Crosse, Wis.

420. *An eight-page illustrated folder,* describing the efficiency of the Master Mixer.

Republic Iron Works. Box 602, Tecumseh, Mich.

421. *An eight-page illustrated pamphlet,* describing the Republic "Ten."

Standard Scale & Supply Co., 1631 Liberty Ave., Pittsburgh, Pa.

422. *28-page illustrated catalog,* describing quick, efficient and money-saving concrete mixing.

CONCRETE MARBLE

Art Stone Co., Waynesboro, Pa.

45. *Descriptive Circulars* with illustrations of different marbles in colors. Sent free to any interested party.

CONSTRUCTION, FIREPROOF

Central Steel Co., Massillon, Ohio.

423. *In the "National Steel Lumber" Handbook* is embodied complete information and authentic data pertaining to the use of Steel Lumber Sections and kindred materials.

424. *"National" Bulletin No. 19B* describes the National Shelby.

National Fire Proofing Co., 250 Federal St., Pittsburgh, Pa.

226. *Standard Fire Proofing Bulletin* 171. 8½ x 11 in. 32 pp. Illustrated. A treatise on fireproof floor construction.

United States Gypsum Company, 205 West Monroe St., Chicago, Ill.

Building Experts Wanted

The Big Money Goes to the Man Who KNOWS

The man who can read plans, make estimates, superintend jobs or take contracts is the man who makes the big money in the building business. Can **you** do these things? If you **can't** do them you are not yet in the real money-making class. You are not prepared for the great rush of building work,—the building boom,—that even now is here.

But, you can become a building expert quickly by giving some of your spare time to home study under the direction of experts of the Chicago Technical College, which for 20 years has been known as "America's Greatest School for Builders." These men will train you in every important branch of the building business by practical and individual instruction on blue print building plans and specifications which we send to you. No "high-brow" book to study. The plans cover all kinds of buildings and are the same as used by the contractor. They are yours to keep.

No Matter What Your Job This Great Opportunity Is Yours

There is no longer any need for a man to stay in a job that offers little or no chance for advancement and more money. There is always a market for brains and the man who gets this Chicago Tech. training soon becomes a top-notcher in the building business; he gets more because he is worth more.

There is a building boom coming,—it's here now! Get this training and your opportunity will come quickly. There will be a lot of money made in the next five years by men who know the fine points of the building business. Take the Chicago Tech. Builders' course,—it is planned for practical men. No time given to "fancy" studies or useless theories. Just everyday practical information that you must have to make a big success as a builder.

Easy Methods—Quick Results

You get the same blue prints, the same lessons, etc., that are used by the hundreds of builders who attend our evening school in Chicago. The same experts who teach them are your instructors. You get the same training at home at a big saving of time and money.

Complete Courses for Men in the Building Trades

PLAN READING

How to read a building plan. Floor plans and elevations. Use and meaning of different lines on the plan. Sections and section lines. Cross sections. How different materials are shown on the plan. How to read dimensions. Detail drawings. How to lay out work from the plans. Tracings and blue prints—how they are made. Practice in reading complete plans from basement to roof, etc., etc., etc.

CONSTRUCTION

Brickwork: Footings and foundation walls of brick, concrete and stone. Brick laying, joints in brick work, pointing, tuck pointing, etc. Brick and stone arches. Use of different kinds of stone.

Carpentry: Kinds and uses of woods, cornices, interior details, framing, roof construction, bridging, miter joints, butt joints, etc. How plans are made. Complete instructions illustrated by working blue prints of residences, apartment buildings, factory buildings, school houses, hospitals, store and office buildings, bank buildings, etc., etc.

ESTIMATING

Practical rules for figuring costs on all classes of construction. Problems worked out from the plans. Methods of practical builders.

Some of the points covered are—Figuring labor and material on brick, frame and concrete work—footings, walls, chimneys, fire places and cisterns. Fire proofing, tile-flooring, arches, partitions, furring, terra cotta, etc.

Lumber and timber: figuring board feet. Estimating posts, girders, sills, joists, stubs, bridging, rafters, etc. Estimating all kinds of roofs, floors, siding, cornices, etc.

Estimating mill work. Labor and material for window and door frames, sash, blinds, baseboard, wainscoting and all kinds of closets, cupboards, etc. Lathing and plastering, sheet metal work, decorating, glazing, plumbing, heating, wiring, etc.

SUPERINTENDING

Methods of work on all classes of buildings. Uses and preparation of material. Hiring and handling of men.

We also offer complete home-study courses in **Architectural and other branches of Drafting.** If interested in any branch of Drafting mention subject and ask for special catalog.

SEND THE COUPON FOR PROOF

Don't delay. Send the coupon and prove to yourself what this course will do for you. You incur no obligation in asking for our new book, "How to Read Blue Prints," a Trial Lesson in Plain Reading for Builders; also blue prints and drawings. All sent free to any builder who sends in the coupon.

CHICAGO TECHNICAL COLLEGE

1038 Chicago Tech. Bldg., CHICAGO, ILL.

Two Books FREE

on "How to Read Blue Prints"

a Trial Lesson in Plan Reading for Builders. Just off the press. Full of building information. Sent Free with Blue Prints, Drawings, etc., to any man now in the building line, who sends us his name on this coupon. Mail the coupon to **Chicago Technical College, 1038 Chicago Tech. Bldg., Chicago.**

(*Continued from page 74*)

463. *Several interesting booklets,* describing the various types of "Built-In-Kitchens." These are illustrated by actual blue prints.
National Mill & Lumber Co., 2 Rector Street, New York.
277. 10-*Page Illustrated Folder.* Describes the necessity and advantages of a National Built-In Ironing Board.

LATH, METAL AND REINFORCING
The Bishopric Mfg. Co., 17 Este Avenue, Cincinnati, Ohio.
Bostwick Steel Lath Co., Inc., Niles, Ohio.
279. *"Beautiful Permanent Walls."* 22-page illustrated catalog. 4 x 9 inches.
Central Pressed Steel Co., Massillon, Ohio.
General Fireproofing Co., Youngstown, Ohio.
97. *Catalog* describes Herringbone Rigid Metal Lath, how it is applied and used, with detailed drawings, specifications, etc.
Truscon Steel Co., Youngstown, Ohio.
99. *Hy-Rib and Metal Lath.* 18th Edition. **Catalog. 8½ x 11 in.** 64 pp. Illustrated. Gives properties of laths, specifications, special uses and views of installations.

LEVELS
A. S. Aloe Co., 513 Olive Street, St. Louis, Mo.
Eugene Dietzgen Co., 162 W. Monroe St., Chicago, Ill.
Keuffel & Esser Co., Hoboken, N. J.
Warren-Knight Company, 136 North 12th St., Philadelphia, Pa.
100. *"Sterling" Levels and Transits.* 32 pp. illustrated catalog. Description, specifications and structural advantages required in modern practice for establishing lines, levels, angles, etc. Vest Pocket Manual of adjustments.
David White Co., 907 Chestnut Street, Milwaukee, Wis.
464. *Catalog A,* "White's Improved Instruments," is a 36-page booklet with a hard cover and illustrated.

LIGHTING
American Three-Way Prism Co., 1307 South 55 Court, Cicero, Ill.
98. *Descriptive Circular* on the use of prisms for directing light to dark corners.

LIGHTNING RODS
E. G. Washburne Co., 207 Fulton Street, New York.
232. *Descriptive Catalog in Colors.* Showing different designs of weather vanes, lightning rods, ventilators, etc.

LIGHTING SPECIALTIES
I. P. Frink, Inc., 24th Street and 10th Avenue, New York, N. Y.
250. *Lighting Service for Hospitals.* A booklet illustrated with photographs and drawings, showing the types of lights for use in hospitals, as operating table reflectors, linolite and multilite concentrators, ward reflectors, bed lights and microscopic reflectors, giving sizes and dimensions, explaining their particular fitness for special uses. Size 7 x 10 in. 12 pp.
251. *Frink Reflectors and Lighting Specialties for Stores* Catalog No. 424. A catalog containing a description of the Frink Lighting System for Stores; the Synthetic System of Window Illumination; and a number of appliances to produce the most effective lighting of displayed objects. 20 pp. Illustrated.
252. *Frink Lighting Service for Banks and Insurance Companies.* Reflectors. Catalog No. 425. A very interesting treatise on the lighting of offices; with details of illustrations and description of lamps and reflectors. Contains a list covering several pages, of banks using Frink Desk and Screen Fixtures. 30 pp. Illustrated. 8¼ x 11 in.

LUMBER
Arkansas Soft Pine Bureau, 802 Boyle Building, Little Rock, Ark.
101. *Arkansas Soft Pine Handbook.* Catalog. 8½ x 11¼ in. 62 pp. Illustrated. Concise, technical information regarding physical character, uses, and including Grading Rules and Standard Molding Designs.
102. *The Home You Long For.* Booklet. 8¼ x 11 in. 32 pp. Illustrated. Folio intended for the layman. Contains 18 homes by Robert Sayfarth, Architect, Chicago. Of general interest to architects, but does not contain technical information.
Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
104. *The Post Everlasting.* Booklet. 10½ x 7½ in. 32 pp. Illustrated. Information regarding creosoted yellow pine fence posts, barn poles, paving blocks, etc.
228. *Poles That Resist Decay.* Booklet. 9¼ x 4 in. 16 pp. Illustrated. Poles for telegraph, telephone, high power transmission lines.
105. *"From Tree to Trade,"* a 48-page illustrated description of the manufacture of lumber from tree to use. Describes methods of logging, construction, etc.
Pacific Lumber Company of Illinois, The, 1105 Lumber Exchange Building, Chicago, Ill.
106. *Engineering Digest.* Redwood Information Sheets. 1. General Data Sheet on Redwood, its Production and Uses. 2. Tanks and Vats for Water Acid and Alkali Solutions and Oil. 3. Pipe for Water, Chemicals and Sewage Conveying. 6. Farm and Dairy Buildings and Equipment, Silos, Tanks, Pipes, Outbuildings, Irrigation Flumes, Drainage Boxes, Greenhouses, etc. 9. Railroad Construction and Equipment. 10. Industrial Building Materials. 11. Residential Building Materials.
Southern Cypress Mfrs. Assn., 1227 Poydras Bldg., New Orleans, La.
107. *Many interesting booklets* on the use of Cypress for all purposes.

LUMBER ASBESTOS
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
108. *Ambler Asbestos Building Lumber.* Catalog illustrated. Describes uses of this fireproof product for both exteriors and interiors. Tables of sizes and illustrations of various types of buildings in which it has been used. Size 8½ x 11 in.

MARBLE, ARTIFICIAL
Art Stone Co., Waynesboro, Pa.

METAL LATH—See Lath, Metal and Reinforcing

METAL BUILDING SPECIALTIES
METALS AND METAL PLATE Co., Frick Building, Pittsburgh, Pa.
American Sheet & Tin Plate Co., *Reference Book. Pocket Edition.* 2½ x 4½ in. 168 pp. Illus.
111. Covers the complete line of Sheet and Tin Mill Products.
113. *Apollo and Apollo-Keystone Galvanized Sheets.* Catalog. 8½ x 11 in. 20 pp. Illustrated.
114. *Research in the Corrosion Resistance of Copper Steel.* Booklet. 8½ x 11 in. 24 pp. Illustrated. Technical information on results of atmospheric corrosion tests of various sheets under actual weather conditions
115. *Facts Simply and Briefly Told.* Booklet. 8½ x 11 in. 16 pp. Illustrated. Non-technical statements relating to Keystone Copper Steel.
116. *Black Sheets and Special Sheets.* Catalog. 8½ x 11 in. 28 pp. Illustrated. Describes standard grades of Black and Uncoated Sheets, together with weights, bundling tables, etc.
Bright Tin Plates. Catalog. 8½ x 11 in. 16 pp.
The Donley Bros. Co., 7400 East 74th Street, Cleveland, Ohio.
237. 28-*Page Illustrated Catalog* on "Donley Devices and Building Specialties." 6 x 9 in.
N. & G. Taylor Co., Philadelphia, Pa.
117. *Booklet and Detail Sheet of Tin Roofing.* See Roofing.

METAL TRIM—See Doors, Windows and Metal

MILLWORK—See also Lumber—Building Construction—Doors and Windows

MORTAR—See also Cement

MORTAR COLORS
Clinton Metallic Paint Co., Clinton, N. Y.
118. *Clinton Mortar Colors.* Booklet. 3½ x 6¼ in. 8 pp. Illustrated. Complete description of Clinton Mortar Colors with color samples.

PACKAGE RECEIVER
The Donley Bros., 3700 East 74th Street, Cleveland, Ohio.

PAINTS, STAINS, VARNISHES AND WOOD FINISHES
Samuel Cabot, Inc., Mfg. Chemists, 141 Milk Street, Boston, Mass.
S. C. Johnson & Son, Racine, Wis.
182. *The Proper Treatment for Floors, Woodwork and Furniture.* Booklet. 6¼ x 8½ in. 32 pp. Illustrated in color. A treatise on finishing hard and soft wood in stained and enameled effects; also natural wood effects.
123. *Portfolio of Wood Panels.* 5½ x 10¾ in. 14 pp. Containing actual panels of finsihed woods. Also contains valuable information on finishing and re-finishing floors and woodwork.
John Lucas & Co., Inc., Philadelphia, Pa.
264. 100-*page "Descriptive Catalog."* 6 x 9 in. Published for the purpose of familiarizing "Lucas" distributors with the characteristics, purposes and uses of "Lucas Paints and Varnishes."
National Lead Co., 111 Broadway, New York City.
124. Handy Book on Painting. Book 5½ x 3¼ in. 100 pp. Gives directions and formulas for painting various surfaces of wood, plaster, metal, etc., both interior and exterior.
Ripolin Co., The, Cleveland, Ohio.

Directions for the proper finishing of wood, metal, plaster, concrete, brick and other surfaces, both interior and exterior, are included in this Specification Book.
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
131. *Spread the Sunshine Inside.* Booklet. 5 x 8 in. 24 pp. Describes methods for light saving by the application of light reflecting enamels to interior walls of factories.

PARTITION SYSTEM
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels with special clip, ready for plastering.

PARTITION TILE
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PERGOLAS
Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
235. *Album No. 33.* 7½ x 10½ in. 42 pages of illustrated literature regarding the various types of Pergolas.

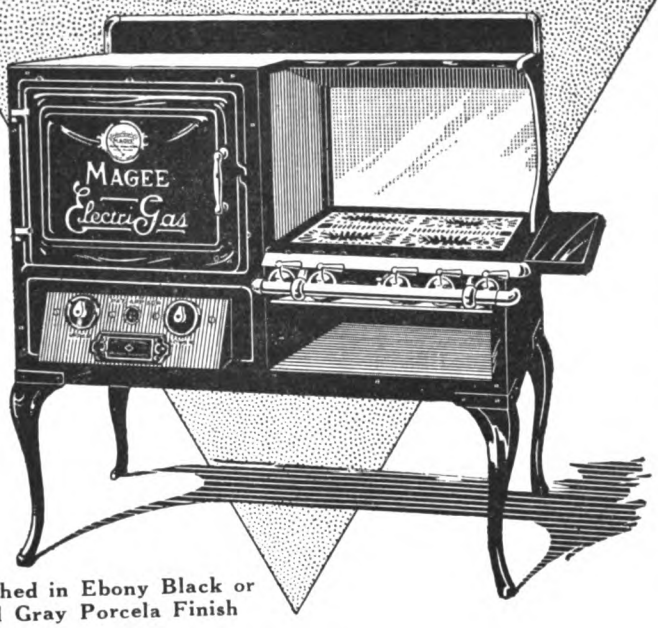
PLASTER BASE
The Bishopric Mfg. Co., 17 Este Avenue, Cincinnati, Ohio.

PLASTER BOARD
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PLASTER, INTERIOR
National Kellastone Co., 155 East Superior Street, Chicago, Ill.

PLUMBING SUPPLIES
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.
Hess Warming & Ventilating Co., 1205D Tacoma Bldg., Chicago, Ill.
136. *Hess Sanitary Steel Medicine Cabinets.* Booklet. 4 x 6 in.
B. Karol & Sons Co., 806 So. Kedzie Avenue, Chicago, Ill.
465. *Write for Catalog K,* describing the complete line of Plumbing and Heating Supplies.

PUMPS
C. H. & E. Mfg. Co., Milwaukee, Wis.
251. Bulletin No. 2. Pumps.
The F. E. Myers & Bro. Co., Ashland, Ohio.
137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.
138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinder and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illus-



REFRIGERATION
McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.
466. *Catalog No. 95*—Refrigerators for Residences.
467. *Catalog No. 53*—Refrigerators for Hotels, Restaurants, Clubs.
468. *Hospitals and Institutions.* Catalog No. 64—Market Coolers and Refrigerator Counters.

ROOF DECKS
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

Decorative effects and how to obtain them. Flashings, reglets, gutters and leaders. Cornices. Copper-covered walls. Specifications. 32 pp. Ill. 8½x11.

Cortright Metal Roofing Co., Philadelphia, Pa.

236. Four-page circular describing the various shingles.

Creo-Dipt Company, 1025 Oliver Street, North Tonawanda, N. Y.

153. *Standard Stained Shingle.* Samples of different kinds mailed.

154. *Architectural Service Sheets.* 8½ x 11 in. Illustrated. Working drawings of construction. with standard specifications for design and construction of same.

Edwards Mfg. Co., 423 Eggleston Avenue, Cincinnati, Ohio.

471. *Catalog No.* 65 describes fully Metal Roofing, Siding, Ornamental Ceilings and other Sheet Metal Work. This is a 210-p. catalog well illustrated.

C. G. Hussey & Co., Pittsburgh, Pa.

227. *Copper Roofing and Flashings.* Book No. 6. 34 pp.

Illinois Zinc Company, 280 Broadway, New York, N. Y.

155. *Pure Rolled Zinc.* (Corrugated and Plain Sheets.) Booklet. 3½ x 6¼ in. 8 pp. Illustrated. Facts regarding adaptability of zinc for roofing. Specifications of corrugated zinc sheets. Weights per square. Comparative gauge lists.

156. *The Roof That's Always New.* Booklet. 3⅛ x 6 in. 12 pp. Illustrated. Story of Illinois Zinc Shingles, their everlasting and artistic qualities. Information regarding a complete zinc roof, shingles, starting piece, valley, ridge and hip piece.

National Sheet Metal Roofing Co., 339 Grand St., Jersey City, N. J.

159. *Manufacturers of Metal Shingles* in various designs, both in painted tin or galvanized iron. Samples sent on request.

Richardson Co., Lockland, Cincinnati, Ohio.

472. *Four-page folder,* describing the Flex-A-Tile Roll Shingle Roofing.

F. C. Sheldon Slate Co., Granville, N. Y.

473. *Sixteen-page colored catalog,* describing the "Most Attractive Roof at the Most Reasonable Cost."

N. & G. Taylor Company, 300 Chestnut Street, Philadelphia, Pa.

160. *Selling Arguments for Tin Roofing.* Booklet. 6¼ x 9¼ in. 80 pp. Illustrated. Describes the various advantages of the use of high grade roofing tin, gives standard specifications, general instructions for the use of roofing tin, illustrates in detail methods of application.

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

161. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins. 8½ x 11. Pyrofill.

Vendor Slate Co., Easton, Pa.

474. *"A Book for Architects"* is the title of the new 24-page, well-illustrated catalog.

Vulcanite Roofing Co., Buffalo, N. Y.

475. *Interesting booklets,* describing the "Better Shingle" and "Vulcanite Roll Roofings."

RULES

A. S. Aloe, St. Louis, Mo.

Eugene Dietzgen Co., 162 Ft. Monroe Street, Chicago, Ill.

476. *Write for an instructive circular.*

Keuffel & Esser Hoboken, N. J.

Sargent & Co., New Haven, Conn.

Stanley Rule & Level Co., New Britain, Conn.

SASH CHAINS, HOOKS AND ATTACHMENTS

The Bridgeport Chain Co., Bridgeport, Conn.

209. *An interesting catalog* describing fully Sash Chain in Steel (six sizes and six finishes), in Bronze (six sizes). Hooks and Sash Chain Attachments.

SASH CORD

Samson Cordage Works, Boston, Mass.

477. *An interesting catalog* with actual samples of the various grades of cordage therein.

SAW MACHINERY

American Saw Mill Machinery Co., Hackettstown, N. J.

162. *Catalog No.* 21, describing Circular Saws of all sizes.

163. *General Catalog No.* 22 and *special Bulletin No.* 77, describing sawing machinery for use on the job in the shop.

W. F. & John Barnes Co., 71 Ruddy Street, Rockford, Ill.

478. *Catalog No.* 84 describes in full detail the Patent Foot and Hand Power Wood Working Machinery.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.

164. *Bulletin No.* 1, *Saw Rigs.*

Creecent Machine Co., 206 Main Street, Leetonia, Ohio.

479. *This* 1921 *catalog* contains improvements on No. 3 and No. 5 Saw Tables. No. 2 Motor-Driven Saw Table, New Motor-Driven Sharper, Hollow Chisel Mortiser.

Huther Bros. Saw Mfg. Co., Rochester, N. Y.

480. *Catalog No.* 38 describes the complete line of Saws.

C. E. Jennings Co., 321 Winthrop Avenue, New Haven, Conn.

481. *An interesting* 46-page Tool Chest Catalog may be had on request.

Parks Ball Bearing Machine Co., Station A. Cincinnati, Ohio.

482. *Catalog B* describes in detail Wood Working Machines.

Sidney Machine Tool Co., Sidney, Ohio.

483. *Twelve-page illustrated booklet,* describing the "Famous Universal Wood Workers."

484. *One hundred-page, pocket-size catalog,* giving full information on the "Famous Woodworking Machinery."

SAWS

E. C. Atkins Co., Indianapolis, Ind.

286. Booklet and chart describing saws. Especially the cross cut saw.

SCREENS

American Wire Fabrics Company, 208 So. La Salle St., Chic., Ill.

165. *Catalog of Screen Wire Cloth.* A catalog and price list of screen wire cloth, black enamel, galvanized, galvanoid, American bronze. 30 pp. Illustrated. 3½ x 6¼ in.

SHEATHING

Bishopric Mfg. Company, 103 Este Avenue, Cincinnati, Ohio.

171. *Homes Built on the Wisdom of Ages.* Catalog. 6 x 9 in. 48 pp. Illustrated. Describing the use of Bishopric Stucco-Board and Bishopric Sheathing Board.

U. S. Gypsum Company, 205 West Monroe St., Chicago, Ill.

173. *Eight-page Folder.* Describes Adamant Sheathing Board for use instead of wood sheathing.

SHINGLES—ASPHALT

Winthrop Tapered Asphalt Shingles, 19 So. La Salle St., Dept. No. D-20, Chicago, Ill.

SHINGLES—METAL

Cortright Metal Roofing Co., 50 North 23rd St., Philadelphia, Pa.

174. *"Concerning That Roof."* A complete catalog describing and illustrating Cortright Metal Shingles and Trimmings. 7 x 10¼ in. 32 pp.

SHOWERS, CURTAINLESS

Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.

260. *4-page File and Reference Sheet* describing six different models of the shower.

SLATE—See also Roofing

Blue Ridge Slate Corp., Esmont, Va.

Knickerbocker Slate Corp., 153 East 38th Street, New York, N. Y.

485. *Four-page folder,* describing the "Graduated Slate Roofs."

F. C. Sheldon Slate Co., Granville, N. Y.

175. *Commercial and Architectural Roofing Slate* in all colors and textures. Also blackboards, structural and electrical slate. Slate Granules.

Vendor Slate Co., Easton, Pa.

STAIRWAYS

Beasler Movable Stairway Co., Akron, Ohio.

169. *Illustrated catalog,* containing 24 pp., describes how the Beasler Movable Stairway saves floor space and adds an extra convenience to the home.

STANDARD BUILDINGS

Truscon Steel Co., Youngstown, Ohio.

176. *Truscon Standard Buildings.* Fourth Edition. Catalog. 8½ x 11 in. 40 pp. Illustrated. Erection details, cross-section diagrams and adaptations are given.

STONE, BUILDING

Art Stone Co., Waynesboro, Pa.

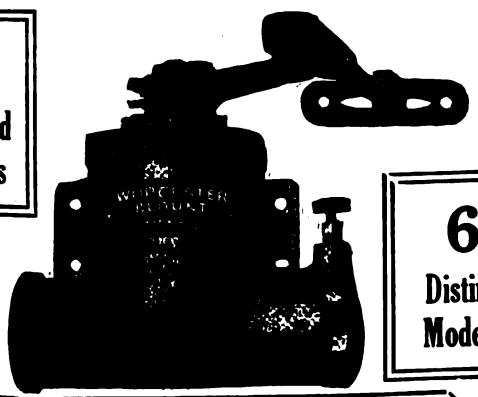
Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth.
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.



Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

Park Production and Engineering Organization Assure the Utmost in Delivery and Mechanical Service.

Here's A Helpful Item to Combine with Your Bids or Proposals on Residences

It Will Interest the Home Owner—and May Help You Secure the Contract

For less than $100.00 additional the plaster-base of walls and ceilings of the average home (costing in the neighborhood of $5,000) can be Bostwick Truss-Loop throughout.

One thousand wood lath equals 60 sq. yds. of wall surface and costs $12.00. Wood lath, properly spaced, takes almost exactly the same amount of plaster as Bostwick Truss-Loop. Truss-Loop, therefore, costs only the margin between first cost of wood lath and first cost of Truss-Loop. This works out to from $65.00 to $100.00 more for the usual types of moderate-priced homes. Just this small margin secures lasting wall beauty and fire-protection.

In addition, Bostwick Truss-Loop will save for you in Time, Labor, Lath, Studding and Waste Plaster. Let us tell you how—write us for particulars and proofs.

American Universal Floor Surfacing
THE BIG PROFIT SYSTEM

The American Universal Floor Surfacing Machine is the best money maker the contractor can own. It is practically "fool proof" and can be operated by any man of ordinary ability and do only the best grade of work, for its operation is automatic. When your building is about ready to turn over to the owner, it does the last big job, the floors, when everyone is anxious, quickly and perfectly, leaving everyone feeling satisfied. One man and one American Universal does the work of six men and does it perfectly.

Old Floors Made Like New—New Floors Made Perfect

Contractors owning American Floor Surfacing Machines keep them going all the time at big profits on old floors when they are not needed on the new work—this is an excellent source of profits. Often, too, floor surfacing contracts are taken on other jobs. Just read what users say about the labor-saving, money-making ability of the American Universal. Hundreds of others have gone into the floor surfacing business and are independently well fixed.

1 Man—Big Profit

6 Men—Small Profit

Saves Labor of Six Men and Does Better Work
We can surface more floors with our "American Universal" machine than six men can scrape by hand, considering the quality of the work.—Schneider & Hein, Nebr.

Would Not Go Back to Old Way
The "American Universal" is a great labor saver, doing the work of about eight men, so naturally I would never consider going back to hand scraping again.—M. B. Warner, Colo.

Surfaces 1500 Square Feet Per Day
The "American Universal" does all you claim, for it has surfaced 1500 square feet of flooring per day for me and is doing the work of six men.—L. F. Walla, Va.

Customers Satisfied—Business Increases
The "American Universal" has replaced five men at least on my payroll, does better work than before, and so, as my customers are so well pleased, I have found my business increasing right along.—A. G. Thompson, Ark.

Afraid to Go Back to Hand Work
Since the "American Universal" has proven such a great labor saver, would not dare to go back to the old method of hand scraping.—C. E. Andrews, Pa.

Saves Six Men
The "American Universal" replaces six men on my pay roll and I find it to be a great labor saver.—E. A. Bittner, Pa.

Light and Easy to Handle
In the first place the "American Universal" machine is light and easy to handle and does lots more work than the other sander of a different make which I have.—Kroffganz and Frank, Mont.

No Kicks—Replaces Six Men
Want to tell you that I've never had a kick about unsatisfactory work from any of my customers ever since I bought the "American Universal" and it replaces six men on my pay roll, too.—A. F. Grow Brothers, Nebr.

Saves Ten Men
Your "American Universal" floor surfacing machine is a labor saver. It will do the work of ten men in one and in much better shape.—M. B. Battien, S. D.

Replaces 10 Men
The "American Universal" replaces ten men on my pay roll, and surely does excellent work.—I. O. Fette, Ia.

Machine Does Better Work Than Hand Scraping
The "American Universal" has replaced five men on my pay roll, and I can do a better quality of work with my machine than by hand scraping.—L. L. Howard, Kans.

Quality of Work Only Advertisement Necessary to Secure More Work
I want to tell you that the "American Universal" is some labor saver—it replaces at least five men on my pay roll, and the quality of work it turns out is all the advertisement I need for my business.—Hugh A. Cox, Fla.

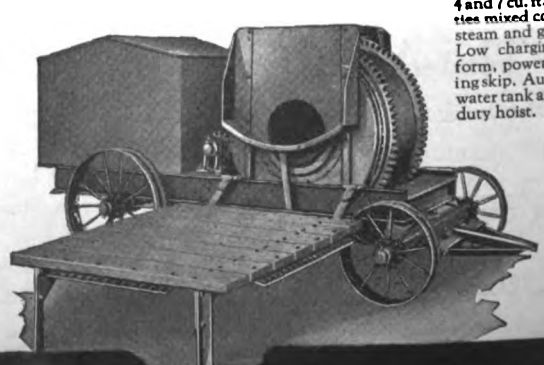
KOEHRING DANDIE Light Mixer



—yet it is within the price range for light mixers

THE Dandie is a light, easily portable mixer for concrete footings, culverts, floors, and has also proved suitable for mortar mixing.

It is a Koehring mixer—Koehring designed and constructed—and this means that dependability and long service life are the first considerations, not lowest price. No it is not the lowest priced mixer, but is well within the price range for light mixers, making it the greatest ***value*** in light mixer field. It sets a new standard of efficiency and value for light mixers. Big production, standardization in every part, and automatic shop equipment keeps the price down!

4 and 7 cu. ft. capacities mixed concrete, steam and gasoline. Low charging platform, power charging skip. Automatic water tank and light duty hoist.

Send Today for Catalog D 4

Get the details of construction—the liberal drum dimensions—double gear drum drive—the drum roller construction—universal bearings, mixing action—the two side discharge control—trouble-proof power—dust-proof housing. Get these details and you will see why the Dandie offers a remarkable value. Write for catalog D 4 today.

The Plan Book No Builder or Contractor Can Afford to Be Without

Here is a plan book which is entirely different from existing plan books. Every design, whether it is of the simple frame dwelling or the larger residence has been designed so as to secure beauty and convenience.

Builders and contractors can use

"Beautiful Homes of Moderate Cost"

to create more business. Just show this book to your prospects and let them pick out the home they like best. Every home illustrated in this book will be a credit to the community where it is built and to the builder.

The designs include bungalows, one-family and two-family houses; frame, brick, hollow tile, stone, stucco and combination of these materials.

Complete Blue Print Plans, ¼" Scale, and Specifications for each design are available at small cost.

The book also shows Garages, Pergolas, Garden Furniture, Gates and Fences, Kitchen Arrangements, desirable Built-in Features, and articles on Financing, Carrying Charges, Landscaping, Wiring, Furnishing, Decorating, House Building Materials, Roofing, Heating, Plumbing, etc.

A book of exceeding importance to every prospective home owner, and, consequently, just the book for every builder, draftsman, lumber dealer, real estate operator, and mortgage and building loan organizations.

Published to complete our service to the industry and so priced very nominally—$1.00 the copy, heavy paper covers; $1.50 in cloth covers.

The New JAEGER

Jaeger Trailer-Mixer No. 3-E

We Couldn't Get More Speed Into the Drum, So We Put It Into the Wheels

A Step in Advance of Anything in the Concrete Mixer Line

More *Speed*—

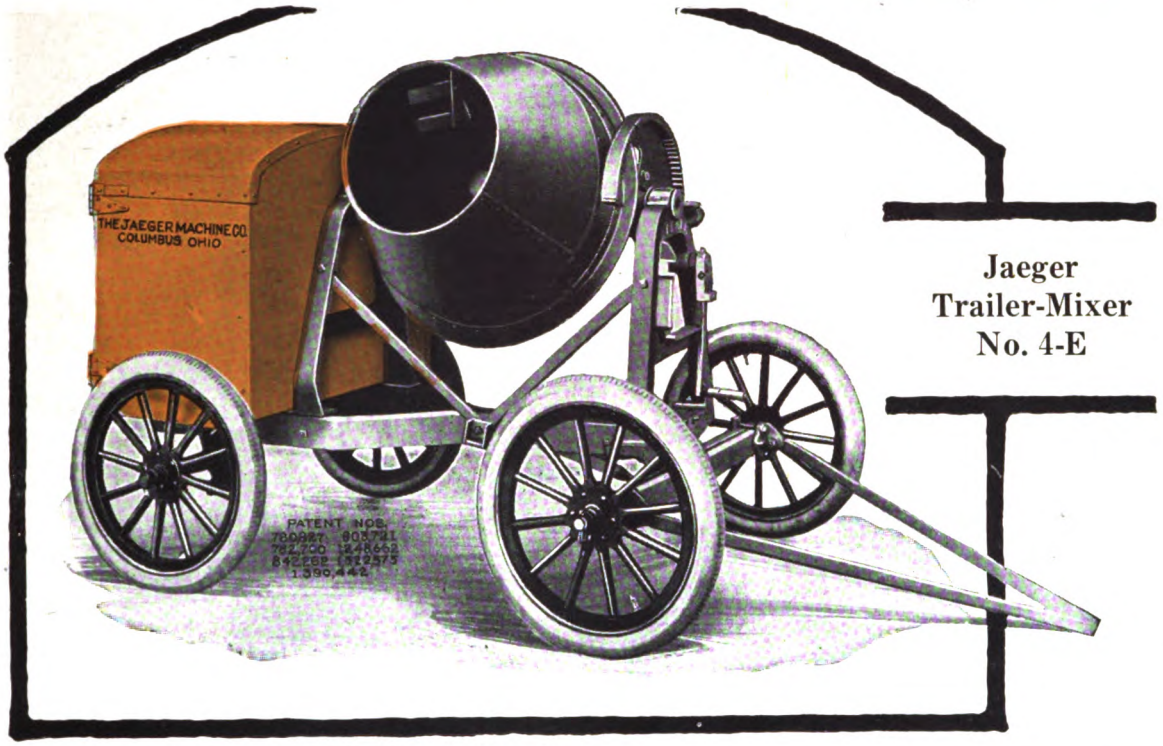
JAEGER has again stepped ahead of the crowd—by producing this new Trailer-Mixer. Here is a mixer outfit whose MIDDLE NAME IS SPEED. And it is living up to its name by speeding up the work and profits of hundreds of contractors.

This new fast-moving, fast-mixing outfit is a regular Jaeger mixer mounted on automobile wheels, with pneumatic tires. This gives EXTREME PORTABILITY. This is the outfit that contractors have wanted for years.

When ready to move, the contractor simply loads his equipment into his truck or machine, attaches the trailer and "steps on the gas." Instead of traveling a careful 10 miles an hour, he "full speeds ahead" at 20 or 30. His trailer-mixer floats noiselessly along behind—no rattling, no jarring, no loosening of bolts, no hold-up in traffic. HE GETS ON THE JOB, COMPLETES IT AND GETS TO HIS NEXT STOP IN FAST, PROFIT-MAKING TIME.

SPECIFICATIONS

TRAILER-MIXER (3-E)



Size over all—3 ft. 6 in. by 5 ft. 6 in.
Height to charge—40 in.
Engine—2 H. P. hopper cooled.
Costs 1 to 2 cents per hour for gasoline.
Capacity—3 to 4 cu. ft. per batch.
Capacity up to 25 yds. per day.
Weight—985 lbs. Only 145 lbs. weight to be lifted in moving the trailer about.

TRAILER-MIXER (4-E)

Four wheels instead of two.
Capacity—Up to 7 cu. ft. unmixed material.
Weight—Only 1760 lbs.
Here is the same machine as our regular 4-E iron-wheel mixer except for its special wheels and pneumatic tires. Just as easily portable as the 2-wheel trailer.

Digitized by Google

Trailer-Mixer

Jaeger
Trailer-Mixer
No. 4-E

More *Profit!*

UNDOUBTEDLY you've often found little profit in some of your smaller or medium-sized jobs, simply because of the time it took to get to the job, get your mixer set and under way. You needed an outfit that would speed things up all around. HERE IS A SPEED OUTFIT IN EVERY SENSE OF THE WORD!

The Trailer-Mixer can start and finish a medium-size job before a big mixer can be placed and put in work. The country and the city contractor will find it indispensable on account of its extreme portability. It mixes mortar and plaster as well as concrete. Its orange cab makes it easily seen—thereby helping eliminate traffic collisions. Consider the negligible amount of weight and wear on the pneumatic tires compared to those on an automobile, and you will see that these tires will last many many months.

A Real Jaeger Outfit

Above all, the Trailer is a real Mixer—a standard, Jaeger tilting-drum outfit whose reputation for thorough mix and absolute dependability is backed by the word of more than 18,000 contractors.

Consider the LIGHT WEIGHT, LOW COST, EXTREME PORTABILITY AND SPEED OF MIX and you'll agree that for rapid work and quick profits not an outfit on the market can compare with this new Trailer-Mixer.

Send the Coupon for Full Facts

You'll be vitally interested in this new Jaeger Trailer-Mixer. Let us send you more complete information on this speedy mixer outfit. MAIL THE COUPON TO-DAY.

The Jaeger Machine Co.
216 DUBLIN AVENUE COLUMBUS, OHIO

230 Miles in Two Days With Trailer-Mixer

"I want to say that when it comes to making time and making mileage, the Jaeger Trailer-Mixer can't be beat. I'm rather proud of the two-day record I made with my outfit.

"I hooked it on behind my Cadillac and traveled from Columbus, Ohio, to Newark, Ohio (35 miles), in less than two hours. I put in a drive for a filling station—and left the same evening for Marietta. I put in another filling station in Marietta and left that evening for Columbus. I traveled 230 miles in two days with my Trailer, put in two good jobs and came through without a rattle. I can't say enough for the Jaeger Trailer-Mixer. It's just what I've always wanted. I wouldn't buy one with iron wheels now."

WM. M. FRAVEL,
Columbus, O.

American "Jewel" Bench Planer

American "Variety" Tilting-Table Saw Bench

American "Universal" Saw Bench

American "Triumph" Planer, Matcher and Moulder

"Furnishes All Necessary Mill Work"

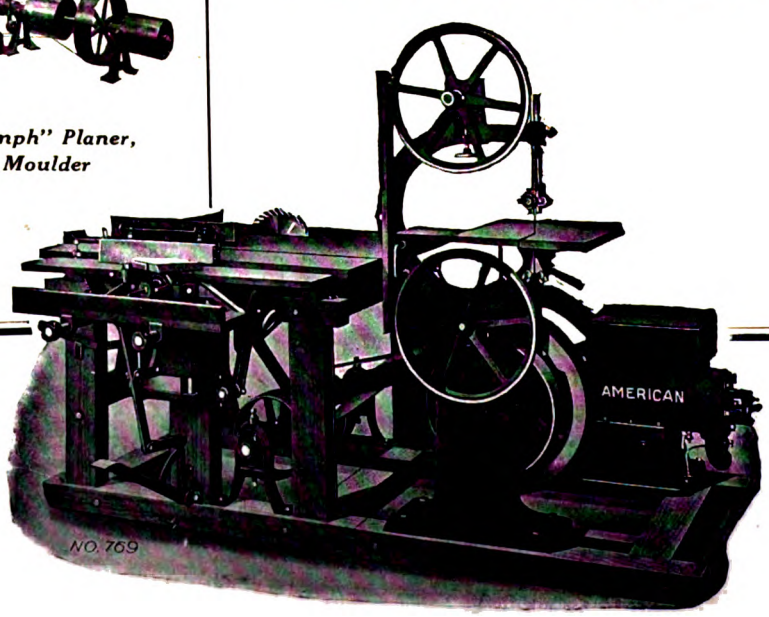
THAT is what Frederick Skon, a carpenter and builder of Jersey City, N. J., says about the American Contractors' Variety Woodworker.

His letter is as follows:

> "The Contractors' Variety Woodworker has proven very satisfactory in my shop. I cannot say what department the machine has proven most useful in, as the rip-saw, cross-cut saw, jointer and mortiser are in constant use by two men in my shop. I think it is sufficient recommendation for the machine to say it furnishes me with all necessary mill work."

Hundreds of contractors, builders and carpenters the country over voice the same enthusiasm, on the all around utility of the "American" Contractors' Variety Woodworker.

Put an "American" in your shop and from the start it will prove a dividend paying investment in time and labor saved and volume of work turned out.



Write for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of woodworking machinery.

American Saw Mill Machinery Company

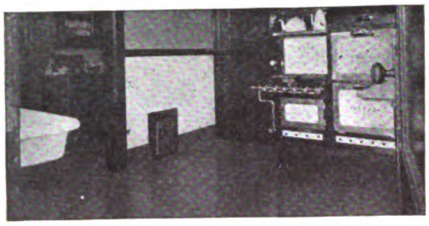
M. R. AMERMAN
PAVING CONTRACTOR

Norman, Oklahoma,
May 19th, 1922.

Victor L. Phillips Company,
Oklahoma City, Oklahoma.

Dear Sir:- Attention Mr. W. R. Wilson.



We believe that we have established a record in pouring Curb, on our Norman Oklahoma job, with a Wonder 7 Mixer.

On May 17th, we poured and finished 2,666 feet of curb in 8 hours with your machine, using 24 men. We also have poured over 60,000 feet of curb on this job to date, with an average of 1,800 feet per day and have experienced no delay on account of Mixer trouble.

Being especially pleased in the way this Mixer handles both our base material, which is dry, and the top coat, which is wet, with no loss of time, we take this opportunity to state that we are glad to say a most kindly word at any time for the Wonder 7 Mixer.

Yours very truly,
M. R. Amerman, Paving Contractor.

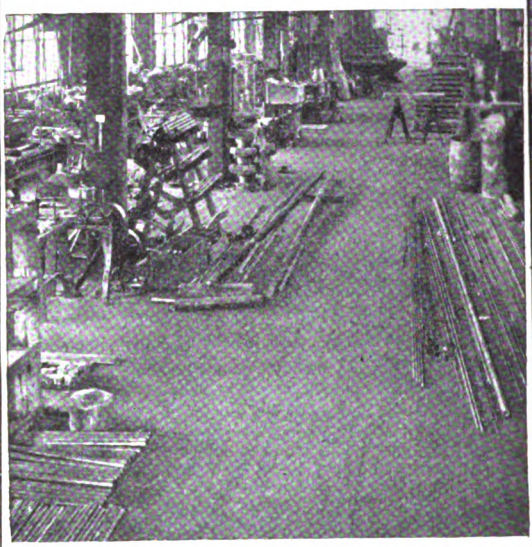
Everlasbestos Floor in Kitchen

For Every Good Contractor Everlasbestos—A Profit Maker in All Seasons

There is no dull season in the money-making business of laying Everlasbestos floors. There are always numbers of old worn-out wood floors and dusty concrete floors to be covered with new sanitary Everlasbestos Flooring—the Composition of Highest Quality.

You can also sell large areas in new buildings. In homes for kitchens, bathrooms, enclosed porches, laundries. In factories and institutions for washrooms, restaurants, kitchens and offices. Thousands of feet have been laid in hospitals, schools, Y. M. C. A.'s, railroad stations, hotels and retail stores.



Highest quality materials and our detailed instructions for laying assure success in all installations. Colors—red, buff or gray.

Write today for sample and catalog. Learn about the money to be made in selling and laying Everlasbestos

OAK FLOORS

(For Everlasting Economy)

For Factories

The strength, toughness and natural resiliency of No. 2 Common Oak Flooring, formerly called "Factory Oak Flooring," make it w orth many times its cost in factories, warehouses, armories, coliseums—wherever a high duty floor is demanded.

Half a Century of "Machine Duty" and Better Than Ever

"After fifty years' service, the Oak Floors in the works of The Charter Gas Engine Company, Sterling, Ill., have been taken up. Although there has been a great deal of trucking and moving of flywheels and other heavy castings on this floor, it is stated that there has been comparatively little wear."—*The Iron Age, July* 28, 1920.

A Smooth Trucking Floor

Tightly fitted, blind nailed and well oiled Oak Floors in the factory present the ideal trucking surface.

Owners of big buildings must pay maintenance and cleaning bills, and Oak Floors, with a good oil finish to preserve the wood and prevent dust from rising, effect an astonishing saving.

They also make for better health and greater efficiency of employes; and a large building with Oak Floors throughout always sells and rents for 5% more, at the least.

Three booklets, in colors, containing much accurate and valuable information for a builder's files, mailed free on request.

Oak Flooring Advertising Bureau
1041 Ashland Block, Chicago, Ill.

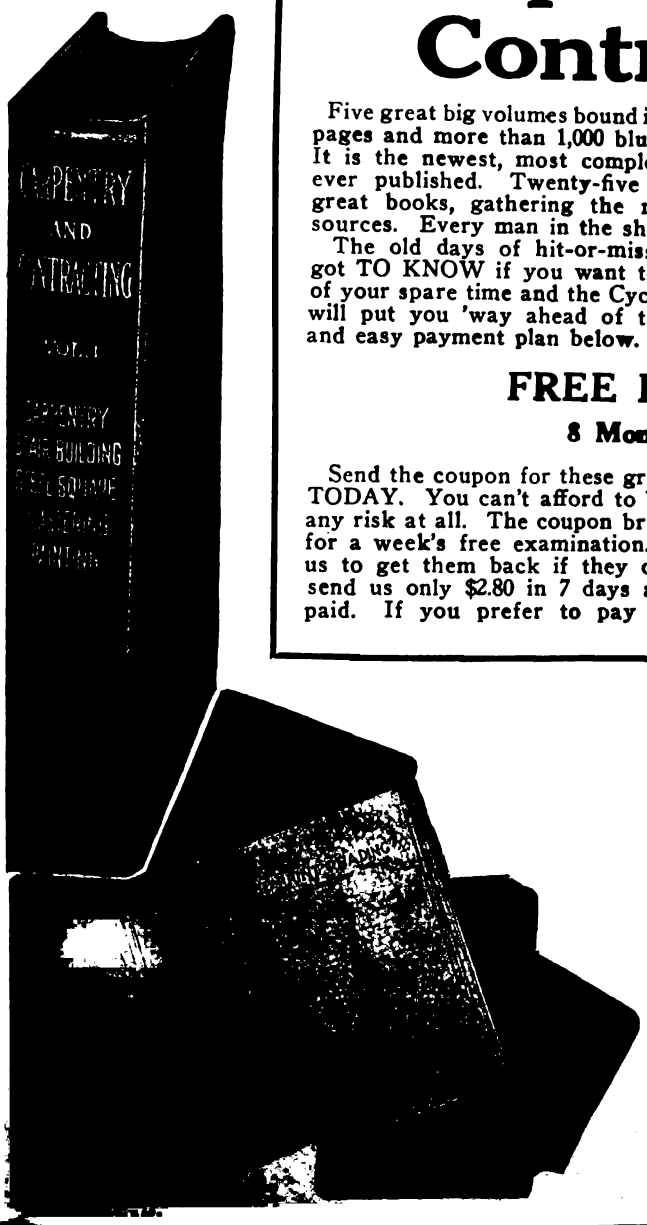
How to Be a Successful Building Superintendent.

What You Should Know About Contracts and Legal Relations.

How to Know Material and Select the Best.

How to Write and Read Building Specifications.



How to Read Blueprints and Plans.

A Thousand Things You Ought to Know

EVERY day in your work you get up against new problems—sometimes it is only some old "sticker" coming in a new way. Just the same though it takes a lot of time to figure them out. DON'T DO IT. Here's everything worked out for you. Every problem, big or little, that you will meet in a day's work. Hundreds of new ideas and better ways of doing things. Hundreds of ways the other fellows are making money. Hundreds of ways you can make more out of the same work you are doing now.

Cyclopedia of

Carpentry and Contracting

Five great big volumes bound in genuine American Morocco with 2,138 pages and more than 1,000 blueprints, plans, pictures and diagrams. It is the newest, most complete, most practical work of its kind ever published. Twenty-five well-known experts prepared these great books, gathering the material from hundreds of different sources. Every man in the shop and on the job should have them.

The old days of hit-or-miss experience are passed. You have got TO KNOW if you want to keep in the running now. A little of your spare time and the Cyclopedia of Carpentry and Contracting will put you 'way ahead of the rest. See our FREE trial offer and easy payment plan below.

FREE Examination

8 Months to Pay

Send the coupon for these great Carpentry and Contracting books TODAY. You can't afford to be without them, and you don't take any risk at all. The coupon brings the whole set by express collect for a week's free examination. Use the books a week and notify us to get them back if they don't please you. If you like them send us only $2.80 in 7 days and $3.00 each month until $19.80 is paid. If you prefer to pay cash with order send only $17.80. The return privilege holds good just the same. Send the coupon NOW. Remember—sending for the books does not obligate you to buy.

New and Standard Books

Arthur's New Building Estimators' Hand Book
1922 Edition Revised to June 30

Have you bought your copy of this standard work? It gives the latest information on costs on every branch of the building trades taken from work done in all sections of the country and ranging from the smallest job to large municipal work. It tells how long it took and how much material was used on each operation, so it may be used as an accurate guide by anyone. Your money back if you don't find it worth many times its cost. 1002 pages, 7¼x4¾ inches, Flex Fabrikoid Gilt Edges.....**$6.00**

Joslin's Plan Reading and Estimating Building Costs

A simple and practical work on costs and superintendence written for Eastern conditions, with important chapters on plan reading, taking off quantities, estimating the cost of labor and materials and a splendid system for keeping track of the progress of the work. There are 29 chapters; four on Reading Architects' Drawings, nine on Masonry, Iron Work, Marble Work, and Metal Work, four on Carpenter Work, five on Miscellaneous Subcontracts, four chapters on Estimating the Cost of Building Alterations, and three chapters on Building Superintendence. 188 pages, 6x9 inches, 41 illustrations. Numerous tables. Cloth.....**$1.25**

Hick's Estimators' Pocket Companion

A guide to prices of all kinds of building materials with handy rules, tables and information for the estimator.

The chapter on Carpentry gives the number of board feet and cost of framing lumber per square of 100 sq. ft., and many valuable tables, including timber measure, common and hip rafters for roofs of various pitches and with from one to eighteen feet run, the safe bearing loads of timber and yellow pine posts. Reliable data on figuring the strength and weight of materials is also given.

Contents: Introductory. Preparing Estimates. Excavating. Stone Work. Plain Concrete. Reinforced Concrete. Concrete Cement Stone. Cellar Bottoms and Walks. Brick Work. Hollow Building Tile. Masonry Tables. Estimators' Guide. Plastering. Carpentry. Iron Work. Sheet Metal and Roofing. Plumbing. Heating and Ventilation. Electrical Work. Tile Work. 218 pages, 4x6 inches, 92 tables. Cloth.....**$1.00**

Hick's Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Space is left at the end of each specification for extra data. 8 pages, 7x10 inches.....**20c. each, 6 for $1.00**

Modern Building Superintendence and Specification Writing

It covers details of the very newest building methods and modern material, steel skeleton construction, steel beams, reinforced concrete, plumbing, electric lighting, vacuum cleaning, etc., etc. The author takes a fine modern business building of twenty stories high and, beginning with the excavation, covers every detail of construction until the building is completed. In the second part of the book he deals with the writing of specifications. A careful and accurate and clear writing of specifications involving a knowledge of materials and matters of construction is an essential in the equipment of every young architect. 247 pages, 4¼x7 inches. Cloth.....**$1.75**

Kidder's Building Construction and Superintendence

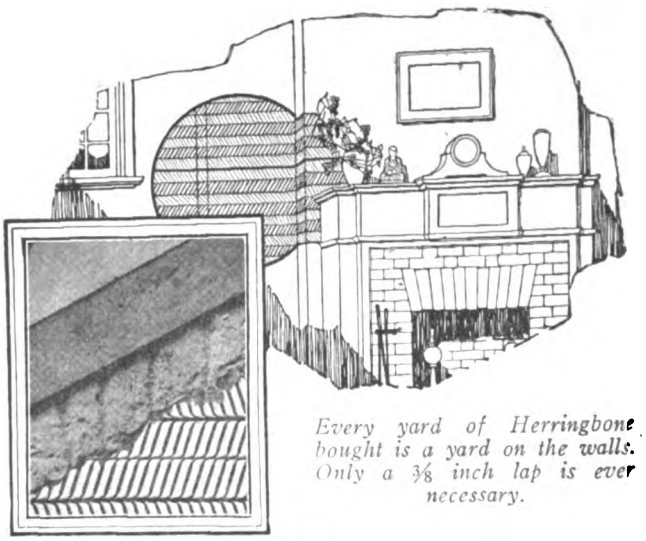
Part II. Carpenters' Work. This part has also been completely revised and rewritten. The book has been extended in scope to meet the improvements that have been made in construction methods during the period since it was first published. 931 pages, 830 illustrations, 7x9¾ inches. Cloth....**$7.00**

Part III. Trussed Roofs and Roof Trusses. Describes nearly every type of roof construction commonly met with in buildings, wooden and steel trusses for different spans and building requirements, computing the loads, drawing the stress diagrams, proportioning the members and joints to stresses, etc., etc. 294 pages, 306 illustrations. Cloth.....**$3.50**

Odell's Hardwood Floors

A practical little book from the pen of a man who has an extended experience in the better grades of modern floor finishing. It was written to meet the increasing demand for a simple treatise on the tools required and methods of handling same to turn out an even, well-laid floor. 50 pages, 5x8 inches, 13 figs. Cloth.....**$0.50**

Colwell's Kinks for the Builder



A practical manual on carpenter's work, foundation, cement and plaster work worth many times its cost to the carpenter and builder.

Contents: I, Foundations; II, Short-Cuts for the Carpenter; III, Problems in Framing; IV, Floor Construction and Finish; V, Cornice and Tower Work; VI, Fitting and Hanging Doors; VII, Cement and Plaster Work; VIII, Carpenter's Tool Chests and Mitre Boxes; IX, Miscellaneous Kinks and Wrinkles. 160 pages, 5x7¾ inches, 116 figs. Cloth.....**$1.00**

More Enduring
Than Wood—
Better and Cheaper
Than
Marble or Slate

H & H Toilet Partitions are rapidly replacing Wood, Marble and Slate.

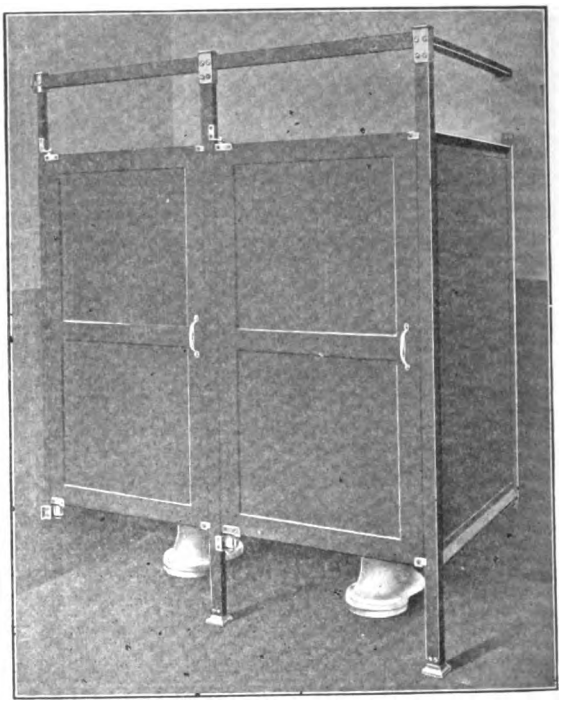
More sanitary than wood, because they do not absorb odors—more enduring, too.

They do not break or flake like slate or marble.

Shipping costs are less, because of their lighter weight.

Labor costs are less, because they can be set in much less time than it takes to set marble or slate.

Special rust-resisting filler finish—a second coat can be our standard green, or other shades can be applied over the filler after being installed.



Shipments now ready for replacements.

New Students' Edition of the GEORGIAN PERIOD

Edited by WM. ROTCH WARE

Just Published in one DeLuxe Portfolio—**$15.00**

Only the best known examples of Georgian architecture are contained in this new portfolio just off press. Measured drawings by eminent architects of a hundred carefully chosen, full page plates enable the student to quickly work out any motive he desires. In addition, 24 text pages offer a critical discussion of Colonial design.

Detailed drawings, elevations, perspectives and photographs present a complete picture of various designs of the Georgian Period the Student or Builder may be working upon.

Each portfolio, 10x14 inches in size, is delivered in a heavy board container.

ONLY A LIMITED PRINTING

Northern Italian Details

The new edition of this well-known work, limited to 250 copies, is now ready. Orders will be filled as they are received.

Formerly Sold for **$10.00**—*This Edition only* **$7.50**

An inspirational book that takes the builder off the beaten and prosaic path, and presents him with new, yet meritorious, examples of Italian details. Compiled by architectural draughtsmen of unquestioned ability, Messrs. Walter G. Thomas and John T. Fallon, this work offers exceptional help to all progressive builders.

The portfolio consists of 24 pages of text, and 143 full-page plates, 9x12 inches, covering "architectural bits." such as doorways, windows, stairways, panelling, grills, gates, fountains, knockers lamps, etc.

Are You Using Basement Windows that come Complete?

Think how much time and money you could save by installing a basement window that comes COMPLETE!

By "complete," we mean—the sash fitted and hung in the frame—the hardware in place—and the priming coat of paint applied.

When you use Fenestra Steel Basement Windows, you profit by these very advantages—they "come complete"! You don't have to have a carpenter on the job to build the frames—fit the sash—attach the hardware—or brace the window. This new Fenestra Steel Basement Window is all ready for the mason to install. It saves time, labor and money—makes a neater and more attractive job—gives the home owner a better buy for his money.

And here are the reasons why home owners want Fenestra Steel Basement Windows:

—they admit 40% to 80% more light than wood windows
—can't warp or stick
—resist fire
—provide better ventilation
—last as long as the building
—are surprisingly Low in Cost!

Let us send you our pamphlet that tells the whole story about these new steel windows. It shows how to install in all types of basement construction, —gives the four standard sizes—tells how to glaze, screen, and many other valuable pointers on the easy handling and installation of these windows. Write for you copy NOW—it's FREE!

The MURPHY IN-A-DOR BED

How it would fit into the plan of the famous "John W. Journal House."

WE show above the house erected by the Minneapolis Journal. The building was completely under the charge of the Architects' Small House Service Bureau, Northwest Division. In this home, the Journal demonstrated the present building and financing conditions—and shows what the average family may accomplish in providing an attractive home at moderate cost.

The Murphy In-A-Dor Bed will greatly increase the facilities and value of the small home. Perfectly concealed by day. Swings with ease through a three-foot closet door. A splendid bed in appearance and comfort. Equipped with Simmons Springs.

SERVICE DEPARTMENT

Write us today for specifications and information. We gladly co-operate with architects and builders—simplifying your lay-out problems.

KNAPE & VOGT Garment Carriers

FOR THE CLOSETS OF MODERN HOMES

KNAPE & VOGT Garment Carriers are made in all lengths from 12 to 60 inches. They will fit any and all closets in old homes and transform disorderly clothes racks into modern garment cases.

In new homes—or homes about to be built, as much as 15 per cent in construction costs is saved when Knape & Vogt Garment Carriers are planned for in advance, because this modern system permits smaller, space-saving closets, which reduce the overall dimensions of the building without reducing the size of the rooms. And yet these smaller closets will hold more clothing, create order, cleanliness and lengthen the life of the garments. Architects and builders who do not know the Knape & Vogt Garment Carrier System are not giving their clients the benefit of the latest developments in home conveniences.

Write for prices and details of simple installation.

KNAPE & VOGT MFG. CO., Grand Rapids, Mich.

CONSERVATION OF FUEL

Metal Weather Strips

The difference between a metal weather strip of the one piece rigid type and the DIAMOND flexible and removable type is about the same as the difference between candle light and the modern electric light of today.

The DIAMOND is the latest in practical, efficient and scientific weather stripping because it can be easily removed for making repairs and has exclusive features for taking care of the shrinkage, swelling and warping of sash. They have been time tested and tried and thousands of buildings in all parts of U. S. and Canada are yearly making a saving of from 20 to 40% in their fuel bills by having installed them. Diamond strip is made of a non-ferrous metal so that they will not rust and will be in place when the sash or door have rotted out. They are made to meet the requirement on any kind of a window or door in new or old buildings.

They not only save fuel, but they keep out cold wind, dirt and storm and add to the comfort of the occupants of any building.

DIAMOND METAL WEATHER STRIP is exclusively made by the DIAMOND METAL WEATHER STRIP COMPANY OF COLUMBUS, OHIO, and sold only by their established representatives in all the principal cities of this country.

MEANS SOMETHING IN THESE DAYS OF SCARCITY AND HIGH PRICES

A Book of Money Making Suggestions

There is an opening in your town to become the recognized store front builder. Every retailer desires a modern front and with the proper effort you can turn that desire into profit for yourself. This is a big store front year. Thousands of contractors throughout the country are making big money tearing out old store fronts and replacing them with modern fronts. Hundreds of these contractors are using "Desco" construction because it is practical, protects the glass, is permanent, easy to order, and because any carpenter can properly install it.

Turn to pages 819-827 of Sweet's Catalogue and you will find details of this modern and practical store front construction.

To be of help to you in going after the store front business in your town we have prepared a book which will be sent to you gratis; also full information, with details about "Desco," and will give you a price list so that you can figure the cost of a job right on the spot. Speed is an essential in building store fronts and we are prepared to co-operate with you.

Your letter will receive our prompt reply.

Why Kelsey Health Heat Is Ideal for the Home

Warm Fresh Air

Plenty of pure warm air for every room in the house, regardless of the direction of the wind or severity of the weather. The positive cap sends an extra supply to the room that is hard to heat.

Circulation

The warm air is delivered not only in large volumes, but at high velocity, insuring proper circulation.

Ventilation

The exhausted air is removed through vents at the floor line.

Humidity

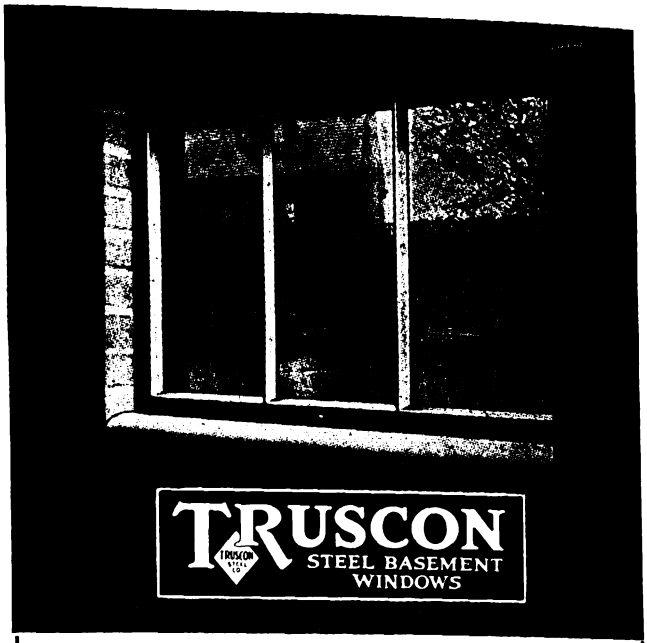
The automatic humidifier supplies the proper amount of moisture for health and comfort.

Convenience

No radiators occupying space that should be used for furniture.

Economy

The Kelsey Warm Air Generator extracts more heat from a ton of coal than any other system. This can easily be proved by records of actual performance.



Our Engineering Department will furnish detailed plans and specifications, insuring satisfactory installation.

Let us send you descriptive Booklet No. 5.

THE KELSEY
WARM AIR GENERATOR

405-B P. O. Sq. Bldg.

When You Build a Home *Start Right*

Compare the daylight area of a Truscon Steel Basement window with a wood window of the same size and you will find there is a gain of 50% to 80%, depending upon the size of the window. This is one reason why home-builders are using them to build daylight into their cellars.

Truscon Steel Basement Windows won't stick or warp. They are always easy to open and close; they lock automatically. Double contact weathering effectively keeps out wind, rain and snow. They are easy to install.

In making comparisons remember that Truscon Basement Windows come complete with the Sash accurately fitted to the frame and heavy hinges and lock attached.

Building supply and hardware dealers practically everywhere carry Truscon Steel Basement Windows in stock for immediate delivery. If your dealer does not handle them send us his name and ask for complete information.

You will find this name on every window

Architect Lawrence Barnard, New Rochelle, N. Y., used "CREO-DIPT" Stained Shingles on hundreds of houses in New York suburbs as well as for this home of Mrs. J. F. Mahlstedt, Pelham Manor, N. Y.

To many families home building means years of planning that they may build wisely.

"CREO-DIPT" Stained Shingles have come to be known, thru their use by prominent architects, as one of the most satisfactory and economical building materials for side walls as well as roofs.

You save cost of material, time in construction, and painting and repair bills. "CREO-DIPT" Stained Shingles are made of straight grained red cedar of first quality, stained with earth pigments in pure linseed oil carried into the wood with creosote oil. The open market does not afford such quality in either shingles or stain.

If you are going to build or remodel, send 6c. to cover postage for Portfolio of Fifty Large Photographs of Homes by Prominent Architects with color samples. Also ask about our Special Thatched "CREO-DIPT" Stained Shingles for Thatched Roof effect; 24-in. Dixie White Side Walls for the true Colonial White Effect.

Level and Plumb With Your Own Instrument

$5.00

BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

Write for Free Book

For Complete Satisfaction Now and in the Future

Frequently you like a thing at first, but later tire of it. Too many times this is the case with the roof of your home.

When you build or re-roof your house use

BLUE Asphalt Shingles
surfaced with
Flint-Arrow BLUE

the latest and most artistic slate surfacing material. Such a roof is distinctive, durable and fire-resistant. Its deep blue-black tone is unaffected by any climatic conditions and will be a source of permanent pride and satisfaction. It will complete the artistic effect of the house and will add dollars and cents to its value.

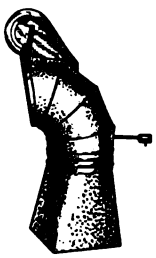
Ask your dealer for samples and information or write to us.

BLUE RIDGE SLATE CORPORATION
Esmont, Virginia

Can Your Houses Withstand Tomorrow's Competition?

THE far-sighted contractor knows that only well-built, up-to-date homes will rent or sell on the basis of present values after the supply of residences is sufficient to meet the demand. That's why he is equipping the houses he builds with the Kernerator—the modern system for disposing of household waste. Wherever in use the Kernerator is proving a vital sales factor because of the comfort, convenience and sanitation it affords.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected and a hopper door located in the flue on the first floor. The Kernerator costs nothing to operate, for no commercial fuel is required.



Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, Sweet's 1921 Catalog.

A Huther Brothers Dado Head Insures The Lower Production Cost Necessary for Reduced Prices

Huther Bros. Dado Head

Huther Brothers Dado Head possesses advantages unknown to similar types of saws. There are two reasons for this: First, because we were the patentees of this type of saw. Second, because the full knowledge gained from fifty years' experience in manufacturing saws is applied to the manufacture of every one.

A Huther Dado Head will greatly simplify intricate cutting and grooving. It consists of two outside cutters and as many inside cutters as required. Cutters may be used singly or in pairs.

Huther Bros. Hollow Ground Saw

Huther Brothers Dado Head is sold under an ironclad guarantee. We will cheerfully send one on approval to any responsible party. If not satisfactory in every respect it may be returned at our expense.

Write for illustrated catalogue showing complete line of Huther Brothers Saws.

Huther Bros. Manufacturing Co.
Rochester, N. Y.

TRADE MARK

When Buying Wall Board
Consider These Features

Compo-Board takes any form of decoration—wall paper, burlap, canvas, or it may be painted or kalsomined.

Does not require panel strips. Compo-Board has the extra strength needed to withstand hard knocks. It keeps out the dampness, heat and cold. Compo-Board Filler is especially prepared to conceal the joints and nail heads.

TRADE **Compo-Board** MARK

The Wood Core Wall Board
will not crack, crumble, shrink, warp or buckle.

No other wall board has ALL of these advantages. It insures a worth-while, permanent job that your customers will always be satisfied with. Write for sample and interesting booklet of uses.

Clinton Mortar Colors used in attractive home in Forest Hills, Long Island

Make Mortar an Asset

Mortar does much more to a building than hold its bricks together. It makes a great difference in its appearance.

1/5 of all brick work is mortar. Clinton Mortar Colors make that fifth a big factor in the attractiveness of a fine looking building. With Clinton Colors the mortar blends or contrasts perfectly with the rich tones of the face brick. Their colors are absolutely permanent.

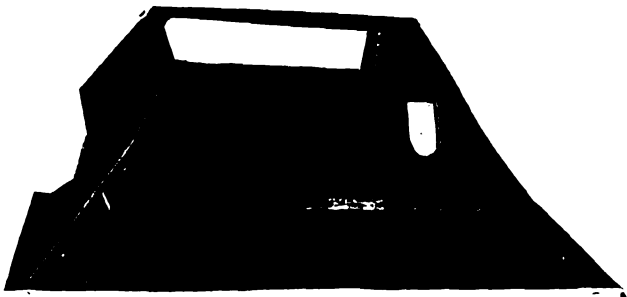
The **FIRMNESS, DURABILITY** and **ATTRACTIVENESS** of **AMERICAN BRAND SCREEN WIRE CLOTH** will appeal at once to the architect, home builder, or screen manufacturer who desires to give maximum Fly Screen satisfaction.

AMERICAN BRONZE: This grade is made of best hard drawn wire 90% copper, 10% non-corrosive alloy, principally zinc. **BRONZE** should last as long as the house in most sections.



Avoid copper substitutes as these are too soft.

GALVANOID: This grade is heavily electro-zincked **after** weaving, then varnished. It is the recognized leader in its field—the **best** grade of zincked cloth made.

We also make
PAINTED, GALVANIZED, COPPER, KOPNIK, MONEL
and many special grades of wire cloth. Samples and descriptive literature sent upon application.
Order from your Hardware Jobber or Dealer. If he cannot furnish, advise us, and we will see that you are supplied.

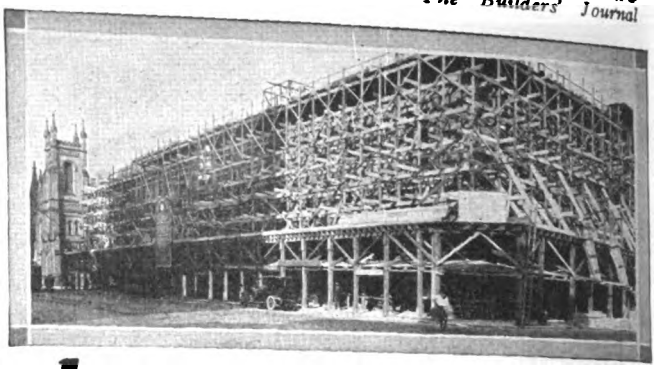
Smoky Fireplaces



The installation of an Apex Throat Damper with smoke chamber lining, will positively produce a clear burning fireplace, without smoke trouble at all times; if the chimney is (8 inches by 16 inches), and carried well above roof peaks.

A throat damper is no prevention against a smoky fireplace; a smoke chamber is. We are doing our part. Do yours! If you can afford a fireplace, you can afford to install a proper smoke-eliminating device, or better not build a fireplace at all.

Get the mechanism blueprint and find out about the most ingenious device ever created in the fireplace line. Simple! Effective! Perfect! Designed by a successful fireplace builder.

GRANVILLE, N. Y.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

New Tape Hook Makes Pullman Sash Balance

The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

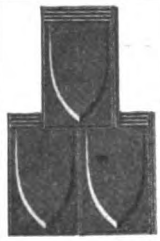

Fig. 157
Note the construction of patent Interlocking Device used on Edwards Metal Shingles and Spanish Tile.

Fig. 367
Metal Spanish Tile for main part of roof.

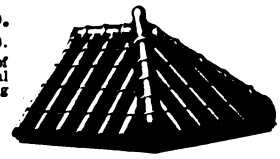
Edwards "Queen Anne" Metal Shingles

Residence, Senator Geo. S. Nixon, Reno, Nevada. Edwards Metal Spanish Tile used on this building.

EDWARDS
Metal Spanish Tile

It is wonderful what a remarkable transformation takes place when an "Edwards" Metal roof is properly applied to a house—all of the charm of the Old Spanish Terra Cotta Roofing Tile is preserved, even to the color.

The house takes on a new lease of life. It seems a better place to live in. It helps put the stamp of progressiveness and thrift on a community. An Edwards Metal or Tile Roof is a real commercial asset and will bring a better return in rent or sale.



Edwards Metal Roofings made in various styles, to have the appearance of wood shingles, tile, slate, or any other roofing effect, and none of these fine artistic effects will cost any more than a plain, commonplace roof.

All Edwards Metal Roofing is easy to lay—no big expense for skilled labor—storms and winds will not wrench it loose or make it a rattle-trap. It is lightning-proof and fire-proof —Reduces Insurance Rates.

When an Edwards Roof is laid, it is there to stay.

Send for our literature—it explains.

A Better Mortise

Easier and Quicker

Make a smooth, clean-cut job in any kind of wood; hard, soft, knotty, cross-grained or end wood; through dowel pins or panel ends with perfect ease. A perfect mortise with straight sides and uniform depth—and made ten times faster than by ordinary method. Specially adapted for use on doors, sashes, screens, cabinet work, etc.

The Champion Mortiser

easily makes 100 perfect mortises per day without the use of brace and bit or chisel. Quickly adjusted from round hole to 6¼ in. slot. Accurate and automatically regulated. Has 3 speeds for working in different woods. Simple to operate. Any workman can cut 100 mortises per day. Uses ¼ in., ⅜ in., ½ in., ⅝ in., and ¾ in. bits; special sizes up to 1¼ in.

Fully guaranteed. You take no risk. Money back if not satisfied, after 10 days' trial. Price includes any two bits. Additional bits $1.50 each. Send today.

Price $35.00

Made in several sizes

will surface right up to the wall or baseboard without the use of Edge Roller. Just the machine you would want for surfacing all kinds of wood floors, whether old or new. Will smooth down rapidly and easily all joints or warped edges. Perfect results guaranteed. More than 20,000 of our machines now in use. Guaranteed against defect in material and workmanship for five years.

Send for our Free Trial Offer. It will interest you

M. L. Schlueter, 223 W. Illinois St. **Chicago, Ill.**

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive shank, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

Kellastone's High Plasticity Is Scientifically Regulated

NO one of experience will gainsay the statement that the plasticity, or lack of it, in a stucco, governs the life and character of the finished work.

In ordinary stucco, for instance, it has been found that it is impossible to maintain the degree of plasticity necessary to good workmanship without at the same time creating a mix so rich that early cracking is the inevitable result.

On the other hand, long experience has proved that **Kellastone** magnesite stucco retains a desirably high plasticity even when the amount of magnesite present is held within the limits necessary to give low volume change.

Furthermore, the plasticity of **Kellastone** can be regulated by the addition of certain fibrous inorganic mineral fillers. And as it is well known that only the most expert workman can handle a non-plastic mix on a vertical surface, this easy working property of **Kellastone** practically assures superior workmanship.

Kellastone Interior Plaster is also highly plastic. It is immune to internal shrinkage stresses, works easily and freely and is much lighter and more durable than lime or gypsum.

Kellastone literature represents the most advanced thought in modern construction materials. Write for it.

AIR-WAY

A typical AiR-Way installation. In the view at the left, the windows are completely closed against the weather. In the view at the right, those above are fully opened while those below are adjusted for ventilation.

Rx Sunshine and Fresh Air

A NOTED physician (name and address on request) writes: "During all my 42 years of practice, sunshine and fresh air have been my best prescription. Some time ago I discovered your *AiR-Way Multifold Window Hardware*, and saw at once that it puts a sun room or sleeping porch within the reach of all. Good for you!"

AiR-Way Multifold Window Hardware makes a sun room or sleeping porch of any outside room. When closed, the windows fit snugly and are absolutely weathertight. It takes but an instant to throw them open—they may be operated from the inside without interference from either screens or draperies.

You will add greatly to your prestige as a progressive builder by introducing *AiR-Way Multifold Window Hardware* in your locality. It should be used in every new and remodeled home. If your local hardware or lumber dealer cannot supply you, it may be obtained from our nearest branch.

We want you to be thoroughly acquainted with AiR-Way hardware, as well as our many other items of hardware for the modern home. If you do not have our latest catalog covering these items, write today for Catalog J-28.

You'll Find it Easy to Sell Homes from These Plan Books

COUNTLESS people are on the verge of building the homes that they have long wished for, but they delay actually starting because they have not found just the plans they want.

By being able to show these intending builders a selection of designs from which they are almost sure to find a home which just suits their requirements and tastes, you are most certain to get them to take definite action and close the contract.

In the three books described below are shown nearly two hundred designs for small and moderate-priced face brick homes. The beauty and charm of brick, its permanence and economy, and the fact that the public is beginning to realize that face brick homes cost little more to build than frame and considerably less to maintain, are forces that are creating a widespread demand for smaller homes of face brick.

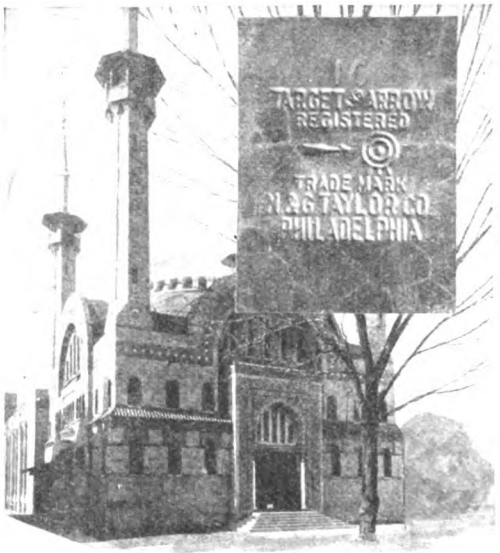
The houses pictured in these plan books are designed by architects recognized for the high quality of their residence work. The designs are all original and cover every type and style of architecture, and range in size from 3 to 8 rooms.

Complete working drawings and masonry material surveys can be obtained for every house design shown at very nominal fees. You'll find them a great help.

Bungalow and Small House Plans: A set of four booklets presenting ninety-two attractive face brick houses in interesting diversified styles. Booklet B1 contains 14 three and four-room designs; B2—30 five-room designs; B3—30 six-room designs; and B4 22—seven and eight-room designs. Single booklets are 25c, the set of four is $1.00.

The Home of Beauty: A 72-page book showing the fifty best designs for small six-room houses submitted in a country-wide architectural competition. These original designs are by the best architects on small houses in the country. These homes will be a lasting credit to the owner and contractor. Price 50c per copy.

Manual of Face Brick Construction: This 116-page book contains thirty-one attractive house designs by Dean and Dean, well-known house architects. The varied designs afford a fine selection of very desirable brick homes. This manual, as the name implies, also gives complete technical information on brick wall construction. Price $1 a copy.



You can order these Plan Books individually, or we will send the entire set of six at the special price of $2.00. Address Dept. B 11.

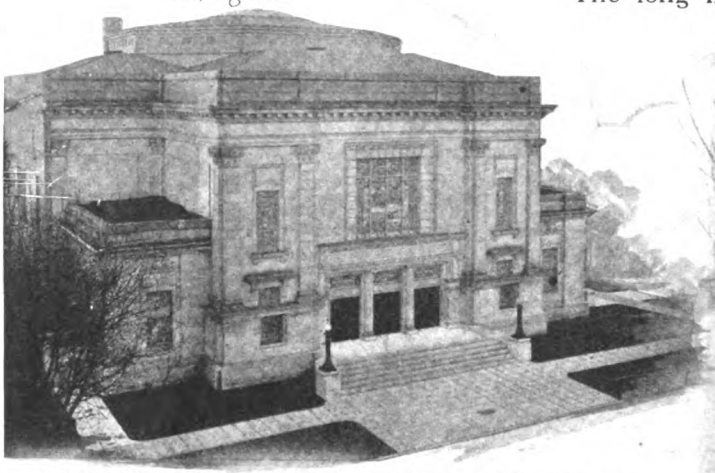
TARGET and ARROW for BUILDINGS of



IREM TEMPLE, WILKES BARRE, PA.
Roofed with 15 000 Sq Ft. of TARGET & ARROW Roofing Tin

THE surrounding pictures give some idea of the types of "buildings of distinction" roofed with Target and Arrow Roofing Tin.

Most of the roofs shown are "ribbed," a strong architectural effect attained by laying the roofing tin over heavy wooden battens. Their beauty has been further enhanced by finishing them in appropriate shades of gray, brown or green.

Target and Arrow is particularly desirable for roofing high-class buildings because it *lasts as long as the building it covers*—a statement amply sustained by numerous records of properties protected by Target and Arrow for fifty, sixty and even seventy years with countless records of perfectly satisfactory service for thirty years and more with this material still on the building and fit to render service for many years to come.

The long life of Target and Arrow Roofing Tin is due

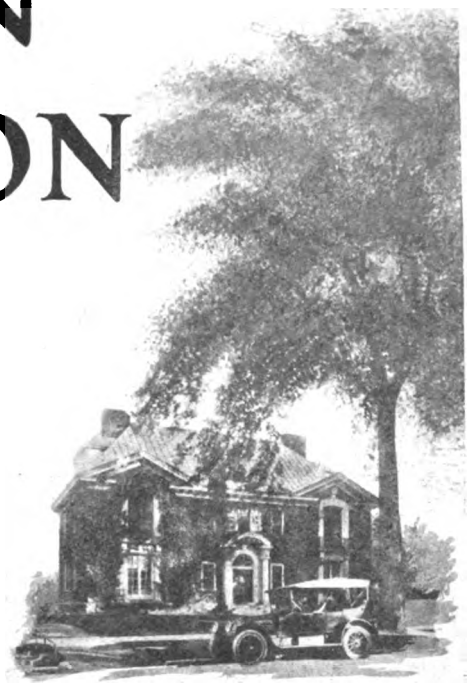
ROOFING TIN DISTINCTION



to its method of manufacture, for it is a truly hand-made roofing tin, made by an old Welsh process in which each sheet is repeatedly soaked and dipped by hand in pots of boiling palm oil and molten metal, consuming thirty-five minutes' time to coat each sheet and insuring an amalgamation of the coating with the base plate that cannot be done in any other way.

Target and Arrow Roofing Tin will solve more roofing, valley, gutter and flashing problems than any other roofing material on the market today. Full information and details of application on request.

Home seekers now regard electrical conveniences as essential and, accordingly, have given up-to-date builders an added selling point

Houses are sold for homes

IF the builder can show that the houses he has constructed will make real homes, they will sell more quickly and command a far higher price.

Every builder knows that provided the location of a house is pleasant, it is the *conveniences* in it which make it attractive to purchasers.

And of all conveniences, none is more important in the home-maker's eyes than the wiring.

Convenience outlets for everything—fans, irons, lamps, cooking appliances, vacuum cleaner, heaters. Plenty of switches conveniently located in every room to assure step-saving control. ***These are the things that sell houses for homes.***

G-E national advertising is creating a demand for the comforts and conveniences of completely wired homes. Builders can profitably capitalize this demand.

Shoulder device forms perfectly sealed roof. Three thicknesses everywhere except at slots.

Patented shoulder makes correct application easy. Set upper half of each shingle against next. Quickly, automatically done.

A Patented Feature that Makes Even Laying Easy

THE patented shoulder of the Vulcanite Self-Spacing Shingle makes for quick, accurate laying. The illustration at top of page shows exactly how it's done. You can't go wrong.

Also, this snug-fitting, quality shingle builds a roof that looks finer, serves better and lasts longer.

We will gladly send one of our large force of roofing experts to your office to explain Self-Spacing Shingles or any other Vulcanite Roofing. The line also includes the two high-grade specialties illustrated at the right, as well as *a better roofing for every possible requirement*—shingles, rolls, ornamental effects and built-up roofings for every conceivable use. Also roofing cement and roofing paint.

And remember this—no matter where you are located we can assure *prompt deliveries and low freight rates.* Conveniently located warehouses. Factories at Albany, N. Y.; Anderson, Ind.; Chicago and Kansas City.

Communicate with our nearest office for Vulcanite sales proposition.

The Cellar as clean as The rest of the house

The Sharp Rotary Ash Receiver consists of a set of five, eight or twelve rugged cans, mounted on a revolving steel frame, installed in a concrete pit under any size or style heater. There's nothing to get out of order.

Ash Dust Entirely Eliminated

Even the most careful housekeeper can't compete successfully with the dust that always rises and floats through the house when the ashes are taken up and shovelled into cans.

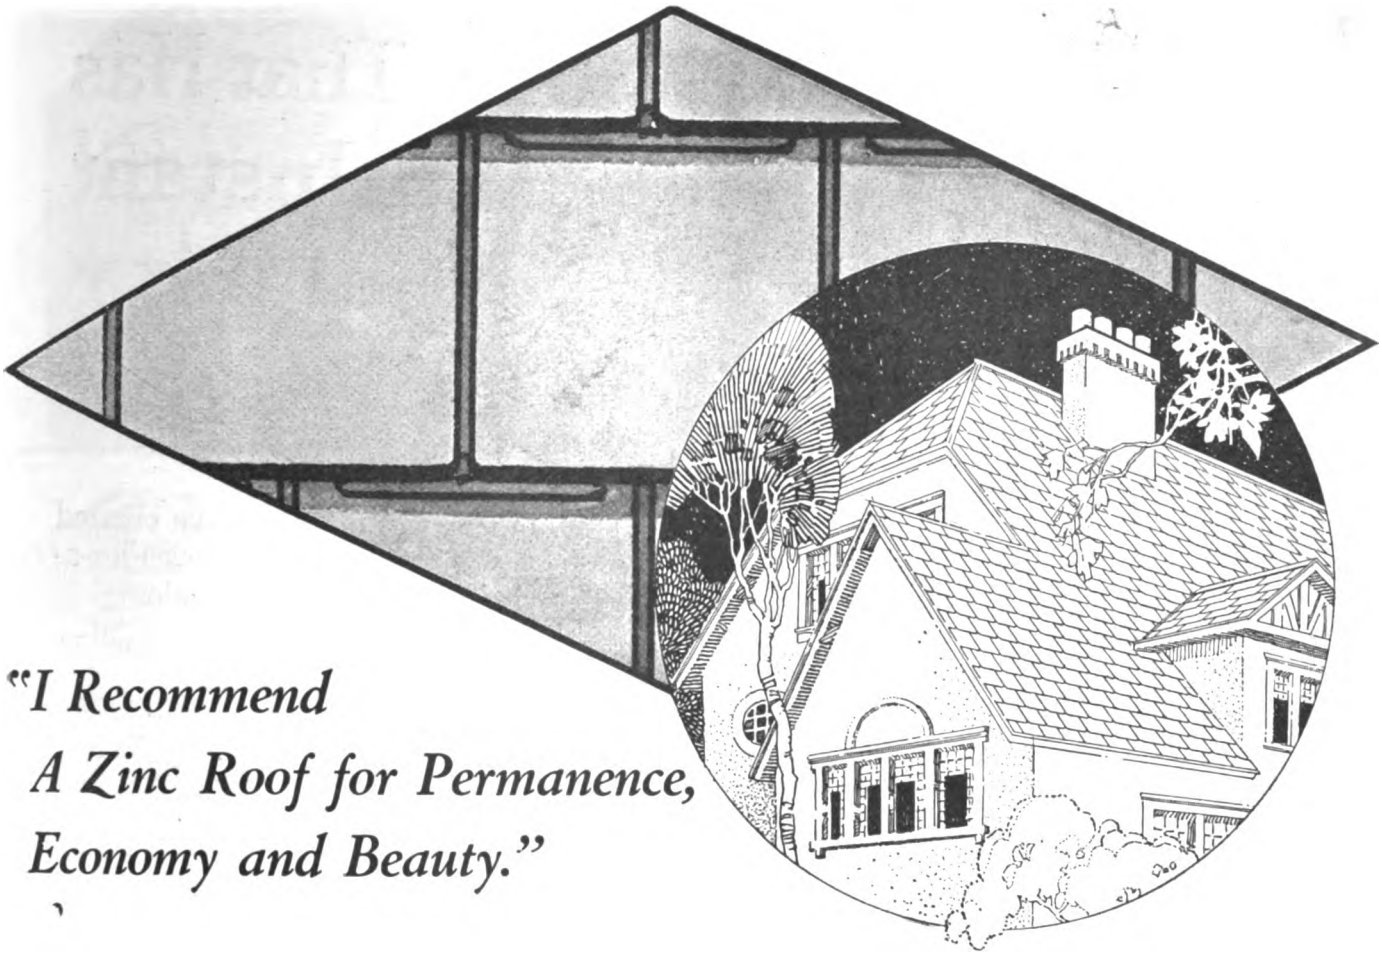
But the forethoughtful installation of the

Sharp Rotary Ash Receiver

will eliminate entirely all the nuisances connected with the old fashioned methods of ash disposal.

With the SHARP ROTARY ASH RECEIVER there are no unsightly cans to litter the cellar, no more dirt, no unnecessary labor. Just rake the ashes through a hole in the bottom of the heater into the can beneath. When the can is filled, just turn another can into place. The complete equipment provides storage for several weeks accumulation of ashes.

No matter what kind or size heater you may have, the SHARP ROTARY ASH RECEIVER is readily adaptable to it. It can be installed in houses already built at small additional cost.



You will be interested in the new Sharp booklet that tells the story of "The Cellar as Clean as the rest of the house." Send for your copy today.

"I Recommend A Zinc Roof for Permanence, Economy and Beauty."

"AMERICANS are realizing more and more what Europeans have known for centuries—the great economy and durability of zinc for roofing," said the up-to-date roofing contractor. "I recommend the Illinois Zinc Shingles to my customers for permanence, economy and beauty. I tell them it is a practical roof which they will never get tired of—and I guess I ought to know after more than twenty years in the roofing business."

We guess he ought to know too, after more than twenty years in the roofing business, during which time he has come in contact with every kind of roof manufactured. We asked him to explain those three words—*permanence, economy* and *beauty*—in relation to the Illinois Zinc Shingles.

"Well," he continued, "look at those European roofs, some of them more than 100 years old, and as good as new today. That's permanence for you! Pure zinc will outlast the building which it protects, and Illinois Zinc Shingles are zinc all the way through! Not plated; not zinc coated. They are economical from the beginning because their initial cost is low. They are quickly and easily laid; they can't rust (because zinc is a non-ferrous metal); they are fire-safe; water-tight; can't warp. There is *no cost of upkeep*—you lay them and leave them! You don't have to paint them—but painted or not they remain unaffected by weather, smoke or gases. They grow more beautiful the longer they are exposed, the original soft grey taking on a deeper tone. Besides all this, they are strong and light, weighing approximately only 100 pounds to the square. I'm glad I carry them, for zinc is *the* roofing material today."

We shall be pleased to send you detailed information on the Illinois Zinc Shingles; also on Illinois Corrugated Roofing and Siding. Mail us a postal card.

A New Shingle That Has Won Instant Popularity

Distinctive qualities have created a strong demand for the new Flex-a-tile Weathered Brown Shingle.

The beauty of this rich, mellow color is out of the ordinary.

The added weight and stiffness of the new super-giant, plus the superior strength of Richardson felt beneath its waterproof surface, give exceptional durability.

The 10 x 14 inch size makes it economical to lay, saving 35 per cent in labor and nails as compared with Standard Asphalt Shingles.

FLEX-A-TILE
HOUSE TOPS

But this fourth Flex-a-Tile color has made possible a still more striking chapter in roofing history, for with Weathered Brown has come the multi-tone roof—a blending of brown shingles with green, of brown with red, of brown with blue-black in many combinations, laid promiscously on the roof.

A roof effect to suit exactly each builder or owner can readily be chosen.

Men who build have but to see this new shingle effect to appreciate the rare beauty of a Weathered Brown roof—for here is a shade that suits equally well the dignity of the finest dwelling or the charm of the modest bungalow.

The profits of this instant popularity are yours if you sell this shingle—Weathered Brown. Like many other Richardson Products it presents a real business opportunity.

Window Glass Grading Depends on Standards

FIRST, second and third quality are relative terms which depend on the standards used in grading.

The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

"Let in the Sunlight"

The Friendly Hearth

Hospitality and good cheer pervade the home that is protected by storm sash. The double panes form an effective shield against the searching winds of fall and winter, assuring a comfortable interior in any weather.

The installation of storm sash enables a saving in fuel equal to many times their first cost and upkeep.

Insist on plenty of windows equipped with storm sash. Specify the grade of glass and make sure it is the finest obtainable in that grade.

Garage for Dr. J. C. Criswell, Waynesboro, Pa.
Built by J. W. Rockwell, Contractor and Builder

Only *Slidetite* permits an opening of this width

Only by using ***Slidetite*** Garage Door Hardware was it possible to build a garage with an ***unobstructed*** opening of such exceptional width. The doorway is 28 feet 6 inches wide—affording ample room for three cars to enter abreast, and is 9 feet in height. It contains eight doors, four of which fold to either side.

This exclusive feature makes ***Slidetite*** particularly desirable for private and public garages, implement sheds, warehouses and all other structures requiring wide doorways. Leading builders everywhere are installing ***Slidetite*** with the assurance that it will meet every requirement and withstand long years of service.

Slidetite Garage Door Hardware

Slidetite is the ***only*** garage door hardware that is practicable for use in openings requiring more than six sliding-folding doors. Even in openings as wide as 30 feet, the doors will never stick or sag.

Doors hung on ***Slidetite*** fold up flat against the wall, completely out of the way. They cannot possibly blow shut, thereby harming either automobile or person.

Slidetite equipped doors operate on a jointless track—a mere push is all that is required to open or close them. Yet they fit the opening snugly and always remain weathertight.

"Sheetrock goes up faster and finishes better"

EDWARD J. O'CONNOR
Contractor and Builder

Raritan, New Jersey
June 26, 1922

UNITED STATES GYPSUM CO.
Chicago, Ill.

Gentlemen: Referring to your letter of May 8th, 1922, a few words of commendation are due you. First: Your "Sheetrock" wallboard is superior to any of the wallboards on the market. Second: The setting up and finishing is faster and better than others, saving time and expense. Third: No mess like lath and plaster to be taken away. Fourth: Our customers are quick to see the advantages of this fireproof wall and ceiling material. I am pleased to recommend "Sheetrock."

Yours very truly,
E. J. O'CONNOR

Sheetrock is a fireproof, permanent wall and ceiling material in unit form. It is made of gypsum rock, the same material used for the finest wall plasters. You saw and nail it the same as lumber. Hundreds of letters in our files, like the one written by Mr. O'Connor, tell of the ease and economy with which Sheetrock is put up. Return the attached coupon and we will send you a sample of Sheetrock along with a plan that will help you get profit-increasing Sheetrock jobs. Send it in today!

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

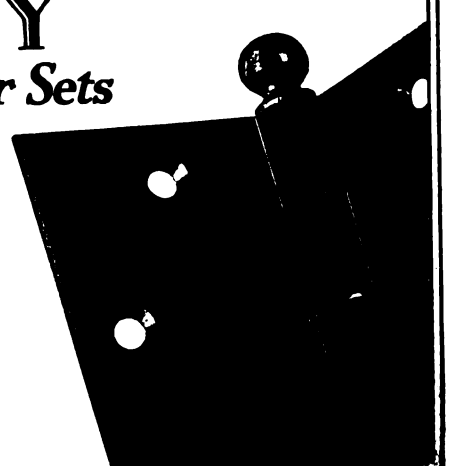
More Book and Less Pencil

PLANNING a garage entrance can be a simple matter of selecting one of the many types of doors illustrated and described in the booklet—"McKinney Complete Garage Sets."

For any dimensions of entrance width or space allowance there is a swinging, sliding-folding or around-the-corner door to fit. Beside each type of entrance illustrated is shown the particular McKinney Complete Garage Set to be used in its installation. Simple working plans for the erection of the door are also given.



The McKinney Garage Sets are made according to the McKinney standard—quality always. Each set is packed complete in a single box, and numbered. Specify this number on the plan and the purchaser of the hardware cannot make any mistake.

Builders will find this booklet helpful, too, when called upon to advise garage owners what kind of an entrance to construct, and to select the hardware for the erection of the doors. We will be glad to send this booklet to any Architect or Builder.

Accurate Construction Makes Easy Running Windows

ACCURACY of construction and careful choice of materials in the Andersen Frame make snug fitting yet easy-sliding windows.

Andersen Standard White Pine Frames are accurately made. Each part is the product of a special machine. The parts, when assembled, form a perfect fitting frame that excludes all weather.

Exposed portions of Andersen Frames are of genuine White Pine. This wood has for centuries shown its ability to weather all out-of-door conditions without warping, shrinking, swelling or rotting. Windows run easily in Andersen accurate Frames; the use of White Pine keeps them easy running for all time.

Dealers in Andersen Standard Frames can deliver immediately 121 different sizes from a stock of only 11 standard sizes, simply by interchanging heights and widths. The advantages of an accurate frame, ready when wanted, are evidenced in the saving of time, labor and money. Such frames are more profitable for the dealer to handle yet cheaper for the builder to use.

Each Andersen Standard Frame is packed in two small bundles containing seven units. These seven units with pockets and pulleys in place complete can be nailed up in 10 minutes.

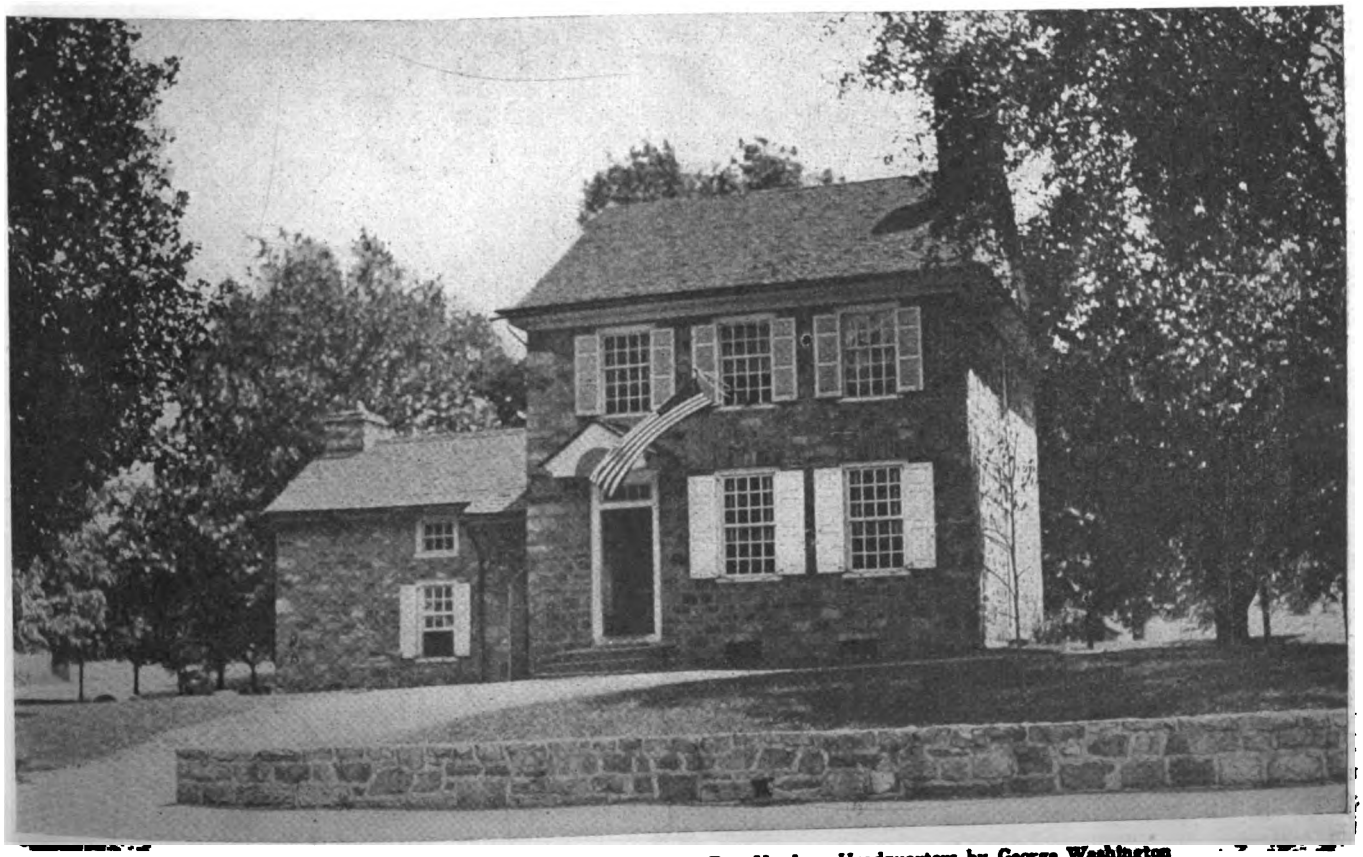
BUILDING AGE
AND
THE BUILDERS' JOURNAL

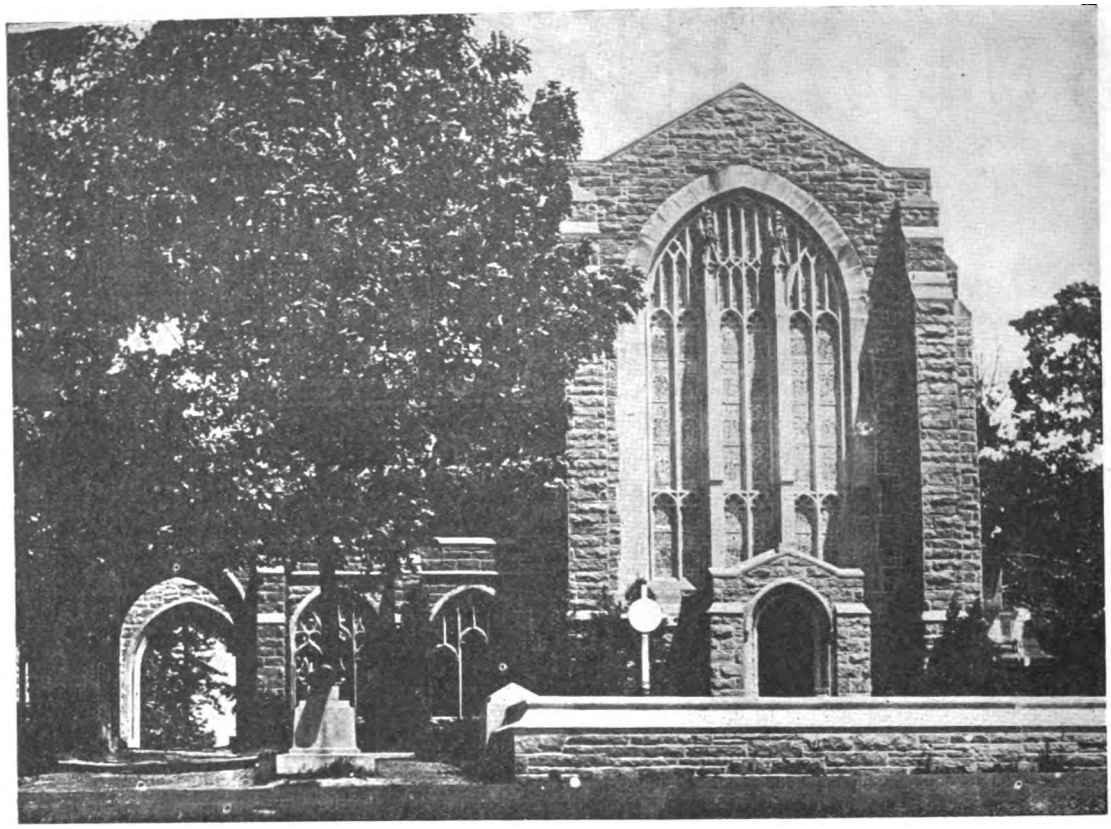
NEW YORK, NOVEMBER, 1922



The Washington Memorial at Valley Forge

WINTER work is the theme of this issue of BUILDING AGE AND THE BUILDERS' JOURNAL. We who are enjoying the prosperity of a wonderful country should pause and consider that all this would not be possible had it not been for the work done that one winter at Valley Forge by Washington and his army of patriots.

Were it not for the stout hearts and courage of the Continental Army to do Winter Work, very few of us, perhaps, would today be enjoying the comforts of a home in the United States. It is only fitting that we should perpetuate the record of their sacrifices in a suitable memorial at Valley Forge, Pa. The words of Mr. Brady given here sum up the greatness of this beloved and historic spot, dear to thousands of patriotic Americans, and conceded to be the one shrine of American Patriotism to which every citizen should journey at one time or another and give it due reverence. The building work now being done there is of national importance and rightly deserves every possible bit of publicity given it.



NO spot on Earth, not the plains of Marathon, nor the passes of Seenpach, nor the place of the Bastile, nor the dykes of Holland, nor the moors of England, is so sacred in the history of the struggle for human liberty as Valley Forge.
—Cyrus Townsend Brady

The Washington Memorial, when completed, will be one of the greatest memorials in the world. It contains

The Old Home of Dutch Colonial Design at Valley Forge, Pa., Used as Headquarters by George Washington

Digitized by Google

The Washington Memorial Chapel at Valley Forge. A Stone Edifice of Dignified Gothic Architecture.

much of an educational value, holding in its mass many different kinds of workmansihp that have been wrought through careful study and the benefit of education of a vast nature. Its conception has won the admiration of patriots, and its completion will give to the American people a group of buildings of rare beauty and unequaled significance.

The Washington Memorial stands upon a commanding site at Valley Forge, in full view of almost the entire encampment and facing the great National Arch, erected by the United States in memory of the officers and men who made these hills sacred ground.

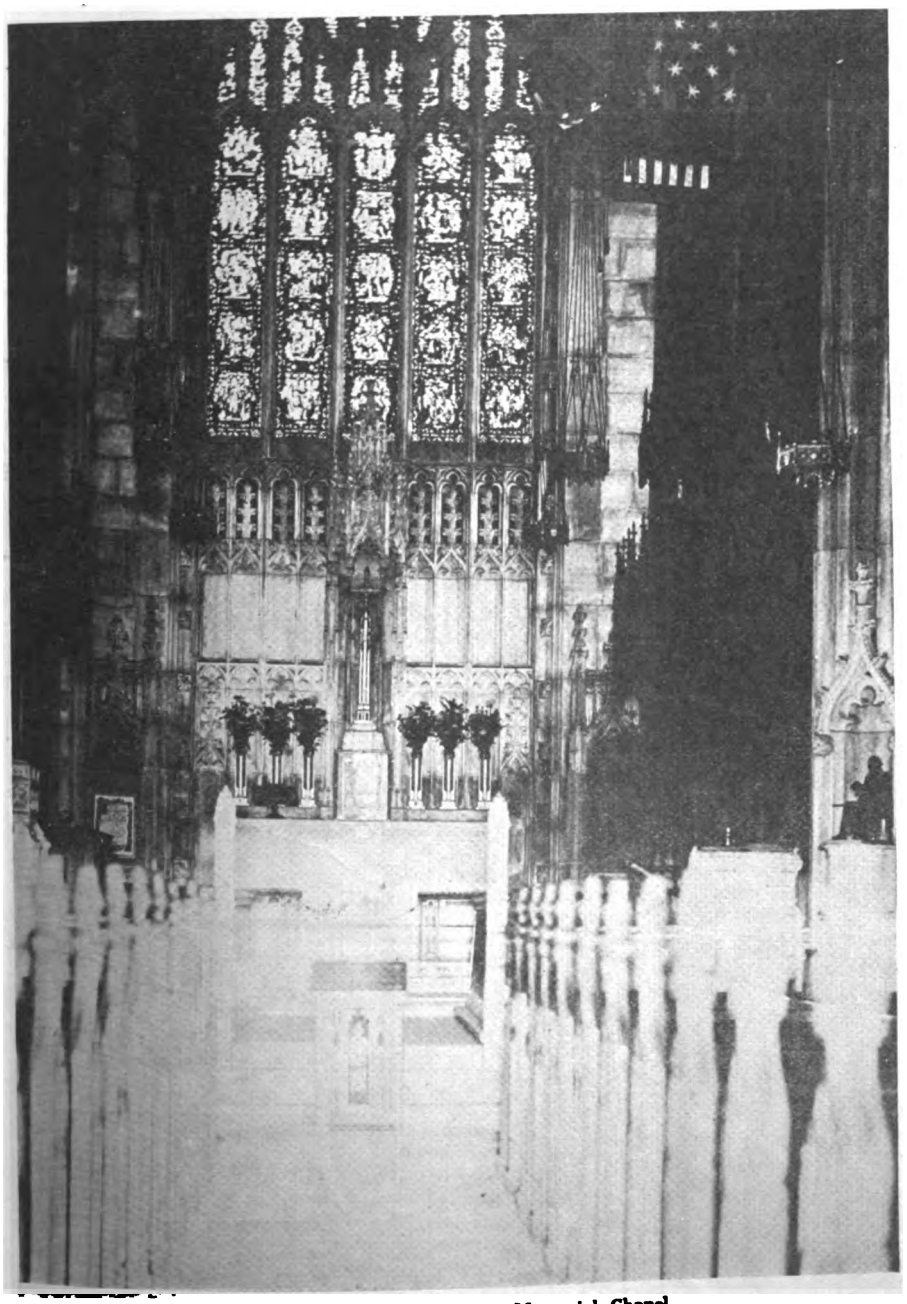
The memorial will include the following structures: The Patriots Hall, Washington Memorial Chapel, Washington Memorial Library, Cloister of the Colonies, Porch of the Allies, Thanksgiving Tower, and the Woodlawn Cathedral. These will form the administration group of the memorial.

In addition there will also be eight Halls of History, wherein the entire nation's history will be in review, affording a truly great and wonderful education for anyone. The different halls are named: (1) The Aborigines, Pocahontas Hall. (2) The European Background, Raleigh Hall. (3) The Colonial Period, Franklin Hall. (4) The War of the Revolution, Washington Hall. (5) The Period of National Development, Jefferson Hall. (6) The Civil War, Lincoln Hall. (7) The Period of National Expansion. (8) The World War, Victory Hall.

The Halls of History of the Valley Forge Museum of American History will culminate in Victory Hall. This will represent not only the last period to date, but will be the greatest of the eight buildings. It will represent man's last and supreme battle for freedom, for the larger life of man. It will be a great national memorial to the men and women whose devotion and sacrifice won the victory. It will honor all the allies, but it will be pre-eminent as America's tribute to her heroic sons and daughters.

All that art and building craft can do will be employed to give expression to the meaning of the conflict between brute force and the spiritual life of man. It will be carved in the stone tracery, leaded in the windows and painted on the walls.

Charming Exterior Corner of Chapel with the Statue of "Peace and Devotion"



Digitized by Google

Such a conception realized anywhere in the land would become at once the mecca of today, tomorrow and for all time. Such a Victory Hall will have a hundred fold more value when built upon the hills of Valley Forge, where it stands surrounded by the unmarked graves of those who nearly a century and a half ago heard the call of duty, rose to fight for freedom, and gave their all for the American ideal of democracy.

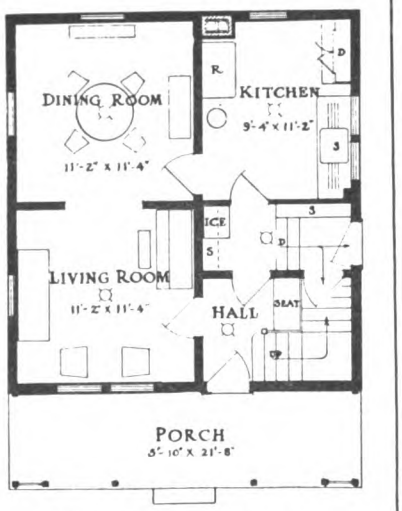
The Rev. W. Herbert Burke, D.D., who is president of the Valley Forge Historical Society, has been and is an untiring worker in this great memorial idea. Recognizing the historical importance of Valley Forge and appreciating the importance of its ideals and spirit in the life of the nation, Dr. Burke suggested in 1903 the erection of the Washington Memorial at Valley Forge as a national shrine and as a school of patriotism.

A Replica of One of the Hospitals. Their Best Was Far From Comfortable.

Interior of the Washington Memorial Chapel

The Washington Memorial Chapel, an American Westminster, the shrine of the American people, has been completed, and in the past two years attracted over 90,000 visitors. Its beauty and historic significance are unexcelled.

Into its sacred fabric and furnishings has been woven the history of the nation, and its many memorials commemorate not only Washington, but all who labored with him in the building of the nation. In it are memorials of the men and women who made our great Republic.



The screens in memory of Washington and the Major and Brigadier Generals at Valley Forge, and the choir stalls in memory of the brigades, make a collection of memorials unequaled in importance and patriotic inspiration anywhere.

The extent and scope of a great work should interest every loyal American. All who make the trip to Valley Forge will be well repaid and will go away with a deeper and finer sense of patriotism than ever before. Valley Forge is today THE really great and true shrine of American patriotism. Valley Forge, being near Philadelphia, is easily reached from many points. All should see it.

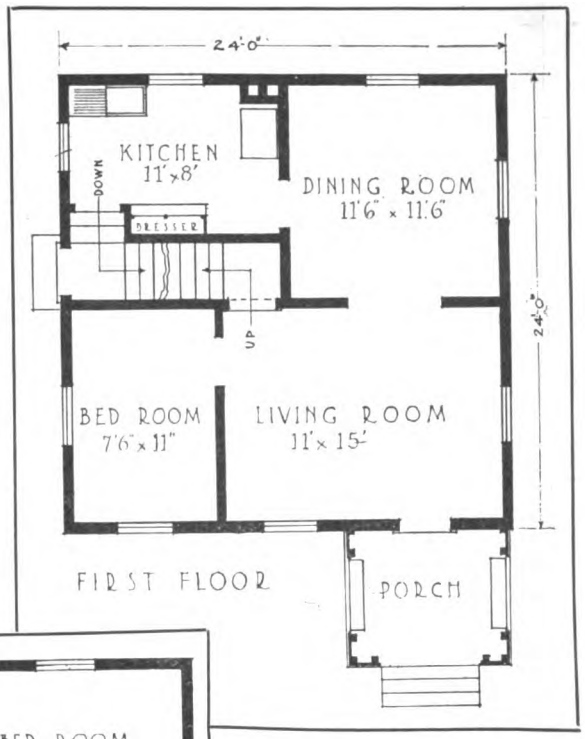
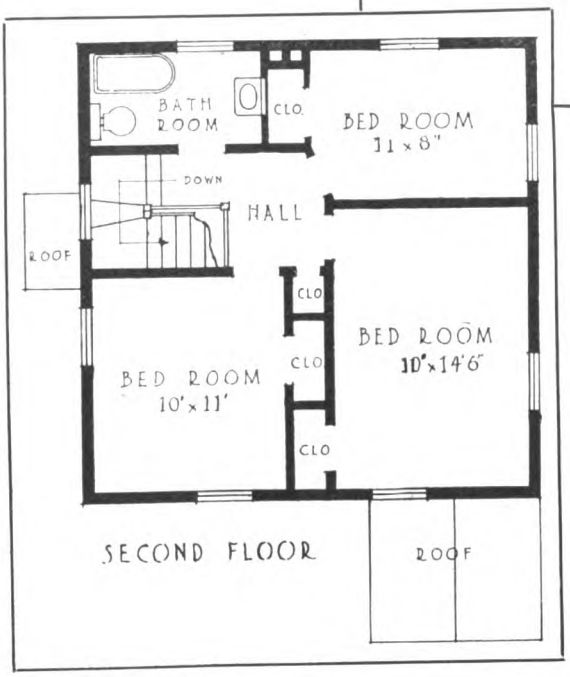
Slight Changes in Details Prevent Sameness

Designed by C. E. SCHERMERHORN, Architect

IN building a number of small houses it is more economical that they be made all alike in interior arrangements and exterior design. Perhaps only a few exterior details are changed to lend a little variety, sometimes the only change is the difference in painting.



To show that a considerable change in appearance may be made and still have the same design, we give a picture of two houses that are identically the same in room arrangement and exterior. The houses are 24 feet by 24 feet in size. On the one, the gable is towards the front, and on the other it is towards the side. Likewise, the one has the front entrance on the side and the other in the front. This simple change results in both houses having a distinctiveness of its own.

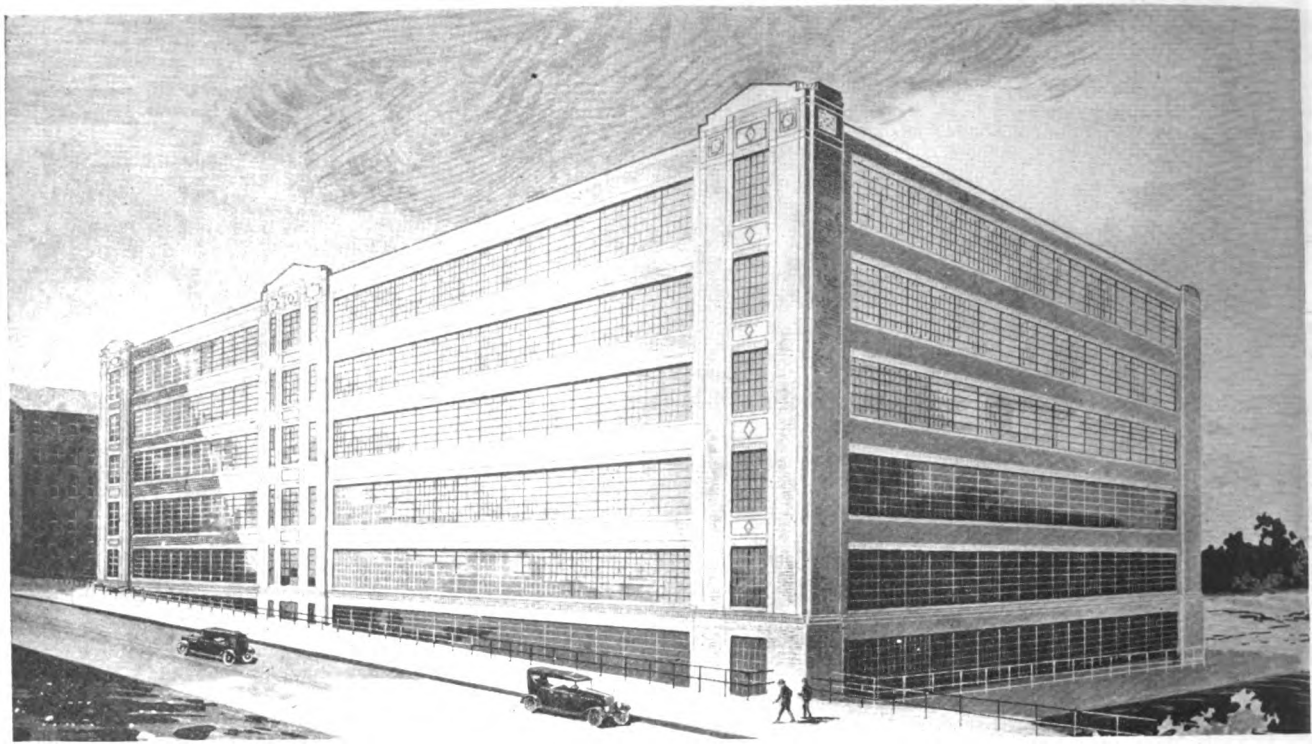


A further change could be made if there are a number of such houses in a row is to have some set back further than others, that is, to give some thought to a proper grouping. Another variation would be to have the porch in the center on some houses.

The room arrangement in this small house is worthy of special study. There are seven fair sized rooms in the small space of 24 feet by 24 feet. Each room has been so planned that there is ample space for all necessary furniture. There is no waste space, each bedroom is provided with a closet and there is a linen closet in the upper hall.

For anyone requiring a small home that can be built at a moderate price and still have a pleasing design, a house of this kind is to be recommended.

The exterior of these houses can either be shingled or have wide Colonial clapboards with mitered corners. To lend variety in a group some houses could have a stucco exterior and some others be built of brick or in combination.



The design shown on the opposite page is another interesting example of how small changes may be made to secure a variety in design. Here also the one house has the gable to the front while on the other it is to the side, with the porch extending half way across the front and floor plans reversed.

Digitized by Google

New Departure in Building Construction The Glass Front Factory

By WILLIAM R. FOGG

ONE of the prime requisites for the production of first quality work under economical conditions is that the rooms in which work is performed shall be provided with ample daylight. The older forms of factory construction consisted of more blank wall space than windows, while the modern tendency has been to make the windows as large as possible.

The majority of recently built factories consists of a series of large steel sash windows with columns between, which for architectural effect have been treated as pilasters, and many an artistic factory building has been the result. In these the pilasters and intermedite rails below the windows are frequently of ornamental brick work, concrete with tile inserts, terra cotta, etc.

The latest step in securing the maximum amount of daylight in the interior of a factory itself is by practically eliminating the pilasters and having what amounts to all glass walls. This result is insured by the new features in industrial building construction which have been envolved by the Ballinger Company, architects and engineers of Philadelphia, and embodied in the construction of a new worsted mill now being erected at Bridgeport, Pa., for James Lees and Sons Company.

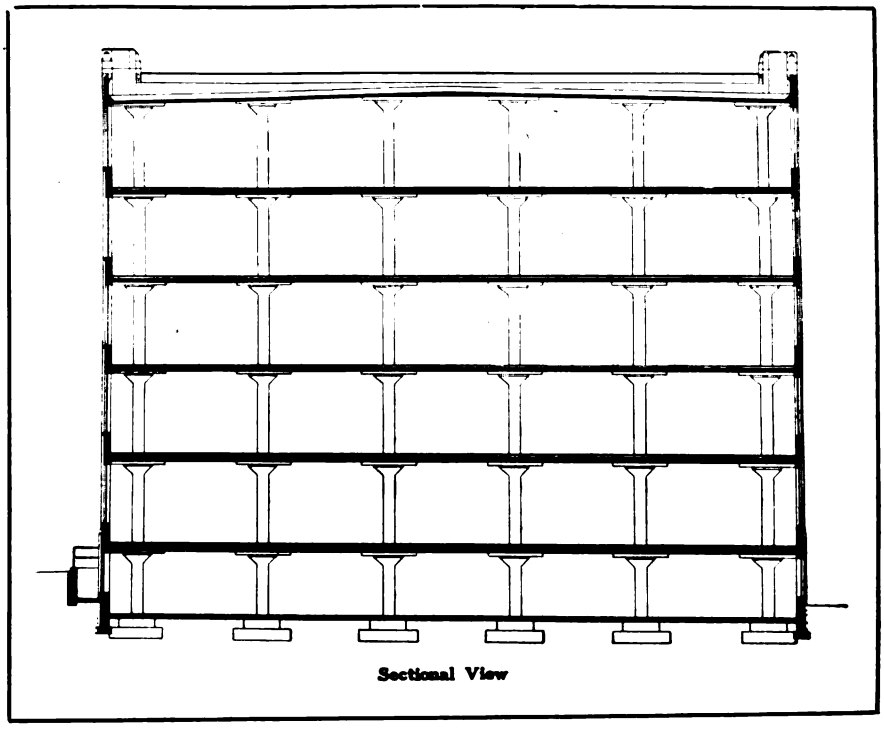
This new building is an addition to the present plant operated by this company, and it will be five stories and basement in height. The total length from the front and rear is 250 feet with a depth of 121 feet; this is exclusive of the stair towers. These six floors will give a total area of about 180,000 square feet and will be used for the housing of machinery, etc., used in the manufacture of worsted yarns.

This interesting industrial building is of reinforced concrete, flat slab construction. On account of the delicate nature of the machinery employed in the manufacture of the worsted yarn, danger from dust had to be guarded against, and for this reason a maple floor was used as a top wearing surface.

The unique feature in the construction of this factory consists of the entire omission of exterior wall columns permitting if desired an unbroken line of light around the entire building, except at spaces where the wall surface is necessarily broken by stairways or other features.

This arrangement results in permitting an unusual amount of light to flood the interior of the building, adapting it admirably to the purposes of manufacturing. In this particular case a building 120 feet wide has been erected without requiring an excessive story height to obtain the proper daylight illumination that has been found so necessary to a proper working by the operators at the looms.

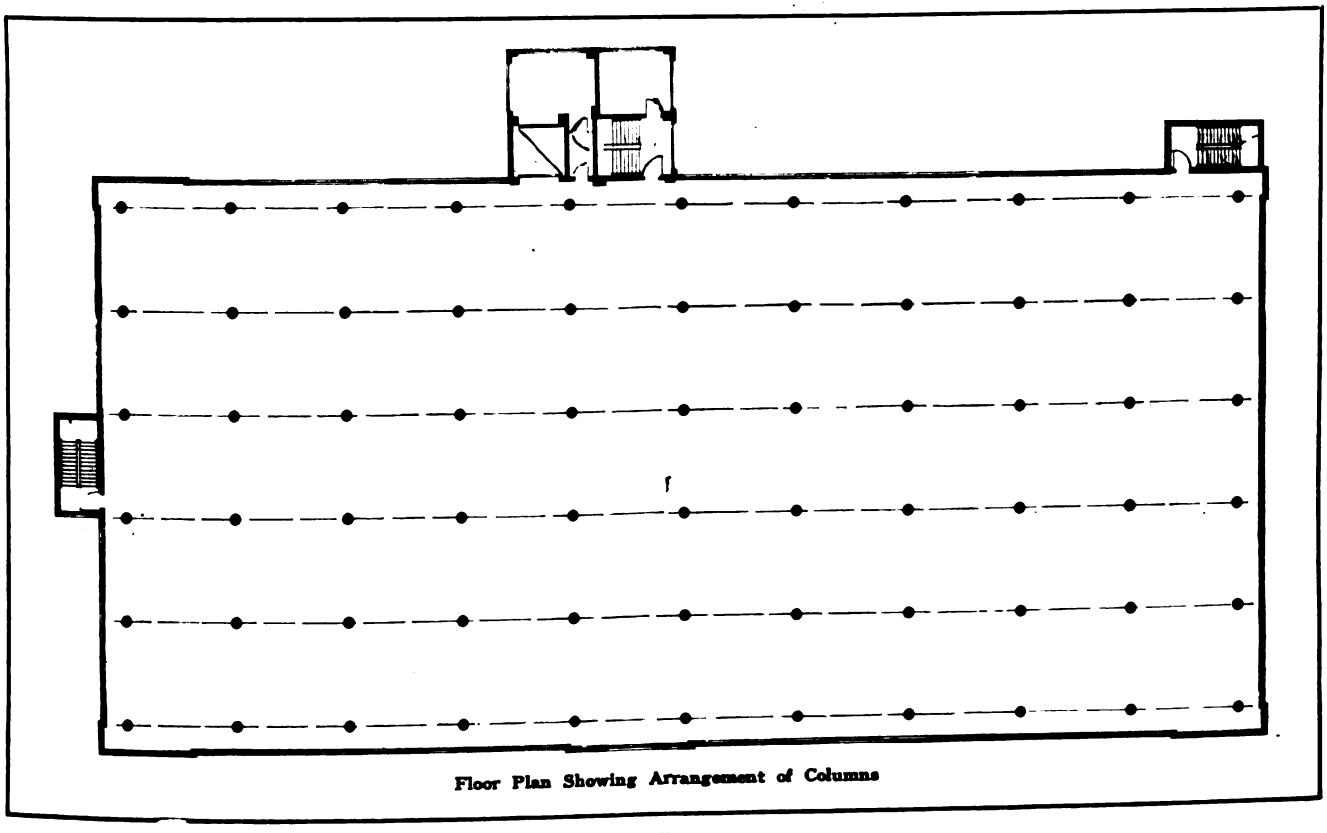
This unbroken extent of window space has been made possible by making use of the well-known principle of the cantilever. The first row of interior columns is placed five feet back from the outer



Digitized by Google

wall and the concrete floor slabs extend as a cantilever beyond the columns to the wall line. The structural walls under the windows are built directly upon the projecting cantilever floor slabs, they have to bear the weight of the steel windows and in addition a certain floor load.

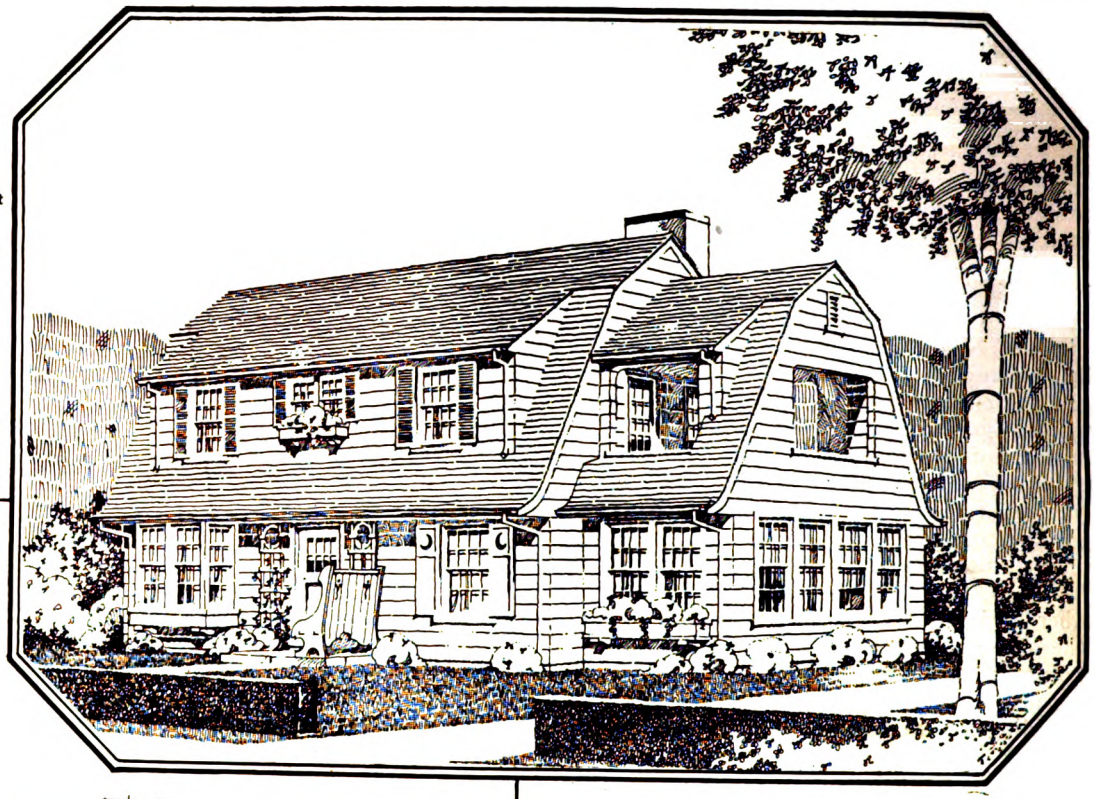
This ingenious method of construction gives not only a maximum amount of daylight but by the elimination of wall columns or pilasters, the concrete work itself is simplified so that economy in the construction work is obtained by making use of this cantilever principle. A rather considerable saving in the cost of erecting such a building results by this method.



Another advantage resulting from the omission of the exterior wall columns and their corresponding projections on the inside of the building is that the installation of work benches, machinery and other equipment as well as placing the radiators for the heating system is greatly facilitated as all the various jogs are eliminated.

It is certainly a new departure in industrial construction. This building is now under construction and rapidly nearing completion. It is expected that it will be ready for occupancy by February 1st, 1923. The floor plan shows the location of the different columns, in the length of the structure they are placed 24 feet on centers and in the width 22 feet on centers.

Sectional View



It will be noted that all the stairways are placed on the exterior of the building proper. Three separate stairways are provided so that there is ample safeguard for rapid escape in case of an emergency. Toilet rooms are placed on each floor in the rear extension.

Novel Arrangement of Sleeping Porch and Living Porch Are the Special Features of This Clever Dutch-Colonial Design

FIRST FLOOR PLAN

SCALE OF FEET

SECOND FLOOR PLAN

Comfortable Home With Attractive Porches

THIS house has been designed for comfortable living. The architects have so arranged the plans that the housework can be done with ease. Note the arrangement of the kitchen with relation to the rear entry, cellarway, pantry and dining room; all can be reached with but a very few steps, this also applies to the front door, a call at this point does not require one working in the kitchen to pass a long distance through main rooms.

The dining room has a large bay window on the front that gives a pleasant outlook. The living room has a generous open fireplace with bookcases on either side under the windows.

The striking feature of the plans is the porches. The architects have solved the problem of the living porch and the sleeping porch in an admirable manner, so they are not only livable, but add to the exterior appearance of the house as well.

The porches are placed in a wing at the end of the main house, this gives three sides exposed for the porches—plenty of air and sunshine—and the roof of this extension has been designed to harmonize with the main roof.

Digitized by Google

Too often sleeping porches are simply "stuck" on the houses, giving the appearance of a sanatorium; which has been the reason why so many people have given up the idea of a sleeping porch. The living porch is completely enclosed with sash and screens, so it becomes an all year around room.

The second floor provides three nice bed rooms, a bath room and ample closets, all conveniently arranged about the center hall. The hall has a large window that gives light directly on the stairs, just where it is most needed.

Specially Designed for

BUILDING AGE
and
THE BUILDERS' JOURNAL

Together with
Constructive Details

by R. C. HUNTER & BRO.
Architects New York

The interior should be carried out in the Colonial style to harmonize with the exterior.

A cellar, providing the laundry, heater and coal spaces, etc., extends under the entire house.

The exterior of this house is attractive, every detail has been well designed and the general proportions are good. The graceful Dutch roof lends charm. The house is, throughout, true to the best Colonial traditions. The estimated cost of the construction is about $8,000.

Quantity Survey *of* Comfortable Home

Shown on Preceding Page

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor cuts have been disregarded.

Such items as clearing site, temporary work and protection, scaffolding and general equipment and supplies have not been included.

Such items as are marked "Unit," are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	240 cu. yds.
Excavation for footings	13 cu. yds.
Excavation for areas	4 cu. yds.
Excavation for trench walls	9 cu. yds.
Excavation for leader drains and dry wells	12 cu. yds.
Backfilling around walls, etc.	35 cu. yds.

Leader Drains and dry wells—

Field stone for dry wells	10 cu. yds.
4 in. salt glazed tile drain pipe	36 lin. ft.
4 in. elbows	6

Masonry

Concrete for cellar walls	770 cu. ft.
Concrete for footings	178 cu. ft.
Concrete for trench walls	126 cu. ft.
Concrete for area walls	84 cu. ft.
Cellar floor (3 in. concrete and 1 in. cement finish)	595 sq. ft.
Area bottoms (brick and sand)	32 sq ft.
Porch floors (12 in. cinders, 3 in. concrete and brick finish)	40 sq. ft.
(concrete without cement ft)	123 sq. ft.
Concrete forms	2100 sq. ft.
Pointing cellar window sills	14 lin. ft.
Common brickwork for chimney (or 1.9 M.)	93 cu. ft.
Face brick for fireplace hearth and jambs (or 105 brick)	15 sq. ft.
Fire brick for fireplace (or 75 brick)	15 sq. ft.
8 in. x 12 in. T. C. flue lining	54 lin. ft.
3 in. bluestone chimney cap (1 ft. 10 in. x 2 ft. 8 in.)	1

Mason's Iron Work

Fireplace damper (2 ft. 8 in. opening, with throat, etc.)	1
C. I. ash dump	1
C. I. cleanout door for ash pit (16 in. x 12 in.)	1
C. I. cleanout door for boiler flue (8 in x 8 in.)	1
Thimble for boiler flue	1

Plastering

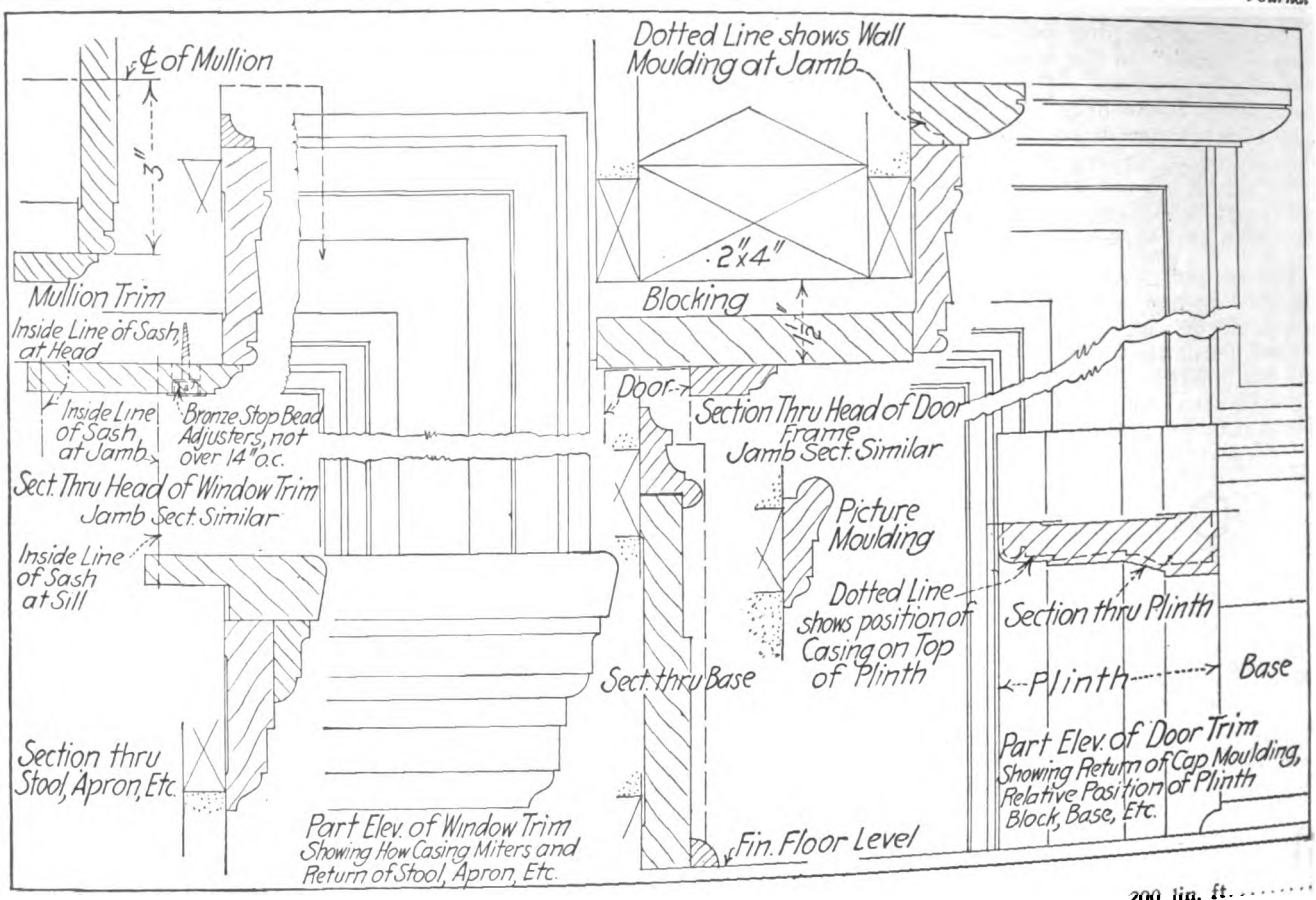
Three coat Patent plaster on metal lath, gross (Net 590 sq. yds.)	640 sq. yds.
G. I. corner beads	100 lin. ft.

Tile Work

Tile work for bath room—	
Floor (1 in. hex. white)	47 sq. ft.
Wainscot (3 in. x 6 in. white wall tile)	100 sq. ft.
6 in. sanitary base	25 lin. ft.
Moulded cap	25 lin. ft.
Living Porch floor—	
6 in. x 6 in. quarry tile	123 sq. ft.

Sheet Metal Work

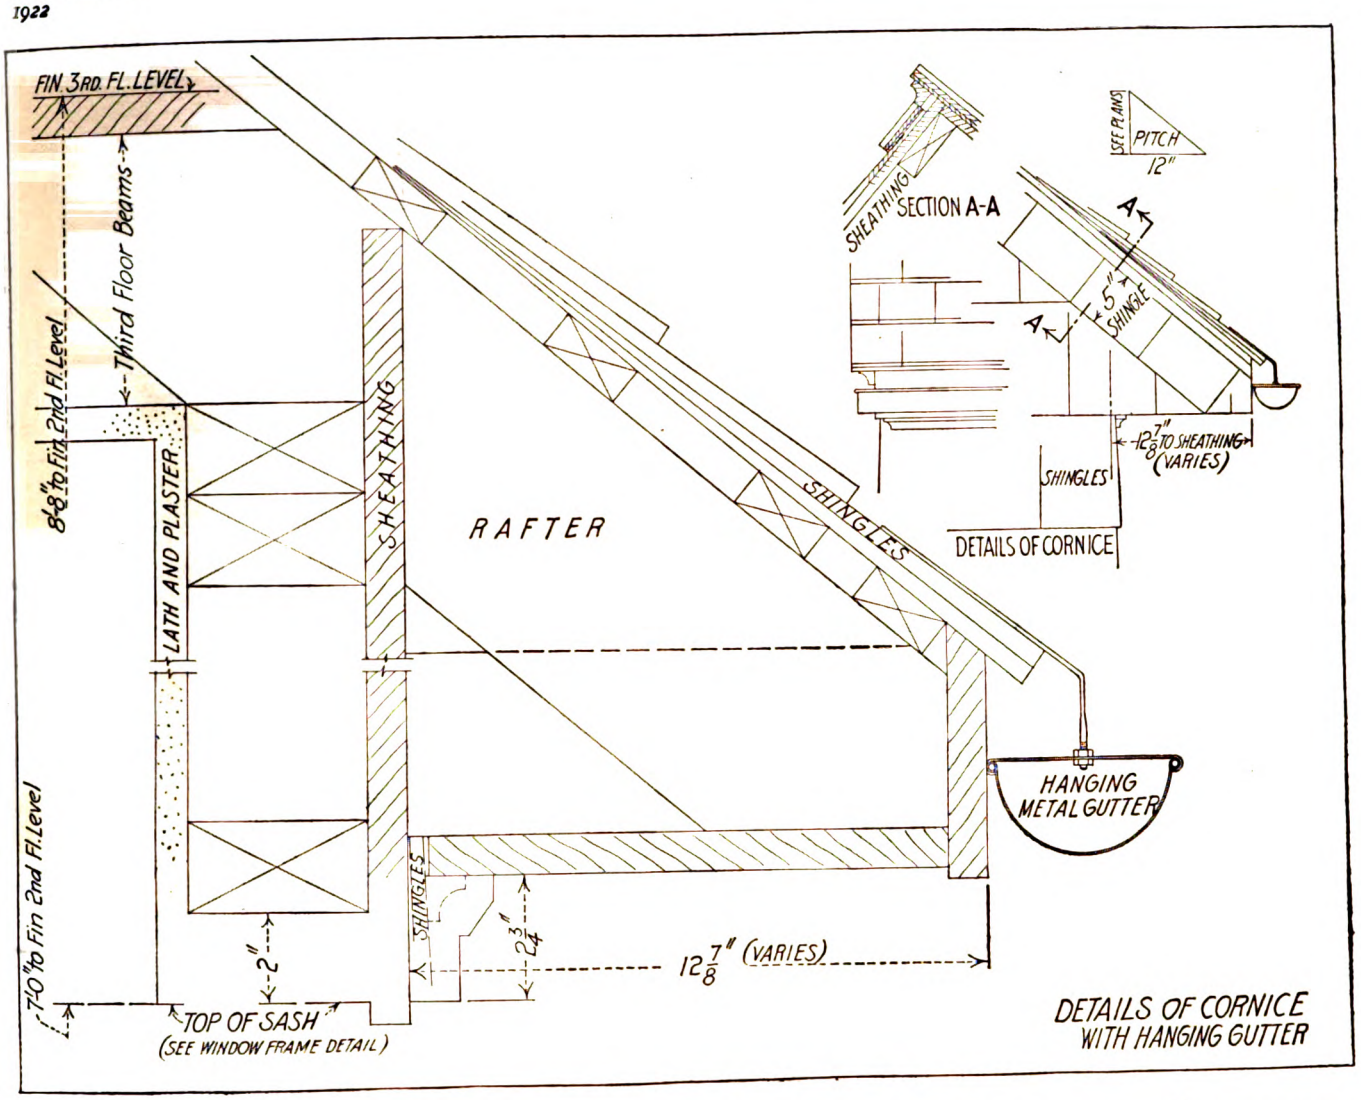
Copper flashing for roofs, sleeping porch floor	222 lin. ft.
Copper flashing and counterflashing for chimney	9 lin. ft.
Copper chimney cricket	5 sq. ft.
Canvas floor for sleeping porch	98 sq. ft.
4 in. half round, hanging gutter	168 lin. ft.
3 in. x 4 in. leaders	90 lin. ft.
Bends for leaders	24
Gutter thimbles	12
3 in. x 4 in. G. I. gas range vent	21 lin. ft.
Cap and thimble for same	1



Carpentry

TIMBER
All No. 1 common stock, hemlock, rough unless noted.

Cellar girders—	
6 in. x 10 in. spc.—2/12, 1/10, 1/8	210 F. B. M.



BLUE Print Plans and Specifications of many Beautiful Homes of Moderate Cost can be supplied at a nominal price by Building Age and the Builders' Journal, 912-920 Broadway, New York.

Let Us Think that We Build Forever, *or the* Present Magnitude *of the* Building Industry

By H. A. BRICE

> WHEN we build, let us think that we build forever. Let it not be for present delight nor for present use alone. Let it be such work as our descendants will thank us for; and let us think, as we lay stone on stone, that a time is to come when those stones will be held sacred because our hands have touched them, and that men will say, as they look upon the labor and wrought substance of them, "See! This our father did for us."—John Ruskin.

IN a talk before the Birmingham, Ala., Kiwanis Club the author stated that few are aware of the magnitude of the great construction industry and what it represents. Reliable data recently compiled show it to be second only to that greatest of all industries, agriculture.

It has been called the key industry in that it unlocks practically all of our activities and resources. It reaches into the mines and forests and into a multitude of factories, and draws from them the raw material and finished products which are wrought into buildings and other construction enterprises.

Approximately 90 per cent. of all iron ore, copper, zinc ore and 95 per cent. of lead production are consumed by construction. About eleven million persons, either as workers or as members of workers families, derive their living from construction. The support given to agriculture and trade by the annual expenditure of this great number of persons is too apparent to require discussion.

The value of new capital issues during 1920, so far as data have been reported, reaches the high figure of four and one-half billion dollars, consisting of State, municipal, railroad and industrial securities; and of this total approximately 60 per cent. were issued for construction in some form or another.

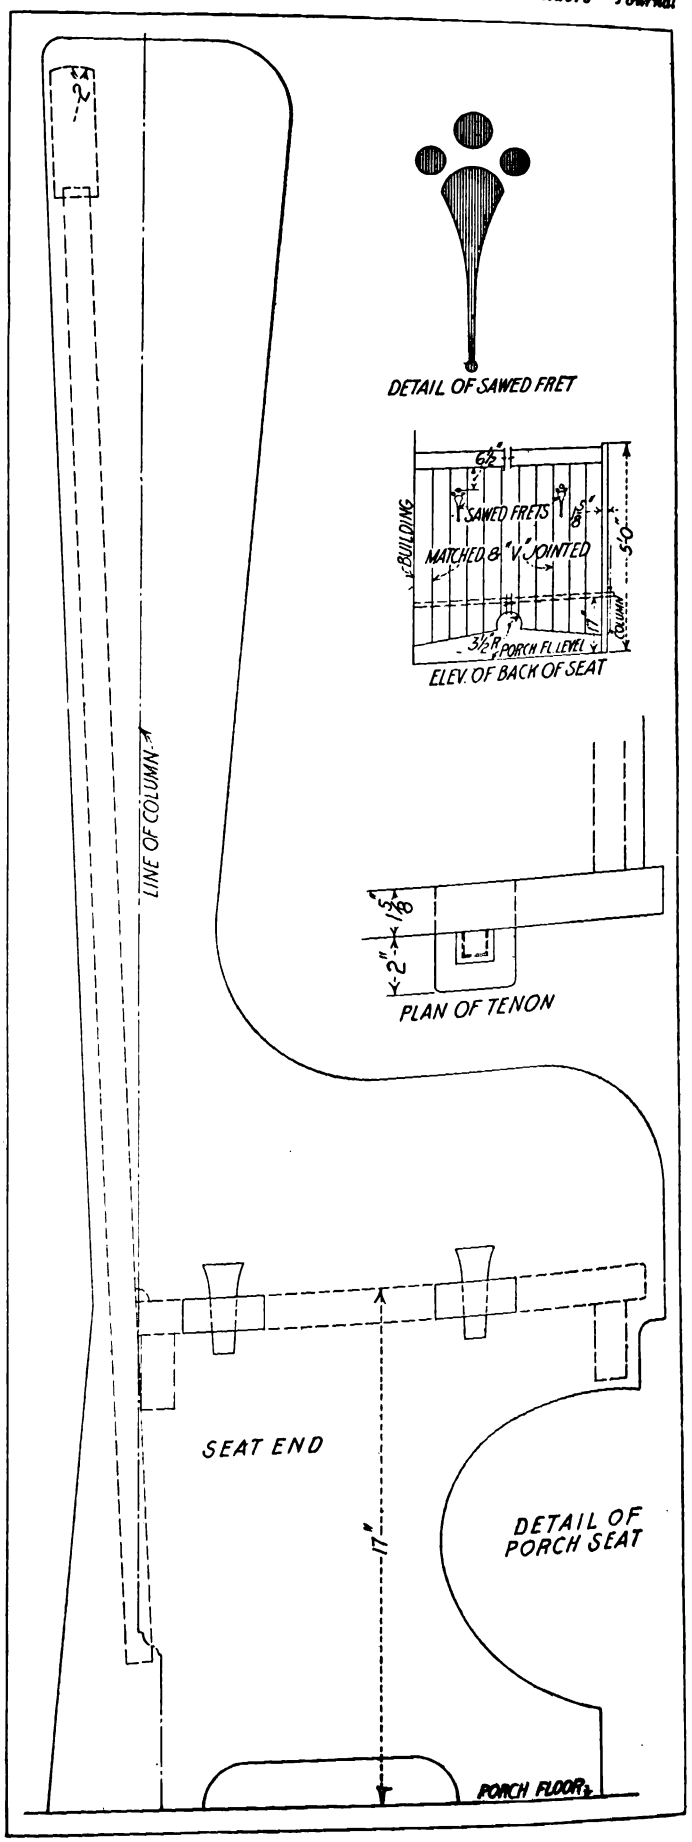
While it is true that the builders who handle the final assembling of materials represent only a limited part of this industry, they may be likened to the keystone of the arch. On them depends the great responsibility for safeguarding the industry and the nation.

Looking into the future of construction we seem to be faced with a situation unparalleled in its history. Aside from the development we might expect from the normal growth of this country and the great highway building program now under way throughout the country, we have an accumulated shortage resulting from that period of restricted building during the war when the industry was practically at a standstill. It has been conservatively estimated that it would require approximately ten years to catch up this shortage.

The Memorial Arch at Valley Forge in Honor of the Patriots Whose Efforts and Sacrifices Made Possible Our United States. Let Us Be Grateful This Coming Thanksgiving Day That "They Did Build Forever"

For the period including from about the first of the year 1915 until the beginning of the present year, if one were to plot a curve representing the average change in construction costs, he would find that the line would rise gradually, though with periods of fluctuation, until about the middle of 1920, when it would reach a peak at approximately 250 per cent. above the level at which it began. From that date a more rapid descent takes place until the fall of 1921, when general business conditions began to improve. From that time up until the present, the line maintains practically a level.

In the face of the fact that at the present time many of the larger cities are announcing building programs for the coming months that are staggering to contemplate, it would seem hardly possible for one to expect further decline in construction costs within the near future.



The activities of our company are devoted mainly to building construction. We have our problems from day to day in common with every other business enterprise. But it has been our earnest effort at all times to give to every obligation, whether it be a contract for a store front, alteration involving a few hundred dollars or a monumental building costing hundreds of thousands, the last ounce of effort toward the single aim—a duty well performed.

There is one thing about the Kiwanis Club which has always impressed me very much; that is the slogan, "We Build." The spirit back of this slogan is the spirit which we endeavor to instill into our work in such a manner that we may be able to quote the words of John Ruskin.

But it has been our earnest effort at all times to give to every obligation, whether it be a contract for a store front, alteration involving a few hundred dollars or a monumental building costing hundreds of thousands, the last ounce of effort toward the single aim—a duty well performed.

There is one thing about the Kiwanis Club which has always impressed me very much; that is the slogan, "We Build." The spirit back of this slogan is the spirit which we endeavor to instill into our work in such a manner that we may be able to quote the words of John Ruskin.

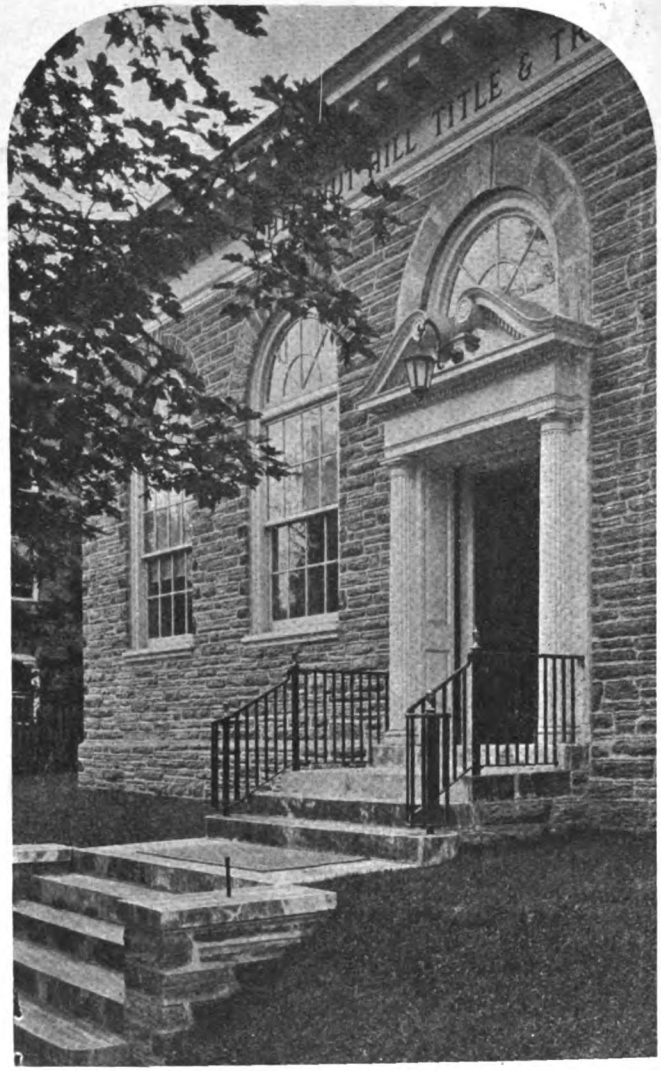
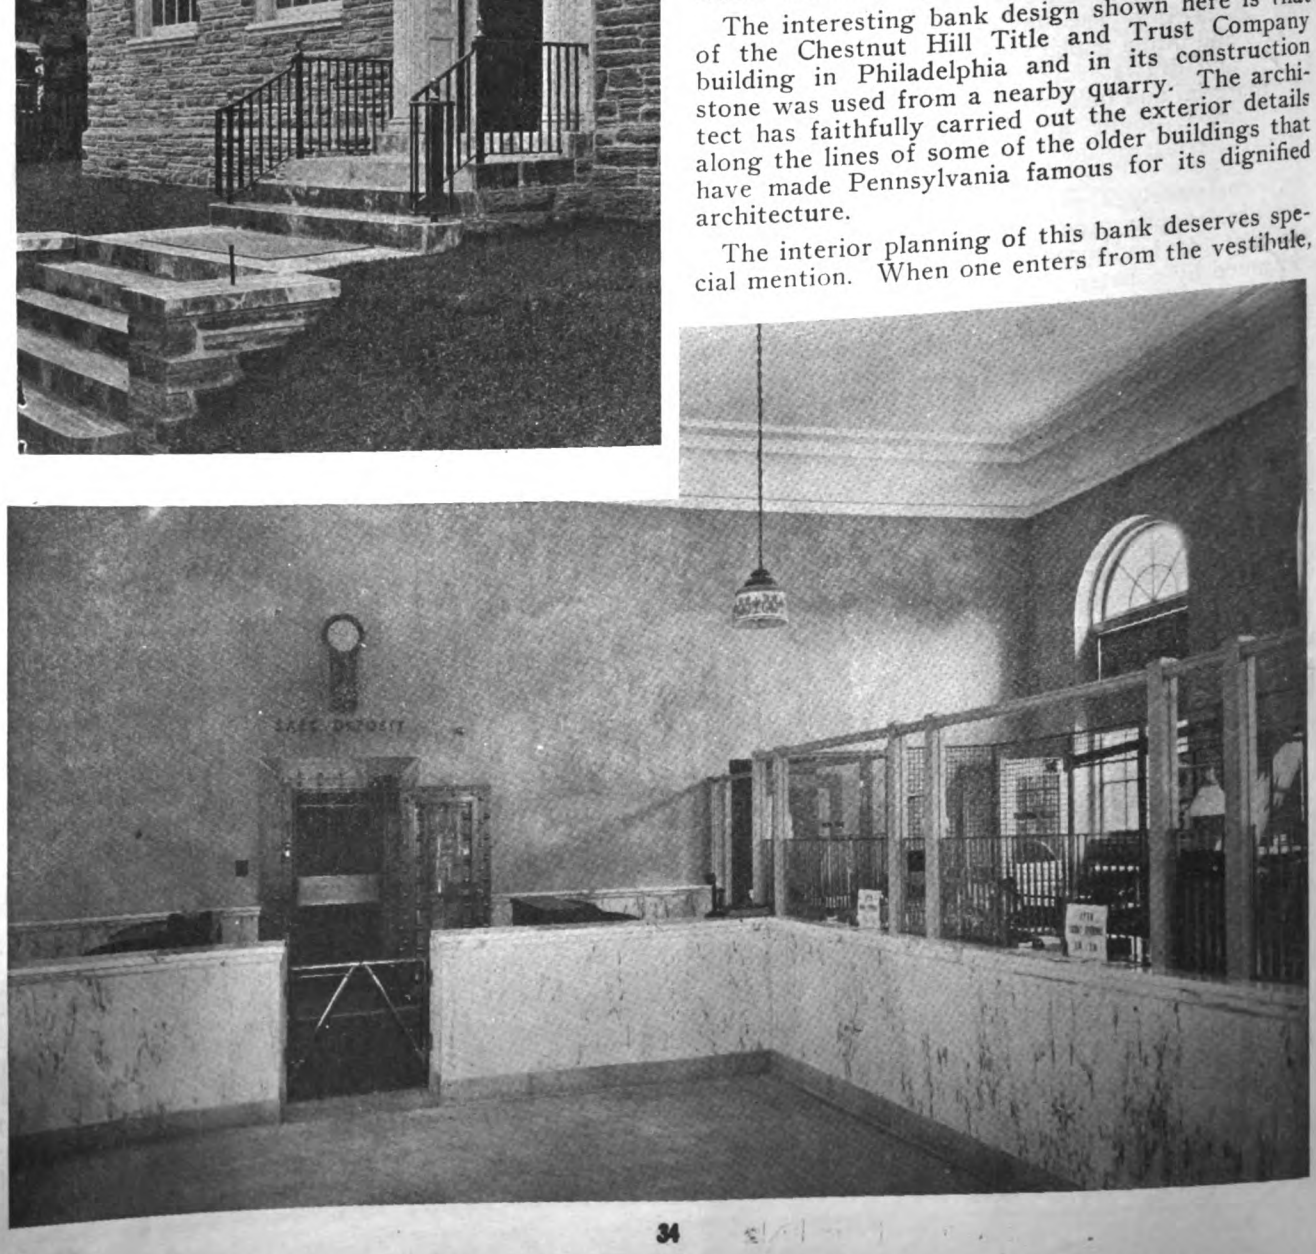
Colonial Architecture Lends Character *to* Modern Bank



ARTHUR H. BROCKIE, Architect



WELL designed bank buildings are in demand in even our small cities. A bank building in every detail must typify the strength, dignity and stability of the institution it houses. In a way, its quarters must be more or less in keeping with the surrounding traditions and customs.

Quite often the architecture adopted for the bank building follows the style for which the district is more or less famed. What could be more appropriate for a Pennsylvania bank than to follow out the lines of its old buildings known to us as the Dutch Colonial style?

The interesting bank design shown here is that of the Chestnut Hill Title and Trust Company building in Philadelphia and in its construction stone was used from a nearby quarry. The architect has faithfully carried out the exterior details along the lines of some of the older buildings that have made Pennsylvania famous for its dignified architecture.

The interior planning of this bank deserves special mention. When one enters from the vestibule,

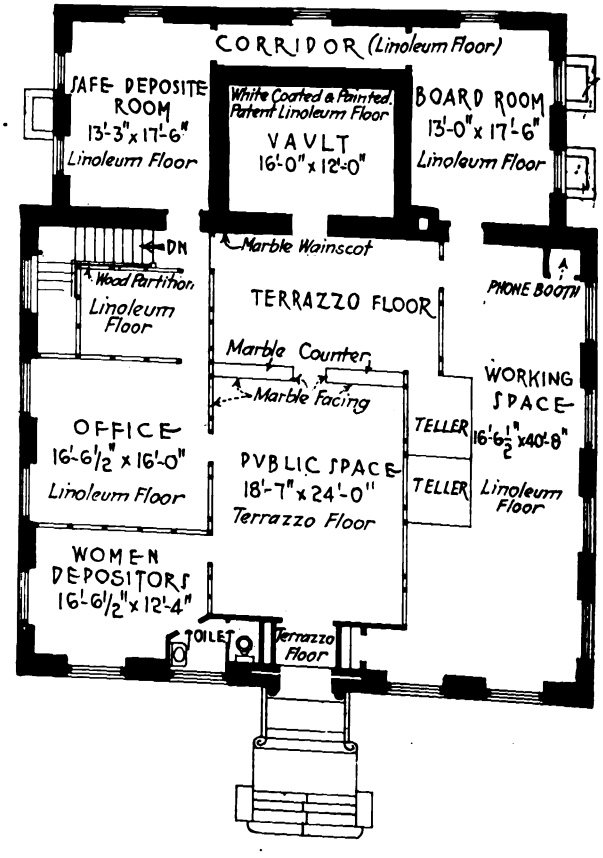
Grey Stone and White Trim Produce a Very Pleasing Exterior.

Observe Large Detail of the Entrance on Opposite Page



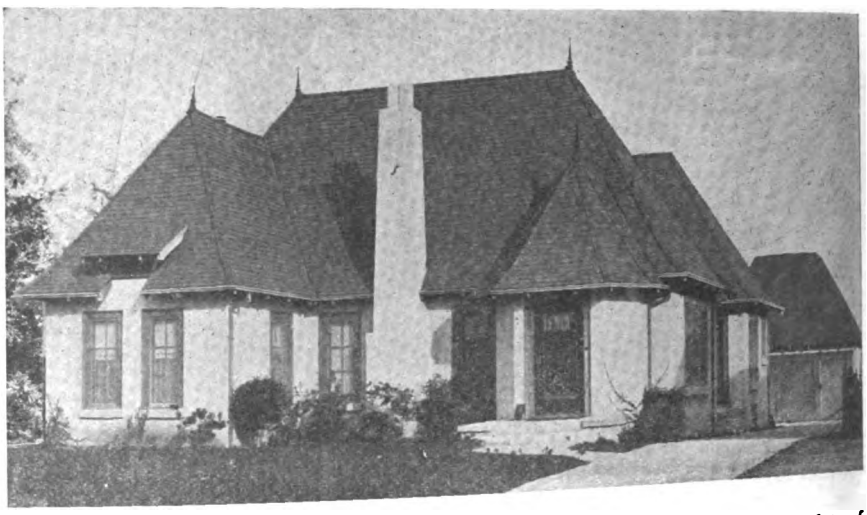
practically the entire bank interior is in view, disclosing a large open space, well lighted by windows on three sides. Directly opposite the front entrance is the entrance to the safe deposit vault. This is located in sort of an extension built in the rear of the main structure. The different office space is railed off into smaller compartments by marble counters.

The area devoted to use of paying and receiving teller, etc., has an additional bronze and glass screen on top of the marble counter. A special section has been railed off especially for women depositors and off this is a small toilet room.

All of the public space is floored with terrazzo laid on a concrete base. The balance of the concrete floors are covered with linoleum cemented down so that it is an integral part of the floor just the same as though it were wood. Here the bookkeepers, etc., are assured of plenty of daylight while at work. In the rear, on one side of the vault, is located a good sized room for board meetings and on the opposite side a room of the corresponding size is specially devoted to the use of the safe deposit customers.

The entrance itself is interestirg in detail but very dignified and artistic. A hanging lantern overhead illuminates the steps at night. A well designed cornice with brackets supporting the overhang surrounds the main portion of the building. The roof on the main portion of the structure is of slate and the flat surface over the vault extension is of tin.

This building was erected from plans prepared by Mr. Arthur H. Brockie, architect, of Philadelphia, and was erected by J. C. Cornell & Son, building contractors of Philadelphia. The different views that we show of this building were taken by Mr. Philip B. Wallace, photographer, of Philadelphia.



The above floor plan shows the convenient arrangement of the interior of the Chestnut Hill Title and Trust Company, Philadelphia. A good size central space makes it convenient for the public to transact business with either the officers or tellers. Good, light working space is also provided as well as Board Room, etc.

Attractive Bungalow *of* Seven Rooms

By CHARLES ALMA BYERS

THE steeped-roofed little house illustrated here commends itself to the interest of prospective builders in a number of ways. In the first place, it is uncommonly attractive in outward appearance, and it is, moreover, of a style architecturally to be practical for any climate.

Having seven rooms, it is a much roomier house than its dimensions of thirty-six by fifty-three feet lead one to expect, which means that the floor space is handled most economically. The interior is further arranged very conveniently, and there are many excellent closets and built-in features to win the especial delight of the housewife.

The steep roof with its ornamented peaks, the chimney prominently situated on the front, the octagon-like entrance extension and various other well-handled details, together with a very effective color scheme, all combine to make the street view of the little house particularly attractive.

In studying the accompanying floor plan, it should be especially noticed that but very little space is required for providing hallway connections, and yet all parts of the house are conveniently accessible. A possible change or two in the use of rooms also deserves to be brought to attention. The front bedroom, for instance, might be utilized as a den, and the little breakfast room would make either a very delightful sewing room or a play room for children.

The house has neither basement nor furnace. However, had either been desired, a stairway might have been substituted for the little toilet room on the rear-entry porch.

The heat is furnished by several built-in gas radiators, and every modern convenience is provided. The house is located in Los Angeles, California, and was designed by E B. Rust, architect, of that city.

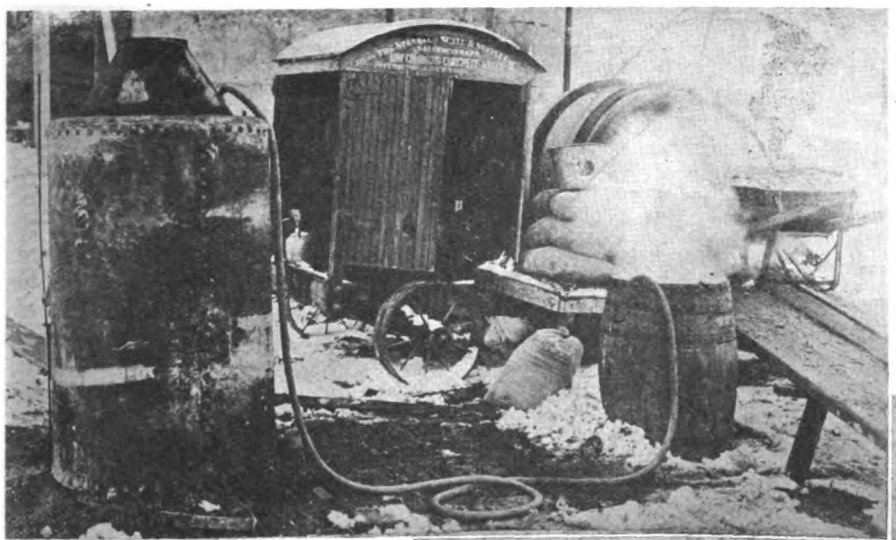
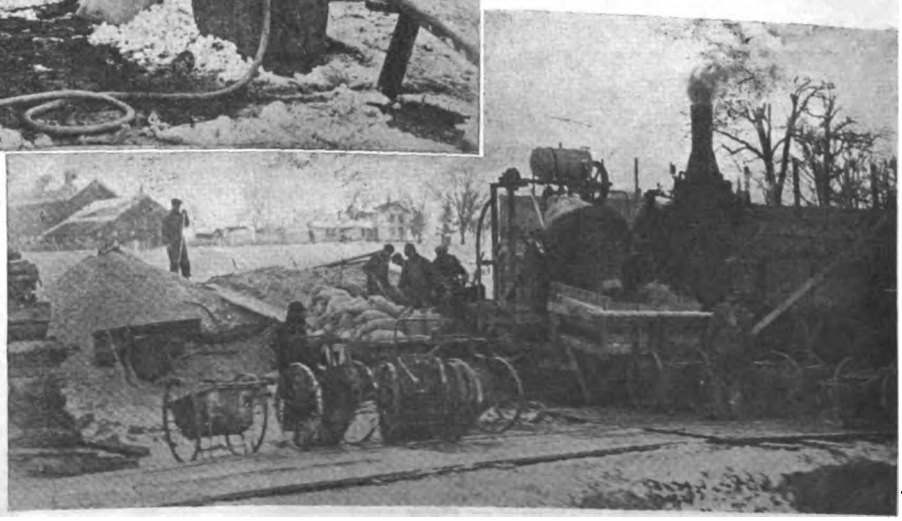
CONCRETE
Form Work-Reinforcing Methods
Monolithic and Block Construction

Methods *of* Placing Concrete *in* Cold Weather



By A. J. R. CURTIS

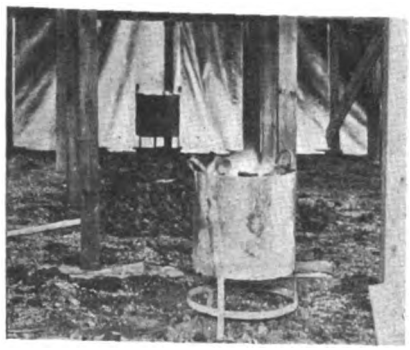
NONE of the radical departures in building operations during the last few years carries greater economic possibilities than that of carrying on these operations continuously or nearly continuously throughout the year. Frequently, closing down for the winter means the loss of valuable time in the fall as well, because of the fear that work started in moderate weather may continue after cold weather sets in.



Most building materials are easier to procure in the winter and sometimes at lower cost. Labor is usually more plentiful and labor turnover is less. Winter interruption to his business often means that the contractor has to rebuild almost an entire trained organization—frequently including technical and superintending forces and fifteen or more different trades—every spring.

Winter construction costs are usually somewhat higher, but nearly always worth more than they cost to the owner, because his income or benefits from the structure start months sooner and to the contractor because he can complete the work, take out his payments and look ahead to the next job. The construction season is thus profitably lengthened for both owner and contractor.

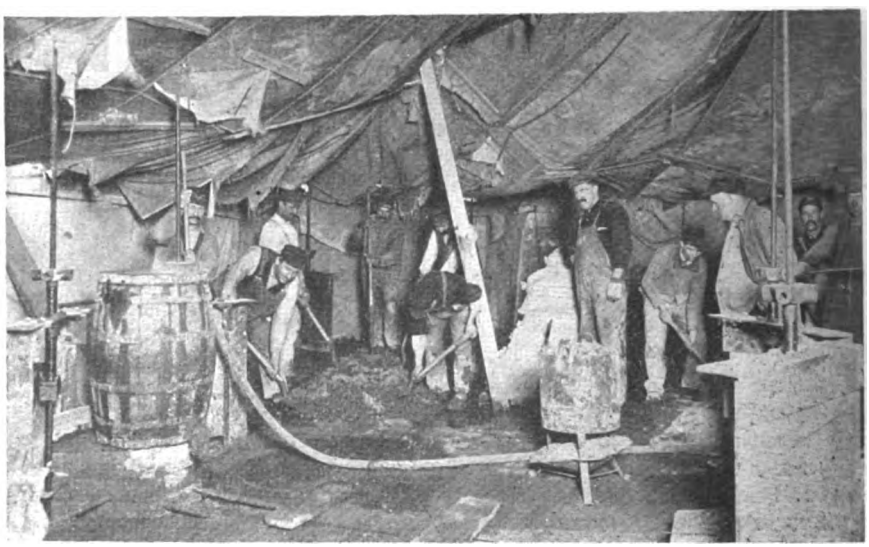
About the only important obstacle to winter construction has been the lack of an understanding and application of the relatively simple precautions necessary to successful winter concrete work. Much winter concreting has been done successfully during the past ten years and some of the largest and finest construction work of the war period was completed with the thermometer around the zero point.



An old boiler supplies steam to heat mixing water and aggregates and warms up surfaces of the forms

A concreting outfit ready for business, with the thermometer at eight degrees below zero. The steam boiler at the right furnishes power for the mixer, steam for heating the aggregates and boiling-hot mixing water

Digitized by Google

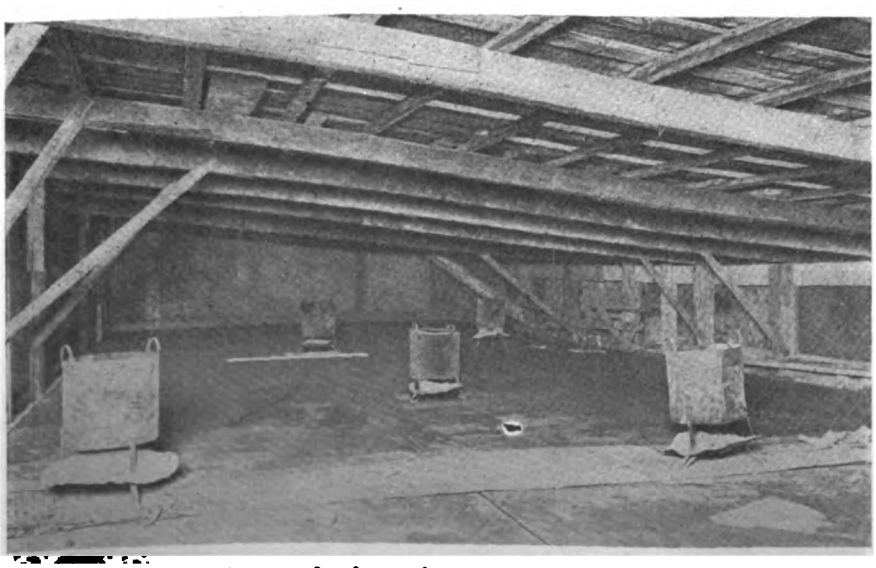


Slamanders furnishing heat within building shown below, which is protected with canvas covering

The contractor who carefully plans ahead can often complete all concrete portions of a job before severe cold weather sets in so that the remainder of the work may proceed regardless of outside temperature conditions. Concrete work started in October and November is usually subject to considerable economies, for concreting crews work most efficiently during moderate or cool weather.

Planning for Winter Concreting

The contractor who expects to undertake building work likely to involve placing of concrete in freezing weather will do well to arrange as early as possible for necessary supplies of sand, gravel and stone. Rail priorities given to facilitate the movement of coal have already made it difficult to obtain cars for the movement of concrete materials and this situation can hardly be expected to improve until coal requirements have been taken care of.



Gravel pits cannot operate in the winter and they are usually compelled to close down with the first hard freeze. Materials wet in transit and frozen in the car are difficult and expensive to thaw out and unload. These facts are stated to emphasize the importance of arranging early and carefully following up deliveries of concreting materials.

Hand mixing outfit within canvas enclosure using live steam for heating the water. A salamander heats the enclosure

Principal preparations for cold weather concreting consist of providing or conserving heat in the presence of sufficient moisture so that the concrete can harden uniformly and with reasonable rapidity. If concrete freezes, the hardening action stops, for the water, which must be depended upon to react with cement, has changed to ice and, as is well known, cement and ice do not react nor does concrete harden while frozen; but the formation of ice is accompanied by expansion which may spall or disfigure the surface of the work or interfere considerably with the strength.

For a period during the fall, the temperature at night may go down to freezing, although quite moderate or even warm during the day. It is usually possible under these and similar weather conditions to take care of concrete work satisfactorily by covering the work carefully in order to trap the heat present, when the concrete was placed, keeping out cold winds, rain and sleet. Even where the temperature does not go below freezing, covering the work is beneficial in hastening the hardening.

Salamanders (coke stoves) arranged to heat a low wooden and canvas enclosure over a newly-placed sidewalk on a city street

Protective Coverings

The nature and duration of this protection depends upon the character of the work to be protected and prevailing temperature conditions. Every covering should be tight, to resist and keep out wind and water. Beware of holes, tears or openings of any kind and be particularly careful to amply protect exposed protruding portions of the work.

Contractors generally prefer tarpaulins as the most adaptable covering for concrete work of various kinds, large and small. Tarpaulins may also be effectively

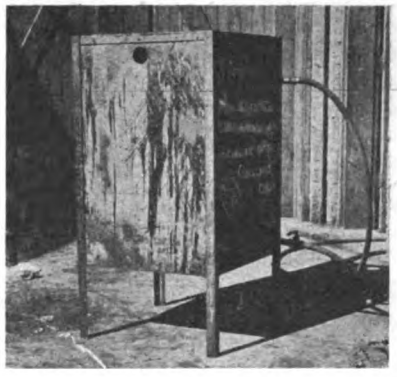
Digitized by Google

used to cover exposed piles of aggregates. Wooden housing makes the most substantial covering for whole buildings, floors of buildings, small and moderate size bridges and similar work, and where the expense can be justified or compensated by re-use of the lumber, it is commonly preferred.

Straw or manure is commonly used around low forms and for foundations and low walls. Manure must not touch freshly placed concrete. Building paper, where it can be properly supported, is an efficient protection against cold winds and is used over walks and floors, frequently carrying a covering of straw or manure.

Sections of a discarded smoke stack in use on the Chicago Union Station job for heating aggregates

Heating the Mixing Water



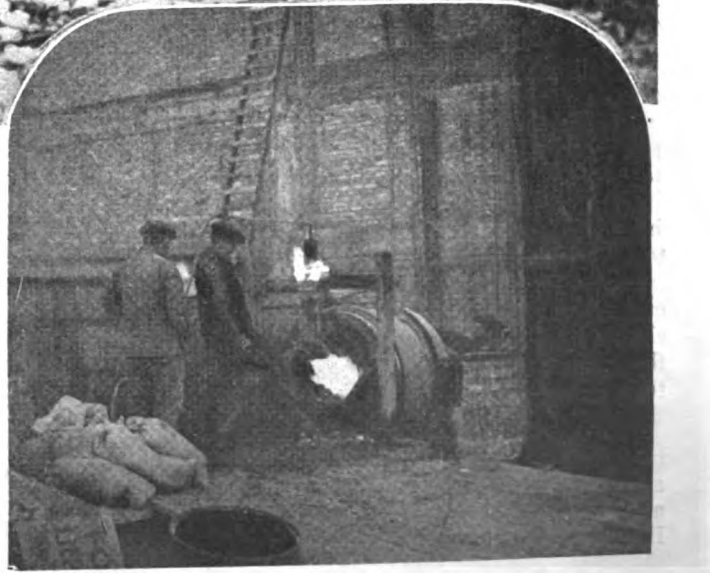
When it becomes necessary to impart heat to the concrete in order to have it come through the first 48 hours at a temperature of 50 degrees or more which is recommended, heating of the mixing water is usually resorted to as the cheapest and easiest method. An effort is often made to deposit the concrete at a temperature of 80 or 90 degrees. To do this the water may be used at the boiling point. It may be well to observe that since it is only the water in concrete that freezes, a reduction of the mixing water somewhat from the quantities ordinarily used will be found beneficial.

The three most common methods of heating mixing water for concrete are as follows:

(1) By exhausting live steam in the water tank or barrel, a method which is adaptable wherever live steam is available;

(2) By running the water through a coil of pipe supported over a fire, perhaps the easiest arrangement where there is running water but no live steam, and

(3) By the use of kettles or tanks supported over a fire—suitable where neither live steam or running water can be obtained.



Several modern heating devices have been made available recently. This heater, in addition to its function as a salamander for keeping the enclosure warm where desired, contains a coil of pipe by means of which the water may be heated to a desired temperature

Heating Aggregates

As the weather grows colder it is even more desirable to get the concrete into the forms at high temperature and heating of the aggregates—sand and pebbles or stone—is usually the next of the progressive methods employed. Contractors are in a habit of heating these materials to from 100 degrees to 150 degrees, striving t

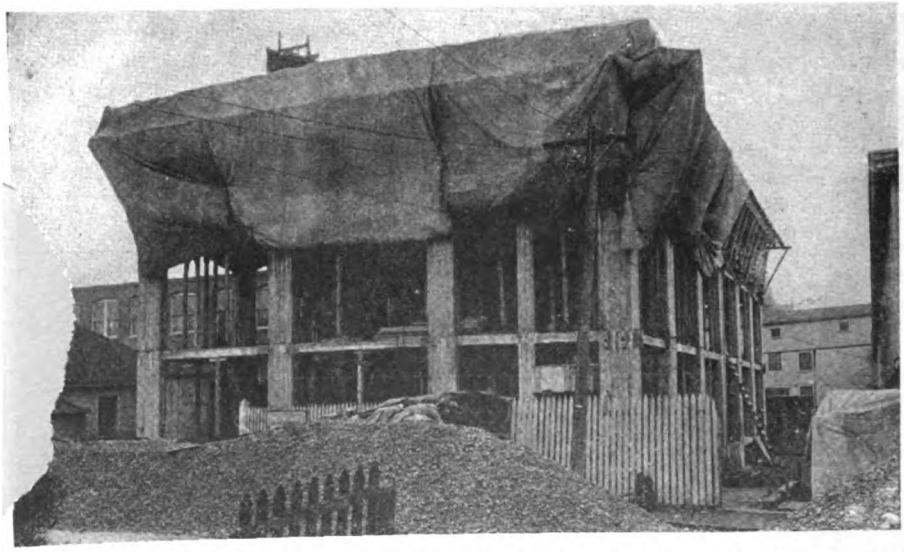
"Pipe heaters" in use showing the desirable method of keeping sand and pebbles in distinct piles. The materials should be turned frequently so that they will be heated uniformly

A new and practical apparatus is the kerosene heater, which keeps the mixer drum and its contents warm

Digitized by Google

Walks and floors and other low work are frequently protected by covering with heavy paper covered with straw. Heavy planks are used to weight the covering

is not used as frequently as formerly, experience appearing to show that where steam is available it is more efficient and convenient to supply the heat through a grid of steam pipes, laid upon the floor where the aggregates are piled. In this case the pipes do not exhaust the steam into the pile, but simply supply heat in the same manner as an ordinary steam coil. Tarpaulins are frequently used to cover the pile and retain the heat.



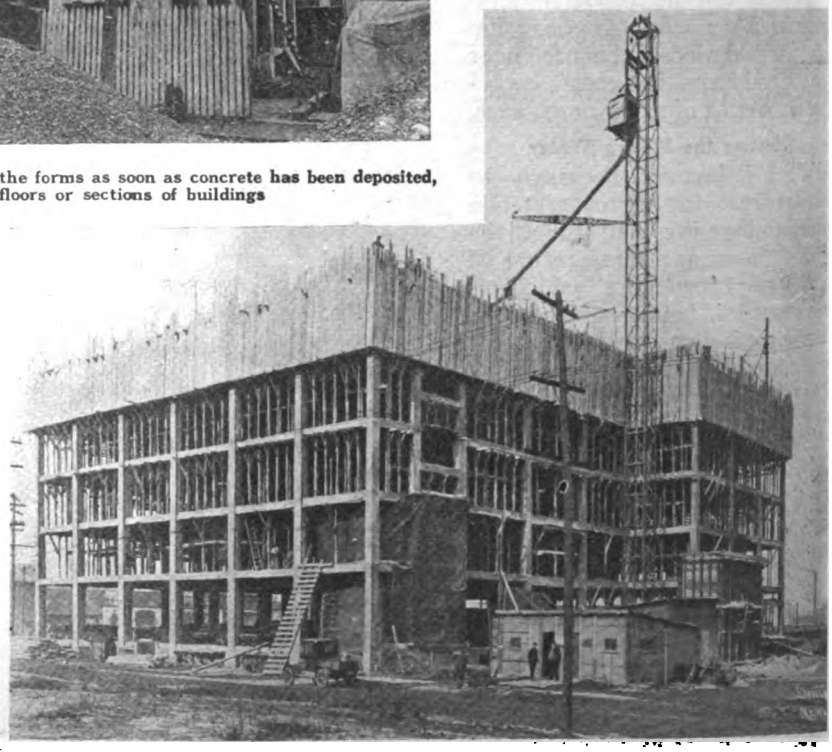
Cement forms a relatively small portion of the bulk of a concrete mixture and, therefore, need not be heated. It should be stored where well protected from moisture and extreme cold. Never depend upon the heat generated by the action between cement and water. It is inconsiderable.

Some Other Suggestions

In extremely cold weather heat is frequently supplied at the mixer. This has been done by exhausting steam in the mixer drum and providing the latter with "flaps" if necessary to retain the heat. Recently very efficient kerosene torches have been introduced for the same purpose. Location of the mixer and other details should be arranged so that concrete will be carried in the quickest possible time to the forms, and with the least exposure.

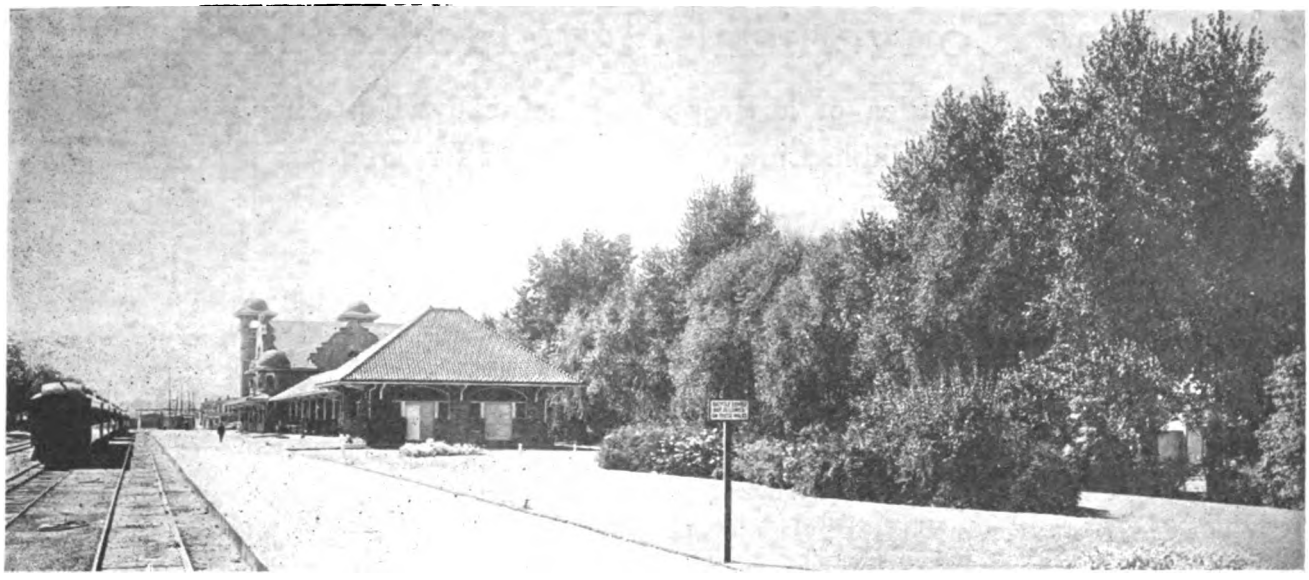
Immediately before filling each small portion of the form, the ice is removed if any be present. A steam hose is a great help in melting ice and warming form surfaces. In the absence of steam an ordinary blow torch may be used to heat the surface of steel forms.

Salamanders (coke stoves) and steam coils are the more commonly used pieces of apparatus for heating enclosures. A recently invented salamander having a water pan to provide moisture as well as heat in the enclosure is considered particularly efficient. Oil stoves and large lamps are quite frequently used on smaller work in rural districts where they are more easily accessible.



Large tarpaulins are very commonly used to cover the forms as soon as concrete has been deposited, or frequently to enclose entire floors or sections of buildings

deposit the concrete at 90 degrees or as near thereto as possible.



Fireboxes, made of sections of discarded smokestack, iron pipe or boilers, serve as efficient heaters, the materials being banked around them and turned occasionally to insure reasonable uniformity of heating. Some concrete contractors prefer to construct their heaters of steel plates laid on concrete blocks or similar supports, the materials being heaped on the flat plates from which it is easier to remove them.

Steam jets are occasionally used being long perforated pipes which are thrust into the piles and used as a means of exhausting steam into the materials. This apparatus

Wooden housing is frequently found economical on such large jobs as this and, in a few cases, entire buildings have been enclosed with wood. The material so used is employed several times, so that each use represents only limited investment in lumber

Railroad Sets Example in Beautifying Homes

By GEORGE A. BARCLAY

TWO ideas have animated the Grand Trunk Railway in beautifying the stations along its right of way in Canada and the United States. One is to make the station an ornament to the town in which it is located. The other is to furnish an example in landscape gardening and attractive building to rural owners of homes.

By carrying out these ideas, the railway has become recognized as a civic benefactor. For several years the road has had a few show stations in the larger towns. Here its stations were built with striking architectural effects and surrounded by patches of fairyland gorgeous with flowers, shrubbery and fountains. But in the last year the road has adopted a comprehensive plan for the beautifying of all its stations—a plan that makes the small towns and the cities alike sharers in beauty.

Distinct progress has been made in carrying out this plan. Waste land and cinder beds on which the stations stand have been transformed into green lawns and flower beds.

The amount of ground available around the stations was, as a rule, not extensive and nothing of an elaborate nature was attempted, the main object being to have some simple arrangement of lawn, shrubs and annual flowers in keeping with the general surroundings. In order to obtain results with the minimum of expense, the general land contour was not changed.

Considerable care was given to the collection of the shrubs and flowers as they were required to grow under conditions not conducive to the best of plant health. The work has been carried out entirely by the track forces and station staffs of the railway, and the fact that a large portion of the upkeep has been done by the men on their own time shows how they have supported the plan.

The men in charge of the various stations were supplied with the plants, and in the majority of cases they did their own arranging. The ultimate results of their work, as seen from the passing trains, were in every way satisfactory, and reflected great credit on the men, who, previous to the company's taking up the subject, had done little or no horticultural work. As there has been a marked awakening of interest in the improving of home surroundings, the work accomplished by the Grand Trunk employes in beautifying the railway premises will serve as an inspiration to the citizens of many towns in what can be done in a simple and inexpensive way in improving their own home grounds.

Besides neat and artistic grouping of shrubbery one can use lattice screens, pergolas, fences of wood, stone, brick or concrete, with neatly designed gates. All help to make the "home beautiful."

Usually the chicken house, woodshed, dog house, garage, etc., are eyesores. A few dollars spent for architectural advice will be well invited to obtain an artistic result.

Wash poles are usually no ornament to a lawn or landscape scheme, yet they can be made so—one pole can have a piece of lattice work with vine; another a bird house on top; another a part of a pergola, etc. It only costs a small amount to do these things, and they surely pay.

Even a Tool Shanty Can Be Attractive by Giving a Little Thought to the Design

Making Convenient New Homes from Old

A Woman's Idea of a Properly Electrically Equipped Home

A Profitable Line of Winter Work for Builders

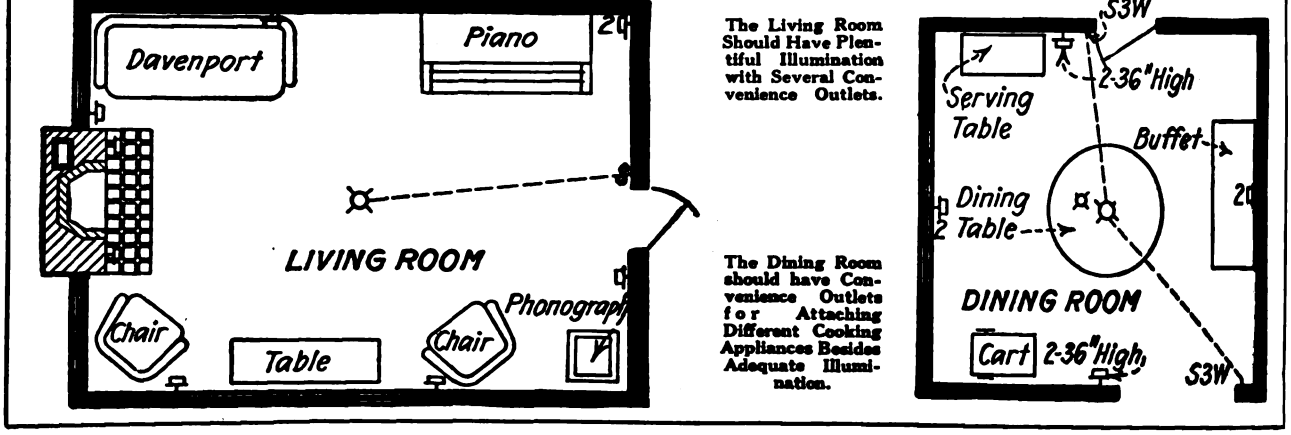
By LILLIAN CASSELS
of the Society for Electrical Development

WINTER gives builders an opportune time of putting old houses through a process of revamping, and promises large returns in both profit to builder and pleasure to owners, and no one thing has such a bearing to comfort as a proper electrical equipment.

The profit accrues in transforming squalid buildings, melancholy and untenable in their present shabbiness, into property whose selling or renting values increase tremendously by reason of the small investment.

This has been done in many places. But not by any means to its fullest possibilities. Scarcely a city in the country does not contain street after street filled with houses which while sound at heart have been permitted to shed paint and paper and to grow generally disreputable for want of repairs.

The vagaries of a growing city have in most instances made these neighborhoods unfashionable — and they have been turned over to that sad poverty-bitten element of society known as The Poor, who live in some sort of hand-to-mouth fashion in the crumbling homes which once sheltered substantial citizens.



The Poor we may have always with us—but it is decidedly questionable whether these would not be more self-respecting, consequently more ambitious, and less of a reproach to society, if there were no opportunities offered them to congregate in houses whose condition emphasizes their own misery.

Is a Civic Improvement

It is undeniable that the making over of old houses into clean, comfortable dwellings is a possible and a promising public improvement. Building is still far in arrears of demands the country over. Consequently the revamping of old houses so as to meet a part of the constant demand for decent habitations should make a strong appeal to builders possessing public spirit.

In this process of making new homes from old ones New York City has long ago shown the way. Thousands of old "brownstone fronts," each soaked with traditions and memories, are being made over yearly into clean, trim, comfortable apartments of one, two, or three rooms with baths and kitchenettes. As fast as carpenters and painters and electricians can function, parquet floors where once belles and beaus stepped daintily to the strains of the Blue Danube Waltz are finding their still substantial surfaces broken and divided by partitions which may cut a ballroom of noble proportions into a cozy suite—living room, bedroom, and vestibule. Closets where once hung lacy petticoats and sealskin sacques have become tiny tiled baths; butlers' pantries, their shelves and sinks perhaps still intact, are convenient little kitchenettes.

While other cities may not be so crowded as to necessitate making one old home into six or eight apartments as is being done in New York's cross streets from Washington Square northward to Central Park, yet it is true that the fashion of the day is for smaller dwellings than those which flourished when the substan-

The Living Room Should Have Plentiful Illumination with Several Convenience Outlets.

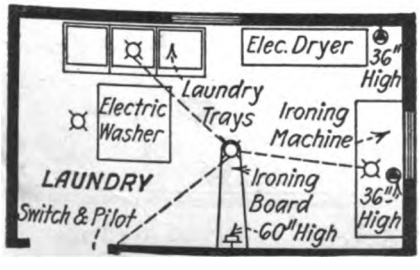
The Dining Room should have Convenience Outlets for Attaching Different Cooking Appliances Besides Adequate Illumination.

The pleasure comes in achieving large results in possible comfort and happiness for many families through minimum expenditures of money and labor. Especially in cities is this true, where concentrated humanity makes housing one of the biggest problems of progress.

Reclaiming the desert, making it bloom and blossom as the rose, turning sterility into fruitful loveliness, is one of the proud accomplishments of the twentieth century.

Reclaiming those shabby down-at-heels sections that seem to be an integral part of every city, making them over into clean, shining avenues of homes, with faces newly washed and pinafores and underthings freshly starched, would seem to be an accomplishment equally valuable to humanity.

Digitized by Google



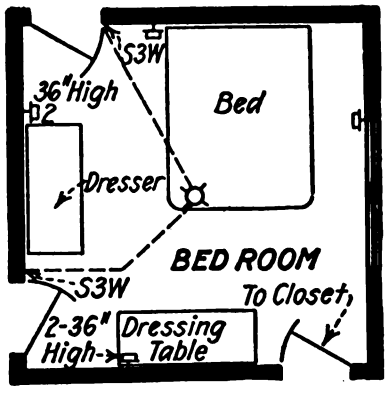
tial old houses which are candidates for rebuilding were erected. These are now in many instances being divided into two-family houses or apartments, and the comforts and conveniences made possible to them by the ingenuity of architects of today may be added to turn them into homes nearly, if not quite, as attractive as those being built outright.

Wiring Is Most Important

Most important among the changes made to bring old homes up to new standards is the system of electric wiring which will be installed. Striking differences between housekeeping of today and that of yesterday has grown out of the evolution of electricity. Housekeeping is not alone in this — business, commerce, and industry have been "sped up" by the same magical power. But builders are slow in sensing the change as regards housekeeping; they have failed to keep up with progress in this, a most important development in home-building; they are prone to relegate wiring and electrical fixturing to an obscure place in the budget of building costs, instead of putting it where it belongs among the essentials.

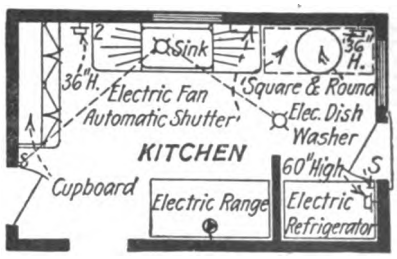
Yet if homes are to be up to date there must be wiring installations which will provide ample current and ample connections for the fast-increasing tribe of electric servants which women are using and demanding.

That builder who is first to get the habit of incorporating a generous electrical installation in his other plans will certainly reap pleasing returns in the popularity of the homes he builds or remodels. This fact has had ample proof in the sales of homes throughout the country which have been fitted up with elaborate electrical installations as showplaces. Without exception, it has been demonstrated that sales have been quick on these homes; and that prices because of the electric equipment were considerably in advance of the differences in cost incurred by the inclusion of that equipment.



In the accompanying illustrations are embodied suggestions for electrical installations which may be made a basis of plans to be used in remodeling homes and bringing them level with present-day requirements.

These diagrams designate the average number of outlets for electricity, lighting outlets or convenience outlets, switches, etc., required in each room of a home. They must be read flexibly, and their designs adapted to the size and the floor and wall plans of the home being remodeled; but they should not be cut down if a truly modern wiring plan is wanted.



Rooms in Detail

The living room plans provide for plentiful illumination. There is a ceiling fixture, also wall brackets; in addition to this the prevailing popularity of portable lamps is recognized

in the numerous convenience outlets where these may be attached for providing light in individualized areas. These outlets will also be wanted for fan, talking machine, electric cleaner, portable heater, electrified teawagon, and many other appliances. There can scarcely be too many; it must be remembered that furniture is occasionally moved and rearranged, and that abundant convenience outlets make this easy.

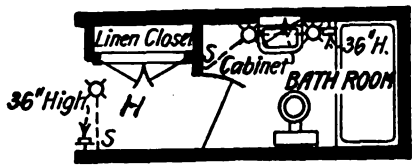
The dining room plans call for an adequate table lighting fixture. Considerable discussion has taken place of late concerning the type of lighting suitable for this purpose. While the old-time dome was, if planned and hung just right, satisfactory in that it lighted the table brilliantly and left the rest of the room in shadow there were so many times it was anything but just right in this placing that it grew to be regarded with suspicion. Lights frequently were so

low diners were annoyed by glare in their eyes. Or the dome interfered with vision across the table. In many instances the dome was a clumsy, ugly affair, taking up so much room that it was an eyesore when the table was under it and a nuisance when the table was removed.

Yet the theory of directing light on the table is a pleasing one. Today there are made many efficient fixtures which will accomplish this hemming in of those at the table without the objections of the old-time dome.

In the dining room, as elsewhere plentiful convenience outlets should be installed to care for the table appliances, and the other labor-saving electrical equipment which will be used there. Especially obnoxious is the practice of hooking electrical table cooking appliances to lamp sockets. Convenience outlets, adequately wired, preferably on a separate circuit from that devoted to lighting, make appliances decidedly more practical and convenient than when they are unprovided with these connections.

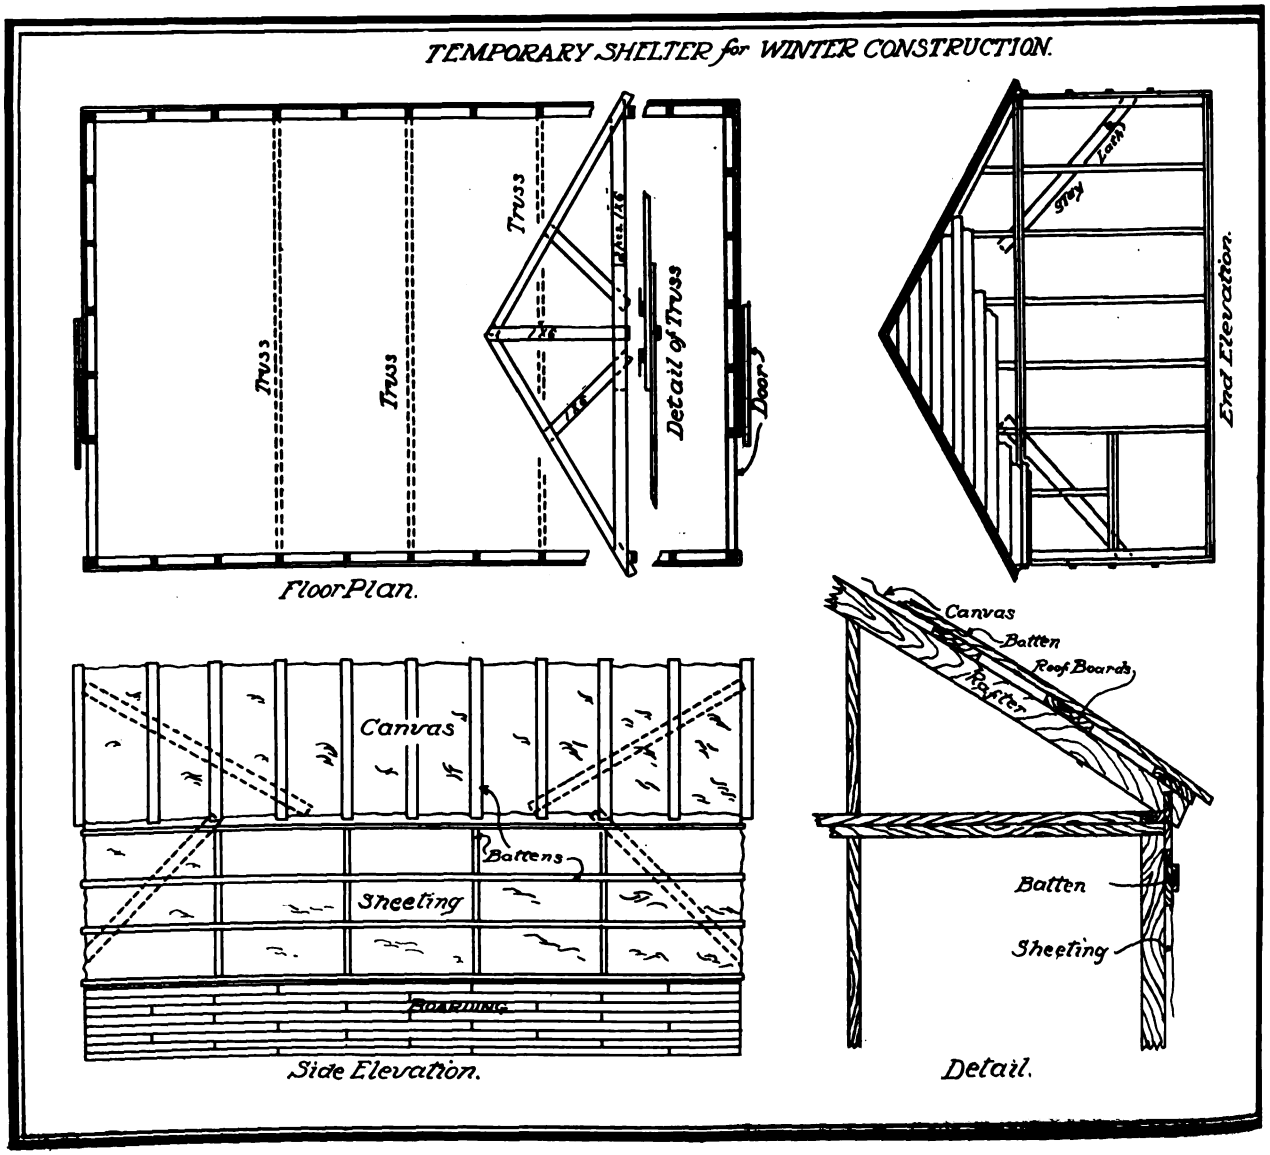
This plan of placing power and heating equipment on a separate circuit from lighting is promising to be popular, and is certainly efficient. Wiring in this instance may be sufficiently heavy on the power circuit to permit the use of all the devices a woman's heart can desire without the chance of overloading the lighting circuit, with consequent annoyances.



Let's Have Abundant Light

Bedroom comfort will demand an equally generous allotment of outlets. In addition to the places where heater, sweeper, heating pad, curling iron, or any of the other electrical comforts will call for connections, there must be ample and plentiful lights in the bedrooms so that each mirror and each bed shall have its individual illumination. Other lights than this should be considered for sewing, or for general use. There may be a desk where a portable lamp is needed. Lights in closets, etc.

Digitized by Google



Good lighting in the woman's workroom is as essential as is good lighting in factory workrooms; yet it is frequently omitted in kitchens and laundries. There should be central lighting in the kitchen which really illuminates the room. Supplementary brackets should be added if necessary over stove, sink and kitchen cabinet. Convenience outlets should be provided for iron, fan, dishwasher motor, plate warmer, fireless cooker every labor-saving device which may be adopted to give kitchen ease. There should also be wiring for an electric range; though this be not installed at the time the house is first occupied, yet it is very likely to be purchased later, and wiring will then be more difficult. And don't forget oulet for an electric exhaust fan in the kitchen.

In the laundry lights must be as conscientiously chosen as in the kitchen. There should be an overhead fixture with a carefully devised shade so as to flood the room with brilliant, pure white light. This is

better for the searching vision required in laundering clothes than the yellower light popular in other parts of the home. Supplementary brackets may also be needed here. Convenience outlets for connecting washing machine, ironer, and iron and fan are requisite. For attaching the washing machine, an outlet high in the wall is preferable to one near the floor as this keeps the cord protected from dampness.

In the fall of the year, when there is a rush to get a job done, work can be carried on at night by having electric lights around on the job. For outside work large nitrogen lamps with reflectors are the thing. In the majority of cases, however, a great amount of work that is to be done during the winter is done under cover, and, of course, here electric light can be used to advantage. In fact, the entire twenty-four hours is really available working time. This is quite important when there is a rush to get a building completed. This temporary lighting is very easily accomplished; while portable lamps produce adequate illumination at any particular point of the work desired.

Type of Temporary Building Recommended to Protect Winter Work Described on Opposite Page

Digitized by Google

How to Protect Work and Workers During the Winter Season

By LAWRENCE S. KEIR

MORE than usual consideration is being given lately to the protection of work in cold weather. Perhaps a little more on the subject will do no harm. We still put off too many jobs until warm weather that could, with a little protection, be done in cold weather.

Naturally it costs something to protect a job from cold and storm, but often the extra cost is small, and our only real reason for not going on with the job is lack of gumption. I ought to know, I have been the same myself.

Frequently the owner is willing to pay extra to have his work pushed along. Perhaps the loss of rent or use of the building will cost more than the added cost of winter work. Lots depends on the character of the work. On some jobs it would hardly pay to go ahead in cold weather, while on other jobs the building may be urgently needed or perhaps the job is of such a character that considerable hours of labor will be required in a small space. Such jobs as waiting stations, auto service stations, comfort stations, new fronts, etc., are examples. Many small structures are easily protected by erecting temporary frame buildings to enclose the entire job.

Sure, it costs something. Perhaps a bigger price can be asked for doing the work in winter. Even if not, small protecting buildings do not take long to erect and the materials used can be made use of again on some later job. Some small jobs have considerable labor attached to them, what with excavating, foundations, plumbing and the building proper, and a "half loaf is better than none" any time. There is also an advantage when spring comes if you and your cash are free for new jobs. Also you have added a little of your reputation, and that is worth something.

YOU may even take advantage of chances for some good advertising by use of a proper sign on the premises, giving the builder's name and address and calling attention to the fact that Jack Frost can't phase you. Where small jobs are entirely closed in houses of the general type shown by the drawings are usually used. The lower four or five feet of the structure and also the gable ends are boarded solid. This gives stiffness and adds protection.

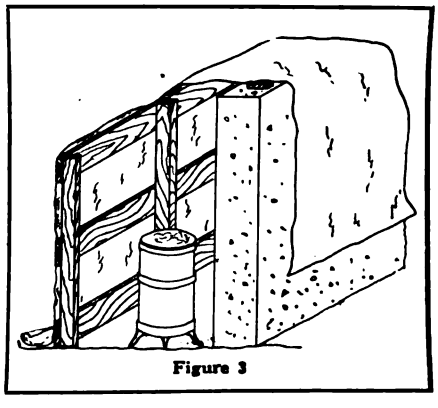


Figure 3

The studs and rafters are usually four feet on centers and braced by nailing stay lath to the inside of the framing.

The upper portion of the side walls is closed in with unbleached muslin. This is a cheap material and furnishes both cold and storm protection and light. The roof is covered with canvas or roofing paper. If canvas is used it may be made up in several sections of convenient size to handle, and if well taken care of it can be used for many other purposes from time to time.

These buildings are generally heated with open salamanders, and it is well to provide some sort of shutter or door in the gable ends of the building to provide ventilation. Often it happens that it would hardly pay to go on with a building during severe weather, but it would be a big advantage to have the foundations all ready the first thing in the spring and not be obliged to wait until frost goes out of the ground to get started.

If trenches are dug wide enough so that forms can be carried down to the bottom, the forms can be filled with concrete and then covered with tar paper, canvas or litter. Warm concrete when protected in this way is not harmed by cold (Fig. 1).

CANVAS hung over the sides of the forms or paper lining on outside of them adds considerably to the protection of the concrete (Fig. 2).

Forms may be lined both inside and outside. This gives slightly more protection from frost and prevents the forms sticking or freezing to the concrete. Where one side of a wall is against a bank and the other side exposed a canvas can be hung over the wall, and at some convenient point held away from the wall, by use of some sort of frame work, far enough to allow a salamander or even one or more oil stoves to be placed beneath it safely (Fig. 3).

Another way is to hold the canvas away from the wall a few inches by

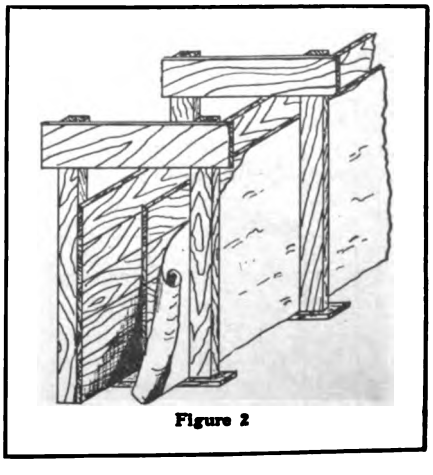

Figure 2

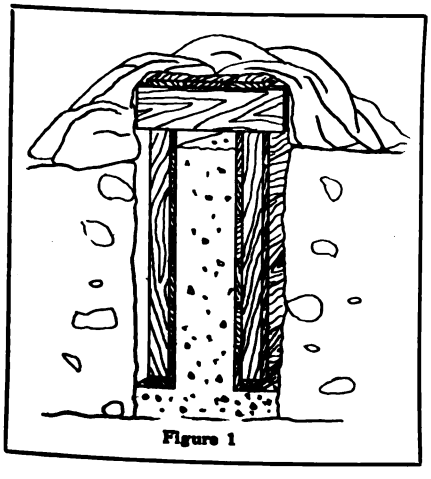

Figure 1

Digitized by Google

using brackets, the same brackets supporting a steam pipe as shown in Fig. 4.

Where a foundation wall runs only two or three feet above ground, a simple wind break on the north side of the wall will make it possible to take advantage of many sunny days that would otherwise be lost. Even when using warm concrete in protected forms it is sometimes desirable to erect wind breaks to protect the workmen. A couple of portable windbreaks covered with canvas or boards or roofing paper are sometimes handy to have (Fig. 5).

A few slats tacked across the scaffold poles and a canvas hung over them is a worth-while protection to a man engaged on some tedious exposed work (Fig. 6).

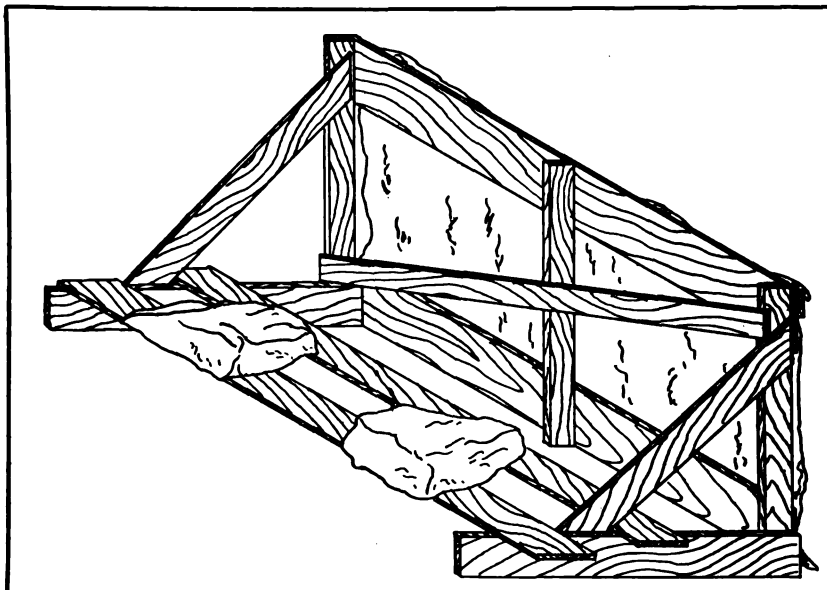

Figure 5

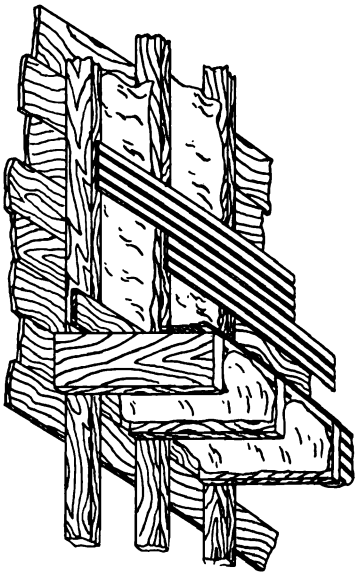

Figure 7

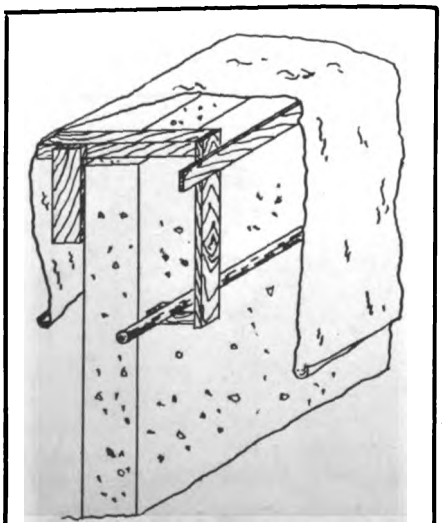

Figure 4

Plastering can usually be done in winter, especially if there are chimneys in the house. Where there are no chimneys, salamanders can be used, and if the sash are not in place the window openings can be covered with muslin.

Where attic floors are not boarded over tight a lot of warmth escapes. Building paper laid between the attic joists will help to prevent the escape of heat and also help protect the fresh plaster on the bedroom ceilings from frost. Paper laid in loosely will not interfere with plastering. The same idea can be used inside the studs on sections of outside wall where for some reason the siding or other outside covering has not been put on (Fig. 7).

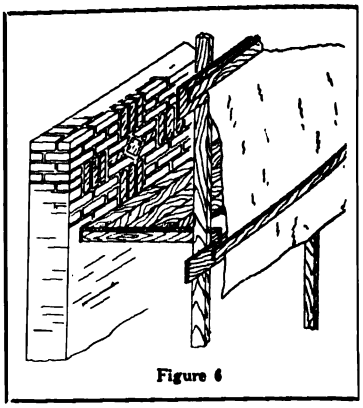

Figure 6

Where the stair well extends to the attic, a lot of heat will be conserved by covering the well with canvas or other covering. If the house can be best kept warm by heating only one portion at a time, the building can be divided into sections by using canvas or paper over the studs or lath and the heated part of the house plastered first, etc.

In some houses considerable bench work is done on the premises. A room, preferably on the sunny side of the house, can be partitioned off with canvas and heated comfortably warm even before other parts of the house are closed in.

There are endless jobs that can be done in winter by a little added planning and protection. Only a few suggestions have been made.

Unbleached muslin or sheeting may be had in the following widths: 36", 54", 72", 81", 90". Canvas covers are usually made to order and can be had in several weights and any shape or size desired, and in either white or khaki. It pays to buy good ones.

In the words of H. Colin Campbell, of the Portland Cement Association, "Let's Keep Building Going All Winter." There is no excuse for anything less than a twelve-months' construction season — except the excuse of bad habit. There is no reason why the winter months should not take some of the burden of keeping things going. It can be done and is being done every year by builders and contractors who know the profit of keeping their efficient organizations together and working. Let's all do it!

PAINTING

Practical Points of Interest to the Builder

Painting *in* Winter-Time: *and Its* Difficulties

By A. ASHMUN KELLY

WHICH is the best season of our year for doing exterior painting? This question has been discussed for many years, and still without having been decided one way or the other. This because each season has its advantages and disadvantages for this kind of work. The Spring has its showers, catching wet paint and hindering the work. Summer has dust and flies, which spoil the paint. Autumn comes nearest to scoring perfect. Winter has its frost, snow and freezing, all bad for painting, though I cannot say positively bad for paint.

Some wise man has said that the best time for outside painting is when you are ready to have it done. And that is not very far from the truth.

Now, as to winter painting. Winter is at or around the corner as I write. There will be plenty of painting to do, inside and out. So I will discuss this matter of winter painting here.

There are two main difficulties that we painters have to meet with when doing outside work in cold weather. The oil becomes stiff, making it difficult to spread, and taking more time than in warm weather. Also the paint does not get rubbed out enough.

It is very important that a coat of exterior paint be brushed out thin and even; if too heavy a coat, or uneven in its brushing out, it is liable to crack or peel in the future. The only way to do, is to warm the paint once in a while, to keep it in a working condition, and this takes time, too. But it will pay in the time saved in its application and in the better coating it will give.

BY having the paint mixed in quantity in a warm place, one can run in and get a fresh pot of paint whenever the paint we are using becomes too stiff. Some painters make the mistake of thinning the paint, sometimes with oil, sometimes with a little turpentine. This is a mistake, as it makes the paint thinner than it should be.

Turpentine is often added to the paint in mixing for cold weather, for that makes it easier to spread, but for a last coat I never want turpentine added. A little might do in previous coats. It tends to harden the paint a little, and also assists the drying.

I have mentioned the difficulty of spreading oil paint in cold weather. In addition to that there is the discomfort of working in cold weather, for the painter does not have the exercise that other mechanics have in working, hence feels the cold more. The situation may be greatly improved for him by working in the least exposed parts, as on the sunny side when the sun happens to be in evidence.

That used to be my practice, though most employers insist on taking the building right around regardless of weather conditions.

Now as to the character of painting done in cold weather. Is it as durable, and will it make as nice a job? Yes, quite as durable provided the paint has been properly rubbed out, as I have already pointed out. There are two important points here to be taken into consideration, namely, the character of the wood that is to be painted; is it as dry as it would be in warm weather? Usually it is not, and therefore the paint does not do as well as in dry, warm weather.

ON the other hand, the sun bites the life of paint, which is the oil, so that it may not be as durable as winter-applied paint. Also, if the paint that has been applied in the winter afternoon is fanned by a raw, damp breeze at night it is sure to affect the fresh or undry paint and give its surface a rubber-looking appearance, which, while no harm is done to the integrity of the paint, spoils the finish. When such a case occurs all you can do is to either remove it, or rub it well with raw linseed oil, which may restore its luster. To prevent is, in this case, the best policy. Try to avoid painting that part in late afternoon that may be exposed to a possible damp night air.

I have painted in winter on the north side of a house, when the breeze was in that quarter, and the cold so intense that I have had to run to shelter every little while, to knock my frozen fingers to get the blood to going in them.

Good Practice in Frame Construction and Finish

Profitable Work *for* Winter Time

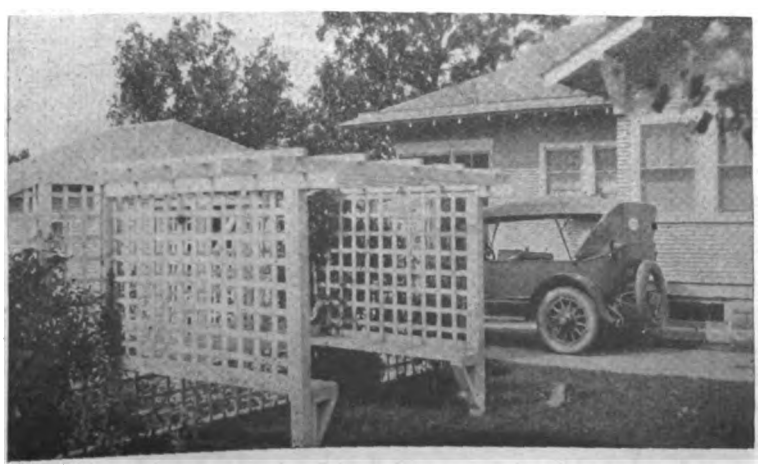
Little Things That Can Be Made and Sold When Big Jobs Are Few

By DALE R. VAN HORN

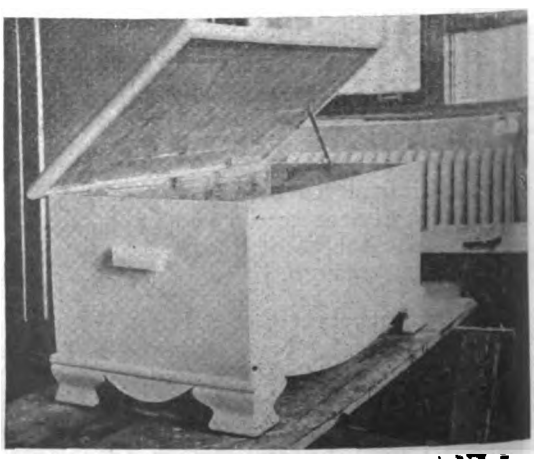
ONE can often find good money in an almost virgin field during the slack months of the contractor-builder's season. In other words, when no large jobs appear on the horizon and the wallet grows thin, go out and create a market for some useful thing, and then push it. It will provide enough to live on, if nothing else.

When the contractor or carpenter has finished the house he usually thinks that his presence there is no longer needed and sets out for new ventures. When work is scarce it behooves the man with an eye to his income to seek additional work about the place which will bring in money.

Beautifying the Home Surroundings



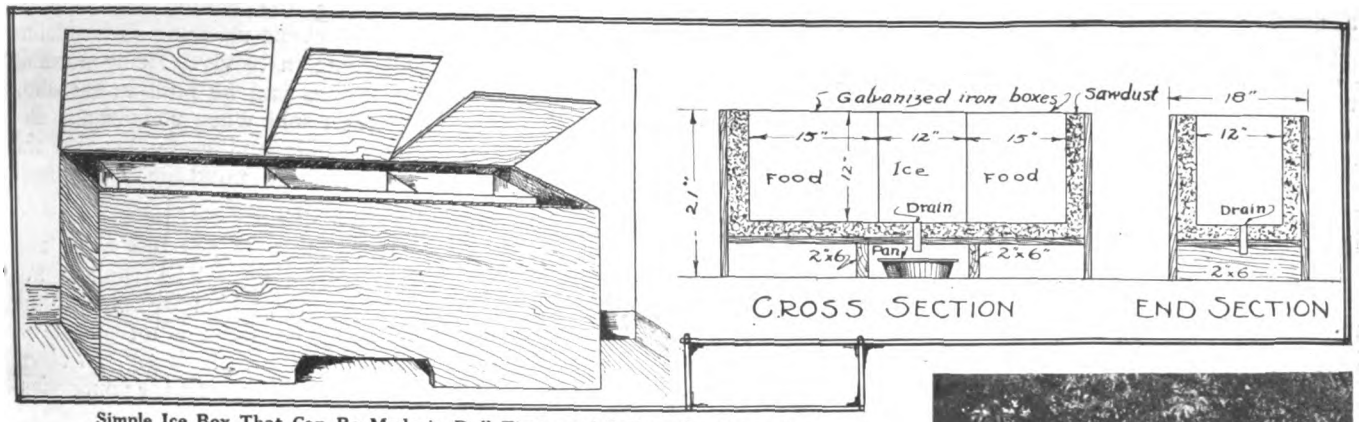
Almost every new building site presents a good field for such effort, if the financial status of the owner is such as to warrant it. In the photo is shown a corner of a western home site. The bungalow, recently erected, shows in one corner. This lot upon which the house has been built was low and below the roadway. For this reason the owner was able to buy it cheap. After it was graded up to the proper level its value was almost doubled.



But at the back of the lot there was an abrupt drop of several feet to the old level. The builder, noting this, brought the matter to the attention of the owner, who, after hearing a suggestion or two, turned over the matter to the contractor with the result shown.

The attractive lattice fence of one inch white pine strips runs the full length of the lot, and on the front side a few feet from the drive to the garage the pergola was built. Though the material costs practically nothing, the contractor was able to realize handsomely on the job because the work required was nominal compared to the result thus obtained, which was what the owner wanted.

Cedar Chests to Conform to Room Colors



One seldom sees a cedar chest finished in anything but the natural colors, yet often a chest of this wood is built of such a light or inferior material that the effect is anything but pleasing. A chest built of the red cedar should be made from pieces carefully selected to give the variegated finish found on the best pieces of work. When this is not possible and only second quality lumber available the chest can be made to fit in with the color scheme in any room by giving it the proper treatment and the desired finish.

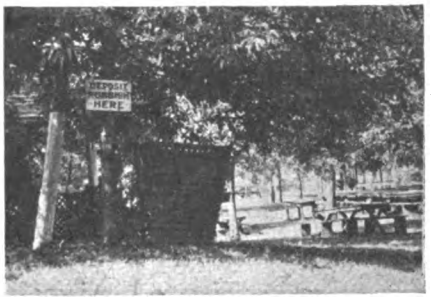
Making Lattice Fences, Pergolas, Summer Houses, Cedar Chests, etc., are Profitable Lines of Winter Work

Digitized by Google

Simple Ice Box That Can Be Made in Dull Times and Sold to Campers, etc.

Also, where the chest is wanted of cedar only for its peculiar properties, namely, to keep away insects and pests, considerable of the purchase price may be saved by a chest made of the cheaper wood and then painting it the proper color.

The cedar chest shown in the accompanying cut has been finished a soft cream color to harmonize with the color of the woodwork in the room for which it was intended. It was first given two coats of shellac to keep the rosins and oils in. After this had dried thoroughly a coat of the flat color was applied. Two days later the first coat of the interior cream finish was put on, and ten hours later, the second coat.



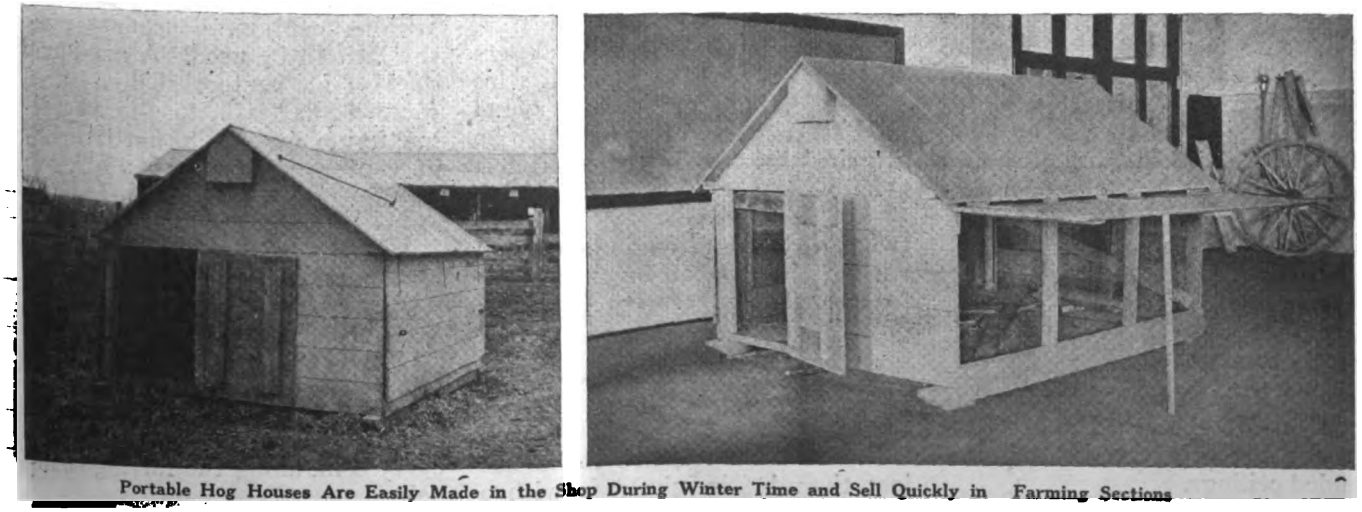
Combined Kitchen Seat and Refrigerator

Briefly, the ice box, which is shown in the accompanying drawings, consists of a wood box made in the shape of an ordinary window seat. Within are three compartments, the center one containing the ice, and the two on the outside being used for food and other things in need of ice. The wood box forms the outer wall, then comes two inches of sawdust, with a galvanized iron box partitioned off into the three spaces mentioned above. The front side is cut away as shown in figure one for the drip pan, and the hinged top which extends over the edge on three sides one inch is cut into three sections, so that one compartment may be opened without disturbing the others. Cleats which may be nailed on the under sides of the doors will prevent them from splitting and will further add to the strength of the box.

The outside dimensions of the box are: Height, twenty-one inches; length, four feet; width, eighteen inches.

The outer walls should be made first. The floor is supported above the floor of the kitchen by 2″x6″ pieces running from front to back. Upon these are laid matched lumber for the floor. Suitable hardwood to take an interior finish should be used for the outside.

Measurements for the iron box may be taken to the hardware store



Waste Receptacles Sell Readily and Are Easily Made in the Shop

and there made. See that all joints are tight and a short length of pipe fitted into the center of the floor of the ice compartment to drain away the water.

This is then set into the box, after the bottom has been covered with two inches of sawdust well packed, and then the sides filled. When full, strips of linoleum should be tacked over the top of the sawdust filling to prevent occasional working out.

The metal partitions between the ice and the two adjacent compartments readily permit the passing of the cold and save space. Moreover, it makes a tight inner lining and keeps the sawdust dry.

By altering the size and construction of the box it can be made to suit

Portable Hog Houses Are Easily Made in the Shop During Winter Time and Sell Quickly in Farming Sections

Digitized by Google

a number of individual conditions. The drip pan may be done away with by attaching a short length of hose to the end of the drain pipe and running it to some convenient place outside. And if a hole is cut through the side of the house to open into the ice compartment, filling may proceed without having the kitchen floor tracked.

This box can be used in the spring and fall as a simple cooler, by leaving this door from the outside open, if it has been provided. The outside air will circulate freely within, keeping the whole box at an even, low temperature.

Waste Receptacles Are Easily Made from Waste Lumber

One Sunday while spending the afternoon in a city park a carpenter noted that the campers and picnickers were often forced to carry their waste paper and empty pie plates a long distance to throw them in the discard. They did it, of course, most of them, but the receptacles should have been more frequent and not so far apart.

The next day he sought an interview with the park commissioner. He argued the wisdom in providing these containers at frequent intervals over the parking area, and in less than thirty minutes he had an order for twenty-four such as are shown in the photo. These sold at a nominal figure, and yet represented a neat profit, for they were all made from scrap lumber.

While he was at it, the carpenter built a dozen more and disposed of them readily. The investment was labor alone, and he realized on an otherwise waste product.

Individual Hog House Proves Good Sideline

The cut shows a small individual or colony hog house of the portable type. It has been designed by the University of Nebraska and is proving good success on the farm. An idea of the way it is proving up in the field can also be otbained by the large number of orders which come in from out in the state for blueprints of the house.

During the winter season when work slackens up some such sideline will come in handy. Being portable the houses can be built in the shop and then sold when completed. Being portable and easily handled the farmer will not mind the idea of hauling it home.

This house is six feet wide and eight feet long. The runners are four by sixes, which are bolted to the frame. The floor is of plank on stringers, and a plank pig rail about the four sides protects the young pigs.

One unique feature of this house is the large number of doors. There are two doors in each side of the roof, and each side is also hinged to swing up. The entrance is two feet wide and three feet four inches high, which is large enough for the biggest brood sow, with a rare exception.

Ventilators, one at each end, insure a maximum amount of fresh air when the building is closed. A farmer who raises hogs could readily afford the small amount asked for one or more of these.

Some Points on the Use of Metal Lath

THE use of metal lath as a plastering base for suspended and vaulted ceiling is resulting in an ever increasing use of this form of construction. It is being quite extensively used for decorative purposes in the better class of residences, theatres, schools, institutions, public and office buildings, etc.

Its economy and ease of erection compared with other methods of obtaining equal effects has resulted in greatly extending its use throughout the country. In places where this material is not used to any great extent, it has been probably due to a lack of realization of the advantages of its use by local lathers and plaster contractors who sometimes fight shy of a suspended ceiling job that is out of the ordinary.

After much research in connection with the common practice in different localities throughout the United States a form of specification has been approved by the Associated Metal Lath Manufacturers for the safe erection of suspended ceilings.

In a great many cases, suspended ceilings were erected in a manner that violated some rules of good construction and several failures have occurred. Now, this was not due to any fault of the metal lath or hanging equipment, but rather to faulty knowledge of the proper way of erecting the work. Following are specifications that if followed will result in a good job:

HANGER—The vertical member which carries the steel framework.

The minimum size for hangers shall be No. 8 galvanized wire 1 3/16 in. flats or 7/32-in. round mild steel rods. The wire is to be attached by twisting three times, —flats attached by bolting with ⅜-in. bolts,—rods by twisting twice, or by right angle bends and wiring. They shall be spaced not to exceed 4-ft. centers in either direction.

RUNNER CHANNEL—The heaviest horizontal member.

Runner channels are to be not less than 1½-in. channels with a minimum of .442 lbs. per lineal foot. They shall be spaced not to exceed 4-ft. on centers.

FURRING CHANNEL—The smallest horizontal member, to which the lath is attached.

Furring channels shall be not less than ¾-in. channels with a minimum weight of .276 lbs. per lineal foot, attached to runner channels by at least three loops of No. 16 galvanized wire at each crossing. They shall be set on various centers, depending upon the lath to be used. A maximum of 11¾-in. centers shall be used for 3 lb. flat lath, 15¾-in. centers maximum for 3.4 lb. flat lath, 19-in. centers maximum for 3 lb. Rib Lath.

METAL LATH — The plastering base and reinforcement.

Metal Lath shall weigh not less than 3 lbs. per square yard. Metal Lath shall be attached to the furring channels by No. 18 gauge annealed galvanized lather's wire, every 6-in. along the furring channels.

What the Editor Thinks

Winter Building

NOVEMBER in our Northern States will bring to completion many building projects, and there will be but comparatively few new jobs started until next Spring, but this is no reason why builders should let up and not do any work. There are many things that can be done to keep one profitably occupied during the next few months even though the winter should be very cold.

In several articles in this issue different suggestions are made on how construction work can be carried out during cold weather—profitable side lines, and other work that will tend to eliminate this seasonal difficulty in the building industry.

Elimination of the Cellar

MANY changes are occurring in the building of homes. The tendency of late years has been the making of smaller and more compact homes, so that work will be reduced to a minimum. In the old days when "servants" were plentiful at small wages, large houses were the rule. Today when "maids" are an expensive luxury, house work duties are cut to a minimum. This has brought into being the kitchenettes and diningettes, door beds, etc.

Another step in eliminating work will be the omission of the cellar. The constant going up and down stairs takes time. Nowadays heating plants, etc., can be arranged on the floor level. Another point that is of considerable importance is the saving in expense of excavation and foundation work. To take the place of cellar a storage room can be added to the floor plan.

How Long Can Workers Labor Efficiently?

LABOR efficiency is higher with three shifts of eight hours each than with two shifts of twelve hours each. This was indicated in a careful survey and report made by a committee of the American Engineering Council.

Continuous operations, according to the committee, were found to constitute a great industrial problem about which almost nothing is known either by labor, the employee or the public. In the building industry, continuous labor is but seldom resorted to, but in the case of large buildings work is frequently carried on day and night, artificial illumination being provided.

It is a curious fact that a great percentage of the accidents occur on Monday or the day following a holiday. The day of rest seems to make men a trifle less careful.

Our Cover Design

BRICK work lends itself to make the very interesting home shown on our front cover. This was designed by S. Edson Gage, architect, and was built at Rye, New York, for Mr. E. Brophy. In the chill days of November, there is something very comfortable looking about a house of this sort with its glass enclosed living porch.

Quantity Surveys

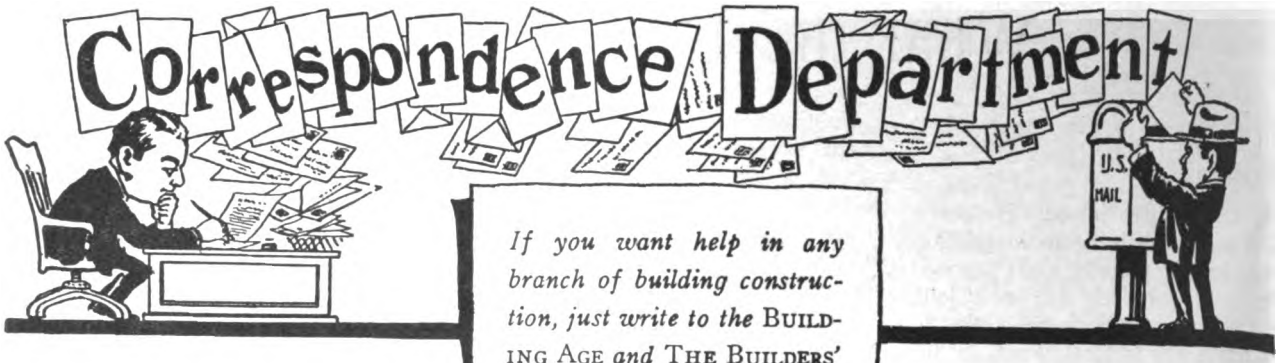
RATHER interesting was the experiment of the Master Carpenter Association of Milwaukee, in clubbing together to hire special estimators to take off a quantity survey from plans submitted by architects to different members of their organization. Sometimes as many as ten members were asked to figure on the carpentry work of some particular building and this would mean that each would have to figure out the quantity separately.

The subject of the quantity survey is an interesting one. Why should builders make this up? It is really part of the architect's work as well as plans and specifications. We may as well expect the builder to furnish plans, specifications and everything, and, of course, that is frequently done on most small jobs ,but for larger operations a quantity survey should be an essential part of the data given the builder when asking for his bid.

The fault, however, is largely due to the owner. He wants to get plans and specifications as cheaply as possible and should an architect suggest to have a quantity survey, in most cases he will be over-ruled on account of expense. Little does he think that the builder must, in all fairness to himself, charge in his time for taking off this quantity survey and not only that, but he must also charge in his time spent for making estimates on jobs that he does not get.

The owner actually pays for all this, and if he was required to give a quantity survey with plans and specifications, the architect would be more than willing to give it as part of his service. It would result in an actual saving to the owner, better satisfaction to the architect and a better and more definite bid from the contractor, as he would not have to add a safe percentage for items that *may* be called for.

The construction industry as a whole should try to educate the public to know what constitutes the proper preliminaries for a building. In very few other occupations or industries is anyone asked to do a whole lot of hard work for nothing. Why should it be in the building industry?



Give the Boy a Chance

WATCH the boy that hangs around a building operation. Give him an encouraging word once in a while instead of chasing him away. He is usually a bright youngster that looks with awe on the workmen doing their appointed tasks. He is interested in building. A word or two of encouragement will instill in him a desire to join the building craft when his school days are over.

If this kindly interest had been taken universally in this country, we perhaps would not be feeling the present lack of skilled labor to such an extent. The boy is the hope of the building industry.

It is absolutely nonsensical for Americans to deplore the fact that skilled mechanics are not coming from Europe. We have the best material here—give the boy a chance.

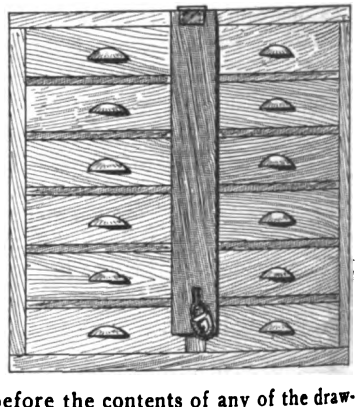
Roadside Markets

SEEING an article in a recent issue of BUILDING AGE and THE BUILDERS' JOURNAL about the desirability of building roadside markets, I think it will be of interest to your readers to see a picture of one.

At Avondale, Penna., on Route 131, Charles H. Sweigart, a man who has made a success of farming and chicken raising, has built for himself a farm products booth along the highway, in which he sells the things that are raised on his farm. This building is all his own idea, and while not pretentious to any great extent, still, is very well executed and answers the purpose most admirably, being both near and serviceable.

The roof is of asphalt shingles and the building is well planned and put together. It is not an eyesore and the neat signs help to carry out the idea of a service station for the selling of farm produce.

This little building was erected for a modest sum and as you suggested in your editorial similar structures could be used along many roadways by other people with changes to suit, obtaining perhaps a more artistic design, but this venture is a pioneer one and is certainly a step in the right direction.—**C. H. Thomas.**



Locking Several Drawers With One Padlock

OUT in the middle west a farmer employed three tractors and several men throughout the summer months. To keep the tractors and other machines in repair he fitted up a small shop and laid in a supply of plenty of tools. At first the tools were kept in a drawer in the bench. He found, however, that these tools, small wrenches, a hammer now and then, and chisels and punches were frequently used and not replaced. In time, a hasty inventory disclosed the fact that some eight dollars' worth of tools were missing. Not that the men were suspected, yet he knew that they were the ones who failed to replace the articles.

A set of drawers were built between two studding, each large enough to take the small things which are the most easily lost about the place, and then instead of leaving them without a lock of any kind, or providing every one with a separate lock, he hinged a strip at the top, cut a hole near the lower end, and drove a hasp staple into the center strip between the two rows of drawers so that the hole in the wood strip would fit over the staple. In this way one padlock kept all of the drawers locked.

The plan seemed to work very well, a point was made with the hired help to do most of the repair work, and it was always necessary to get the key

before the contents of any of the drawers could be touched. Later a list of the articles to be kept in each drawer was pasted on the front of each.—**Dale R. Van Horn.**

Successful Rust Remover

THE most thoroughly rust-covered metal may be restored to its original bright color and condition by rubbing with a red eraser, or—better yet, a sand eraser. A too coarse sand eraser should not be used if scratching the metal's surface is to be avoided. This method of removing rust is effective on any metal and will restore rust-covered carpenter's and builder's tools and draftsmen's instruments, to their original appearance. To those trying it for the first time, the result is surprisingly satisfactory. —**C. Nye.**

What One Builder Did With Cobblestones

THE attractive bungalow shown here is thirty-four feet by sixty feet. It was designed by Mr. Durbin Swartzell, of Cincinnati, as a suburban home at Brookville, Indiana.

The house has a wide veranda along both its front and side. Two doors open from each of these porches. The one gives access to parlor and sitting-room, the other dining-room and kitchen.

The house has been built, as far as possible, of cobblestones brought from the bed of Whitewater River nearby. —**Felix J. Koch.**

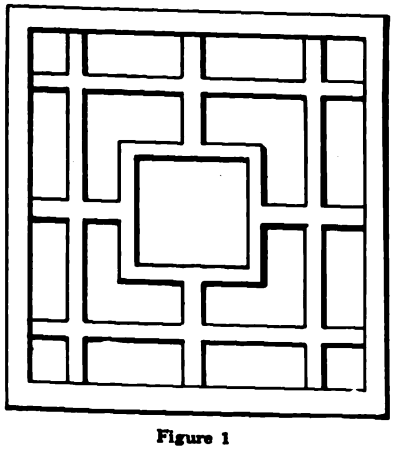

Figure 1

Ornamental Lattice Easily Produced

IN building fences where certain portions are to have ornamental pieces of lattice work, it sometimes puzzles the carpenter how to get the desired effects shown, except at an immense amount of labor.

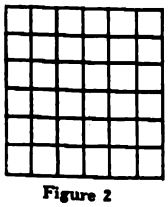

Figure 2

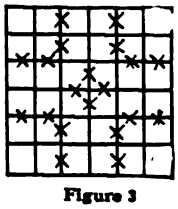

Figure 3

I follow quite an easy method. For instance, the design shown in Fig. 1 does look a little bit complicated, but it can be very easily finished. I simply nail my lattice strips in the frame as shown in Fig. 2. This is just plain cross pieces. At every junction point, I put in a small nail and clinch it. Of course where a large quantity of this work is being done and especially when it is being erected in position, it is necessary to have a helper on the other side to help in this clinching. Sometimes there are thousands of these clinches to be made. In all cases it is not necessary to nail every crossing, but every other one will give the required amount of rigidity.

When the different crossings are firmly fastened together by this clinching process, then proceed to cut away with a small saw the different pieces marked XX as shown in Fig. 3. When these cut portions fall away, the result will be the ornamental design shown in Fig. 1.—**Albert Fair.**

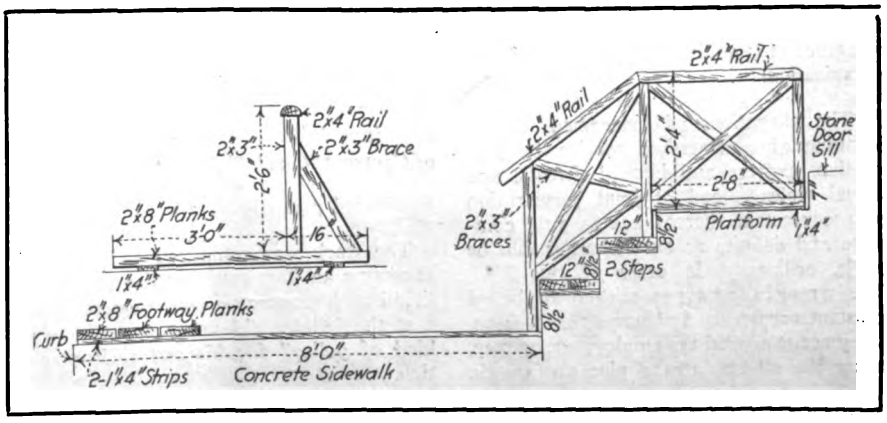
HAVE you ever used any machinery or device which has saved you time and money?

Have you ever invented any way of doing a piece of work quicker?

If you have BUILDING AGE and BUILDERS' JOURNAL wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

Address The Editor, BUILDING AGE and BUILDERS' JOURNAL 920 Broadway, New York City.



Storm Platforms and Steps

THE attached sketches show how simple platforms and steps across and on either stone, brick or concrete sidewalks, stoops, piazza, etc., may be cheaply and quickly constructed.

The covering or footway from the curb line to the bottom of the first step is 8-0 feet in length made up of 1x4 yellow pine flooring strips on which is placed 2 x 8 good spruce planed planks nailed from the under side and spaced 3/8" to permit rain or snow to percolate through and keep the top surfaces dry. The width is 3 feet to permit two persons to pass each other conveniently. The steps are made up of 2" x 6" spruce planks nailed as before to the flooring strips underneath. A hand rail 2" x 3" and 2" x 4" scantlings is placed on the right-hand side of the steps and entrance platform.

By reason of the frost and snow rendering concrete and stone surfaces slippery and dangerous to life and limb these platforms and steps which are portable should be provided for Winter weather for houses, flats, apartments, offices and public buildings.

They can be removed in the spring, stored away carefully in cellars and basements for use the following Winter. Any janitor who can use a hammer and screwdriver can put them up and take them down in a short time.—**Owen B. Maginnis.**

Legal Department

FUNDAMENTAL legal principles prevent litigation in a suit of matters as to which there is not a joint interest on the part of several plaintiffs and a joint responsibility on the part of several defendants. It was unsuccessfully sought to invoke the rule in the case of R. R. Kitchen & Co. et al. vs. Local Union No. 141 et al., 112 Southeastern Reporter, 198, a suit brought by members of the Building Construction Employers, an association, to restrain various building trades labor unions, their officers and members, from carrying on a conspiracy to prevent plaintiffs from executing their construction contracts, by threats, violence, picketing and other illegal strike measures. Upholding the right of the several plaintiffs to maintain the single suit against the several defendants, the West Virginia Supreme Court of Appeals says, in part:

Right of Employers to Join in Restraining Unlawful Strike Measures

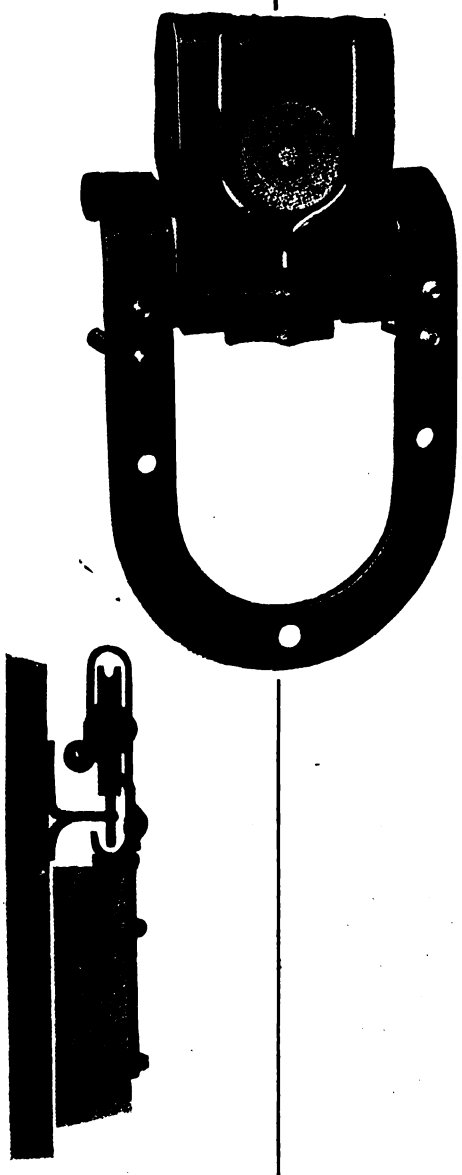
"Ordinarily, one class of contractors might not have any interest in wage scales pertaining to the business of other classes and not directly affecting them. However that may be, this bill alleges the extraordinary case of an association of contractors to enforce a demand for a reduction of wages in all vocations, and the organized workmen in all the building branches of labor to resist it. In the effort to maintain their position and accomplish their declared purpose, the former have jointly proclaimed inauguration of the open shop in all of their respective departments of industry and are endeavoring to maintain it, by prosecution of their business with labor employed at what they conceive to be reasonable and fair wages and without reference to affiliation with any labor organization.

"The allegations of inducement to the breaking of contracts of service, by persuasion, express and implied threats, and actual violence, and of joint perpetration or procurement thereof are as full, complete and definite as such charges can be made, ordinarily, in cases of this kind. The wrongful acts are alleged to be of constant occurrence and unrestricted scope. They occur around the employment agency, along the streets, at the places of work, and about the lodgings and homes of the employees. They are directed against the business of the plaintiffs through their employees, wherever and whenever they can obtain any workmen. Their generality, pervasiveness, constancy, and similarity are significant of concert and direction, such as might characterize the activities of a committee of action representing all of the defendants, and the bill alleges that they are emanations of confederacy and conspiracy on their part. In our opinion, the sufficiency of these allegations is beyond doubt."

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

FROM a New England builder our views are asked on the following stated case: He contracted to build certain structures "at actual cost of labor and materials, plus five per cent. profit. It is understood that liability and builder's insurance is to be placed on the above work and considered part of the cost," etc.

Liability Insurance Premium As Part of Contract "Cost"



The work was completed and paid for, excepting an item covering the cost of the liability insurance. The owners claim that the builder did not carry "the right kind of policy" for his and their protection.

In the absence of more particulars, and especially as to what the claimed defects in the insurance effected were, we are unable to give a definite opinion which we should be willing to have followed without regard to the undisclosed points. However, it may be found that the case will fit within one of the general rules of law stated below.

If no binding insurance was effected, and if the builder did not reasonably pay premiums to effect such insurance, the owners' non-liability appears to be clearly established by a decision of the highest court of the land. In the case of Tillson et al. vs. United States, 9 Supreme Court Reporter, 255, the United States Supreme Court decided against the right of petitioners to recover for premiums for insurance covering granite sold and shipped to the Federal Government. The court said:

"The first claim is based upon the clause in this contract by which the United States agreed to pay to the petitioners 'the full cost of the said labor, tools, and materials, and insurance on the same.' The petitioners contend that the insurance thus agreed to be paid for is insurance on the cost of labor, tools, and materials used; that is to say, on that part of the value of the cut granite which was represented by the cost of the labor, tools, and material used in cutting and boxing it. We have not found it necessary to consider whether the words 'insurance on the same' mean insurance on the granite, or insurance on the cost of the labor, tools and materials used in cutting and boxing it, or only on the materials so used; because, it being found as a fact that the petitioners never did effect or pay for any insurance whatever, we are clearly of opinion that they are not entitled to recover anything for insurance. The United States have not agreed to obtain insurance, or to become insurers themselves, but only to pay to the petitioners the 'cost of insurance,' which is as much as to say, *'reasonable premiums of insurance paid by the petitioners.'* By the terms of the contract the United States are no more bound to pay for insurance which has not been effected, than for tools or materials which have not been used, or for labor which has not been performed."

You Need

the NATIONAL

"Big 4" Flexible Door Hanger and "Braced Rail"

That barn—or similar job—that you are handling, calls for a heavy-duty Hanger and Rail; for an easily sliding door gives the stamp of right construction to the whole building.

The Big-4 Flexible Door Hanger has as its keynotes Simplicity and Strength. Note its sturdy appearance in the illustration. Thousands of pairs in use for years in all sections of this country and Canada prove its Serviceability under varying conditions. Made entirely of steel and supplied with anti-friction-steel roller bearings, giving a perfectly free motion to the door.

Braced Rail: Millions of feet of this rail are in use and giving uniform satisfaction for these reasons: brackets only 12 inches apart and double riveted—giving extreme rigidity. The brace below the screws trebles the holding power of the screws. Brackets are same width and thickness as the rail itself, and holes are staggered so the screws will not go into the same grain of wood. A fitting companion for the Big-4 Hanger.

Such time as we have been able to bestow on this inquiry has failed to reveal any court decision having a closer bearing on the subject than this decision of the Supreme Court. But we deem it sufficient to indicate the true principle applying to cases of this kind. We interpret it as saying that the contractor is entitled to credit for premiums *reasonably* paid.

If a reasonable effort was made to effect binding insurance, and if premium for such insurance was reasonably paid, we are convinced that the builder is entitled to recover on the disputed item. A lawyer undertaking to obtain proper insurance would not be regarded as impliedly making an absolute guaranty that the insurance would be binding, under pain of losing right to compensation for his services in the matter and reimbursement for his expense. The lawyer would merely be held to the exercise of such care and skill as would be required by the circumstances. For stronger reasons, a builder, under a contract like that here presented, is not bound at his peril to make sure that court-proof insurance is effected. If he does what a reasonably prudent builder would do under the same circumstances he does all that the law requires of him.

The language of the contract here presented and the remarks of the United States Supreme Court in the case presented to it show that agreements of this kind place the builder's duty concerning obtaining insurance on the same plane as his duty concerning the obtaining of labor and materials and their use in the construction work. Both duties merely require the exercise of reasonable care and skill.

The general rule as to a builder's duty being merely to use ordinary or reasonable care and skill is stated at pages 749-750, 9 Corpus Juris, with a citation of numerous decisions of courts of last resort. And that this rule applies to cost and percentage contracts is shown by the decision of the New York Supreme Court in the case of Title Guaranty, etc., Co. vs. Pam. 155 New York Supplement, 333. The court states this as the limit of what an owner may expect under such a contract: "He has the right to expect the same skill and ability to be applied to his work that it (the construction company) would give to a work where its profit was dependent upon its ability to do the work at a cost less than the contract price."

Let it be supposed that the builder in this case, after using all due and proper diligence to employ only honest and industrious men on the work, had found that some of the employees were dishonest and inefficient, doing more harm on the work than good, but that the builder immediately discharged them on discovering their shortcomings. Clearly enough, he would not have been deprived of right to full credit on account of wages paid to them before discovery or opportunity for discovery of the unfitness of such employees.

Or, let it be supposed that despite the exercise of all reasonable skill and care in selecting building materials it should have later appeared that, because of latent conditions, some of the materials had proved worthless. The builder's right to credits in his accounts for money reasonably paid for such materials would seem to be clear.

For the same reasons, it must be held, in our opinion, that the builder's right to reimbursement for insurance premiums actually, fairly and reasonably paid is undeniable.

But if he paid a premium without any policy issuing at all, or if he vitiated the insurance by inexcusably making some material misrepresentation of fact in applying for the policy, or if he did something else which must be said to have been careless or wrongful and thereby failed to effect any binding insurance, it is both just and lawful that he be denied allowance against the owners for an expense which so proved to be fruitless through his own failure to use that skill and care which a reasonably prudent builder would have used under the same or similar circumstances.

Performing Stone Cleaning Contracts

A STONE cleaner and general contractor agreed in writing "to clean down thoroughly all the front and side of" defendant's building. The front was of stone and the side of brick. The contractor, by the use of chemicals, steel brushes, sponges and water, cleaned the superficial area of the front and side, but on completion of the work stains on the stonework were plainly visible. These stains appear to have been the outward evidence of saturations several inches in depth.

When the contractor sued for his compensation defendant resisted liability on the ground that the contract had not been sufficiently performed. The trial judge upheld the defense and ordered dismissal of the suit. But in the case of Krauth vs. Harris, 194 New York Supplement, 526, the Appellate Term of the New York Supreme Court reversed the decision and ordered a new trial, holding that the trial judge erred in permitting plaintiff to testify that before the contract was entered into the stains were mentioned and defendant undertook to remove them. The presiding judge of the appellate court said:

"I think the agreement, as it was expressed in the writing, is susceptible of but one construction, which is that the plaintiff undertook to do no more than clean the superficial area, and thus it was error to admit parol evidence to show the meaning of language that we think is plain, and refers only to superficial area."

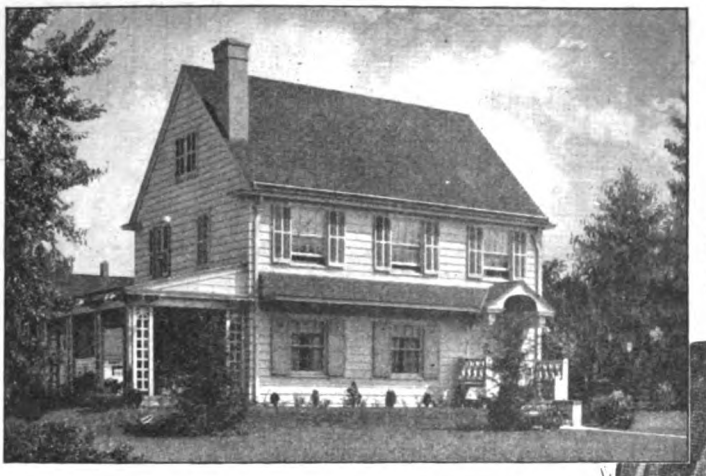
The higher court says that if the written contract failed to express the true agreement defendant should have sought a reformation of the instrument by court proceedings.

Right of a Student Architect to Compensation for Services

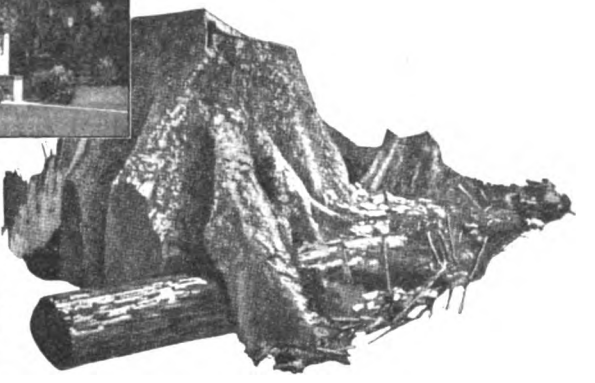
A SHORT time before I graduated from a school of architecture," writes a young New Yorker, "I was employed by a man to prepare a set of plans to build a five-room house. After I got bids from the contractor and informed the owner of the total cost of the house, he refused to pay me for my services; claiming that the building will cost more than he intended to pay. I expect my architect's license soon. Can I recover in this case?"

If you represented yourself to be an "architect," without disclosing that you were merely an ungraduated student in architecture, we are of the opinion that you have no right to recover.

Section 77 of the General Business Law of New York, as amended in 1921, declares that one who did not practice architecture in the state before the act took effect (1915), "shall before being styled and known as an architect, secure a certificate of his qualifiation," etc. As amended, the law provides that it shall not "prevent persons other than architects from filing applications for building permits or obtaining such permits."



It seems, under this law, that if you held yourself out as an architect your violation of the law would preclude your recovering compensation for your services. However, if the owner understood that you were still a student we do not believe that he could invoke your lack of certificate as an architect to defeat your compensation.



On establishing a right to compensation, the amount would be controlled in the first instance by any agreement on the subject. If no rate or amount was agreed on, you would be entitled to reasonable pay, which might be held to be less than a registered architect would be entitled to under the same circumstances.

Assuming that your lack of registration is no bar to your recovery, your letter still fails to show a right to recover anything, because you do not state the nature of the agreement you had with the owner. However, the mere fact that it may cost more to construct the house than the owner expected will not defeat your right to pay. If he did not disclose to you a cost limitation beyond which he was unwilling to go, and if you prepared plans in accordance with the ideas he gave you as a basis for doing your work, no reason is perceived why you should not recover.

As a practical matter, your proper course is to place your claim in the hands of a local attorney if the owner refuses to make a satisfactory adjustment.

This Redwood log was sound and free from decay when dug up after 600 years' burial in moist soil—proved by the annular rings of the giant tree that grew over it.

Where Moisture Lodges Use Rot-Resisting Redwood

For siding and porch work on which climbing vines retain moisture and foster the development of mould and decay, for shingle roofs shaded by trees so that they dry out very slowly—wherever moisture lodges—Redwood can be specified with perfect assurance that decay producing fungus will not make early replacement of these parts necessary.

The same *natural,* odorless preservative that protects growing Redwood against wood destroying agencies during centuries of growth protects Redwood lumber and lumber products.

Redwood is not expensive. While it will add greatly to the permanent soundness and appearance of any frame structure, it can be bought at prices little in excess of those paid for lumber that cannot compare with it in rot-resistance, percentage of clear lumber, uniformity, or freedom from shrinking, warping and swelling.

For the convenience of architects and builders we have recently issued our "Construction Digest" and our "Engineering Digest," which either our Chicago or New York office will gladly forward upon request. Write for them.

Designing and Estimating Roof Work

By I. P. HICKS

THE styles of roof, methods and cost of construction, and easy ways of estimating the material and labor for the same is a matter of considerable importance and interest to the carpenter and contractor.

First we want to say a little about the styles of roofs. The styles of roofs and the proportions of their shapes and sizes to fit the house have just about as much to do with the appearance of the house as selecting an appropriate hat for a lady.

Figures 1, 2, 3, and 4 represent four styles of roof in general use. These, when used singly or in combination and with variations to meet the different requirements of different buildings, constitute the larger part of the roofing of the average building.

Figure 1 represents a plain gable roof, which is one of the most common and easily constructed roofs. As to the style of this roof, it is almost always of the plainest type. Yet to choose a proper pitch for the roof and a proper width for the cornice, according to the width and height of the building, will have much to do with its general appearance.

If it is a building with 12 to 18 feet studding, 18 to 26 feet wide, with a plain box cornice, the horizontal projection of the cornice plancer should be from 18 to 24 inches and the pitch of the roof from 7 inches to 12 inches rise to the foot run of the common rafter, using the wider cornice and steeper roofs on the higher and wider buildings.

Where buildings are finished with a bungalow cornice, the projection of the cornice is often 2 feet to 2 feet 8 inches, and in some cases as much as 3 feet, even 4 feet in some of the so-called "prairie designs" of houses.

We will not attempt to lay down any definite rule for determining all these variations in dimensions, as it is a matter mostly of good judgment with the designer, but it is a sure thing that good proportions in designing the cornices and roof add very much to the general appearance of the completed building, and it is well worth while for the carpenter and contractor who has more or less of this to do to study up some on the art of designing and proportioning of his work so that it will produce the most pleasing results.

In our opinion a plumb cut on the ends of the rafters, so that the fascia stands plumb, always looks best, although it is not always the easiest of construction.

Estimating the Roof

NOW, something about estimating the material and labor for the roof. This can quite readily be estimated by the square. Sometimes in making an estimate the length of the rafter is not quite exactly known and it may be that the contractor has no way at hand to determine the length of rafter, or does not want to take the time to figure it out just at the moment.

It is easy to figure the cost of this work without stopping to figure the length of rafter required. Add the horizontal projection of the cornice to the size of the building, on each side and each end of the building and proceed as follows:

Multiply the length of the building by the width, and for the different pitches add the following per cents, which will make the amount of space to be covered for the different pitches:

For a 6 x 12 pitch add 12%
For a 7 x 12 pitch add 16%
For an 8 x 12 pitch add 20%
For a 9 x 12 pitch add 25%
For a 10 x 12 pitch add 30%
For a 12 x 12 pitch add 42%
For a 15 x 12 pitch add 60%
For an 18 x 12 pitch add 80%

The above figures will give the exact amount of roof surface, and it is applicable to either gable, shed or hip roofs of any shape or size, or where there are both hips and gables on the same roofs of about the same pitch. We do not use it on gambrel roofs because there is too much difference in the pitch of the two roof sections.

In the case of dormers on roofs it is necessary to add the number of feet included in the dormer cornice because the dormer cornice projects over the main roof. The dormers cut out a portion out of the main roof where they are placed, and the roofing of the dormer just about equals this space plus the amount necessary to cover the dormer cornice.

This makes easy figuring when it is thoroughly understood. It is also advisable to put in some for good measure, for there is liable to be more or less waste cutting in and finishing around dormers.

Having obtained the number of feet roof surface, divided by 100, which will give the number of squares of roofing, the roof sheathing can be figured from the number of feet at the local price of lumber per M.

Where the roof sheathing is put on about 2 inches apart, as for shingle roofs, it is not necessary to figure any for waste, for the spreading of the boards will fully make up for the waste. If the roof is to be sheathed tight, then add to the above amount 6 per cent to cover the waste in cutting.

The feet board measure per square required for rafters in ordinary roof framing is about:

Size of timber	16-inch centres feet	20-inch centers feet	24-inch centers feet
2x4	64	56	48
2x6	96	84	72
2x8	128	112	96

On the framing the labor can be figured at from $16 to $20 per 1,000 feet of timber, figuring the higher rate for roofs that are complicated and require more cutting and framing. By this method the feet of sheathing can be readily found, the number of squares of roof, the feet board measure of rafters, and then the cost of labor on any part, or the entire roof can be determined.

The number of shingles required per square laid 4½ inches to the weather will be about as follows: On plain roofs, 900. On hip and valley roofs, where there is much cutting, 1,000. The labor can be figured at $3.00 per square on plain roofs and $4.00 per square on hip and valley roofs where there is lots of cutting to do.

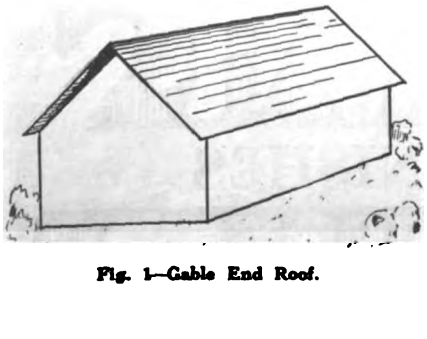

Fig. 1—Gable End Roof.

Other Common Roof Types

FIGURE 2 represents a shed roof, which is one of the simplest forms of roofs. It is used principally on additions to the main roof and in the construction of dormer roofs, particularly on roofs of the bungalow type. Shed roofs as a rule do not have a very pleasing appearance, yet by taking care to proportion the cornice so that it does not look out of place or botchy in construction, they can be made to look fairly well and sometimes very good for the places where

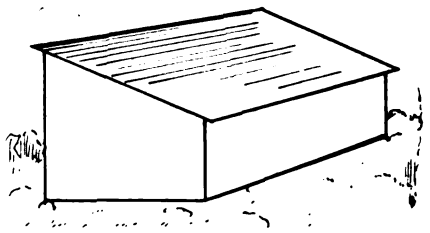

Fig. 2—Shed Roof.

they are used. As a rule, they are cheap in construction as regards material and labor and can be figured on the same basis as the plain gable roof. The shed roof is one rectangle, while the gable end roof is simply two rectangles.

Figure 3 shows the outlines of a plain hip roof. In this kind of a roof there is, of course, more time consumed in the framing, sheathing and shingling, and it is necessary to figure more for labor. If the roof has numerous hips and valleys, then the framing should be figured as high as $20 per thousand feet and the shingling as high as $4.00 per square.

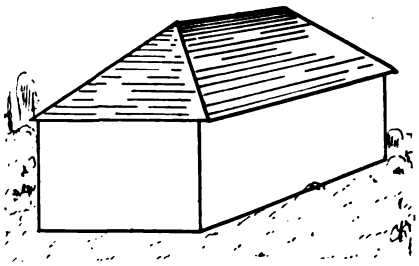

Fig. 3—Hip Roof.

Figure 4 shows the outline of a gambrel roof. There is nothing difficult or expensive about this form of roof, and it can be figured on a basis of $16 per thousand for the framing and $3.00 per square for the shingling.

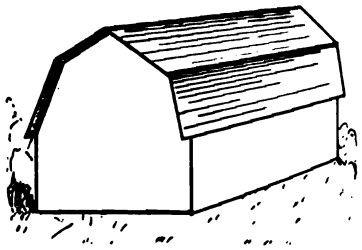

Fig. 4—Gambrel Roof.

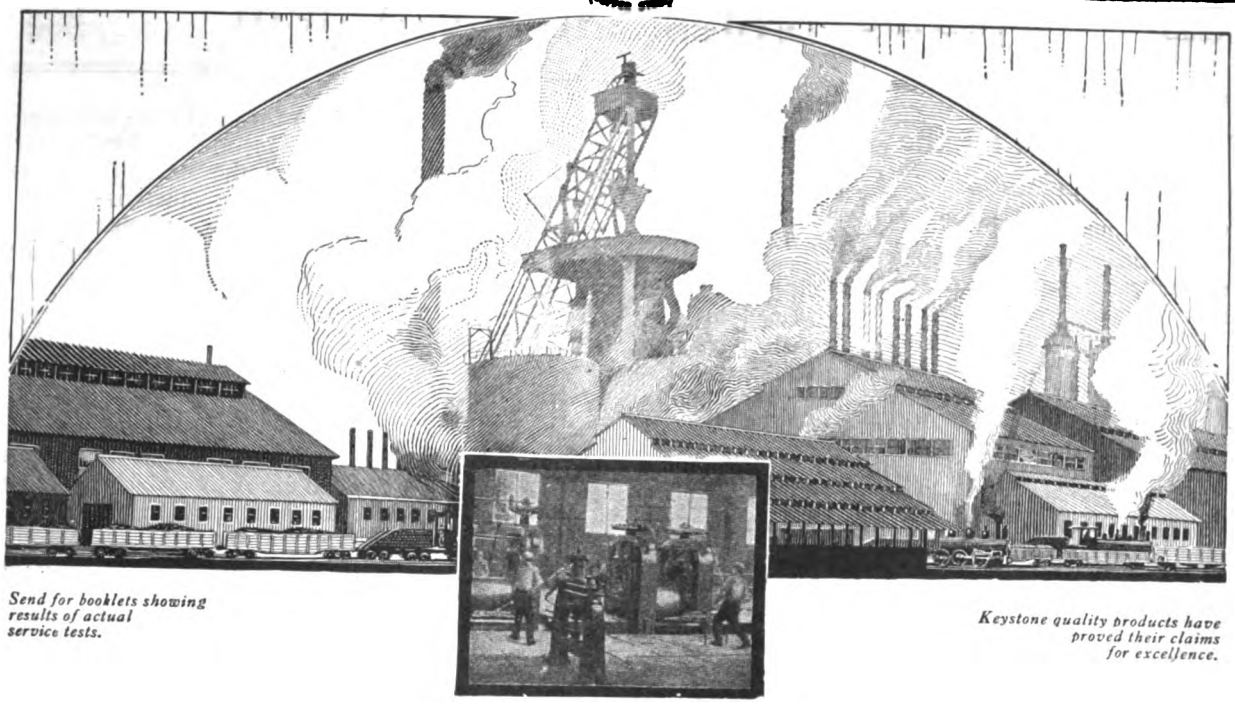
The gambrel roof has no real pleasing effect, so far as appearances go, but it makes a fairly strong roof, and in house building it makes nearly a two story house out of a one story building, because the first section of the roof is so steep it makes the second floor space nearly all available for use in the rooms. In house building, the first roof section is seldom sloped in more than two feet at the top.

GOOD roofing tin is considered one of the standard roofing materials for buildings of the better type. It has qualities which peculiarly fit it for roofing purposes.

A good tin roof is light in weight and requires light roof construction. Tin is easily put on and is adaptable to any surface, whether it be a flat deck or a vertical wall.



If it should become damaged, it can be quickly and cheaply repaired, a leak being permanently fixed in a few minutes. It is impervious to moisture, as it covers the surface of the roof with a continuous, unbroken sheet of metal, no seams serving to admit rain.

In case of fire from within, the tin roof acts as a blanket for the flames, smothering them and preventing the upward draft which often carries burning embers to a distance.

Before laying, a tin roof should be painted with one coat on the under side, and the upper surface should be carefully cleaned and immediately painted, all coats to be applied with a hand brush and well rubbed on.

Inasmuch as gutters are the natural receptacle for dirt, leaves, etc., they should be swept and painted every two or three years. The roof itself will not need painting more than at five or six-year intervals. Each painting restores a roof of good tin to its original condition.

Send for booklets showing results of actual service tests.

Keystone quality products have proved their claims for excellence.

SEVERE Service Conditions

demand better material. The metal which goes into the roofing, siding, and structures of great steel mills and industrial plants, must *resist rust* to the highest possible degree. Keystone Copper Steel Sheets and Roofing Tin Plates give *maximum service and rust-resistance* not only for industrial uses, but for residences, public buildings, and all forms of construction work to which sheet metal is adapted.

The high reputation of our products is recognized wherever sheet metal is used. Each brand of our manufacture has behind it a service—the scope of which has a tangible value to every architect, contractor and builder. This service begins with the planned care and skill in the making, which is carried through to the thorough system of distribution which keeps these products obtainable in every part of the country. For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use Keystone Copper Steel Galvanized Sheets and Roofing Tin Plates—best for both builder and property owner. Sold by leading metal merchants, and used by the leading contractors.

KEYSTONE COPPER STEEL

Keystone Copper Steel is an alloy made by the addition of a certain percentage of Copper to well made Steel, thereby greatly increasing its lasting and rust-resisting qualities under actual service conditions. It has been scientifically developed and tested—and its use is strictest economy.

News, Notes and Comment

Fire Protection for the Small Houses

FIGURES published by the National Board of Fire Underwriters indicate that the loss to buildings for a five-year period from 1916 to 1920 amounted to a total of $1,672,722,677. This is equivalent to 334,000 dwellings costing $5,000 each. Of this sum, figures show that a $223,000,000 loss was sustained through roof fires, that is, from sparks and flying embers carried by high winds to the roofs of nearby buildings.

As there are a very large number of buildings with wood shingle roofs in our country, a simple plan to make them safe from this danger has been suggested and this is to run a perforated pipe along the ridge of such buildings and have this connected with the water supply. By opening a valve a spray of water will fall on the roof and form a water curtain, which would effectively stop any small flying embers from igniting the roof.

The water could be controlled by a valve at a convenient location either inside or easily reached from the outside.

The perforated pipe should preferably be made of brass or lead as they would stand the exposure to the weather.

This little scheme does not cost much to install and it would give some desired protection from such fires.

Planning for the Future of New York

CITIES have a habit of growing in directions not exactly looked for by their original planners; still proper planning has accomplished wonders. Many people who have visited Washington have wondered why the Capitol has its back to the principal part of the city. When Washington was originally laid out, it was intended that the city should grow eastward, and therefore the Capitol was faced that way.

The Russell Sage Foundation has undertaken the work of planning for the future of New York and its environs. The committee in charge will propose no abnormal expansion of public expenditure. With a wisely conceived plan public funds which will be expended in any event can be directed into projects of permanent constructive value; without a plan millions are likely to be wasted in desultory or ill-considered public works.

City planning requires imagination, it requires vision; it requires a long continuing study of facts, and it costs a substantial sum of money. There is no public treasury which can be drawn upon to create such a plan, for no one governmental agency has jurisdiction over all of that area which includes portions of three states and many municipalities.

After these inquiries have laid solid foundations upon which to base sound planning, the man, or the group of men, will be found to plan for New York and its environs as George Washington and Pierre l'Enfant planned for Washington, or Burnham and Bennett and their committees of business men planned for Chicago; to create a plan which, with wide public participation and approval, shall embody and record the best thought of our engineers, our artists and architects, our public servants, our social workers and economists, and far-seeing business men.

Why Lumber Is Steamed During Kiln Drying

FROM the questions asked by numerous students taking the short courses in kiln drying at the Forest Products Laboratory, Madison, Wis., it is evident that many who operate kilns and handle lumber do not understand the object of steaming lumber in a kiln. There seems to be a common impression that the purpose of steaming lumber is to "remove the sap." This is far from being the fact, for when lumber is steamed it takes on moisture, as a rule, instead of giving off anything.

The reason for steaming lumber during drying depends on when it is done, but nearly always the treatment is given for one of the following purposes—(1) to heat lumber through quickly at the start; (2) to relieve stresses which otherwise would produce checking, casehardening and honeycombing; (3) to equalize the moisture content and condition the lumber ready for the use at the end of the run; (4) to kill fungi and insects in the wood.

When lumber should be steamed, how long the treatment should last, and what temperature should be maintained are points which have been determined at the Forest Products Laboratory by experiments on many species of wood. A thorough understanding of the steaming operation is essential, because the whole kiln charge can easily be ruined by too severe a treatment. One of the chief needs of many commercial kilns is proper steaming facilities, without which a high degree of success in the artificial seasoning of wood is impossible.

Book Notices

The Home Painting Manual; 168 Pages; Published by the Sherwin-Williams Company, Cleveland, O.; Price, 50c.

Here we have a really practical book on the subject of painting the house both inside and out. It is excellently illustrated by a number of colored illustrations besides black and white illustrations in the text. The chapters on the right use of painting and estimating will prove of interest and value to any builder as well as the remarks on finishing the interior woodwork and floors. Its many practical points will form a guide of what to do to get best results on this important branch of the building industry.

The Sanitation of Bath Houses by Wm. Paul Gerhard; 16 Pages; Price, 60c.; Published by Wm. T. Comstock Company, New York.

To any builder who is called upon to erect a swimming pool or bath house, this pamphlet contains some very interesting information and data It is well illustrated by pictures and plans of different bath houses, both public and private.

Hospital, Wilberforce University, Wilberforce, Ohio, F. L. Packard, Columbus, Ohio, Architect

Permanence, Safety and Beauty— With Economy

THE walls of this attractive and modern school hospital assure lasting fire-safety, protection and comfort for generations to come. Built of beautiful NATCO Tex-Tile with its blended rich, dark brown shades, it is a worthy addition to the group of buildings of which it is a part.

Each year more architects, builders and building supply dealers realize the merit, popularity and profit of NATCO Tex-Tile. The hollow spaces of the tile form a blanket of of protecting air that insures interior comfort through summer heat and winter cold. By the use of NATCO Hollow Tile, through-the-wall mortar joints are eliminated, so that there is no chance for the penetration of moisture. Last, but not least, NATCO Tex-Tile is decidedly economical, because its units are large and easily laid.

NATCO glazed Tex-Tile, outside face 5 inches x 12 inches. Inside dovetail scored. Easily and quickly handled and laid.

"The Home Beautiful," a small circular describing NATCO Tex-Tile in detail and showing Tex-Tile wall sections in color will be sent free on request. This piece of advertising literature is worth while for showing building prospects.

Review *of* Building Situation

BUILDING statistics for September, just published by F. W. Dodge & Company, show that the volume of contracts awarded for the past nine months of this year is greater than any total recorded and is 51% greater than the figure for the first nine months of 1921.

The total of contracts awarded for September, 1922, is the highest September total on record, being 11% greater than the figure for the corresponding month of 1921. This, despite the fact that September, 1921, total was a 16% decline from August. Of course, a seasonal decline is to be expected at this time of the year, but the fact that the total is higher than last year indicates continued healthy prosperity.

Business and industrial buildings show a very active condition in all districts. This is especially true of the Middlewest District which has been rather behind in the building program. Residential construction in this district also shows signs of a healthy increase.

Residential construction in practically all districts still leads and a surprising fact is that although this is the time for a seasonal decline, the total is a little greater than that of the August record. Residential construction in the Pittsburgh, Middlewest and Northwest districts shows a decline from the August figures, but the New England, New York and Middle Atlantic districts show increase, the largest being nearly $5,000,000 in the New York district.

The total amount contracted for residences during September, amounts to $101,428,000, this representing 9,269 separate buildings, bringing the average cost of a structure to a little over $10,900.

It is rather interesting to compare the amount of residence construction in the different districts, especially the figures for contemplated construction.

Of the $134,093,600 worth of residential construction contemplated the sum of $81,319,300 will be expended in the Eastern states. This amounts to a little more than 60% of the entire total which shows that the demand for residence construction has still to be met very decisively in the East and it is one of the best signs for builders of this class of structures as a forecast for next year's business.

This amount of money is contemplated to be spent on 12,089 separate buildings, 2,889 are to be built in the Middle and North West Districts with 1,753 in the Pittsburgh district, while in the Northeastern states, the number is 7,447, or 60% of the total.

Record of September, 1922, Building Contracts Awarded

ATKINS
SILVER STEEL SAWS

DO YOU WANT A NARROW POINT SAW?

Narrow point saws have become very popular among carpenters who like a light saw. To meet this demand we are making ship point saws in all our popular numbers.

Notice the last saw in the illustration —this is a ship point saw, fitted with our Perfection Handle.

We can furnish Atkins Saws—wide or narrow point—straight or skew back—fitted with either the old style straight across handle or the new Perfection handle.

Take no substitute, demand genuine Atkins Silver Steel Saws.

Send twenty-five cents for carpenter apron, pencil and "Saw Sense" booklet.

E.C.ATKINS & CO.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

"I AM DELIGHTED with Arkansas Soft Pine woodwork—it is the ideal wood for white enamel. We have lived in this home over twenty years and there is not a single sign of discoloration or raised grain in any of the woodwork. Moreover, it cost us just about half the price of other materials often considered as indispensable to a successful white finish."

Arkansas Soft Pine

SATIN-LIKE INTERIOR TRIM

makes a *permanent friend* of every owner, builder and architect who installs it. It is the one moderate priced woodwork of such physical character as assures lasting satisfaction.

Arkansas Soft Pine is the logical woodwork for homes of every size, apartments, offices, and semi-public buildings. See Sweets Catalog and American Architect Manual for specifications, etc.

John Kalsch
Architect

85 Beautiful and Well Planned Brick Houses Available to Every Contractor

An unusually wide range of carefully selected designs—modest bungalows to five and six-room homes and pretentious dwellings. Every plan a masterpiece—drawn by a competent architect.

Beautiful and distinctive, thoroughly practical—*every house has been actually built and lived in.*

You Can Quickly Sell Homes Built From These Plans

These homes are so attractive in design and so practical in arrangement that once built they are *in demand.* They sell quickly, profitably.

They emphasize the value of good design for even with all their advantages over ordinary houses these fine brick homes are *simple and economical to build.* They offer a wonderful opportunity to every builder.

Plans, specifications and complete information are now available at nominal price. Send for "Brick for the Average Man's Home" (1.00) containing supplements which illustrate these 85 valuable plans.

"BRICK — How to Build and Estimate" (25c) contains detailed information about the Ideal Wall and other money-saving methods, together with many estimating tables. $1.25 brings both this book and *"Brick for the Average Man's Home"* with the wonderful supplements illustrating these exceptional plans.

Concrete Equipment Co., 535 Ottawa Street, Holland, Mich.
411. *Catalog No. 22* describes in detail the various products manufactured by this company.

Concrete Block Machine & Mold Co., 114 S. 2nd St., St. Louis, Mo.
253. *Catalogue No.* 38. Describes Building Block Machines. It is a 40-page book, 6 x 10 in.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
412. *Bulletin No.* 1 describes the Portable Saw Rigs.
413. *Bulletin No.* 2 describes the Power Driven Pumps, Centrifugal, Pistons, Diaphragm, Triplex.
414. *Bulletin No.* 3 describes the Hoists, Mortar Mixers, Material Elevators, Engines.
415. *Bulletin No.* 4 describes the Tractor.

Ideal Concrete Machinery Co., 1334 Monmouth Street, Cincinnati, Ohio.
416. *A 100- page illustrated catalog,* describing the Ideal Machine and also data for manufacturing and curing Ideal Concrete Blocks.
417. *Catalog No.* 37 describes the Ideal-Cincinnatus Batch-Mixers.

Jaeger Machine Co., 216 Dublin Avenue, Columbus, Ohio.
418. *A 40-page catalog,* well illustrated, describing the special features of a Jaeger Mixer.
419. *16-page folder,* illustrating a Jaeger for every mixer need.

Koehring Co., Milwaukee, Wis.
46. *Koehring Construction Mixers.* Booklet. 7¾ x 10½ in. Illustrated. 96 pp. Complete information on construction type concrete mixers.
47. *Koehring Dandie Mixer.* Booklet, 6 x 9 in. Illustrated. 24 pp. Illustrating and describing Koehring line of Dandie light mixers.
265. *"Built to Endure."* A beautifully bound booklet of 36 pages, 7¼ x 10 in., describing Comparative Examples of Notable Ancient and Modern Construction Embodying the Element of Permanency.

Little Whirlwind Mixer Co., 438 Gould Street, La Crosse, Wis.
420. *An eight-page illustrated folder,* describing the efficiency of the Master Mixer.

Republic Iron Works, Box 602, Tecumseh, Mich.
421. *An eight-page illustrated pamphlet,* describing the Republic "Ten."

Standard Scale & Supply Co., 1631 Liberty Ave., Pittsburgh, Pa.
422. *28-page illustrated catalog,* describing quick, efficient and money-saving concrete mixing.

CONCRETE MARBLE

Art Stone Co., Waynesboro, Pa.
45. *Descriptive Circulars* with illustrations of different marbles in colors. Sent free to any interested party.

CONSTRUCTION, FIREPROOF

Central Steel Co., Massillon, Ohio.
423. *In the "National Steel Lumber" Handbook* is embodied complete information and authentic data pertaining to the use of Steel Lumber Sections and kindred materials.
424. *"National" Bulletin No.* 19B describes the National Shelby.

National Fire Proofing Co., 250 Federal St., Pittsburgh, Pa.
226. *Standard Fire Proofing Bulletin* 171. 8½ x 11 in. 32 pp. Illustrated. A treatise on fireproof floor construction.

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
48. *Pyrobar Gypsum Tile.* Booklet, 8½ x 11 in. 32 pp. Illustrated. Detail and specifications for fireproof partitions.
49. *Bulletins,* 8½ x 11 in. Containing details and specifications for Pyrobar voids for use with reinforced concrete joist floor construction; Pyrobar roof tile; and monolithic gypsum floors and roofs.

CONTRACT AND ESTIMATE BLANKS

L. Fink & Sons Printing Co., Laurel Spring, N. J.
166. *Samples* of contract sheets, estimate blanks, job tickets, time tickets, time sheets, wage receipts, etc., with prices.

CRYSTALS, MICASPAR

Crown Point Spar Co., 101 Park Avenue, New York.
276. *50-page descriptive catalog,* describing the advantages and uses of the Sparkling Micaspar Crystals.

DAMPERS AND ASH DUMPS (Fireplace)

The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

DAMP-PROOFING

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
425. *Six-page folder,* describing the Nu-Tile 4-in-1 Shingle.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
426. *Send for catalog* on the advantages of the Asbestos Shingle.

Illinois Zinc Co., 280 Broadway, New York.
428. *An eight-page folder,* describing the roof that is always new.

National Sheet Metal Roofing Co., 339 Grand St., Jersey City, N. J.
429. *68-page book,* illustrating the "Shingles That Last."

Rocbond Co., Van Wert, Ohio.
430. *An eight-page folder,* entitled, "Fortifies Your Home Against the Element of Time."

F. C. Sheldon Slate Co., Granville, N. Y.
431. *A 16-page illustrated booklet,* describing "The Most Enduring and the Most Attractive Roof at the Most Reasonable Cost."

DOOR CHECKS

Park Manufacturing Co., Worcester, Mass.
50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS

The Bogert & Carlough Co., 30 Peach St., Paterson, N. J.
247. BOCA steel sash. (E-22.) A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.

Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.
432. *A 32-page catalog,* describing "Window Walls," their cost and their advantages.

Henry Hope & Sons, 103 Park Ave., New York.
51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¼ x 18½ in. 32 pp.

Truscon Steel Company, Youngstown, Ohio.
52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.
53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill.

DOOR AND WINDOW FRAMES

Andersen Lumber Company, South Stillwater, Minn.
55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¾ x 10¾, 24 pages.
56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.

DRAFTING MATERIALS

A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
433. *A 116-page book,* describing the advantages of "Direct-by-Mail" Buying.

Keuffel & Esser Co., Hoboken, N. J.
434. *A 486-page Bound Book.* This is the thirty-sixth edition of the catalog.

Peerless Blue Print Co., 347 Fifth Avenue, New York City.

Warren-Knight Company, 136 No. 12th Street, Philadelphia, Pa.
435. *36-page booklet,* describing the "Sterling" Transits and Levels.

DUMBWAITERS

Kimball Bros. Co., 1106 Ninth Street, Council Bluffs, Iowa.
436. *30-page illustrated catalog,* describing the various models of Dumbwaiters.

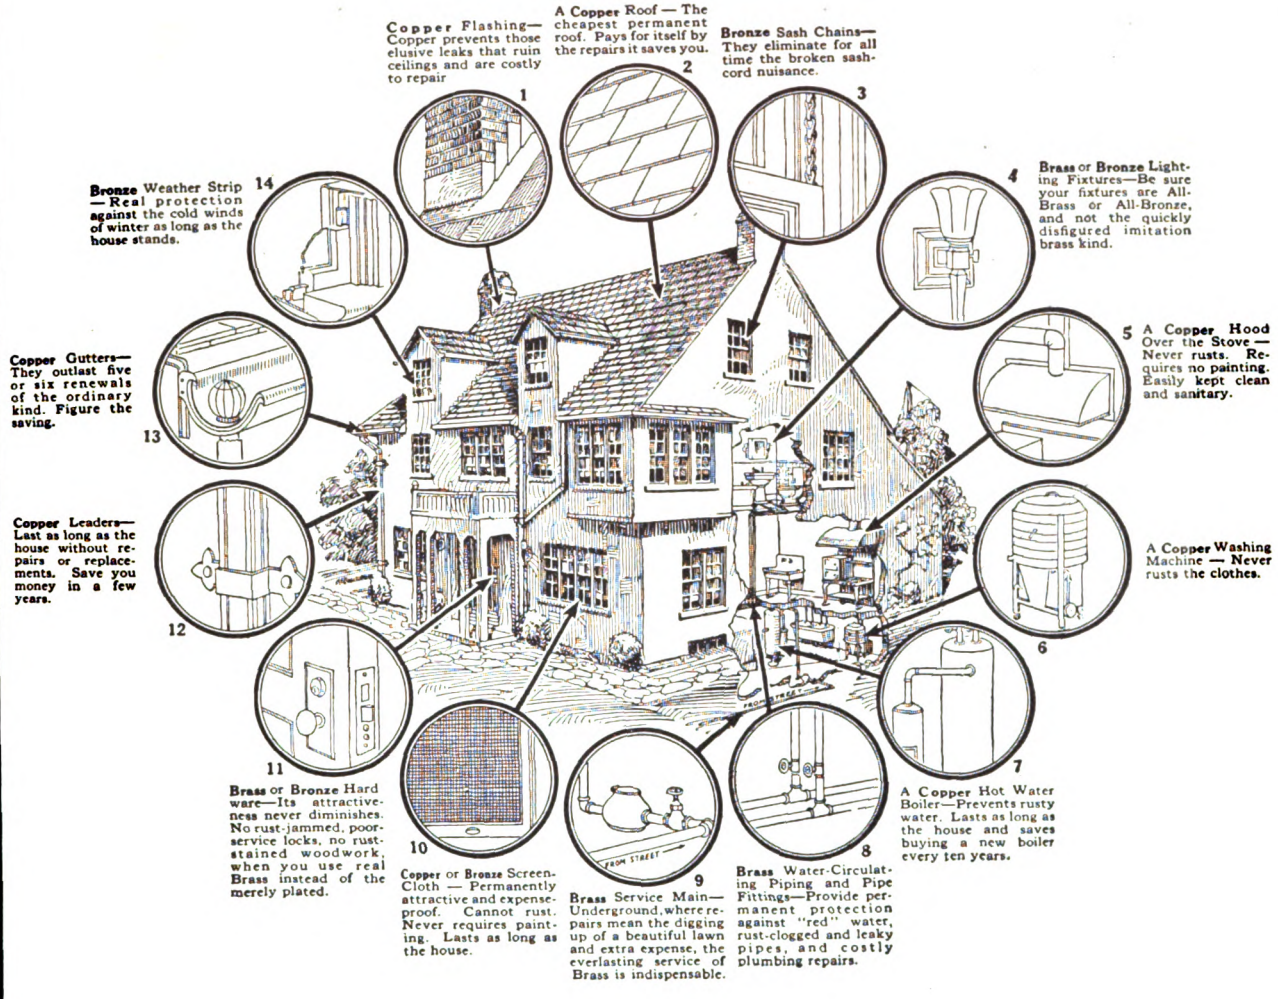
Sedgwick Machine Works, 156 W. 15th Street, New York.
57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

ELECTRICAL DEVICES

Arrow Electric Co., Hartford, Conn.

General Electric Co., Schenectady, N. Y.

ELECTRIC METER BOXES



The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

ELEVATORS

Kimball Brothers Company, Council Bluffs, Iowa.
58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 74*

Richards-Wilcox Mfg. Co., Aurora, Ill.
59. *"Ideal" Elevator Door Equipment.* Catalog showing elevator door hangers for one, two or three speed doors, also doors in pairs and combination swing and slide doors. Door closers and checks. 24 pp. Ill. 8½ x 11 in.
Sedgwick Machine Works, 156 West 15th Street, New York.

ENGINES—GASOLINE
New-Way Motor Co., Lansing, Mich.
437. *Write for helps and suggestions.*

FACTORY EQUIPMENT
The Edwards Mfg. Co., Cincinnati, Ohio.
60. *Edwards' Steel Equipment.* Illustrated catalog. Showing steel lockers and shelving for factories, offices, stores, schools and hospitals, together with illustrations and description of "Edmanco" steel office furniture and filing cabinets. Size 8 x 11 in. 32 pp.

FIREPLACES AND MANTELS
Apex Fireplace Co., Urbana, Ill.
503. *An interesting four-page folder* with blue prints attached.
Colonial Fireplace Co., Chicago, Ill.
Strait & Richards, Inc., Newark, N. J.
62. *Catalog* describing fireplaces, electric and gas logs, heating supplies, heaters, etc.

FLOOR HARDENERS
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
61. *Agatex and Its Performances.* Booklet. 8½ x 11 in. Describes the methods of hardening concrete floors by the application of a chemical which forms a new surface as hard as agate.

FLOORING LUMBER
The Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
63. *The Perfect Floor.* Tells how to lay, finish and care for Oak Flooring. 16 pp. 14 Illus. 5⅛ x 7⅝ in.
Oak Flooring Advertising Bureau, 1014 Ashland Block, Chicago, Ill.
64. *Modern Oak Floors.* Booklet. 6⅛ x 9¼ in. 24 pp. Illustrated. A general book that tells the complete story on Oak Flooring.
65. *Oak Flooring, How and Where to Use It.* Booklet. 3½ x 6¼ in. 16 pp. Illustrated. A small, technical book showing the general rules, standard thickness and widths, how to lay, finish and care for oak floors.
257. *Oak Flooring for Factories and Warehouses.* Booklet. 3¼ x 6 in. 16 pp. Illustrated. Small general book featuring No. 2 Common Oak Flooring for hard usage in factories and warehouses, with testimonials.
Pacific Lumber Co., 2070 McCormick Bldg., Chicago, Ill.
438. *A sixteen-page treatise* on the construction Digest of Information on the Values and Uses of Redwood.
United States Gypsum Company, 205 W Monroe St., Chicago, Ill.
66. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins, 8¼ x 11. Pyrofill.
Wood Mosaic Co., New Albany, Ind.
227. *Catalogue* of wood-carpet, strips, plain and ornamental parquetry, tongue and groove flooring in natural wood colors.

FLOORING COMPOSITION
Everlasbestos Flooring Co., Rochester, N. Y.
439. *Sixteen-page illustrated booklet,* describing the really modern floor.

FLOOR SURFACING
Amer. Floor Surfacing Machine Co., 521 So. St. Claire Street, Toledo, Ohio.
440. *An eight-page illustrated booklet,* describing the "American Universal." Also opportunities of making money in the "American Universal Way."
Wayvell Chappell & Co., 137 No. Jackson Street, Waukegan, Ill.
441. *Four-page folder,* describing the "Little-Automatic Electric Surfacing Machine."
M. L. Schlueter, 223 W. Illinois Street, Chicago, Ill.
442. *Eight-page illustrated folder,* the various "Improved Schleuter" Floor Surfacing Machines.

FLOOR VOIDS FOR USE IN CONCRETE
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
67. *Loose-leaf Bulletins.* 8½ x 11. Pyrobar Gypsum Floor Tile.

FURNACES—See Heating Equipment

GARAGE CONSTRUCTION
McKinney Mfg. Co., Pittsburgh, Pa.
283. *Interesting 16-page Catalog,* describing the complete hardware for various types of Garage Doors.
National Mfg. Co., Sterling, Ill.
248. Catalog of Garage Hardware.

GARBAGE DESTROYERS
Kerner Incinerator Company, 1027 Chestnut St., Milwaukee, Wis.
68. *The Sanitary Elimination of Household Waste.* M-3 Folder. Description of construction, installation and operation of the Kernerator for residences. Illustrated by views of residences in which the Kernerator is installed, with cuts showing all details. 15 pp. 4 x 9 in.

GARBAGE RECEIVERS
The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

GLASS
American Window Glass Co., Pittsburg, Pa.
69. Send for circular describing different varieties of window glass and how to select the proper kind.
American Three-Way Luxfer Prism Co., Cicero (Chicago), Ill.
70. Write for details and prices of glass prisms that will project daylight into dark interiors.
71. Other literature with reference to apartment house installations.

Plate Glass Mfgs. of America, 1st Nat'l Bank Bldg., Pittsburgh, Pa.
443. *Several folders,* describing the necessity of Plate Glass.

GYPSUM
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

HARDWARE
Bridgeport Chain Co., Bridgeport, Conn.
444. *Catalog No.* 14. A 68-page illustrated book, describing an extensive line of chains, stampings and wire.
Caldwell Mfg. Co., 5 Jones Street, Rochester, N. Y.
445. *Sixteen-page illustrated catalog,* entitled "Suggestions for the Present-Day Architect."
Casement Hardware Co., 250 Pelouze Bldg., Chicago, Ill.
446. *Illustrated catalog and price list* of "Casement Window Specialties."
Griffin Mfg. Co., Erie, Pa.
447. *Seventy-six page illustrated book,* cloth bound, entitled "Hinges."
Hess Warming & Ventilating Co., 1204 Tacoma Bldg., Chicago, Ill.
240. *24-Page Illustrated Catalog.* 4 x 6 in. Describing the Sanitary Medicine Cabinet, Lockers and Lavatory Mirrors.
H. B. Ives Co., New Haven, Conn.
448. *Write for their illustrated folder,* describing hardware, window and door specialties.
The Kawneer Co., Niles, Mich.
72. *Kawneer. Simplex Window Fixtures.* Booklet illustrated. Drawings, photographs and text describes weightless, reversible window fixture, its ease of installation, ventilation and light control. Size 8½ x 10¾ in. 16 pp.
Knape & Vogt Mfg. Co., Grand Rapids, Mich.
73. Garment Hangers. Send for illustrated booklet.
McKinney Mfg. Co., Pittsburgh, Pa.
449. *McKinney's "Complete Garage Sets,"* an interesting illustrated eight-page folder.
F. E. Myers & Bro. Co., Ashland, Ohio.
450. *Catalog,* describing the No. 30 Simplex Garage Door Hanger.
National Mfg. Co., Sterling, Ill.
451. *An interesting illustrated catalog* on "Garage Hardware."
Richards-Wilcox Mfg. Co., Aurora, Ill.
75. *Modern Hardware for Your Home.* Catalog of hangers for varnishing French doors; "Air-Way" multifold hardware for sun parlors and sleeping porches; "Sidetite" garage door hardware. 24 pp. Illustrated. 8½ x 11 in.
Sargent & Company, New Haven, Conn.
452. *Sixty-six-page illustrated booklet* on "Planes."
453. *Thirty-six-page illustrated booklet* on "Standard Steel Squares."
The Stanley Works, New Britain, Conn.
76. *Wrought Hardware.* New 1921 Catalog. This new catalog describes additions to the Stanley line of Wrought Hardware, as well as the older well known specialties and various styles of butts, hinges, bolts, etc. 676 pp. Illustrated. 6½ x 9½ in.
77. *Garage Hardware.* Booklet, illustrated. Garages and their equipment, such as hinges, hasps, door holders, latch sets, chain and hand bolts, showing illustration and text with dimensions of garages, describing the Stanley Works product. Size 6 x 9 in. 24 pp.
78. *Eight Garages and Their Stanley Hardware.* Booklet. Plans, drawings and complete hardware specifications. Size 5 x 7 in.
79. *The Stanley Works Ball Bearing Butts.* Booklet, illustrated. Description, with full size illustrations of many typed butts and their parts, dimensions and finish. Size 5 x 7½ in.

HEATING EQUIPMENT
Bowman Supply & Mfg. Co., 886 Progress, Pittsburgh, Pa.
513. Write for the permanent catalog. It is an excellent reference book.
Co-operative Foundry Co., Rochester, N. Y.
454. *Sixteen-page illustrated booklet,* describing the "Red Cross Empire Pipeless Furnace."
Economy Heater Co., 108 S. La Salle St., Chicago, Ill.
The Farquhar Furnace Company, Wilmington, Ohio.
80. *Healthful Helpful Hints.* A discussion of furnace and chimney design and capacity for hot air heating and ventilation. 16 pp. Illustrated. 4¾ x 9¼ in.
81. *A Plain Presentation to Dealers.* A book of selling talk for dealers in Farquhar Furnaces. Four model heating and layouts are shown and there is a page of useful "Do and Don't" advice. 24 pp. Illustrated. 8½ x 11 in.
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.
455. *Handy-Man Book,* or Plumbing and Heating Encyclopedia. Price 50c.
Hess Warming & Ventilating Co., 1205D, Tacoma Building, Chicago, Ill.
82. *Modern Furnace Heating.* Catalog. 6 x 9 in. 48 pp. Illustrated. Complete information on hot-air furnace heating useful to the architect and contractor regardless of what make of furnace he uses.
B. Karol & Sons Co., 802 So. Kedzie Avenue, Chicago, Ill.
Kelsey Heating Company, James Street, Syracuse, N. Y.
83. *Booklet No.* 5. 4 x 9. 32 pp. Illustrated. A dealers' booklet showing the Kelsey Warm Air Generator Method of warming and distributing air. Gives dimensions, heating capacities, weights, kind of coal recommended, and shows the mechanical and gravity system of heating homes, churches and schools.
84. *Monroe Pipeless Booklet.* 4½ x 8 in. 20 pp. Illustrated.
85. *Monroe Tubular Heater.* Booklet. 4¼ x 8 in. 20 pp. Illustrated. General Booklet giving capacities, dimensions, weights, etc.
86. *Syracuse Pipeless Booklet.* 4½ x 8 in. 12 pp. Illustrated. General Booklet giving sizes and capacities.
87. *Valves, Syphons and Traps.* A series of pamphlets to enclose in envelopes, describing the well known Thermostatic Return Line Valves and other heating equipment specialties made by this company.
Magee Furnace Co., Boston, Mass.
Strait & Richards, Inc., Newark, N. J.
88. *Catalog* describing fireplaces, electric and gas logs, heaters, etc.

Eighty-six Cement Manufacturers Unite to Serve You

The Portland Cement Association means this: that valuable scientific, advisory and educational work which no one cement manufacturer could reasonably undertake alone is at your disposal. This means that you can be absolutely sure of yourself in using Concrete.

You can be sure in the first place of the cement you buy. Any manufacturer of Portland cement may join the Association, and no manufacturer has to belong to it. But Association By-Laws require that members' products shall measure up to the high standard of specifications of the United States Government and the American Society for Testing Materials. Cement bought from a member of the Association is therefore dependable.

You can be equally sure of the way to use it. If you want information about its usefulness under certain conditions, or about how to mix it or place it to get the best results most economically, you can get it from any one of our 24 offices, one of which is near you.

Supplying dependable information without charge, by booklet, or by personal correspondence or by conference when necessary, is the work of the Association. To supply it authoritatively, the Association maintains a large research laboratory and a staff of more than two hundred engineers.

The Association is, in effect, the joint research and educational foundation of 86 manufacturers of cement in the United States, Canada, Mexico, Cuba and South America. You are invited to use it freely.

Suggestions as to how our work may be made more useful to you are invited.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 76*

HINGES
McKinney Mfg. Co., Pittsburgh, Pa.
456. *Complete Garage Sets* for all types of hinges. An interesting 8-page folder.

HOISTS—See Elevators
American Saw Mill Machinery Co., Hackettstown, N. J.
89. *Bulletin No.* 10 describing several kinds of builders' hoists.
C., H., and E. Mfg. Co., Milwaukee, Wis.
90. *Bulletin No.* 3. Hoists and Mortar Mixers.

HOLLOW TILE
Fiske & Company, Boston, Mass.
457. *Sixteen-page illustrated booklet,* entitled "Through the Home of Tapestry Brick."
458. *Sixteen-page illustrated booklet,* entitled "Tapestry Brick and Tile Work for Floors and Interior Walls."
Hollow Building Tile Association, Chicago, Ill.
459. *Write* for the "Handbook of Hollow Building Tile Construction." This is an interesting and helpful book.
460. *Seventy-page book,* called "Hollow Building Tile Manual for Builders and Masons," is of vast importance.
National Fire Proofing Co., Pittsburgh, Pa.
461. *Several interesting booklets can be procured,* namely: "Natco on the Farm," "Natco Grain Bins, Corn Cribs and Storage Bins," "Fire Proof Buildings of Natco Hollow Tile," "Bulletin No. 171, Standard Fire Proofing."

HOUSE MOVING
La Plante Choate Co., Cedar Rapids, Iowa.
510. *Descriptive Catalog of House-moving Appliances.*

INCINERATORS—See Garbage Destroyers

INSULATION
Bishopric Mfg. Company, 103 Este Avenue, Cincinnati, Ohio.
92. *Homes Built on the Wisdom of Ages.* Catalog. 6 x 9 in. 48 pp. Illustrated. Describing the use of Bisphopric Stucco-Board and Bishopric Sheathing Board.
Samuel Cabot, Inc., 141 Milk St., Boston, Mass.
249. Cabot's Quilt. Catalog containing drawings and description.
U. S. Mineral Wool Co., 280 Madison Avenue, New York, N. Y.
94 *The Uses of Mineral Wool in Architecture.* Illustrated booklet. Properties of insulation against heat, frost, sound, and as a fire-proofing, with section drawings and specifications for use. It gives rule for estimate and cost. Size 5¼ x 6⅜ in.

JOISTS AND STUDS, PRESSED STEEL
General Fireproofing Co., Youngstown, Ohio.
462. *An interesting booklet,* called "Industrial Housing," has the actual blue prints in it.
Central Pressed Steel Co., Massillon, Ohio.
96. *Descriptive 4-page folder* on metal lumber for building construction.
Truscon Steel Company, Youngstown, Ohio.
95. *Truscon Steel Joists.* Catalog. 8½ x 11 in. 24 pp. Illustrated. Information on Pressed Steel Beams and Joists for light occupancy buildings. Tables, specifications and views of installations.

KITCHEN EQUIPMENT
Bisk Corp., Brockton, Mass.
463. *Several interesting booklets,* describing the various types of "Built-In-Kitchens." These are illustrated by actual blue prints.
National Mill & Lumber Co., 2 Rector Street, New York.
277. 10-*Page Illustrated Folder.* Describes the necessity and advantages of a National Built-In Ironing Board.

LATH, METAL AND REINFORCING
The Bisphoric Mfg. Co., 17 Este Avenue, Cincinnati, Ohio.
Bostwick Steel Lath Co., Inc., Niles, Ohio.
279. *"Beautiful Permanent Walls."* 22-page illustrated catalog. 4 x 9 inches.
Central Pressed Steel Co., Massillon, Ohio.
General Fireproofing Co., Youngstown, Ohio.
97. *Catalog* describes Herringbone Rigid Metal Lath, how it is applied and used, with detailed drawings, specifications, etc.
Truscon Steel Co., Youngstown, Ohio.
99. *Hy-Rib and Metal Lath.* 18th Edition. Catalog. 8½ x 11 in. 64 pp. Illustrated. Gives properties of laths, specifications, special uses and views of installations.

LEVELS
A. S. Aloe Co., 513 Olive Street, St. Louis, Mo.
Eugene Dietzgen Co., 162 W. Monroe St., Chicago, Ill.
Keuffel & Esser Co., Hoboken, N. J.
Lufkin Rule Co., Saginaw, Mich.
Warren-Knight Company, 136 North 12th St., Philadelphia, Pa.
100. *"Sterling" Levels and Transits.* 32 pp. illustrated catalog. Description, specifications and structural advantages required in modern practice for establishing lines, levels, angles, etc. Vest Pocket Manual of adjustments.
David White Co., 907 Chestnut Street, Milwaukee, Wis.
464. *Catalog A,* "White's Improved Instruments." is a 36-page booklet with a hard cover and illustrated.

LIGHTING
American Three-Way Prism Co., 1307 South 55 Court, Cicero, Ill.
98. *Descriptive Circular* on the use of prisms for directing light to dark corners.

LIGHTNING RODS
E. G. Washburne Co., 207 Fulton Street, New York.
232. *Descriptive Catalog in Colors.* Showing different designs of weather vanes, lightning rods, ventilators, etc.

LIGHTING SPECIALTIES
I. P. Frink, Inc., 24th Street and 10th Avenue, New York, N. Y.
250. *Lighting Service for Hospitals.* A booklet illustrated with photographs and drawings, showing the types of lights for use in hospitals, as operating table reflectors, linolite and multilite concentrators, ward reflectors, bed lights and microscopic reflectors, giving sizes and dimensions, explaining their particular fitness for special uses. Size 7 x 10 in. 12 pp.
251. *Frink Reflectors and Lighting Specialties for Stores.* Catalog No. 424. A catalog containing description of the Frink Lighting System for Stores; the Synthetic System of Window Illumination; and a number of appliances to produce the most effective lighting of displayed objects. 20 pp. Illustrated.
252. *Frink Lighting Service for Banks and Insurance Companies.* Reflectors. Catalog No. 425. A very interesting treatise on the lighting of offices; with details of illustrations and description of lamps and reflectors. Contains a list covering several pages, of banks using Frink Desk and Screen Fixtures. 30 pp. Illustrated. 8¼ x 11 in.

LUMBER
Arkansas Soft Pine Bureau, 802 Boyle Building, Little Rock, Ark.
101. *Arkansas Soft Pine Handbook.* Catalog. 8½ x 11¼ in. 62 pp. Illustrated. Concise, technical information regarding physical character, uses, and including Grading Rules and Standard Moulding Designs.
102. *The Home You Long For.* Booklet. 8¼ x 11. 32 pp. Illustrated. Folio intended for the layman. Contains 18 homes by Robert Sayfarth, Architect, Chicago. Of general interest to architects, but does not contain technical information.
Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
104. *The Post Everlasting.* Booklet. 10½ x 7½ in. 32 pp. Illustrated. Information regarding creosoted yellow pine fence posts, barn poles, paving blocks, etc.
228. *Poles That Resist Decay.* Booklet. 9¼ x 4 in. 16 pp. Illustrated. Poles for telegraph, telephone, high power transmission lines.
105. *"From Tree to Trade,"* a 48-page illustrated description of the manufacture of lumber from tree to use. Describes methods of logging, construction, etc.
Pacific Lumber Company of Illinois, The, 1105 Lumber Exchange Building, Chicago, Ill.
106. *Engineering Digest.* Redwood Information Sheets. 1. General Data Sheet on Redwood, its Production and Uses. 2. Tanks and Vats for Water Acid and Alkali Solutions and Oil. 3. Pipe for Water, Chemicals and Sewage Conveying. 6. Farm and Dairy Buildings and Equipment, Silos, Tanks, Pipes, Outbuildings, Irrigation Flumes, Drainage Boxes, Greenhouses, etc. 9. Railroad Construction and Equipment. 10. Industrial Building Materials. 11. Residential Building Materials.
Southern Cypress Mfrs. Assn., 1227 Poydras Bldg., New Orleans, La.
107. *Many interesting booklets* on the use of Cypress for all purposes.

LUMBER ASBESTOS
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
108. *Ambler Asbestos Building Lumber.* Catalog illustrated. Describes uses of this fireproof product for both exteriors and interiors. Tables of sizes and illustrations of various types of buildings in which it has been used. Size 8½ x 11 in.

MARBLE, ARTIFICIAL
Art Stone Co., Waynesboro, Pa.

METAL LATH—See Lath, Metal and Reinforcing

METALS AND METAL BUILDING SPECIALTIES
American Sheet & Tin Plate Co., Frick Building, Pittsburgh, Pa.
111. *Reference book. Pocket Edition.* 2½ x 4½ in. 168 pp. Illus. Covers the complete line of Sheet and Tin Mill Products.
113. *Apollo and Apollo-Keystone Galvanized Sheets.* Catalog. 8½ x 11 in. 20 pp. Illustrated.
114. *Research in the Corrosion Resistance of Copper Steel.* Booklet. 8½ x 11 in. 24 pp. Illustrated. Technical information on results of atmospheric corrosion tests of various sheets under actual weather conditions.
115. *Facts Simply and Briefly Told.* Booklet. 8½ x 11 in. 16 pp. Illustrated. Non-technical statements relating to Keystone Copper Steel.
116. *Black Sheets and Special Sheets.* Catalog. 8½ x 11 in. 28 pp. Illustrated. Describes standard grades of Black and Uncoated Sheets, together with weights, building tables, etc. Bright Tin Plates. Catalog. 8½ x 11 in. 16 pp.
The Donley Bros. Co. 7400 East 74th Street, Cleveland, Ohio.
237. 28-*Page Illustrated Catalog* on "Donley Devices and Building Specialties." 6 x 9 in.
N. & G. Taylor Co., Philadelphia, Pa.
117. *Booklet and Detail Sheet of Tin Roofing.* See Roofing.

METAL TRIM—See Doors, Windows and Metal

MILLWORK—See also Lumber—Building Construction—Doors and Windows

MORTAR—See also Cement

MORTAR COLORS
Clinton Metallic Paint Co., Clinton, N. Y.
118. *Clinton Mortar Colors.* Booklet. 3½ x 6⅜ in. 8 pp. Illustrated. Complete description of Clinton Mortar Colors with color samples.

PACKAGE RECEIVER
The Donley Bros., 3700 East 74th Street, Cleveland, Ohio.

Digitized by Google

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth.
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

SAMUEL CABOT, Inc., Mfg. Chemists
BOSTON, MASS.

Here's A Helpful Item to Combine with Your Bids or Proposals on Residences

It Will Interest the Home Owner—and May Help You Secure the Contract

For less than $100.00 additional the plaster-base of walls and ceilings of the average home (costing in the neighborhood of $5,000) can be Bostwick Truss-Loop throughout.

One thousand wood lath equals 60 sq. yds. of wall surface and costs $12.00. This varies slightly in different localities. Wood lath, properly spaced, takes almost exactly the same amount of plaster as Bostwick Truss-Loop. Truss-Loop, therefore, costs only the margin between first cost of wood lath and first cost of Truss-Loop. This works out to from $65.00 to $100.00 more for the usual types of moderate-priced homes. Just this small margin secures lasting wall beauty and fire-protection.

In addition, Bostwick Truss-Loop will save for you in Time, Labor, Lath, Studding and Waste Plaster. Let us tell you how—write us for particulars and proofs.

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
161. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins. 8½ x 11. Pyrofill.

Vendor Slate Co., Easton, Pa.
474. *"A Book for Architects"* is the title of the new 24-page well-illustrated catalog.

Vulcanite Roofing Co., Buffalo, N. Y.
475. *Interesting booklets,* describing the "Better Shingle" and "Vulcanite Roll Roofings."

RULES

A. S. Aloe, St. Louis, Mo.

Eugene Dietzgen Co., 162 Ft. Monroe Street, Chicago, Ill.
476. *Write for an instructive circular.*

Keuffel & Esser, Hoboken, N. J.

Lufkin Rule Co., Saginaw, Mich.

Sargent & Co., New Haven, Conn.

Stanley Rule & Level Co., New Britain, Conn.

SASH CHAINS, HOOKS AND ATTACHMENTS

The Bridgeport Chain Co., Bridgeport, Conn.
209. *An interesting catalog* describing fully Sash Chain in Steel (six sizes and six finishes), in Bronze (six sizes), Hooks and Sash Chain Attachments.

SASH CORD

Samson Cordage Works, Boston, Mass.
477. *An interesting catalog* with actual samples of the various grades of cordage therein.

SAW MACHINERY

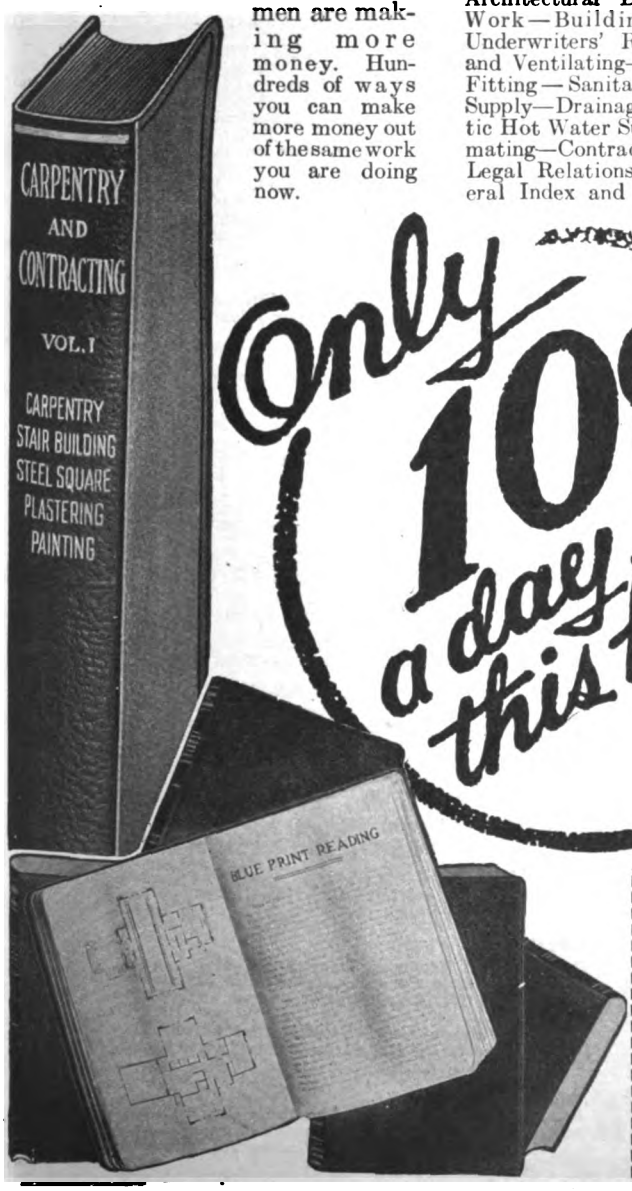
American Saw Mill Machinery Co., Hackettstown, N. J.
162. *Catalog No.* 21, describing Circular Saws of all sizes.
163. *General Catalog No.* 22 and *special Bulletin No.* 77, describing sawing machinery for use on the job in the shop.

W. F. & John Barnes Co., 71 Ruddy Street, Rockford, Ill.
478. *Catalog No.* 84 describes in full detail the Patent Foot and Hand Power Wood Working Machinery.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
164. *Bulletin No.* 1, *Saw Rigs.*

Crescent Machine Co., 206 Main Street, Leetonia, Ohio.
479. *This* 1921 *catalog* contains improvements on No. 3 and No. 5 Saw Tables No. 2 Motor-Driven Saw Table, New Motor-Driven Sharper, Hollow Chisel Mortiser.

Huther Broc. Saw Mfg. Co., Rochester, N. Y.
480. *Catalog No.* 38 describes the complete line of Saws.



C. E. Jennings Co., 321 Winthrop Avenue, New Haven, Conn.
481. *An interesting* 46-page Tool Chest Catalog may be had on request.

How You Can Make Big Money Out of What Other Men Learned

Over 200,000 men in various lines of industry have made good and are earning more money because of what they have learned from the A. T. S. Books. Hundreds are making good every day. What other men have done, YOU can do too.

Every day in your work you get up against new problems—sometimes it's only some old "sticker" coming in a new way. Just the same, though, it takes a lot of time to figure it out. *Don't do it.* That's where you lose out—doing work that someone else has already done for you. Here's everything worked out for you by twenty-five of the world's greatest building experts. Every problem, big or little, that you will meet in a day's work is explained. Here are hundreds of new ideas and better ways of doing things. Hundreds of ways that other men are making more money. Hundreds of ways you can make more money out of the same work you are doing now.

A few of more than a thousand subjects covered by these great books

Carpentry (including everything from the raw timber and tools to the trimming and turning over to owner) — Stair Building — Steel Square—Plastering and Painting—Mechanical Drawing—Blue Print Reading—Architectural Drawing — Sheet Metal Work—Building Superintendence—Underwriters' Requirements — Heating and Ventilating—Steam and Hot Water Fitting—Sanitary Appliances—Water Supply—Drainage and Venting—Domestic Hot Water Supply—Hardware—Estimating—Contracts and Specifications—Legal Relations—Building Code—General Index and Review Questions and Index to each volume.

Everything About Every Kind of Building

Five great books, flexibly bound in handy volume style, with 2,140 pages and more than 1000 blueprints, pictures, plates, plans and diagrams. These books are not a one man proposition but the combined work of twenty-five well known experts who gathered their material from thousands of different sources. Every carpenter, every apprentice, every contractor, in fact every man who has anything to do with building, or who is interested in building in any way should have a set handy to study up with, or to use for quick reference when he is in doubt about something.

Only 10¢ a day for this help

FREE EXAMINATION

Send the coupon for these great books today. You can't afford to be without them. The coupon brings the whole set by express collect for a week's FREE examination. Use the books a week and send them back at our expense if they don't please you. If you like them send us only $2.80 in 7 days and $3.00 each month until $19.80 is paid. If you prefer to send cash with your order, send only $17.80. The return privilege holds good just the same. Send the coupon NOW. Remember sending for the books does not obligate you to buy.

American Technical Society
Dept. G-408, 58th Street and Drexel Avenue, Chicago.

Please send me the five volume Cyclopedia of Carpentry & Contracting by express collect. I will send you $2.80 in 7 days and $3.00 each month until $19.80 is paid or I will send the books back at your expense and will owe you nothing.

The "Master" Woodworker

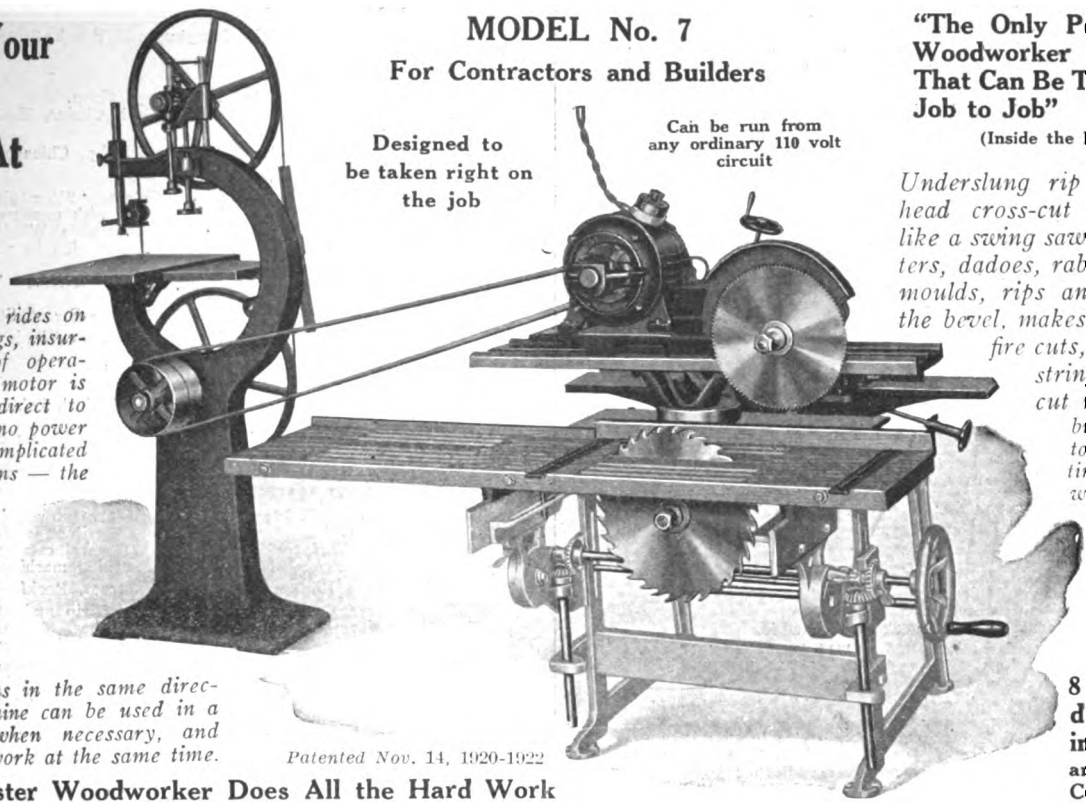
Manufactured by

The Woodworker Manufacturing Co.

614 BRUSH STREET, DETROIT, MICHIGAN

Speedy Powerful ***Accurate Sturdy***

Cuts Your Rough Stuff At Racing Pace



The motor rides on ball bearings, insuring ease of operation. The motor is connected direct to mandrels—no power lost in complicated transmissions — the cost of electric current is infinitesimal. No matter what you are doing the lumber always runs in the same direction. Machine can be used in a hallway, when necessary, and two men work at the same time.

MODEL No. 7

For Contractors and Builders

Designed to be taken right on the job

Can be run from any ordinary 110 volt circuit

Patented Nov. 14, 1920-1922

A Master Woodworker Does All the Hard Work

"The Only Portable Woodworker That Can Be Taken from Job to Job"

(Inside the Building)

Underslung rip saw, overhead cross-cut that works like a swing saw. Bores, mitters, dadoes, rabbets, planes, moulds, rips and joints on the bevel, makes jackrafters, fire cuts, houses stair strings and every cut necessary in building. Built to last a lifetime, sturdy and wonderfully accurate. Two men can carry it. Powerful, goes through a 2' 6" door.

8,500 in daily use in U. S. A. and Foreign Countries.

A PORTABLE ELECTRICALLY DRIVEN MACHINE

Equipped with 2 H.P. Continuous Duty Motor, developing 3½ H.P. Cross-Cutting Capacity, 4 in.; Ripping Capacity, 4 in. Will cut 24" wide by 2¾" thick, with a 10" saw, 4" with a 14" saw. It will rip 10" wide and 3" thick with 14" saw.

Model No. 7, complete length over all, 5 feet; width over all, without table, 2½ feet (will go through a 2' 6" door by folding the brackets). Weight complete, 700 pounds; shipping weight complete 1.100 pounds. Weight and size include 6 inch jointer 42 inches long. All machines taken down in four parts by removing 4 bolts; the heaviest part to carry is 175 pounds. Machine set up, ready in 5 minutes.

The Master Woodworker is the Best Labor Saver on the Market

In the Shop or on the Job the Master has no equal—12 machines in one without the extra expense of individual machines. For contractors and lumber yards is one of the greatest factors in cutting down the high cost of Woodworking.

The Master Woodworker appeals to all woodworkers such as cement contractors, builders, carpenters, cabinet makers, pattern makers, wagon makers, factories, etc., and is being used all over the world.

There are Master Woodworkers in use today that have seen over eight years of service without any repairs other than new belts and saws. There is nothing to get out of order, and any man who can file a saw and sharpen a plane can operate the machine.

The simplicity of construction, small number of parts, direct drive of motor from saw spindle, all contribute to make the Master Woodworker the most practical, portable and universal machine on the market.

The overhead saw carried on a slide, pivoted to swing to cut any mitre, and allowing the saw carriage and motor to be drawn back and forth is the new principle used on the Master Woodworker and can be utilized for a variety of purposes without adding a multitude of parts to the machine to enable it to do different kinds of work. All that is necessary is to change the saw or cutting head on the mandrel and swing the slide to suit the work.

The rip saw is always in position ready to operate independently of the overhead swing saw. The heavy underslung arbor also carries different kinds of moulding dadoes—base, sash, brick moulds, panel moulds, screen mouldings, etc., in fact, any shape of mouldings are cut with the greatest speed and absolute perfection.

No matter what you are doing the lumber always runs in the same direction. Machine can be used in a hallway when necessary and two men work at the same time without interfering with each other. The machine is sturdy, every pound is placed where it will give the maximum result—also is rapidly adjusted from one operation to another. The work is visible at all times. The Master Woodworker is indispensable where speed and power are required. The advantage over the old method of Pushing the lumber against the saw is obvious. The Master Woodworker proves itself in a short time.

SELECTED LIST OF MANUFACTURERS' PUBLICATIONS—*Continued from page 82*

Beaver Board Products Co., Inc., Buffalo, N. Y.
196. *Illustrated folder,* describing various uses and the methods of handling Beaver Board to the best advantage. Samples with descriptive literature sent on application.

Compo-Board Co., 5778 Lyndale Avenue, North, Minneapolis, Minn.
199. *Catalog sent on request with sample.* Describes many uses of Compo-Board.

United States Gypsum Company, 205 West Monroe Street, Chicago, Ill.
201. *Walls of Worth.* Booklet. 8½ x 11 in. 24 pp. Illustrated. Describes Sheetrock, the fireproof wall board, its advantages and uses.

Upson Company, Lockport, N. Y.

WALL FURRING
United States Gypsum Company, 205 West Monroe Street, Chicago, Ill.
202. *Thirty-two-page Booklet.* 8½ x 11 in. Pyrobar. Tile.

WATER HEATER
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WATERPROOFING—See also Dampproofing
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
206. *Science and Practice of Integral Waterproofing.* Pocket size. 33 pp. Illustrated. Contains full specifications for waterproofing MASS Concrete, stucco and Cement Plaster Coat. Entire chapter devoted to "Practical Application of Waterproofed Cement Plaster Coat."
207. *Technical Pamphlet No.* 8. Booklet. 4 x 7 in. 28 pp. A discussion of why concrete requires waterproofing and the properties an integral waterproofing must possess to operate effectively with the natural properties of concrete.

WATER SUPPLY SYSTEM
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WEATHER STRIPS
Allmetal Weatherstrip Co., 126 West Kinzie Street, Chicago, Ill.
239. Six-page illustrated circular, describing the product as used for Hotels, Residences and Institutions.

Diamond Metal Weatherstrip Co., Columbus, Ohio.
242. 34-page illustrated catalog. 8½ x 11¼ in. Containing blue prints of the various styles and sizes of Weathersthip.

Monarch Metal Products Co., 5020-26 Penrose Street, St. Louis.
210. *Cause and Effect.* A series of pamphlets describing Monarch Metal Weather Strips, which are made of bronze, brass and zinc. They differ from all other strips in that they are applied in spaces around doors and windows as elastic fillers and not over the space as covers. Each 4 pp.

WEATHER VANES
Danzer Metal Products, Hagerstown, Md.
E. G. Washburne & Co., 207 Fulton Street, New York, N. Y.
211. *Descriptive Catalog in Colors.* Showing two different designs of weather vanes, lightning rods, ventilators, etc.

WINDOWS—See also Doors and Windows
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
280. BOCA steel sash. (E-22). A catalog containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages.

Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.
Hope & Sons, Henry, 103 Park Avenue, New York.
212. *Catalog.* 12¼ x 8½. 30 pp. Illustrated. Full size details of outward and inward opening casements.

WINDOW CASEMENTS
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.

WINDOW HARDWARE
The Bridgeport Chain Co., Bridgeport, Conn.
266. *Interesting catalog* describing Sash Chains, Hooks and Sash Chain Attachments.

Casement Hardware Co., 250 Pelouze Bldg., Chicago, Ill.

The Kawneer Company, Niles, Mich.
213. *Kawneer Simplex Windows.* Catalog. 8½ x 10½ in. 16 pp. Illustrated. Complete information, with measured details, of Kawneer Simplex Weightless Reversible Window Fixtures, made of solid bronze. Shows installation in residences and buildings of all sorts.
214. *Detail Sheets and Installation Instructions.* Valuable for architects and builders.

Monarch Metal Products Co., 5020 Penrose Street, St. Louis, Mo.
282. 16-page illustrated catalog, 4 x 9 in., on Window Casements.

National Mfg. Co., Sterling, Ill.
500. *An interesting, well illustrated catalog.*

Pullman Mfg. Co., Rochester, N. Y.
502. *Catalog No.* 37, describing the "Unit Sash Balances."

Samson Cordage Works, Boston, Mass.
501. *Catalog.* 3½ x 6¼ in. 24 pp. Illus. Covers complete line.

Sargent & Co., New Haven, Conn.

Stanley Works, New Britain, Conn.

WOODWORKING MACHINERY
American Saw Mill Machinery Co., Hackettstown, N. J.
217. *Contractors' Bulletin No.* 77. Describing various types of portable Variety Woodworkers. General catalog No. 22, describing a general line of woodworking machinery.

W. F. & John Barnes Co., 71 Rudy Street, Rockford, Ill.
218. *Catalog.* Containing description of rip and other machine saws, formers, mortises, tenoners, lathes. 38 pp. Illustrated.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.

The Crescent Machine Co., 259 Main Street, Leetonia, Ohio.
220. *Catalog.* Describing band saws, shapers, jointers, planers, borers, mortises, etc. 144 pp. Pocket size. Illustrated.

R. E. Kidder Co., 35 Hermon Street, Worcester, Mass.
222. *Catalog.* Describing improved boring machine and how it can be used.

Parks' Ball Bearing Machine Co., Sta. "A," Cincinnati, Ohio.
223. *Illustrated Folder.* Describing Parks' Planing Mill Special, comprising circular saw, jointer, band saw, shaper, borer, tenoner, etc.

J. D. Wallace & Co, 1401 Jackson Boulevard, Chicago, Ill
325. *Bulletin No.* 219-K. Describes portable electric punch machines, tools, planers, jointers, circular saw, etc.

Woodworkers Mfg. Co., 614 Bush Street, Detroit, Mich.
263. 18-*page illustrated pamphlet,* 10¾ x 7¾ in., called "The Master Woodworker." The Model No. 7 machine is described.

Statement of the Ownership, Management, Circulation, Etc., Required by the Act of Congress of August 24, 1912.

Of Building Age and The Builders' Journal, published monthly at New York, N. Y., for October 1, 1922.

State of New York } ss.:
County of New York }

Before me, a Notary Public, in and for the State and County aforesaid, personally appeared C. G. Peker, who, having been duly sworn according to law, deposes and says that he is the editor of the BUILDING AGE AND THE BUILDERS' JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the act of August 24, 1921, embodied in section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:

Publisher—Building Age Publishing Corporation, 912-920 Broadway, New York City.

Editor—C. G. Peker, 912-920 Broadway, New York City.

Managing Editor—C. G. Peker, 912-920 Broadway, New York City.

Business Manager—David Meyers, 912-920 Broadway, New York City.

2. That the owners are:

Building Age Publishing Corporation, 912-920 Broadway, New York City.

That the stockholders owning or holding one per cent. or more of the total stock of Building Age Publishing Corporation are as follows:

B. A. & C. P. Holding Corporation, Times Building, New York City.

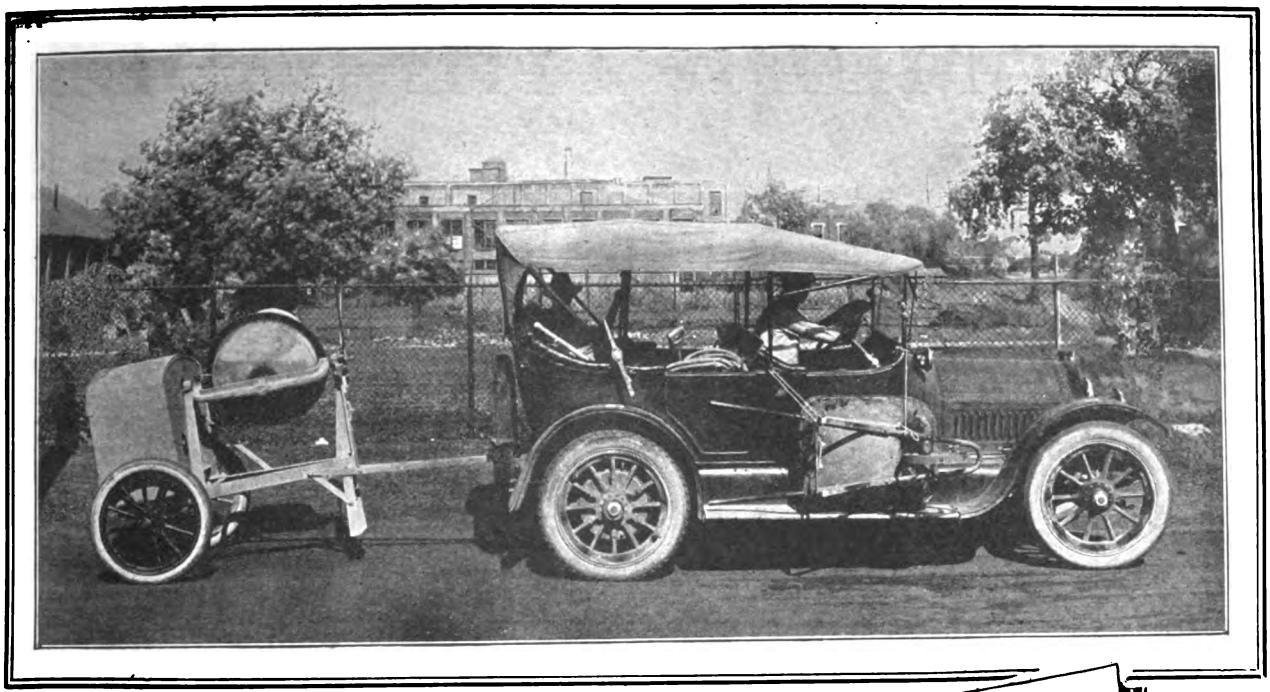
That the stockholders owning or holding one per cent. or more of the total stock of B. A. & C. P. Holding Corporation are as follows:

Frank Meyers, 912-920 Broadway, New York City; David Meyers, 912-920 Broadway, New York City; W. H. Parsons, 912-920 Broadway, New York City; W. A. Bardgett, 912-920 Broadway, New York City; M. & S. Meyers, Times Building, New York City; George Meyers, 1196 First Avenue, New York City; Michael Miller, 794 St. Nicholas Avenue, New York City; David L. Short, Columbia Avenue and Hancock Street, Philadelphia, Pa.; G. Friedman, 627 Broadway, New York City; A. Cowen & Son, 34 West 25th Street, New York City; John J. Robbins, 317 West 93rd Street, New York City.

3. That the known bondholders, mortgagees, and other security holders owning 1 per cent. or more of total amount of bonds, mortgages or other securities are:

Architectural and Building Press, 243 West 39th Street, New York City.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.



CHARLES G. PEKER, Editor.

Sworn to and subscribed before me this 13th day of October, 1922.

[Seal] HERMAN KINSLER, Notary Public. Bronx Co. Clerk No. 88 Reg. No. 194 New York Co. Clerk No. 514, Reg. No. 4026A

Travels 230 Miles in Two Days With Jaeger Trailer-Mixer

WILLIAM FRAVEL'S work with his Jaeger Trailer-Mixer speaks for itself. His experience with this fast-moving, fast-mixing outfit gives you a better idea of the profit possibilities that lie in this Trailer-Mixer.

With this portable outfit you can **get** to a job—**and finish it**—before a big mixer can be placed and started in work. Here is portability plus. Here is speed. Here is quick work—and quick profits. Contractors the country over have placed their O. K. on this simple, sturdy Jaeger outfit. You, too, will agree with them that it is "just the outfit" for the contractor handling smaller and medium-size jobs. You'll be surprised at the extremely reasonable price on this new Trailer outfit. **Write for full facts today.**

The Jaeger Machine Co.
216 Dublin Ave.
Columbus Ohio

Jaeger Trailer-Mixer (4-E) with 4 wheels instead of 2—for larger jobs.

Columbus, Ohio, September 1st, 1922.

The Jaeger Machine Co.,
Columbus, Ohio.

Gentlemen:

I want to say that when it comes to making fast mileage, as well as fast concrete, the Jaeger Trailer-Mixer (3-E) which I recently bought from you can't be beat. I'm rather proud of my recent two-day record with my Trailer-Mixer during which I traveled over 230 miles and put in two good size jobs.

With a contract for a rush job in Newark, Ohio, 35 miles away, and another rush job in Marietta, Ohio, some 65 miles further, I started out of Columbus with my Trailer hooked to my Cadillac. I made Newark in less than two hours, put in a 1025 sq. ft. concrete drive, hooked up my Trailer and made Marietta, 65 miles away, the same night. The next day I finished a sidewalk job there and made Columbus that night. There's a record of 230 miles with my Trailer-Mixer in two days time.

The Trailer is a wonderful little machine. You can trail along as though you had nothing attached to your automobile. There is no rattling, no vibration. I can't say enough for this outfit. I wouldn't buy one with iron wheels now.

Very truly yours,

Wm W Fravel

You'll be vitally interested in the folder giving you the complete facts on the Jaeger Trailer-Mixer. Use the coupon today!

REMEMBER THE FABLE-

how the different parts of the human body—the hand, the mouth, the heart—each felt it was the one essential. But when one refused to work they all perished.

ATLAS Portland Cement is a complex product. First the raw stone from which it is made must have exactly the right ingredients. These must then be so proportioned that, coming from the giant crushers in a dust-like powder, they fuse into a perfect chemical and physical union.

Thousands of tons of coal daily are used in this fusing process alone. The tremendous wear of grinding and regrinding Atlas in its various stages makes necessary frequent replacement of costly equipment. The most exacting chemical tests are required at every stage—of raw material, of material in process of manufacture, of finished product.

For over a quarter century Atlas Portland Cement has been tested in every type of construction. That a complex product such as Atlas can be maintained at highest quality is proved by the fact it is today called "the Standard by which all other makes are measured."

Get Live Information about Standard Materials and Equipment

If our advertisers fail to mention specifically that they offer catalogs and pamphlets covering the various materials and equipment they make—just consult pages 72, 74, 76, 78, 80, 82 and 84 of the

Selected List

of

Manufacturers' Literature

You will find there a brief description of literature offered by advertisers, all of which you should have in your files.

Keep one jump ahead—by sending to us or to the manufacturer direct for catalogs on every feature of building that is of interest to you.

It **pays** to have all available information on the materials going into your buildings and the equipment you must use. Often a suggestion of some special material—or a reply to a question about that material—is just the lever needed to land a contract.

Hundreds of representative Builders-Contractors-Architects are writing us every month for literature on every subject from Asbestos to Woodworking Machinery.

Bring your catalog file up to the minute by writing for the catalogs offered in the SELECTED LIST OF MANUFACTURERS' LITERATURE—TODAY.

American Universal Floor Surfacing
THE BIG PROFIT SYSTEM

The American Universal Floor Surfacing Machine is the best money maker the contractor can own. It is practically "fool proof" and can be operated by any man of ordinary ability and do only the best grade of work, for its operation is automatic. When your building is about ready to turn over to the owner, it does the last big job, the floors, when everyone is anxious, quickly and perfectly, leaving everyone feeling satisfied. One man and one American Universal does the work of six men and does it perfectly.

Old Floors Made Like New—New Floors Made Perfect

Contractors owning American Floor Surfacing Machines keep them going all the time at big profits on old floors when they are not needed on the new work—this is an excellent source of profits. Often, too, floor surfacing contracts are taken on other jobs. Just read what users say about the labor-saving, money-making ability of the American Universal. Hundreds of others have gone into the floor surfacing business and are independently well fixed.

Saves Labor of Six Men and Does Better Work
We can surface more floor with our "American Universal" machine than six men can scrape by hand, considering the quality of the work.—Schneider & Hein, Nebr.

Would Not Go Back to Old Way
The "American Universal" is a great labor saver, doing the work of about eight men, so naturally I would never consider going back to hand scraping again.—M. R. Warner, Colo.

Surfaces 1500 Square Feet Per Day
The "American Universal" does all you claim, for it has surfaced 1500 square feet of flooring per day for me and is doing the work of six men.—L. F. Walla, Va.

Customers Satisfied—Business Increases
The "American Universal" has replaced five men at least on my payroll, does better work than before, and so, as my customers are so well pleased, I have found my business increasing right along.—A. G. Thompson, Ark.

Replaces 10 Men
The "American Universal" replaces ten men on my pay roll, and surely does excellent work.—I. O. Fetter, Pa.

Machine Does Better Work Than Hand Scraping
The "American Universal" has replaced five men on my pay roll, and I can do a better quality of work with my meahine than by hand scraping.—L. L. Howard, Kans.

Quality of Work Only Advertisement Necessary to Secure More Work
I want to tell you that the "American Universal" is some labor saver—it replaces at least five men on my pay roll, and the quality of work it turns out is all the advertisement I need for my business.—Hugh A. Cox, Fla.

Afraid to Go Back to Hand Work
Since the "American Universal" has proven such a great labor saver, would not dare to go back to the old method of hand scraping.—C. E. Andrews, Pa.

Saves Six Men
The "American Universal" replaces six men on my pay roll and I find it to be a great labor saver.—E. A. Bittner, Pa.

Light and Easy to Handle
In the first place the "American Universal" machine is light and easy to handle and does lots more work than the other sander of a different make which I have.—Kroffganz and Frank, Mont.

No Kicks—Replaces Six Men
Want to tell you that I've never had a kick about unsatisfactory work from any of my customers ever since I bought the "American Universal" and it replaces six men on my pay roll, too.—A. F. Grow Brothers, Nebr.

Saves Ten Men
Your "American Universal" floor surfacing machine is a labor saver. It will do the work of ten men in one and in much better shape.—M. B. Battlen, S. D.

Know More—Earn More

Plain Facts for Men in the Building Trades

Never in the history of this country have men in the building trades had the opportunities for money making that are offered today. Building is on the boom. Able men are needed on work already started and on work for which the plans are ready.

There is big money ready for men who can read plans, make estimates and superintend construction—and this is where the ambitious man who will train as an expert will find his chance.

As a workman, a man draws pay for what he can do with his hands. As a foreman or superintendent he gets paid for what he knows. And the contractor taking small jobs who gets posted on the higher branches of building can take on the big propositions which pay the largest profits.

The man who can work best with his head is the man who gets the big pay job or makes the largest profits in business. The world pays more for brains than it does for muscle.

Some men have reached the big money class only after years spent in picking up information as they went along. This is the slow way to success and comparatively few men get very far by depending upon their experience and hard work alone. The man who trains under experts and gets the benefit of their knowledge saves years of waiting—he gets quickly to the front. There—for instance—is a man in Oklahoma. His name is Woodside. He worked for years just as thousands of other carpenters are working, taking a job here and a job there, making a journeyman's wages and no more. He did the sawing and nailing and joining while other men did the planning and directing and made the real money.

Fortunately for Woodside, he saw an advertisement of the Chicago Technical College which offered to train him by mail in his spare time to do the very things which these successful men were doing. He wrote for the catalog, got information about the Builder's Course, and enrolled. Read what he says:

"I was working as a carpenter receiving $6.00 per day when I took up the course. In less than 3 months I got a job as foreman on a big apartment building at $8.00 a day. Five months later I was superintending a reinforced concrete job covering nearly half a block. I am now in business for myself, specializing in theatre construction."

And there is A. C. McEvoy, of Chicago, who says: "I have been greatly benefitted by taking your Builder's Course. I have received 5 times as much money as I paid to take the course, to say nothing of the material good that I derived from it. My advancement has been from an ordinary bricklayer on the wall to foreman-in-charge, where a knowledge of plan reading is very essential.

Another man with Chicago "Tech" training is S. J. Dickerson of Rhode Island, who says: "When I started your Builder's Course I was making $50 a month on the average. Now making $150 a week.

These are only three examples of what this training has done for ambitious men who saw that "the big pay goes to the man who knows" and who put in some of their spare time to get the instruction of the Chicago "Tech" experts.

Let America's Oldest and Largest School for Builders Give You the Training that Means Greater Success and More Money

Hundreds of men in the building trades attend our Chicago school. For 20 years we have been training ambitious men who are now foremen, superintendents and independent contractors, making big money while other men who started with just as good chances as they had are still at the bench. You can get this same training at home in your spare hours, for we teach the same courses by mail and you get the supervision of the same experts. No special previous education required to take up this course. Send the coupon below and get the catalog with full information about our courses and about our small fees and easy terms of payments.

Get This Training in Your Spare Time

The hours that you have outside of your work time can be used to make you a building expert—the man who can "boss" a job and draw a real salary or handle money-making contracts.

Learn to read blue prints as easily as you read these words. Learn to make estimates on time and material for all classes of construction—brick, frame, concrete. Get posted from the ground up on the direction of work—uses and preparation of material, handling help, getting the work done.

Have every branch of building at your fingers' ends. Then you can step ahead—get the pay your ability is worth.

FREE 2 BOOKS AND BLUE PRINTS

Your request brings our 2 Books, one on "How to Read Blue Prints," containing a lesson in Plan Reading, with which we send blue prints, drawings, etc. With this lesson you can test yourself and see how easily you can learn by our method before you decide about enrolling. The other book explains the Chicago "Tech" Method of training by mail.

Send the Coupon

Get these free Books and Blue Prints and see for yourself how Chicago "Tech" training will put you ahead. Just sign your name on the coupon and mail it today to **Chicago Technical College, 1138 Chicago Technical Bldg., Chicago.**

Chicago Technical College,
1138 Chicago Tech. Bldg., Chicago, Ill.

A Sign of Foresight

Many home-builders consider the Kernerator as essential to comfort and convenience as first-class plumbing or an efficient heating plant. They appreciate how this modern system for disposing of household waste saves steps, how it eliminates the health menace of the insanitary garbage can, how it reduces the fire hazard by making unnecessary the accumulation of refuse.

The Kernerator is of simple construction—yet it lasts as long as the building in which it is installed, with **no expense** for repairs or upkeep. It consists of a brick incinerator, built into the base of the chimney when erected, and hopper doors in the flue on the floors above. It disposes of all household waste **without cost** because the refuse, itself, is the only fuel required. Every few months the ashes and non-combustibles are removed from the ash-pit.

Write for interesting literature, giving complete information regarding the Kernerator. Also see page 2124, Sweet's 1922 Catalog.

Herringbone—strong, rigid, easily handled—has met the demand for an economical, practical, fire-retardant lath

Protect the Stairs from Fire

The only fire escape in a house is the stairs. They must be protected. Fire comes upward. Protect the under side of the stairs and you protect all. Use metal lath and plaster.

For a dependable, fire-resisting lath use Herringbone. It spans sixteen inches. The increase in cost is but a small fraction of the increase in value.

More Profits *for* YOU *– and the* MERCHANT!

More profits for you because Desco Store Fronts are attractive and the cost of materials and installation is less; and because one job brings new contracts.

More profits for the merchant because the dollar-and-cents value of modern store exteriors is realized by business men everywhere.

How you can build up a profitable store front business—

How you can increase your profits without special knowledge or experience in store front construction—

How you can establish yourself as a store front specialist is information we will gladly give you. First, get the helpful Desco Book. It is a book that gives valuable information in designing and installing modern store fronts and will enable you to become a successful store front builder.

See Sweet's Catalogue.

Fill out the coupon today and this book will be sent to you by return mail.

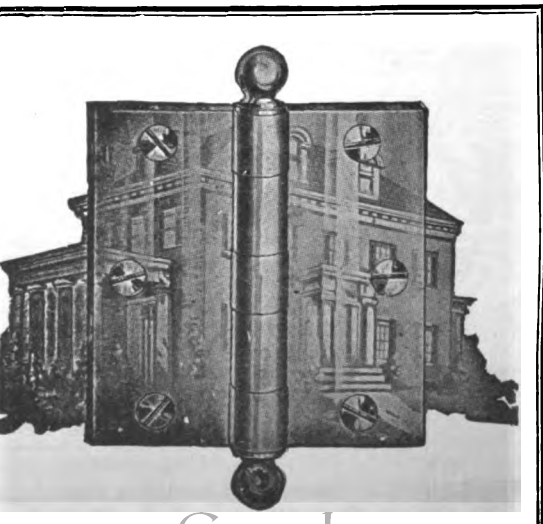
Your
ATTENTION!!

is called to the hinges on the door. To some people door hinges may seem rather small and unimportant—nevertheless, their mission in helping to make or mar the appearance of the rooms in a modern home is worthy of serious thought. The

GRIFFIN
"The Door Butt of America"

is designed along lines that insure both beauty to the home and *service* whenever the doors are opened and closed.



The Griffin operates freely and easily, it is amply strong for heavy doors and it is such a pleasing fixture that architects and home builders are glad to specify and use it.

Being finished in the various Griffin hardware finishes, it is in wide demand for the better class of houses and office buildings.

Making Friends of Your Customers

The man who sells Heating Systems knows that Home Owners sometimes seem to expect the impossible from their heating plants. Under such circumstances it is easy to lose the friendship of a customer.

It is easy to make lasting friends of every customer when you sell—

THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM

Because of these several exclusive and distinctive features, the FarQuar actually accomplishes the seemingly impossible:

—a copper-bearing steel fire-box, electrically welded into one piece, completely prevents escape of gas and fire poisons.

—firebox is specially shaped to avoid irregular faces, eliminate top surface, and minimize friction.

—the automatic control—a positive heat regulator and fuel saver—actuated by the fire-box itself.

—a large air chamber which conforms to shape of fire-box and provides the necessary capacity for handling a large amount of air.

—a construction which provides for an ample quantity of gently warmed fresh air instead of heating and reheating partially devitalized air.

—the FarQuar Vent and Return System carries off the air contaminated by occupancy, and maintains a uniform temperature in all rooms, thereby preventing hot and cold spots.

—heat evenly distributed between floors and ceilings—no drafts along floors.

All this is accomplished with a surprising economy of fuel due to the Scientific Principles of FarQuar Design and Construction.

HIGH GRADE REPRESENTATIVES WANTED

Cash in on FarQuar supremacy. High grade, responsible Dealers are wanted as exclusive FarQuar distributors. Unusual opportunities open to those who can qualify. Write today for particulars; ask for Free Booklet.

TO CONTRACTORS AND BUILDERS

Home Builders and Home Owners are continually asking for information about the FarQuar. It will pay you to have the facts. Write for Free Booklet giving complete information. If interested in Distributors' Proposition, ask for details.

Wilmington, Ohio

LONG-BELL
Trade-Marked LUMBER

"Know the Lumber You Buy"

It is a commonly accepted truth that trade-marks are guides to good merchandise. The reason is obvious. A manufacturer could not afford to put his name upon an article that did not stand up to the claims he made for it.

The Long-Bell Lumber Company takes unusual pains to produce lumber, timbers and lumber products that will maintain a reputation for uniform high quality. It is, therefore, proud to put its name upon them.

You should know the lumber you buy —and the Long-Bell trade-mark provides the way.

ASK YOUR LUMBERMAN FOR LONG-BELL TRADE-MARKED LUMBER

180 Cubic Feet per Hour of

heat escapes from every window in your building. 90% of Heat Units go up your chimney. Can you afford to waste from 20 to 40% of the 10% that is left? Of course, you can't.

WHY DO IT?
DIAMOND METAL WEATHER STRIPS

PRACTICAL METAL THE DIAMOND WAY WEATHER STRIPPING

DIAMOND CALKING COMPOUND will permanently and efficiently save the waste of fuel and keep out wind, cold, dirt and storm.

If you have a building to heat and you PAY THE BILLS, let us prove how we can save you 20 to 40% on your fuel bills this year and every year your building stands.

We have thousands of testimonials from every section of this country proving our claims.

Our nearest agency is ready to give you an estimate on equipping your building.

Let us send you some information and details on how we do it. We have been doing it for fifteen years for others, why not for you?

A building equipped with our product enables you to maintain an even degree of heat with less fuel.

Can be put in any building, old or new, anytime, anywhere.

DIAMOND METAL WEATHER STRIPS AND CALKING COMPOUND GIVE SATISFACTION WHERE OTHERS FAIL

You'd Be Surprised!

Wouldn't you be surprised if the one from whom you buy fuel would hand you back one-fourth to one-third OF EVERY DOLLAR you spend for heating your home or building? WELL, YOU KNOW he won't, but an investment in DIAMOND METAL WEATHER STRIPS will save you that much and will pay for themselves in from two to three years' time, and then go on doing it for at least ten years to come. Don't take our word for it, but let us refer you to people who are making this saving.

We have stripped thousands of homes, both old and new, in all parts of U. S. and Canada.

Not only do they save fuel, but they keep the heat in, the cold, dirt and storm out, and do it continually.

Write us for some interesting data on the subject. It's yours for the asking.

Building Material and Specialty men, Contractors and Carpenters should write for our Agency Proposition. Some desirable territory still open. Volume of business is big the year round and profits are legitimate.

If we have no agency in your city we want one to supply the demand.

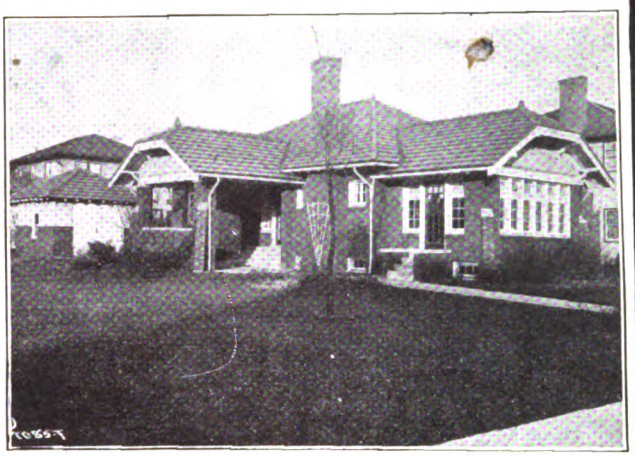
OAK FLOORS
(For Everlasting Economy)

A Real Estate Investment as Good as a Bond

Ten straight carloads of 13-16 x 2 1-4 Clear Plain Red Oak Flooring were used in this mammoth apartment building, the Indian Village Manor, Detroit, Michigan, the largest building of its kind in the world. Only two of the six sections are shown here.



Besides giving the owner the usual advantages of Oak Floors, beauty and durability, these miles of Oak Floors will mean a saving of thousands of dollars annually in his cleaning bills.

And will increase his rental and selling values more than many times their cost spent in other decorative features.

Today's universal preference for Oak Floors is nowhere better shown than in the countless real estate advertisements which never fail to list them, where possible, as selling arguments.

Our three booklets, in colors, containing accurate and up-to-date information on the whole subject of Oak Floors, mailed free to members of the building trades and professions.

Oak Flooring Advertising Bureau
1041 Ashland Block, Chicago, Ill.

New and Standard Books

Arthur's New Building Estimators' Hand Book
1922 Edition Revised to June 30

Have you bought your copy of this standard work? It gives the latest information on costs on every branch of the building trades taken from work done in all sections of the country and ranging from the smallest job to large municipal work. It tells how long it took and how much material was used on each operation, so it may be used as an accurate guide by anyone. Your money back if you don't find it worth many times its cost. 1002 pages, 7¼x4¾ inches, Flex Fabrikoid Gilt Edges.....$6.00

Joslin's Plan Reading and Estimating Building Costs

A simple and practical work on costs and superintendence written for Eastern conditions, with important chapters on plan reading, taking off quantities, estimating the cost of labor and materials and a splendid system for keeping track of the progress of the work. There are 29 chapters; four on Reading Architects' Drawings, nine on Masonry, Iron Work, Marble Work, and Metal Work, four on Carpenter Work, five on Miscellaneous Subcontracts, four chapters on Estimating the Cost of Building Alterations, and three chapters on Building Superintendence. 188 pages, 6x9 inches, 41 illustrations. Numerous tables. Cloth.....$1.25

Hick's Estimators' Pocket Companion

A guide to prices of all kinds of building materials with handy rules, tables and information for the estimator.

The chapter on Carpentry gives the number of board feet and cost of framing lumber per square of 100 sq. ft., and many valuable tables, including timber measure, common and hip rafters for roofs of various pitches and with from one to eighteen feet run, the safe bearing loads of timber and yellow pine posts. Reliable data on figuring the strength and weight of materials is also given.

Contents: Introductory. Preparing Estimates. Excavating. Stone Work. Plain Concrete. Reinforced Concrete. Concrete Cement Stone. Cellar Bottoms and Walks. Brick Work. Hollow Building Tile. Masonry Tables. Estimators' Guide. Plastering. Carpentry. Iron Work. Sheet Metal and Roofing. Plumbing. Heating and Ventilation. Electrical Work. Tile Work. 218 pages, 4x6 inches, 92 tables. Cloth.....$1.00

Hick's Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Space is left at the end of each specification for extra data. 8 pages, 7x10 inches.....20c. each, 6 for $1.00

Modern Building Superintendence and Specification Writing

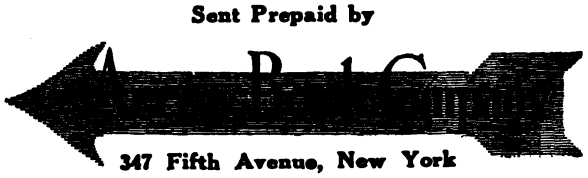
It covers details of the very newest building methods and modern material, steel skeleton construction, steel beams, reinforced concrete, plumbing, electric lighting, vacuum cleaning, etc., etc. The author takes a fine modern business building of twenty stories high and, beginning with the excavation, covers every detail of construction until the building is completed. In the second part of the book he deals with the writing of specifications. A careful and accurate and clear writing of specifications involving a knowledge of materials and matters of construction is an essential in the equipment of every young architect. 247 pages, 4½x7 inches. Cloth.....$1.75

Kidder's Building Construction and Superintendence

Part II. Carpenters' Work. This part has also been completely revised and rewritten. The book has been extended in scope to meet the improvements that have been made in construction methods during the period since it was first published. 931 pages, 830 illustrations, 7x9¾ inches. Cloth....$7.00

Part III. Trussed Roofs and Roof Trusses. Describes nearly every type of roof construction commonly met with in buildings, wooden and steel trusses for different spans and building requirements, computing the loads, drawing the stress diagrams, proportioning the members and joints to stresses, etc., etc. 294 pages, 306 illustrations. Cloth.....$3.50

Odell's Hardwood Floors



A practical little book from the pen of a man who has an extended experience in the better grades of modern floor finishing. It was written to meet the increasing demand for a simple treatise on the tools required and methods of handling same to turn out an even, well-laid floor. 50 pages, 5x8 inches, 13 figs. Cloth.....$0.50

Colwell's Kinks for the Builder

A practical manual on carpenter's work, foundation, cement and plaster work worth many times its cost to the carpenter and builder.

Contents: I, Foundations; II, Short-Cuts for the Carpenter; III, Problems in Framing; IV, Floor Construction and Finish; V, Cornice and Tower Work; VI, Fitting and Hanging Doors; VII, Cement and Plaster Work; VIII, Carpenter's Tool Chests and Mitre Boxes; IX, Miscellaneous Kinks and Wrinkles. 160 pages, 5x7¾ inches, 116 figs. Cloth.....$1.00

When You Build a Home
Start Right

Compare the daylight area of a Truscon Steel Basement window with a wood window of the same size and you will find there is a gain of 50% to 80%, depending upon the size of the window. This is one reason why home-builders are using them to build daylight into their cellars.

Truscon Steel Basement Windows won't stick or warp. They are always easy to open and close; they lock automatically. Double contact weathering effectively keeps out wind, rain and snow. They are easy to install.

In making comparisons remember that Truscon Basement Windows come complete with the Sash accurately fitted to the frame and heavy hinges and lock attached.

Building supply and hardware dealers practically everywhere carry Truscon Steel Basement Windows in stock for immediate delivery. If your dealer does not handle them send us his name and ask for complete information.

You will find this name on every window

The Stucco for American Homes Guaranteed by The Manufacturers

FIRST CHURCH OF CHRIST SCIENTIST
PORT HURON, MICHIGAN

ASBESTONE Everlasting Stucco is recognized by the leading architects and building construction authorities as the standard of quality of Magnesite Stuccos; **unsurpassed in covering power, unequalled in tensile strength and resiliency,** weatherproof, fireproof and permanent.

ASBESTONE Everlasting Stucco has three to four times the tensile strength of Portland Cement Stucco—averaging after ten days set over 700 pounds to the square inch.

The demand for ASBESTONE Everlasting Stucco has grown year by year since 1910, and because of its superiority the demand is still growing by leaps and bounds.

5,000,000 homes are needed. A large portion of these are going to be Stucco. Consult your local Building Supply Dealer. If he does not handle it write us direct for full particulars.

More Enduring Than Wood— Better and Cheaper Than Marble or Slate

H & H Steel Partitions are rapidly replacing Wood, Marble and Slate.

More sanitary than wood, because they do not absorb odors—more enduring, too.

They do not break or flake like slate or marble.

Shipping costs are less, because of their lighter weight.

Labor costs are less, because they can be set in much less time than it takes to set marble or slate.

Special rust-resisting filler finish—a second coat can be our standard green, or other shades can be applied over the filler after being installed.

Shipments now ready for replacements.

Are You Using Basement Windows that come Complete?

Think how much time and money you could save by installing a basement window that comes COMPLETE!

By "complete," we mean—the sash fitted and hung in the frame—the hardware in place—and the priming coat of paint applied.

When you use Fenestra Steel Basement Windows, you profit by these very advantages—they "come complete"! You don't have to have a carpenter on the job to build the frames—fit the sash—attach the hardware—or brace the window. This new Fenestra Steel Basement Window is all ready for the mason to install. It saves time, labor and money—makes a neater and more attractive job—gives the home owner a better buy for his money.

And here are the reasons why home owners want Fenestra Steel Basement Windows:

—*they admit 40% to 80% more light than wood windows*
—*can't warp or stick*
—*resist fire*
—*provide better ventilation*
—*last as long as the building*
—*are surprisingly* Low in Cost!

Let us send you our pamphlet that tells the whole story about these new steel windows. It shows how to install in all types of basement construction,—gives the four standard sizes—tells how to glaze, screen, and many other valuable pointers on the easy handling and installation of these windows. Write for you copy NOW—it's FREE!

Kellastone Is Freeze-Proof

ORDINARY plasters which are mixed with water cannot be used with safety during winter periods. On the other hand, immunity to damage even in zero temperature is only one of the many individual characteristics of Kellastone. It is mixed with a magnesium chloride solution which is absolutely non-freezing.

Use Kellastone Interior Plaster for high-class interior work. It is free from internal shrinkage stresses, is much more plastic and weighs about one-third as much as lime or gypsum.

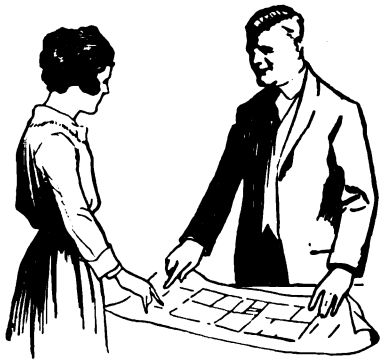
The Modern Trend in Roofing Materials

Is toward a combination of utility with beauty.

In the case of asphalt shingles it used to be merely a question of durability and fire-resistant qualities. Now, however, artistic appearance is required in addition to these other well-known features.

Flint-Arrow Blue



the latest and most artistic slate surfacing for

Asphalt Shingles

is sure to please. Its distinctive deep blue-black tone adds the finishing touch to the house; a touch in harmony with almost any style of architecture but particularly adaptable for houses of the Colonial type.

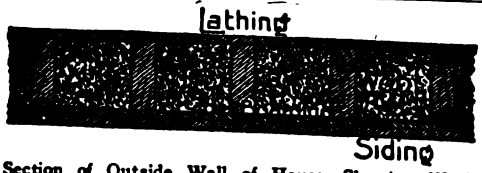
Smoky Fireplaces

result from faulty interior construction and incorrect size of chimney.

The installation of an Apex Smoke Chamber with Damper will positively produce a clear burning fireplace without smoke trouble at all times and give you the approximate flue area.

Tell us the size of the fireplace opening and we will tell you the correct size to build the chimney.



The Apex Smoke Chamber is installed with a patented Kettle Hook.

The Operating Mechanism is movable and always comes in a bed joint and fits the face perfectly. An indicator is attached to prevent accidental closing when fire is burning. This style of mechanism cannot jam and is extremely simple and comes to you all ready set up.

First cost is the only cost and you are assured of a correct fireplace in the minimum of time.

Mechanism Blueprint Available.

APEX FIREPLACE COMPANY
URBANA :-: ILLINOIS

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

280 Madison Avenue, New York
[Cor. 40th Street]

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

In-Lade

Design Roofing

Meets the big demand for a roofing that combines distinctive appearance with permanence.

It is easy to apply and may be laid over wood shingles, keeping the house warm in winter and cool in summer.

Send for samples to show your customers. In-Lade roofing will help you build up your roofing business. It is made in rolls of red, green and white. Approved by the National Board of Underwriters "Class C."

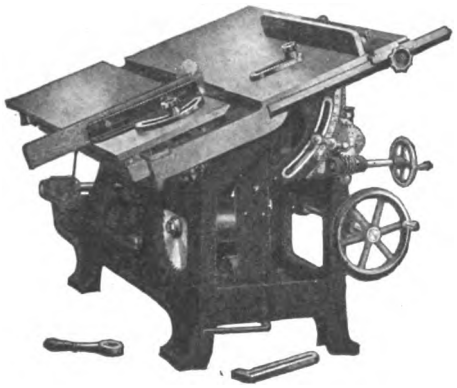
The **FIRMNESS, DURABILITY** and **ATTRACTIVENESS** of **AMERICAN BRAND SCREEN WIRE CLOTH** will appeal at once to the architect, home builder, or screen manufacturer who desires to give maximum Fly Screen satisfaction.

AMERICAN BRONZE: This grade is made of best hard drawn wire 90% copper, 10% non-corrosive alloy, principally zinc. BRONZE should last as long as the house in most sections.



Avoid copper substitutes as these are too soft.

GALVANOID: This grade is heavily electro - zincked after weaving, then varnished. It is the recognized leader in its field—the best grade of zincked cloth made.

We also make
PAINTED, GALVANIZED, COPPER, KOPNIK, MONEL
and many special grades of wire cloth. Samples and descriptive literature sent upon application.
Order from your Hardware Jobber or Dealer. If he cannot furnish, advise us, and we will see that you are supplied.

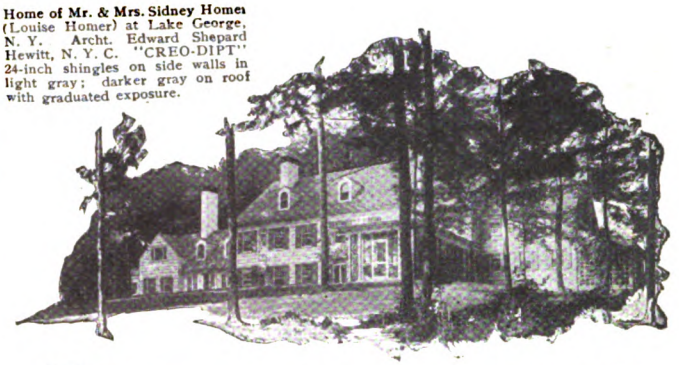
One good job leads to another

Rocbond dealers find that their *best selling* argument is to show a home built of Rocbond. The longer this home has been built, the more unanswerable is their sales argument. One good job enevitably leads to another.

Rocbond offers dealers everywhere an enviable opportunity for continuous profit the year 'round. For complete details address nearest plant.

The Rocbond Co.



PLANTS

Van Wert, Ohio—Cedar Rapids, Ia.—Harrisburg, Pa.

ROCBOND

EXTERIOR STUCCO

Home of Mr. & Mrs. Sidney Homer (Louise Homer) at Lake George, N. Y. Archt. Edward Shepard Hewitt, N. Y. C. "CREO-DIPT" 24-inch shingles on side walls in light gray; darker gray on roof with graduated exposure.

THE selection of proper building materials for side walls and roofs finally determines the character of your house.

Architects specify "CREO-DIPT" Stained Shingles for permanence and economy as well as for their adaptability to detail and the true artistic effects in plain or variegated colors.

The open market does not afford such quality in shingles or stains.

If you are going to build or remodel send 6 cents to cover postage for Portfolio of Fifty Large Photographs of Homes by prominent architects as well as Color Samples. Ask about our special Thatched "CREO-DIPT" Stained Shingles for Thatched roof effect; 24-inch "Dixie White" Side Walls for the true Colonial Effect.

New Tape Hook
Makes
Pullman
Sash Balance
The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

Free illustrated catalog, full of Modern Window Operating Information, sent on request.

ZIMMERMAN
PATENT
IRON BASE

The Zimmerman Base protects the base of the column from rot, preventing the wood soaking up water, besides giving protection from the usual wear and tear. It is the only base having center bearings. It lifts the column from 1¼ to 6" off the floor, allowing air to circulate between floor and column

Sizes from 4" to 16" ready for shipment. Special bases made to order with or without legs.

No. 4 SAW

W. F. & John Barnes Co.
71 Rudy St., Rockford, Ill.

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

50c WE ARE DOWN TO ABOUT 100 COPIES OF OUR 12 LESSON COURSE, **50c**

Better Business for Contractors

and to clear them off the shelves we offer the complete 12 Lesson Booklet Course at the purely nominal price of 50c., first come first served. Heretofore sold only with subscription to Building Age—never sold separately. Worth many dollars of any Building Contractor or Architect Builders' money, hundreds have written us of their worth, and some that they wouldn't part with the Course for $25 to $100, if they couldn't get another copy. See Table of Contents for what the Course contains. Send 50c. for the Complete Course of 12 pamphlets to Building Age and The Builders' Journal, 920 Broadway, N. Y.

COMPLETE TABLE OF CONTENTS

Lesson I
Discovering New Sources of Business
Confidence in Yourself
Fundamentals of the Contracting Business
Finding and Creating Business
Fires as a Source of Business
Capitalizing Social Life
Dividends from the Automobile Business
Finding Fill-in Work
Possibilities of Vacant Property
Developing Business Among Renters
Remodeling Dwelling House Interiors
Improvement of Dwelling House Exteriors
Grasping Opportunities You See
Using the Newspapers
Merchandising vs. Waiting

Lesson II
Securing New Clients
Finding Prospective Home Builders
Owners of Vacant Property
Savings Bank Deposits
Building and Loan Associations
Business and Professional Men
Selling Homes from Plans
Portfolio of Plans
Picking the Selling Points
Visualizing Your Work
Eliminate Trade Talk
Get the "Extras" in the Price
Emphasize the Unusual
The Prospect's Point of View
Simplifying the Housekeeping
The Woman's Influence
Value of Refinements

Lesson III
Building Regulation
Backing Service with Reputation
Public Confidence in Your Integrity
Keeping Appointments
Fulfilling Promises
Prompt Action Makes Friends
Extras as Practical Advertising
Practical Suggestions
Conflicts with Other Contractors
Impressions Made by Employes
Accuracy in Time Charges
Disloyal Employes
Supervising Employes
Satisfied Clients

Lesson IV
Advertising
The Potential Value of Advertising
Some Advertising Don'ts
Foundation for Advertising
The Desire for Business
Facilities for Expansion
Standards Set by Advertising
Your Field of Possibilities
A Definite Plan
Newspaper Advertising
Mailing Lists
Your Advertising Appropriation
Examples of Advertising Copy

Lesson V
Accurate Estimating
Time Schedule
Incomplete Plans and Specifications
Visualizing the Building
Visit the Site
Effect of Season
Lists of Materials
Checking the Estimate
Value of Records of Cost
Table of Percentage of Cost
Sectionalizing the Estimate
Placing the Workmen
Pitfalls of Labor Estimate
Contingency Provisions
Proper Equipment

Lesson VI
Reading Architectural Plans for Estimating
Visualizing the Building
Perspective Drawings as Sales Helps
Quick Methods of Approximate Estimating
Advantage of Keeping Cost Data
Estimating from Working Drawings
Importance of the Specification
Symbols and Codes in Plans
What Is a Set of Plans?
Importance of Dimension Lines
How to Change a Blue Print
Interpretation of Plans
Constructive Criticism
Giving the Plans the "Once Over"
Loose Leaf System in Estimating
Eliminate the "Forgotten" Items

Lesson VII
Keeping Costs Within the Estimate
Eliminating the Gamble
"Rule of Thumb" Fallacies
Experience vs. Knowledge
Think
The Value of Personal Contact
Cost Keeping
Labor Hours Better Than Labor Cost
Watchfulness
Schedule Progress in Advance
Waste Is a Crime
Get What You Buy
Defeat the Weather
Factory Basis of Contracting
The Will to Do

Lesson VIII
Labor Saving Equipment
Higher Price Levels
Education of the Public
Lower Unit Costs
Lower Cost in Lumber Production
Motor Trucks and Trailers
Material Handling Equipment
Mixing Concrete
Job Made vs. Shop Made
Portable Machinery
Finishing Floors
Excavating
Painting
Office Help
Shop and Yard
Preparing for the Future

The story of a HOT WATER FEED PIPE

In Three Parts

Part 1—Black Steel carried hot water at 200 degrees F. for eight years.
Worn down to threads; rough, pitted.

Part 2—Galvanized Genuine Wrought Iron carried hot water at 200 degrees F. for eight years.
Worn down to threads; projecting nodules of rust.

Part 3—Bridgeport Plumrite Brass Pipe carried hot water at 200 degrees F. for seven years.
No wear; surface smooth and clean.

Which is the best?
—which do you use?

CONSIDER the relative amounts of friction in these three pipes—the color of the water delivered by the steel and iron pipes and their probable condition three years later. If experience counts they will be worn out and replaced by Plumrite Brass Pipe.

Only in Plumrite Brass Pipe do you get the right combination of metals, evenly distributed, and correctly heat-treated to withstand severe service conditions.

Bridgeport Brass Co.

BRIDGEPORT BRASS COMPANY, Bridgeport, Conn.

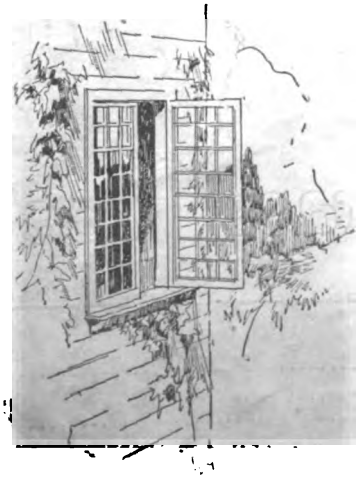
Use PLATE Glass

A mirror for balance

IS there a true lover of artistic achievement in home design who doesn't love the enchanting illusion of the mirrored door? First, the subterfuge of a puzzled architect, but now the artifice of artistic effect in planning interiors.

Seemingly something that it isn't, the mirrored door may add a witching air of mystery. It may hold the secret of balance essential to a restful room. It may compensate a window or a door, or break the tiresome space of blank walls.



A mirror is something more than merely an article of furniture to be hung up. Considered in the building of house or apartment, and in the hands of a skillful artist, it may play an important part in the architectural scheme.

Plate glass mirrors made in America are unsurpassed in brilliance, clearness and flawless perfection. They are made of selected plate glass silvered with the greatest care by skillful workmen.

Specify plate glass mirrors in bedroom doors, closet doors, bathroom doors, medicine-cabinet doors, over the mantel and paneled French doors. If properly installed, built-in plate glass mirrors will last the life of a house without discoloration. They are made for permanency.

A well-designed house, the pride of its owner and builder, deserves nothing less than plate glass in its windows. Its beautifully polished surfaces and crystal clearness make all the difference in the world in the external appearance of the house. Yet the difference in cost between plate glass and common sheet glass is surprisingly small. Get comparative figures from any glazing contractor or builder.

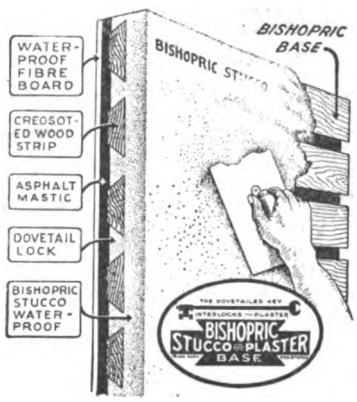
Acknowledged the BEST:

BISHOPRIC stands for and is acknowledged the best Stucco and Stucco and Plaster Base on the market. The leading architects recommend BISHOPRIC, the most prominent builders and contractors use BISHOPRIC, and the wide-awake dealers always carry large stocks of BISHOPRIC to meet the ever increasing demand. BISHOPRIC meets the consumer and builder's needs.

Bishopric Stucco and Bishopric Base



provide an ideal interior and exterior wall for all time and clime

Bishopric Stucco

Tensil strength tests 1,150 lbs. per square inch, insuring lasting durability.

GUARANTEED
Water-proof
Non-Shrinkable
Fire-proof

Beautiful
Durable
Economical

Bishopric Base

Damp-proof
Fire-proof
Vermin-proof
Sound-deadening
Insulating

BISHOPRIC Stucco is shipped in air-tight metal drums (100 lbs. per drum), thus preserving the material in the warehouse and on the job until it is used, regardless of weather conditions, and provides against waste or deterioration.

These BISHOPRIC air-tight metal drums, attractively lithographed, provide most effective advertising value, denoting the superior quality of the product therein.

BISHOPRIC STUCCO is furnished in Alba White, Shell Pink, Sienna Buff, Ivoril Cream, Granistone Gray, French Gray, or any special color one may desire.

BISHOPRIC STUCCO can be finished with stipple, spatter-dash or rough cast finish—therefore many harmonizing effects may be obtained.

Write for booklet, "For All Time and Clime." Beautifully illustrated—working details—specifications. Let us solve your building problems.

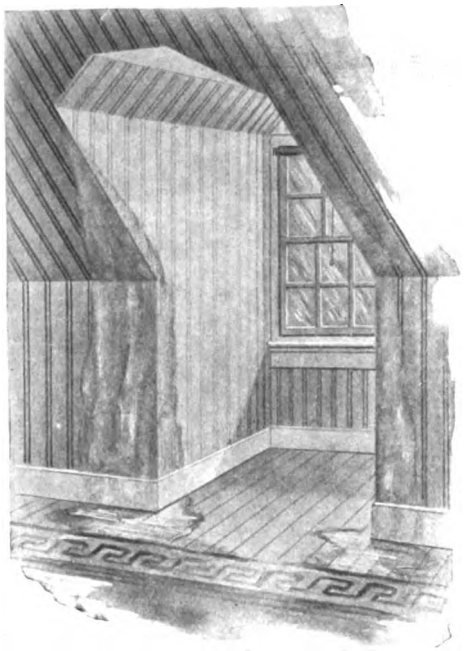
books—

for Constant Reference

Manual of Face Brick Construction
The Home of Beauty
Face Brick Bungalow and Small House Plans

CONTRACTORS, builders, material dealers and others interested in the building industry, will have many occasions to refer to the above three books of house designs and construction data. ¶These booklets, together with "The Story of Brick," will be a great help to you in selling more homes. They are chock-full of authoritative information on Face Brick construction. They present nearly two hundred artistic and practical designs for homes for which full size working drawings and masonry material surveys may be obtained at nominal prices.

The Trend of Construction is Toward FACE BRICK



Face Brick endows the home with qualities which home builders covet, not obtainable with any other material — and the building public is fast realizing this fact. The unmatched beauty of the everlasting colors, the infinite possibilities for individualism from bonds, joints, and mortar colors, the great economies effected by the permanence, the fire-safety, the practical wiping-out of repair costs — all are factors being told about in national advertising and editorial articles which are creating a broader demand for Face Brick homes.

To assure every reader of this magazine having these books on hand for constant reference, we will send all the above books at the Special Group Price of $2.00. A copy of "The Story of Brick" will also be included. Address Dept. B. 12

—these leaks are preventable

Every rain storm causes thousands of dollars of damage to walls, floors and furniture in buildings where unsuitable material has been used for valleys, gutters or flashings.

But trouble of this character can be permanently prevented by using the right kind of material for these important places.

A century's experience has proven the value of

TARGET AND ARROW

Look for this Trade ➵ *Mark on every Sheet*

ROOFING TIN

(Prior to 1905 called Taylor's "Old Style)

the old reliable hand-made, hand-dipped tin, made by an old Welsh process in which each sheet is *repeatedly soaked and dipped in pots of boiling palm oil and molten metal consuming 35 minutes' time to coat each sheet*, and insuring an amalgamation of the coating with the base plate that cannot be done in any other way.

Records show that Target and Arrow, used for valleys, gutters and flashings, will outlast the roof itself—unless the whole roof is of Target and Arrow. Yet the increase in cost, due to the use of Target and Arrow, only amounts to a very few dollars—an insignificant sum when compared to the total cost of the building.

Send for "The Achilles Heels of a Building," a graphic chart showing where the vital spots in a roof occur and explaining why Target and Arrow assures permanent protection to these important places.

Men and women who buy houses are now, more than ever, demanding features that will make them real homes

Their home must be wired for easy house work

HOME buyers know what they want these days. The husband looks around for the convenience outlet that is going to light his reading-chair and cool his evenings with a whirling fan.

And as for the wife—the house is sold if she can picture, in her mind's eye, just where she is going to put the washing machine; and just where the iron, the percolator, the vacuum cleaner, and toaster can be connected.

Both look for complete switch control all over the house.

Take advantage of the buyer's desire for electrical convenience. Houses sell more readily; owners are more satisfied; the builder's reputation is enhanced.

G-E national advertising is creating a demand for the comforts and conveniences of completely wired homes. Builders can profitably capitalize this demand.

Three Indianapolis Homes

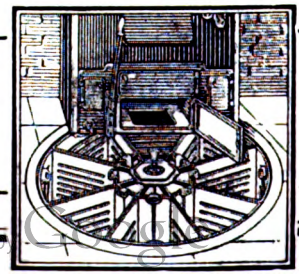
Protected Against Ash-Dust

These three splendid homes point the trend of the times in construction and equipment that provide the greatest comfort, convenience and sanitation.

Each of them has been protected against ash dust nuisance by the installation of the

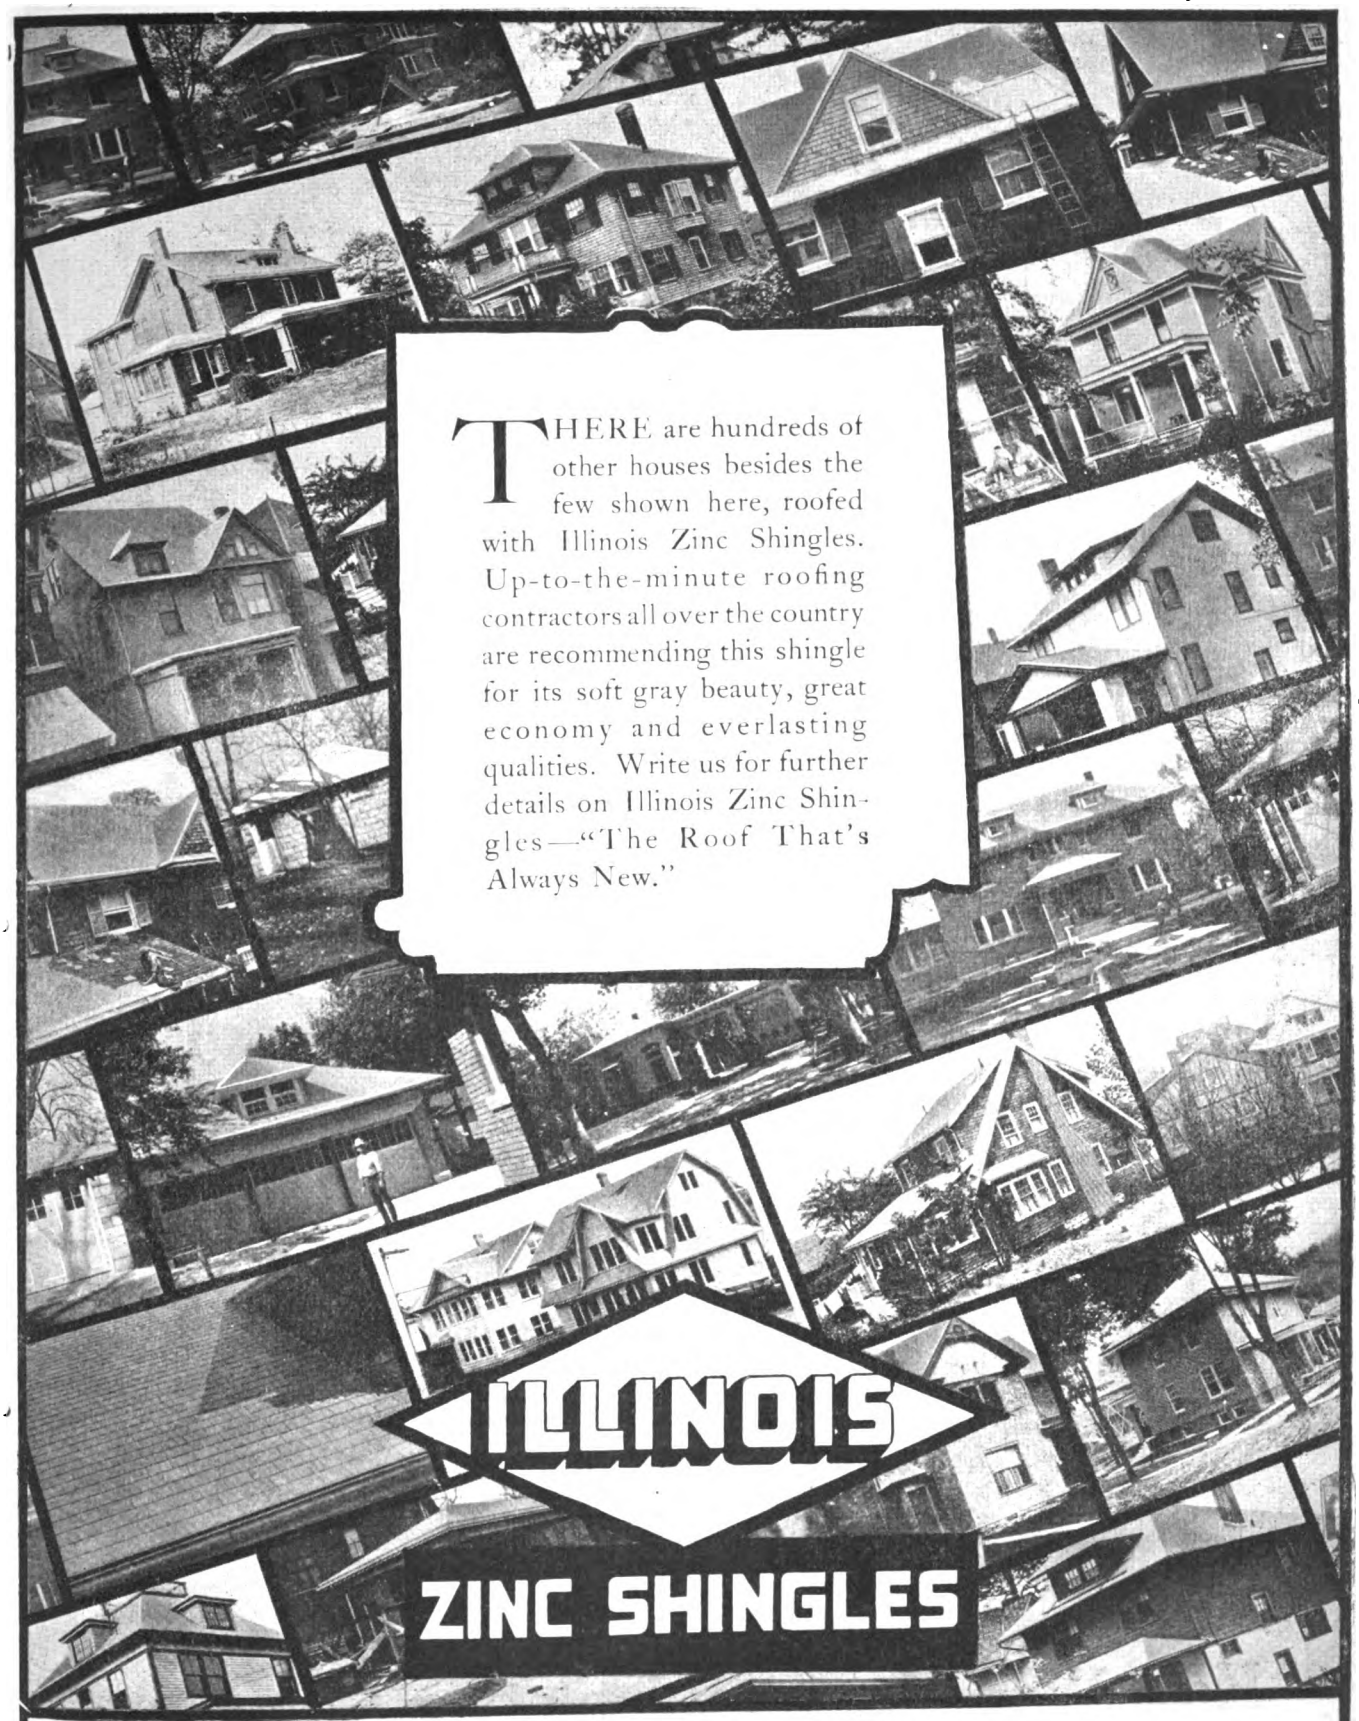
Sharp Rotary Ash Receiver

This shows how the Sharp Rotary Ash Receiver is installed and used. It consists of a set of five, eight or twelve rugged steel cans, mounted on a revolving frame beneath the heater. There is always a can under the ash-pit. When it is filled, simply turn another into place. Easy to operate. Nothing to get out of order.



Every year an increasing number of contractors and builders install the Sharp Rotary Ash Receiver as standard equipment. Each year this system of ash disposal wins new friends among home builders and owners.

There is no substitute for it because there is no other device that so completely eliminates the nuisance and labor connected with ordinary methods of ash disposal.



Contractors and builders—Write for a copy of our booklet which describes the system and shows illustrations of many installations.

The

HESS
Welded Steel Furnace

presents features of excellence not found, **in combination,** in any other furnace, and the result is a heater which has no equal for economy, ease of operation, freedom from gas and dirt, and in its adaptability to all classes of fuel.

The welded seams of the heavy steel radiator, enclosing fire box, grates and ash pit, are absolutely and permanently proof against leakage, **and are so guaranteed, as long as the furnace shall stand.** No cemented joints here—nor castings to crack and warp.

Its durability is **guaranteed** for a period longer than usually guaranteed by makers of cast furnaces.

It is **simple;** nothing to get out of order, and grates and fire box can be replaced without dismantling the heater or taking down pipes, etc., therefore at much less expense than in cast iron furnaces. It can be installed by any handy man.

It **burns anything**—hard or soft coal, wood, coke lignite or slack. All types of Oil burners are successful in it, and no escape of odors from liquid fuel is possible.

It is sold direct from our factory to you—with free plan service—illustrated directions for installing—loan of tools—and positive guarantee of success. Thousands in use everywhere (12,000 in Chicago alone). Send for 48-page illustrated booklet and terms to contractors and builders.

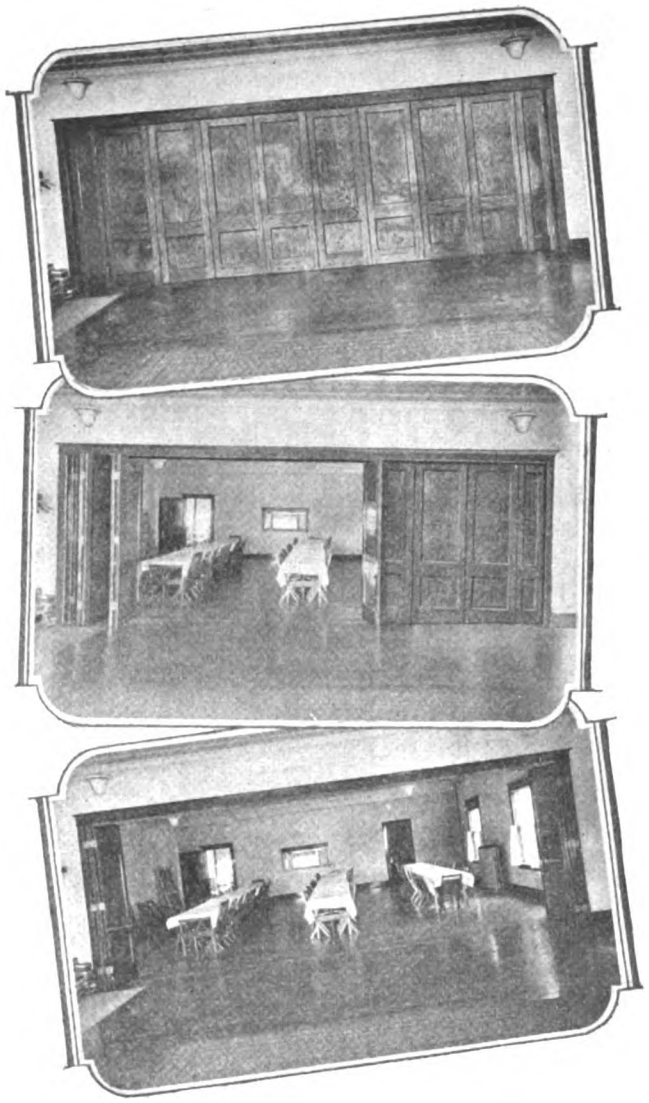
Richards-Wilcox

Sliding Door Hardware



Makes Floor Space Do Double Duty

Churches, schools and other public buildings are made far more useful to the community when movable partitions are installed. In buildings so equipped, two or more small rooms may instantly be converted into one large room, making the same floor space do double duty.

R-W Accordion Door Hardware has long been acknowledged the best for use in the installation of folding partitions. Builders will find our free Engineering Service of great assistance in drawing up plans and specifications covering installations of this character.

For large openings, such as the one illustrated, the R-W accordion door partition is most desirable. The doors operate smoothly, fold compactly against the wall when opened, and never stick or sag.

For small openings the R-W parallel door partition is recommended. In this partition the doors slide parallel to each other, a separate track being provided for each.

A typical installation of Richards-Wilcox Accordion Door Hardware

Our free service to Builders includes the furnishing of illustrations, special plans, and detailed instructions. Write today for free particulars of this helpful service, as well as for a copy of Catalog J-17 for your files. Richards-Wilcox Accordion, Parallel and Vanishing Door Hardware may be obtained from any one of the branches listed below.

Window Glass Grading Depends on Standards

FIRST, second and third quality are relative terms which depend on the standards used in grading.

The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

Keep Out Wintery Winds

PROTECT the home against the searching winds of winter; frost does not form on windows fitted with storm sash. The double panes keep the cold out and the heat in, and quickly pay for themselves in the saving of fuel.

Storm sash can be installed to match the windows of your house, and clear vision as well as comfort is assured if you make sure that the finest glass obtainable is used.

"Nothing but Sheetrock for us"

West Elmhurst, Illinois
July 1, 1922

UNITED STATES GYPSUM CO.
205 West Monroe St.,
Chicago, Ill.

Gentlemen: As a builder with long experience, I make it my business to carefully investigate everything that comes on the market that stands for progress. Sheetrock is head and shoulders above anything in the line of wall covering, that, I am sure of. My wife is very much interested in up-to-date homes and she would consent to nothing but Sheetrock on our new home we are putting up. Nothing but Sheetrock for our buildings. That is what we think of it.

Yours with good wishes,
JOHN J. HUMPHREY.

Sheetrock walls and ceilings insure satisfied customers—customers who are sure to tell others of your dependable work. Sheetrock, being cast from pure gypsum plaster, will not warp or buckle. It will not burn. With Sheetrock Finisher used at the joints it makes smooth, permanent surfaces which take and hold any decoration. You will find it profitable to use Sheetrock on all your remodeling and repair jobs as well as in new construction. Let us send you a sample of Sheetrock and details of a plan that will help you land the Sheetrock business in your locality. Tear off and mail the attached coupon today!

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

Consider the interior

WOULD you install concealed plumbing which you know will leak? Do you install concealed plumbing which *may* leak?—and which records show, does leak often enough to make its use a decided risk?

Bridgeport Plumrite Brass Pipe is still serving after 20 to 30 years as original water pipe installations in buildings—installations which have not cost one cent for repairs. Some of the buildings have been altered for other purposes but the water pipes were either undisturbed or used over again—Plumrite showed no corrosion or season cracking. In other buildings Plumrite is replacing materials which have failed after 5 to 10 years—and such replacements always cost many times the small saving apparently effected by not installing Plumrite in the beginning.

By specifying Plumrite especially in the beginning, you are assuring yourself of a material that will set your mind at ease regarding your water service piping. Without leaks, without rust, without expense—Plumrite lasts as long as the building.

Bridgeport

BRIDGEPORT BRASS CO.
Bridgeport, Connecticut

Bridgeport Plumrite *The Improved* Brass Pipe

Who Purchases Hardware for the Garage You Plan?

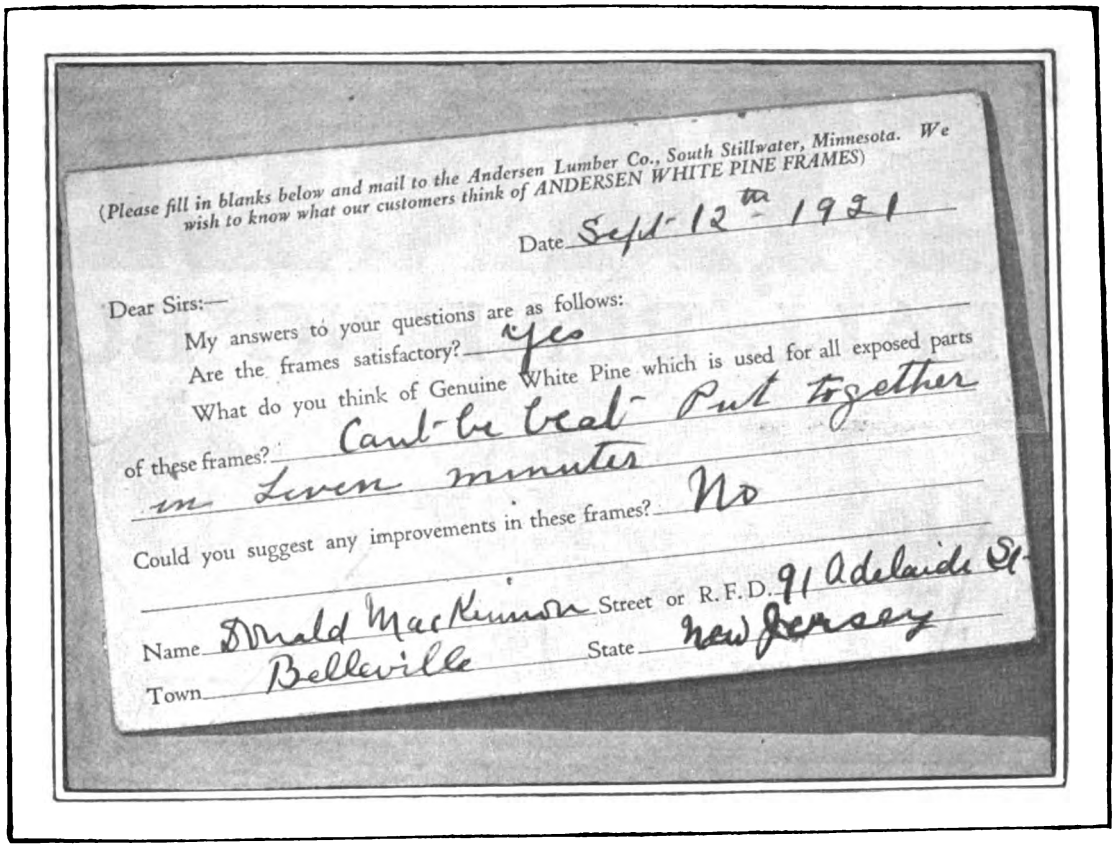
THE selection of the hardware for erecting garage doors should not be left to a guessing contest between the man who will own the garage and a hardware dealer. This important item in garage construction should be clearly specified on the plan.

If you have that interesting little book, "McKinney Complete Garage Sets," on your desk you can easily control the selection of the right kind of hardware.

This booklet is filled with illustrations and descriptions of various types of entrances, swinging, sliding-folding and around-the-corner doors for every entrance width and space allowance. It will help you in choosing a good, serviceable entrance. Beside each door illustrated is shown a complete set of hardware needed for its erection. Simple working plans for the use of the hardware are shown also.

Each set is packed complete in a single box. Builders as well as architects will be glad to know that garage door hardware may be purchased this way. There is nothing missing when the time comes to hang the door. And the hardware is always good—McKinney made. The McKinney Complete Set for any type of entrance should be purchased by the number shown in the booklet.

Send for this booklet. It will interest builders, too, who are often confronted with problems of garage building and hardware selection.



McKINNEY
Hinges and Butts and Hardware

A Frame Up in 10 Minutes

IT TAKES just 10 minutes for an average carpenter to nail up an Andersen Standard Window Frame. Many men can do it in seven minutes. We've heard of some that have done it in three.

An ordinary frame is made up of 57 separate parts. Andersen Frames combine these 57 parts into seven units. These seven units are then shipped in two compact plainly marked bundles, each weighing less than 20 pounds.

The elimination of 50 parts in an Andersen Frame is a direct saving of time, labor and money in the assembling of the complete frame. Using only a hammer, these 7 units can now be nailed up in 10 minutes or less forming a frame complete with pockets and pulleys in place.

Any dealer in Andersen Standard White Pine Frames can supply immediately any one of 121 different sizes from a small stock of only 11 standard sizes. This is done by simply interchanging heights and widths.

All exposed portions of Andersen Standard Frames are of genuine White Pine. White Pine has demonstrated its ability to endure for centuries without changing with time or weather. Windows slide easily because Andersen Standard Frames are accurately made; the use of White Pine keeps them smooth running for all time.

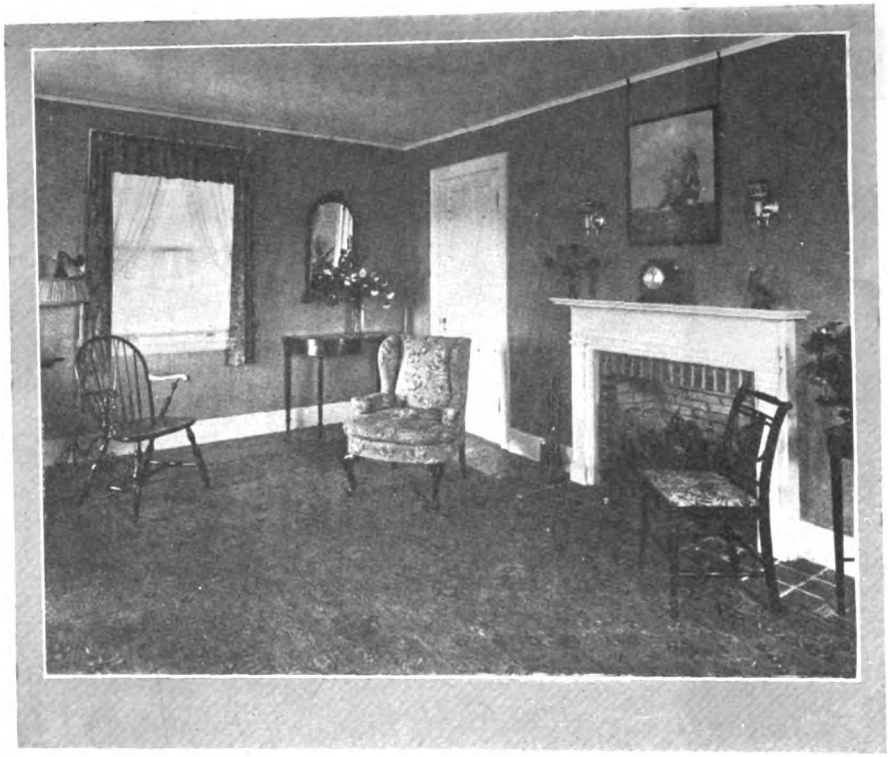
BUILDING AGE

AND

THE BUILDERS' JOURNAL

NEW YORK, DECEMBER, 1922

Creating a Desire *for* Better Building *by* Erecting Model Homes



EARNEST efforts are being made by various groups of builders and different organizations to have better homes, both in design and construction. A rather interesting effort along this line was recently successfully completed at Larchmont Gardens, N. Y. A "Model Home" was erected and this was completed by noon on October 9th and thrown open for public inspection. From October 9th to 15th was "Better Homes Week" in New York, and that is why October 9th was selected for the opening date.

The building industry is receiving a good deal of publicity in various newspapers, magazines, books, etc., all tending to educate the public for the better things for buildings that can be had. More attention is now being paid to conveniences, rather than to mere size and this results in more comfort at less expense.

Sometime ago a design of a house was published in the New York "Tribune" which was furnished by the Home Owners' Serv-

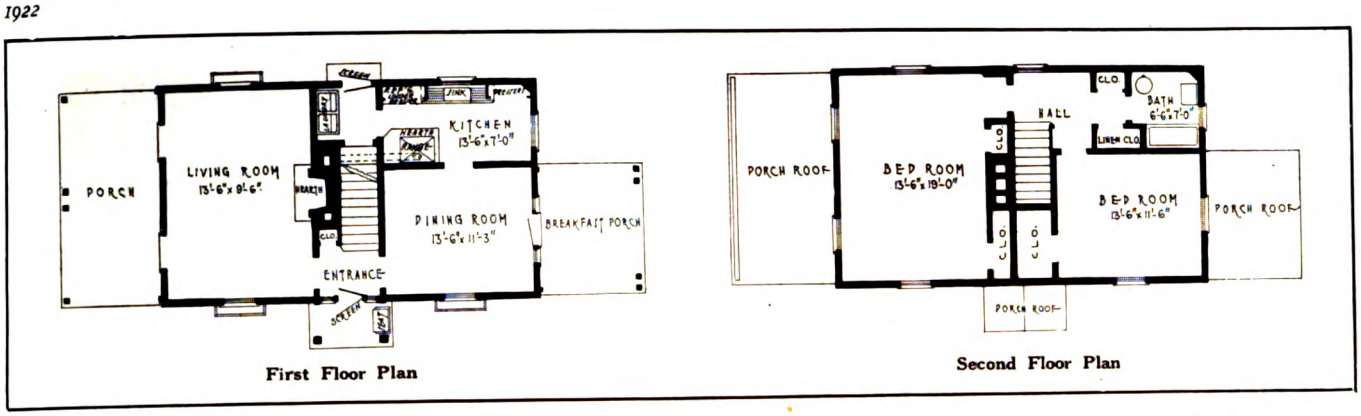
Digitized by Google

ice Institute, of New York, having been designed by John Floyd Yewell, architect. The thought then occurred that to build a house as a demonstration of what could be done and keep accurate records of the cost would be something practical and would create quite a good deal of interest amongst intending home owners. Therefore, with the added co-operation of the Empire Home Building Association, of New York, as builders, the project was started, and brought to a successful finish, as evidenced in these pictures.

The actual construction of the model house was begun at Larchmont Gardens, New York, on August 1, and on October 11 it was completed in every detail within and without and was ready for immediate occupancy. The house cost complete $8,842.06, including the builder's profit. The various items entering into this amount are given in a separate table in detail form. The cost of the land and the landscaping brought the total cost to $11,896.32.

For the above amount this model home represented high standards of construction and was what its builders intended that it should be —a home of trimness and stability. It is the proof of its sponsors that the Larchmont Gardens House is as near to perfect as could be obtained for the American small home of today. This house is located at the corner of Harmon Drive and Weaver Street, Larchmont Gardens, New York, within forty minutes' ride of the Grand Central Station in New York.

The design selected won first prize in the recent National Small House Competition. It was also selected by the National Lumber Manufacturers' Association for exposition in model form at different expositions.



The plan of the model house as given here includes living room, dining room and kitchen on the first floor and two porches, besides the entry porch. The smaller porch off the dining room can be used as an outside dining room. A convenient arrangement is having the laundry tubs in the back entry. There are two bedrooms of good size on the second floor, together with bathroom and ample closet room.

We give in this article several views of the interior, showing the living room, dining room, and one bedroom. The house is 20 ft. x 34 ft. 6 in., not including the porches. As built, the cubical contents is 20,322 cu. ft. The architect estimated the cost of construction at $8,000, and the actual figures come very close to this, which proves the correctness of the estimate.

The house was furnished by several prominent house furnishing establishments of New York. In the actual construction of the house, many well-known adver-

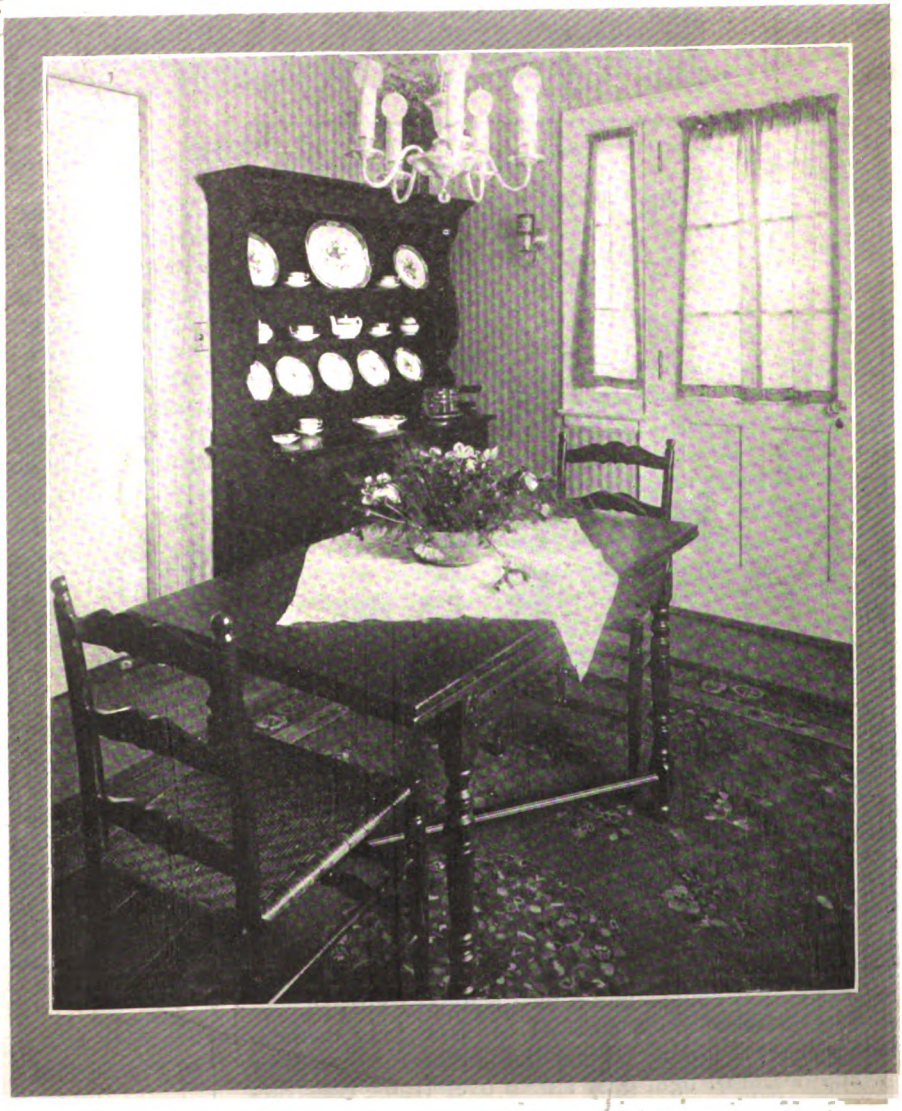
TOTAL	$8,047.33	100.0
CONTRACTOR'S PROFIT—10%	804.73	
TOTAL INCLUDING CONTRACTOR'S PROFIT	$8,852.06	
COST per square foot (692 Square Feet)	$11.63	
COST per cubic foot (20,311 Cubic Feet)	39.6c.	

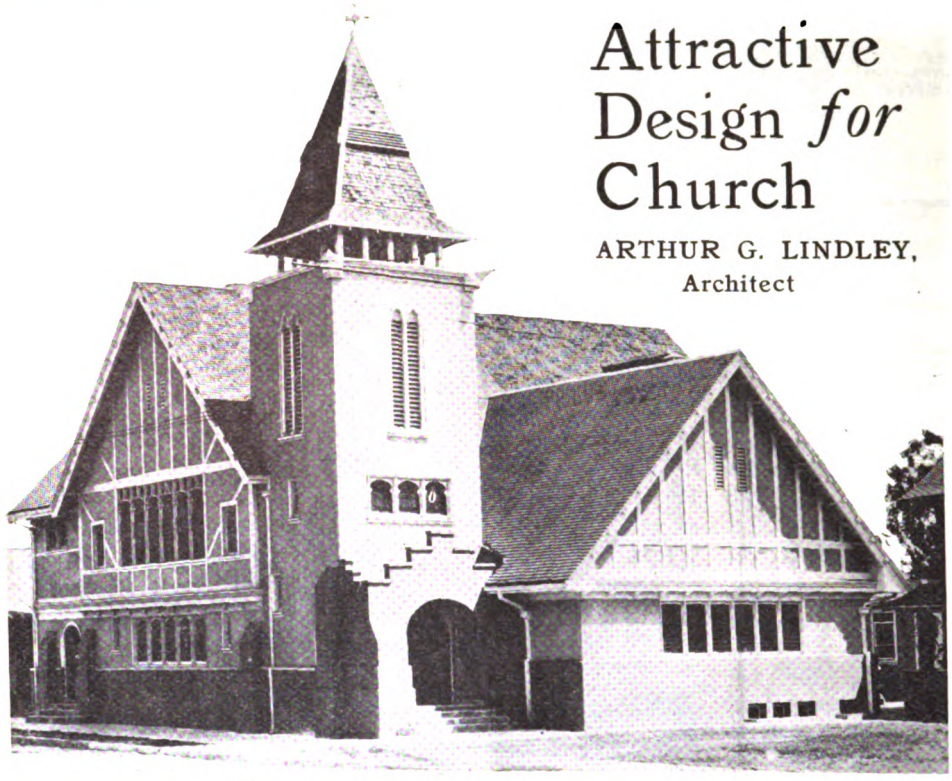


tised building materials were used in its erection and equipment, but everything was bought at regular market price, so as to obtain actual average costs.

When the house was completed, advertisements in different papers called attention to it, and during the first 13 days that the house was open, more than 6,000 people visited it and on the final day of "Better Homes Week" 1,200 people were admitted. The verdict of the thousands who visited the house was that this interesting experiment in home building was a huge success.

The construction of the house was undertaken to determine the actual present-day building costs and conditions. Mere cheapness of construction was not sought. The thought uppermost in the minds of all co-operating was to obtain the best material at the best price and the whole-hearted co-operation of the various building crafts and dealers to obtain a really good job.

Of course, after the house has served its demonstration purpose it will be sold. Through the same parties co-operating again, the experiment will be repeated a number of times with various designs.



The idea of this educational campaign is to determine the variance in costs of different forms of construction and erected in different localities. By this means, it is believed that a great amount of actual first-hand information for the prospective home builder will be gathered. Of course, through the newspaper sponsoring this idea, detailed accounts of the progress of each house will be published, so as to keep the public interest keyed up. All this will tend to create the desire for better home building.

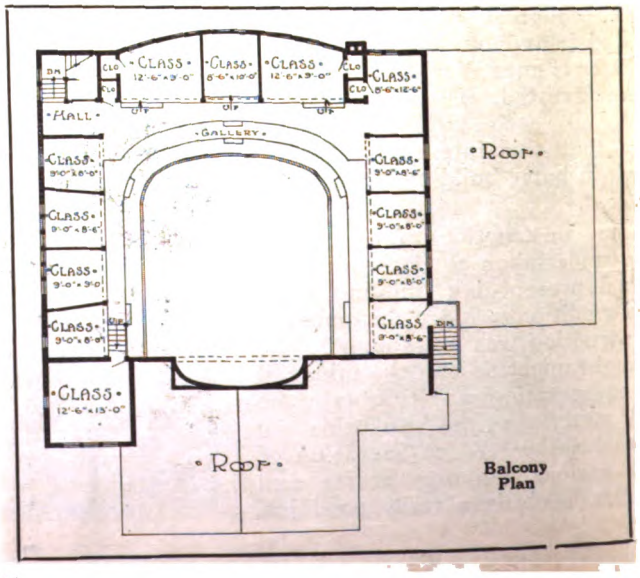
Attractive Design *for* Church

ARTHUR G. LINDLEY,
Architect



Floor Plan

OF quite popular style in exterior design the little church shown in the accompanying illustration shows distinctiveness in the paneled treatment of its outside walls, and possesses an interior arrangement that is exceptionally practical, commodious and convenient. It has a total seating capacity within view of the pulpit—in main auditorium, choir, gallery and Sunday School department—of about 450. In addition to these divisions, it possesses a large primary department, pastor's study, ladies' parlor, thirteen separate class rooms, and a well equipped kitchen.

The exterior finish consists of dark gray cement-stucco over brick up to the bottom of the first-floor windows and of light gray stucco over frame construction from this point upward. The interior is finished in Oregon pine woodwork throughout, which in all divisions, excepting the kitchen, is in old ivory enamel. The general effect is therefore particularly pleasing, and the light woodwork also naturally helps to make the interior bright and cheerful. The pews consist of opera chairs in natural birch, and the pulpit and choir furniture is selected to match the pews. The walls are plastered and tinted. The woodwork of the kitchen is in white enamel, and the walls here are white to correspond. All floors are of Oregon pine. This little church is located in Los Angeles, California, and is the home of the Pico Heights Methodist Episcopal Church.

Preventing Unnecessary Loss *of* Heat *by* Weatherproofing Houses

Some Suggestions That Builders Can Make When Customers Complain of Having a Cold House

BUILDERS are often called upon by people, especially those who have just bought a house, asking them what can be done, as the house is so cold and they seem to burn a whole lot of coal, more than seems necessary to heat such a small house, etc.

In nine cases out of ten, the builder finds on examination that the house is poorly constructed. The party who erected the house, built it as cheaply as possible. It looks like a real house from the outside and inside, but there is something lacking, and that something is what somebody thought they could do without, as it seemed such unnecessary expense.

Good Construction Pays

If it is a home builder that is doing the complaining, he, of course, realizes his mistake and regrets that he did not spend the small difference so as to get good construction. He is spending more than the difference in extra coal, vainly trying to obtain a little heat. The coal he burn is trying to heat.

The United States Department of Commerce, through its Division of Building and Housing, is sending out some useful suggestions that will do for builders to pass on to their customers when they are asked for advice of what to do for a cold house.

Consider Heat Saving

The saving of fuel was not seriously considered in the building of most houses. Many were shabbily built, and permit too much cold air to enter the house. Only a few years ago fuel was cheap and few bothered about saving it. While it is true that most attention should be given to the proper building of new houses, much can be done to prevent the loss of heat in poorly built and run-down houses. To save heat now not only helps to meet the present coal shortage, but it will teach those who plan to build new houses the value of weatherproofing and good construction. Our own comfort and that of our neighbors demands that we obtain the most heat from our coal without waste and that we try to reduce our requirements as much as possible.

Consider Ventilation

All houses should be well ventilated, but this does not mean that unregulated drafts of cold air should sweep through the house at all times. It should also be remembered that in cold weather the warm air is continually escaping, and as it passes through holes and cracks in the walls it is at once replaced by the cold out-of-doors air.

CRACKS around the windows and doors, broken window panes, and unprotected heating pipes indicate that fuel is being wasted. If one family wastes fuel during the coal shortage, another may suffer, for there is not enough coal to supply all with their usual amounts this winter.

The first duty of every one is to see what savings can be effected. Many suggestions appear from time to time as to how to save coal; some are excellent and can be followed easily and at little expense; while others may involve an expenditure which cannot be met. However, broken window panes should be replaced and the worst cracks around windows and doors closed up wherever possible for this cost is less than the cost of the extra coal that will otherwise be burned. Inability to pay for expensive improvements is no excuse for not making those which can be paid for out of the saving of fuel within the next year or two.

Direct Coal Saving

How much coal can be saved? If every family would save one ton of coal it would mean a saving of millions of dollars. During the present coal shortage the coal thus saved might be distributed among those who otherwise would be unable to obtain sufficient fuel, and perhaps keep many from suffering.

Millions of tons of coal can be saved this winter by the making of slight repairs on houses and the exercising of a little more care in burning coal.

Repair Your House

Some home owners have a reliable repair man look over their houses in the same way that they have the dentist look over their teeth. The owner can then decide what repairs can be undertaken. Much of the work he can do himself. The work he is able to pay for now can be done immediately.

In making an inspection the owner should examine the windows, doors, transoms and floors. He should also inspect the attic and the basement, examine the damper in the fireplace, and cracks under the baseboards. It might be well for him to start with the windows.

Windows

MUCH cold air comes in around windows or through them. Windows are often poorly fitted into the openings. Occasionally it is possible to see between the brick wall and the window casing. Window sash are rarely fitted snugly, and cold air enters freely around the sash. It is not uncommon to find a wide crack between the upper and lower sash. Such cracks can sometimes be closed by means of the sash lock. The use of weatherstripping will take care of most of the cracks around a window, and the saving of coal will be well worth while in a large number of houses.

It is well to go over all windows to see that putty is in place around the panes. A poor quality of putty is used in some of our houses, and where it has fallen off air enters around the glass.

That broken window pane in the basement should be replaced as promptly as if it were in the living room. Broken window panes in a

Digitized by Google

basement where heating and plumbing pipes are exposed waste fuel. The attic windows should also be examined.

In cold climates double or storm windows are very good to keep the house from getting cold. The air space between the two windows prevents the rapid passing of heat to the outside. Storm windows might be put over the windows on the side of the house facing the prevailing wind, even though they could not be afforded for all windows.

Doors

Doors are often poorly fitted, and air passes freely both above and below them. The crack below the door is often so large that cold air sweeps across the floor, keeping the room cold. A strip of cloth or felt nailed to the floor or to the door will keep out much of the cold. Hinges are not always well fitted into the door and frame, allowing much cold air to enter the house. This can be remedied by resetting the hinges. Transoms over doors should be examined, for they are not always snug fitting.

Storm doors involve some expense, but in many cases it is profitable to install one on the windward side of the house. It will prevent the inrush of cold air. The storm door, as well as the storm window, is used chiefly in the colder climate.

Floors and Baseboards

While double floors are becoming more common there are many houses in which a single floor is nailed direct to the joists. If tongue and groove flooring is used there is no draft, but there are floors with cracks between the boards. If there is no basement under this part of the house cold air will enter. Even though the floor be good, it does not give as much protection as a double floor.

In houses where there is no firestopping between the studs of the walls, cold air can pass freely from the attic to the basement. In such houses, if the plaster goes down only a little below the top of the baseboard, much air enters the rooms under the baseboards if they do not fit closely. Such cracks should be closed.

Basements

In some houses the warm air can pass from the basement upward between the studs. If such is the case it is advisable to close up the openings between the joists with old brick, or some other material. Basement doors and windows should be examined and made as tight as those in the rest of the house. Cold air entering the basement cools the heating pipes and furnace and the floor above.

The covering of the furnace and of steam and hot water heating pipes, especially in the basement, is advisable. Although insulation may be expensive it is well to consider the cost of fuel and saving that can be effected.

SOME important points to be considered to make a house weatherproof.

Good construction is essential.

Consider fuel saving when building.

Avoid cracks. Be sure to fill any around door and window openings.

Weatherstrips around doors and windows will save lots of heat.

Storm sash and storm doors aid a lot.

Joints should be tight between floor and baseboard.

Close up every possible opening between studs, etc.

Cover all heating pipes in exposed position.

Attics

Attics are usually cold and give plenty of chance for cold air to enter the house and for warm air to escape. Sometimes shingles are nailed direct to cleats and the out-door air enters between the cleats at the ends. Again free passage-ways for air in the walls, between the attic and the basement, keep this cold air in circulation. If the openings between the cleat ends are closed cold air may be kept out. The windows in the attic should receive as much attention as those in other parts of the house. Dead air in an attic keeps the lower stories warmer, while the direct opposite is the case with currents of air. The currents must be avoided, and this is accomplished if the house is properly firestopped.

Personal Attention

There are things that can be done to keep the house comfortable that do not cost money, but require some time and attention.

The locking of windows when closed, the drawing down of shades, the turning off of heat in an unused room or at night when windows are open, periodical care of heating equipment, all require a little time and thought, but will save heat. This means the saving of fuel for the nation, and lessened household expense. Special attention should be given to ventilation.

Thermometers are better gauges of heat than are the various members of a family, each with his own idea of warmth. Sixty-eight to seventy degrees is the normal healthful temperature for rooms in which people live.

To throw bed room windows wide open on cold nights and leave the heat turned on results in much waste of coal. It is often best to turn off the heat. Good ventilation is possible without large openings. In the rest of the house it often is advisable not only to close windows but also blinds and shades. Merely pulling down shades makes a material difference in the temperature of a room.

Chimneys, Stoves, Fireplaces, Etc.

Chimneys and stove pipes should be examined and cleaned out whenever necessary. Chimneys and stove pipes are intended to serve as flues, and the clogging of them affects the proper burning of the fuel. When fireplaces and stoves are not in use the dampers should be closed.

The same care should be given to the heating plant as to one's automobile. If the furnace or stove is out of order fuel will be wasted just as gasoline is wasted when the automobile is out of repair. If cracks are found in the furnace it needs prompt attention. A cracked or broken grate should be repaired or replaced.

Advice as to the most efficient and economical use of fuel in various types of heating plants can be obtained in many cases from the makers of the plants.

There are few householders so situated that they can not save money by attention to weatherproofing and stopping heat losses. At the same time, they will be doing a good turn for their neighbors by saving fuel.

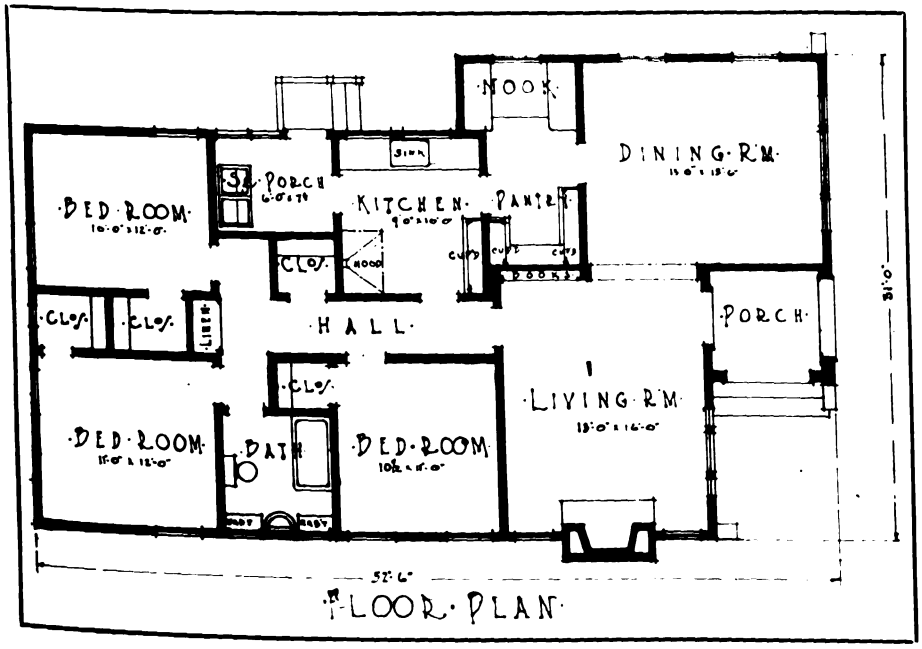
Charming Bungalow Design



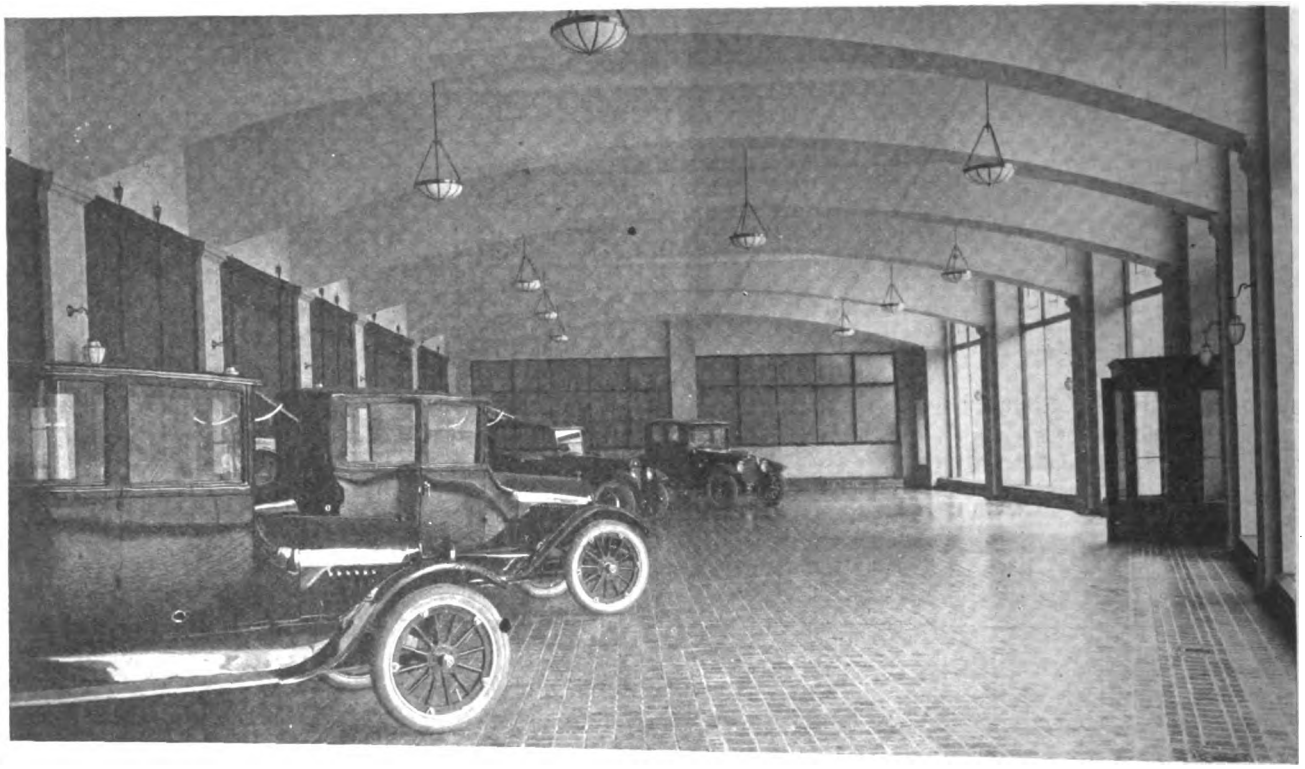
Six Rooms of Large Size Conveniently Arranged

By CHARLES ALMA BYERS

THE little house shown above, built in southern California, represents a charming combination of the English-cottage and Belgian styles of domestic architecture, with certain modifying details that doubtless come largely from the California bungalow. As a result, it both presents an exterior that is unusually pleasing and attractive and possesses an interior that offers the maximum of convenience and livability.

The outside walls are of greenish-cream cement-stucco over frame construction, and the trimming is done in a somewhat deeper shade of the same color combination. The roof, characterized by clipped gable peaks and by doubling each fifth course of shingles, is dark green, and the small entrance porch, which is entered from the side by way of the automobile driveway, is floored with light red cement. And especially deserving of notice, as tending to materially improve the appearance from the street, are the two groups of long casement windows on the front, with their decoratively scrolled tops—which windows also naturally help to give natural light and charm to the two front rooms.

It is in the designing of the interior that the influence of the California bungalow is especially discernible. Referring to the accompanying floor plan, it will be seen that there are particularly convenient connections, and, further, that there is an exceptionally good arrangement of closets and built-in features.



FLOOR PLAN

Not only does each of the three bedrooms, for instance, possess a large closet, but off the connecting hall is another roomy closet, while the built-in features include a book-case in the living room, two small drawer and shelf cabinets in the bath room, a linen cabinet in the hall, and in the kitchen are the usual conveniences in the way of cupboards, sink and so forth.

The woodwork finish in the living room and dining room consists of old ivory with mahogany trim, in the hall and three bedrooms of old ivory alone, and in the bathroom and kitchen of white enamel. Hardwood floors prevail throughout, except in the kitchen and bathroom, the latter of which has tile flooring. The walls of the kitchen and bathroom are finished, in high wainscoting effect, with a smooth, hard plaster coat, which is enameled like the woodwork, and the walls of the other rooms are papered. The fireplace in the living room is faced with dull-toned tile, finished with a wood mantel, and has a tile hearth.

The house has no basement or cellar, but is equipped with built-in gas radiators. It is located in Los Angeles, California, and was designed by William Barber and J. A. Larralde, architects, of that city.

An Attractive Show Room of this Modern

THOMPSON & BINGER INC., Engineers and Contractors

BUILDING a large garage, capable of accommodating 300 cars, was the accomplishment by the builders for the Wilmington Auto Company, of Wilmington, Del. This garage presents some unusual features of design and construction, and a description of same may prove of considerable interest to the reader.

In addition to garage facilities, the Wilmington Auto Company also handles new cars, second-hand cars, tractors, accessories, and does repairing and painting work, and it was necessary to provide adequate space for each department.

The owners desired to have an attractive showroom, and what is believed to be one of the largest showrooms in the country was designed to house the new-car department. This showroom has the shape shown on the accompanying plan, and it is worthy of note that the entire area is absolutely free from any obstructions. We believe this to be rather

FIRST FLOOR PLAN

A large, attractive show room occupies the entire front of 134 feet. The entire depth of the building being 288 feet. At the rear the width is 72 feet. For the convenience of patrons, wash and rest rooms adjacent to the showroom were provided for men and women, this being a very attractive feature particularly appreciated by transients. A large door, 8 feet wide, opens into the garage proper, and also permits the bringing of cars into the showroom without difficulty.

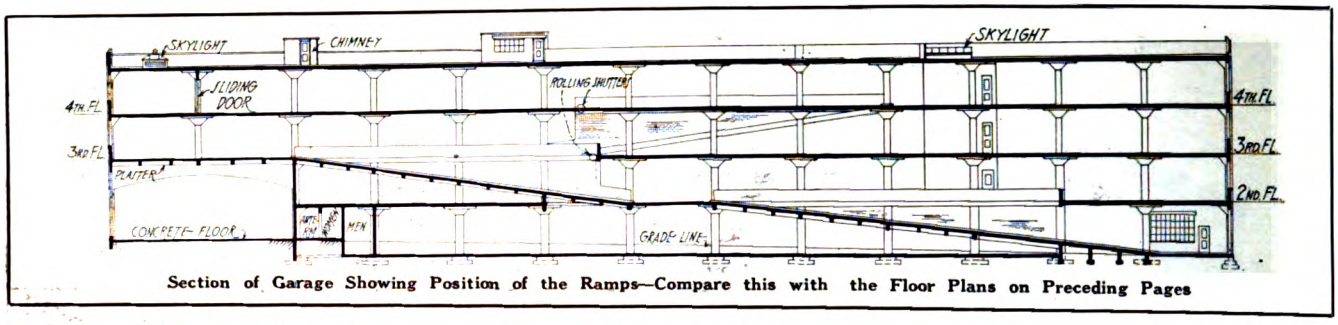
Forms the Novel Feature 300 Car Garage

Described and Illustrated By RAOUL C. GAUTIER, C. E.

unusual, considering that, at the wider end, the clear width of the room is 46 feet. This result was obtained by providing large concrete girders to carry the two stories above, the load being brought down by columns, and being concentrated at the middle of the span. The engineers wished to avoid the ugly appearance of the straight girders, and, taking advantage of the plasticity of the concrete, they designed these girders with a curved soffit, thus greatly adding to the appearance of the room, as will be seen in the interior view, on the opposite page.



These girders and the upper part of the walls were plastered and finished with a sand finish. The rough surface of the finish is contrasted by a walnut panelling running to about two-thirds of the height of the wall, and in the center a large fire-place adds cheerfulness to the room, while the floor, being made up of tiling of a warm color, presents beautiful effects. The tile selected was absolutely oilproof, thereby eliminating

THIRD FLOOR PLAN

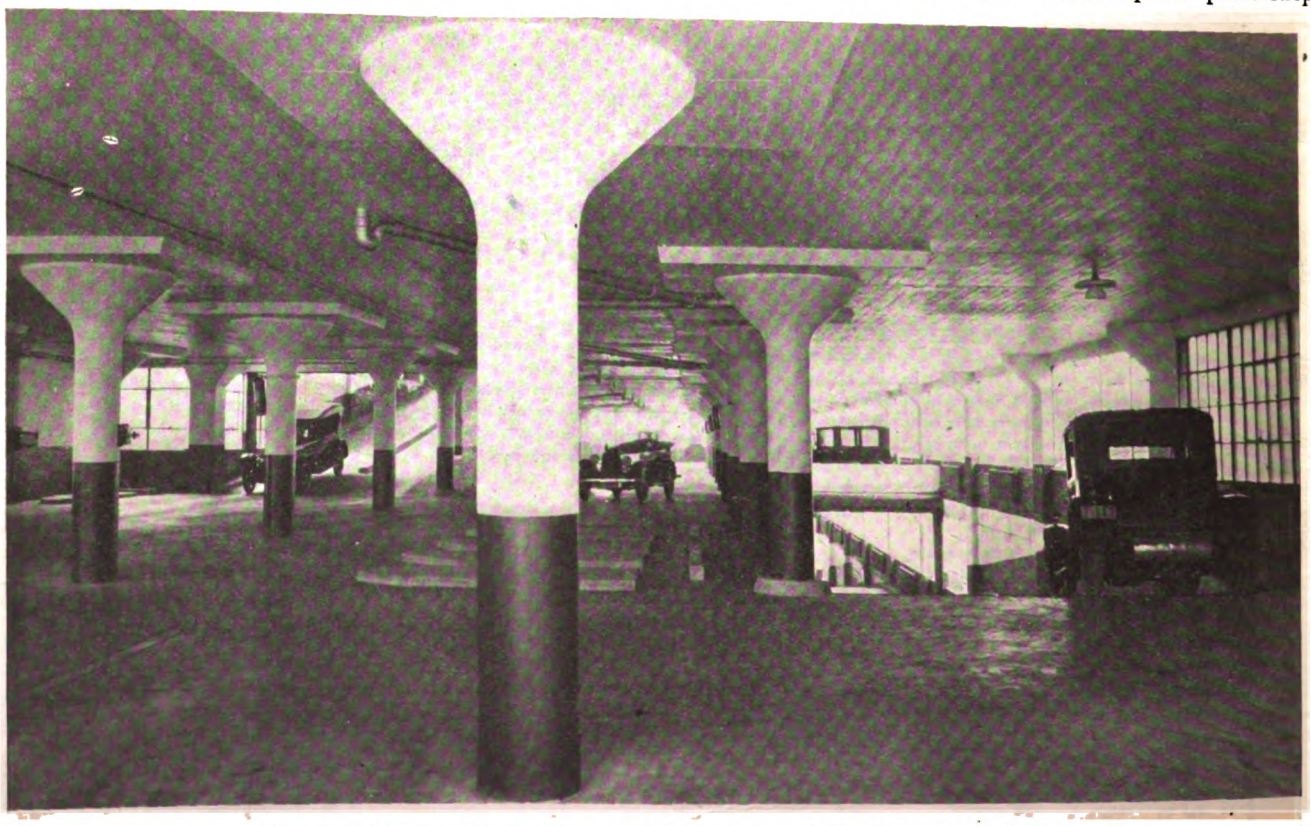
Comare this with the picture taken on this floor shown on the next page. Both the second and third floors are entirely devoted to the storage of cars with the exception of a chauffeurs' rest room located on the second floor. Note the flatiron shaped curb guides provided for each car and the extra bumper in the rear; these simple devices prevent cars bumping into each other and in the ceiling overhead washers make it easy to clean the cars.

Digitized by Google

Section of Garage Showing Position of the Ramps—Compare this with the Floor Plans on Preceding Pages

unsightly oil pans under the cars.

At the back of the building there is a small showroom for second-hand cars and tractors, and we find there also the main entrance, or rather entrances, to the garage. There are two doors, electrically operated; one leads from the first floor and the other to a ramp going to the second floor. Between these two doors, the checker's booth was provided. This room contains the motors operating the doors, so that the checker can open same by a single operation of pushing a lever. Particular attention is called to the size of these doors, which are 18′ 6″ wide and 11′ 6″ high. It was quite a problem to make them work, but difficulties have been surmounted.



As for the fourth floor, part of it is used for storage, but the balance is devoted to the repair and paint shop. It is rather unusual to locate the repair shop on the top floor, but, being easily reached by means of the ramps, it was deemed better to put this shop where it would get the best light and ventilation—both of which are most essential for such work.

This repair shop is equipped with all modern machine tools. It is interesting to note that, while the main part of the floor; i. e., that devoted to damaged cars, is finished in concrete, that next to the machines and benches is finished with wood blocks, thus providing a softer footing for the mechanics. The connection between the wood block area and the concrete area is made by means of a small ramp. As it is often necessary to bring supplies to the repair room, it is connected to the accessory room downstairs by means of a dumbwaiter.

Excellent light and ventilation are afforded by the windows and skylights. The ventilation, however, was not considered sufficient, and special fans, which may be seen on the picture of the front elevation of the building, were installed so that, with all openings closed, at least three changes of air per hour are assured, thereby reducing greatly the obnoxious effects of the exhaust gases produced when motors are being tested.

A blacksmith shop was installed close to the main shop, the enclosure around same being made absolutely fireproof, thus minimizing the results of fire and the explosion.

The Wilmington Auto Company does its own painting, and, to house this department, a special paint shop

View on Third Floor, Showing Ramps in Use by Cars, Also the Curbs for Each Car

Digitized by Google

was installed. The heat in this room having to be constant, an independent piping system, thermostatically controlled, was installed, and, to avoid condensation on the roof, special insulation was provided between the concrete slab and the roofing.

Special mention might be made regarding the construction of the ramps. The grade nowhere exceeds 14%, and cars do not have the slightest trouble in making the grade, especially since, in order to avoid slippery surfaces, the ramps were finished with alundum—a finish, which, by the way, was very successful. These ramps were made 18 feet wide throughout, with a curb separating them in two tracks, so that cars can travel up and down without interference. In the middle of each track, a small groove was provided to collect the oil dripping from the cars, and this oil is collected in a catch basin at the foot of each ramp, thus doing away with the very objectionable coating of oil usually present on similar inclines.

This garage was designed so as to provide for the largest number of cars, at the same time leaving alleys open for traffic. It is then possible for the car owner to enter the building through the showroom, go up in the push-button electric elevator to the floor where his car is kept, and drive out without interference, and without having to pass through dirty entrances, or to climb up through greasy stairways.

Gasoline stations were provided at all floors, and compressed air, being brought through the columns, may be obtained at a number of places on each floor. A drain and an overhead washer were provided in each alley bay so that car owners can lock their cars at night, since it is only necessary to push the cars a few feet forward or backward in order to bring them to the washing space.

This building was entirely built of reinforced concrete, including the front and back elevations, the former of which is on one of the main streets of the city. Nothing was done to disguise the concrete, which was simply rubbed with carborundum and painted with a waterproof paint and decorated with a few tile inserts. As far as the structure is concerned, the design of the girders over the showroom is interesting on account of the unusual loads carried, and also in view of the fact that they were designed, as a whole, with the columns, instead of separate units as is usually the case.

The floors were of the flat slab type, except that over the showroom, which was of the beam and girder type. A glance at the plan will show that the building, being very irregular in shape, it was not possible in every case to make the panels square or even rectangular, and that some of the panels might be thought too crooked to be built with flat slab. Nevertheless, this type of construction was used in all panels and with complete success. These floors were finished with a ¾-inch monolithic finish, containing a liquid hardener, and are giving absolute satisfaction. Incidentally, we might mention that some Fordson tractors (which have wheels equipped with angles to insure a better grip) have been run over these floors without making any indentation.

As will be noted, leaders for the roof and for the floor drains were built inside the interior columns. No special provision was made in the design of these columns, except that all the load was assumed to be carried by concrete and vertical bars, and no hooping, except ¼-inch ties to hold these vertical bars, was provided. This building was designed and built by Thompson & Binger, Inc., engineers and contractors, of New York.

Determining *the* Amount *of* Water *to* Use *for* Concrete

DO you know that the slump test is the simplest and most practical way of determining the proper amount of water to use in mixing concrete? say the experts of the Portland Cement Association.

The correct cement-water ratio for any concrete mixer will develop the maximum strength of the concrete. A knowledge of how to determine this ratio is a matter of importance to the builder.

The slump test is a simple, easy, and practical method of making this determination. The only apparatus necessary is a special mold, made from sheet metal, preferably non-corrosive, in the form of a frustum of a cone 4 inches in diameter at the top, 8 inches in diameter at the bottom, and 12 inches in vertical height.

After thorough mixing the concrete is placed in the mold in three or four successive layers, each layer carefully puddled or rammed with a blunt-pointed ⅝-inch round rod. The metal mold is then removed with a steady, vertical lift, leaving the concrete free to spread at the base. The "slump" or reduction in vertical height of the pile of concrete which results, is an indication of the consistency of the mixture.

The consistency which produces concrete of maximum strength is known as a "normal" mixture, and has a slump of about one inch. A reduction in the amount of water of 10 per cent. below that required for a normal mixture will change the slump to only one-half inch and decrease the strength of the concrete about 30 per cent.

Increasing the water 10 per cent. above normal will result in a slump of almost three inches, and a loss of at least 15% in strength.

A portion of the strength of the concrete must sometimes be sacrificed in order to obtain the plasticity of mixture required by the manufacturing processes employed. For pavements, floors and large foundations, the slump should not exceed 3 inches.

For thin, reinforced concrete walls where smoothness is required but compacting is difficult, a mixture with a slump of 6 or 7 inches is permissible because its wet consistency practically eliminates the necessity of tamping. Remember: Do not make your mixture more plastic than is required by the nature of your work.

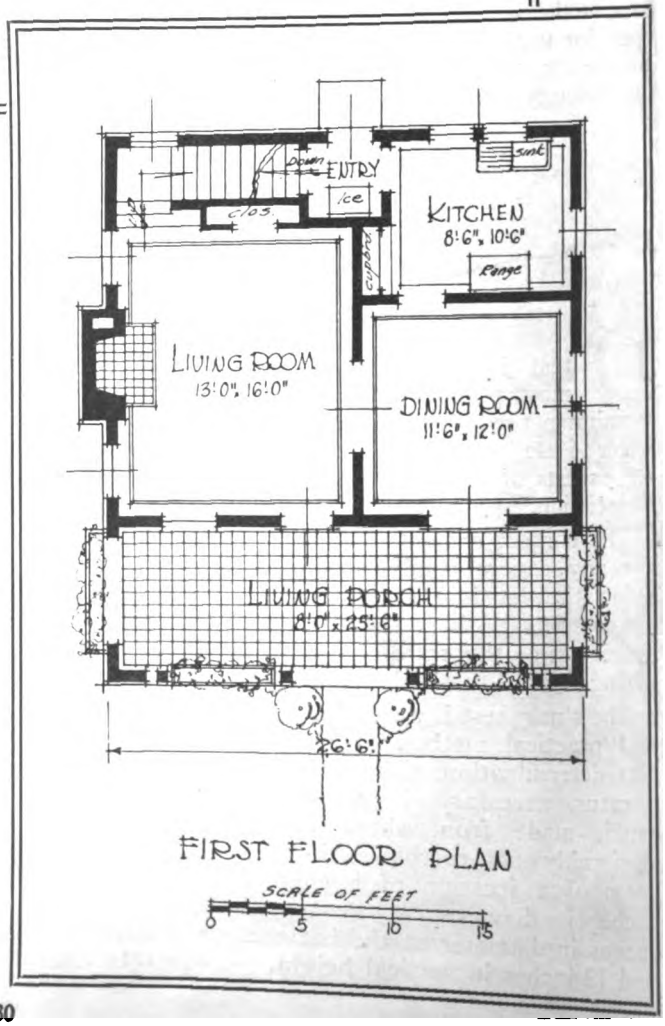
Well Planned Small House Design

Specially Prepared for Readers of



BUILDING AGE and THE BUILDERS' JOURNAL

Together with Constructive Details

By R. C. HUNTER & BRO., Architects,
New York

BUILDERS for the good of the industry should always discourage people wanting to build a cheap house, both in design and in construction. If more of us would turn down work that does not reflect credit on the building craft, it would go a long way to educate the public to ask and desire better construction.

In no particular place does better design and construction show to more advantage than in our homes. Let us build them so that they will be good to look at and comfortable to live in. The designs shown in these pages are examples of good design—something that will be a credit to the neighborhood as well as to the building contractor who erects it.

Digitized by Google

FADS and fancies in house design, as in most everything else, are but short lived. Good design is a matter of taste and proportion, and, as a rule, is akin to simplicity.

Freak houses, built just because they are odd, do not represent the best in home building, but rather otherwise. The curious holds one's interest for a short time, then it becomes loathsome; this applies with double force to home building. Once up, a building stands for years, a monument to good taste, or to bad.

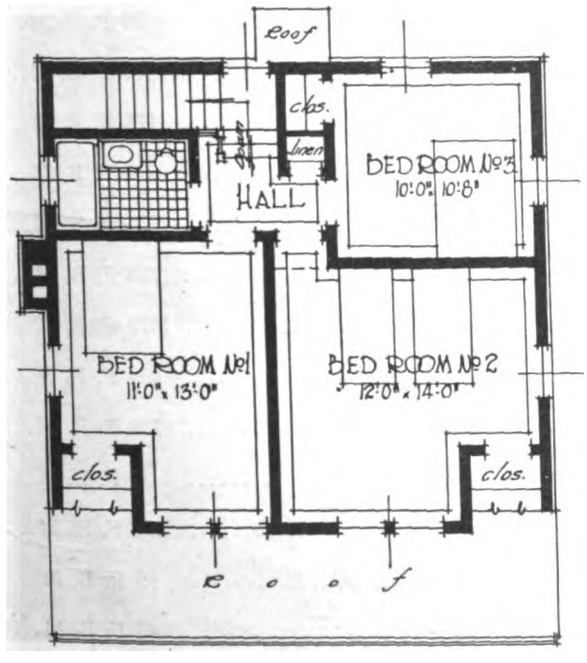
What a community needs is well designed attractive homes, planned along sane rational lines —economical, simple, neat and charming—a credit to the owner and a credit to the community, a home that will give one a sense of pride.

It costs no more to build homes of this type than it does to build the monstrosities one so often sees; in fact, the cost of a well-designed house is often much less than one built haphazard.

The little house shown herewith is a good example of what can be done in the way of simplicity, economy and good design.

The plan is rectangular in shape (the most economical in form, as breaks and extensions are expensive) even the living porch comes under the one main roof; the partitions are plumb over each other and the construction is simple.

The room arrangement is most compact, full, square, and livable rooms; no nooks, waste corners or extravagant halls.



The hall required for the second floor has been reduced to a minimum size; giving three nice bed rooms and a bath on this floor.

The exterior of the house leaves nothing to be desired. The long sloping roof that extends down over the living porch gives a pleasing cottage effect, while the broad dormer allows a full second floor. The simple detail of the cornices, the well-proportioned windows and the broad brick chimney; all lend strong character that no amount of "gingerbread" would give.

The flower boxes encourage one to plant the grounds and complete an ideal little home. Cost about $6,700.

Quantity Survey *of* Small House

Shown on Preceding Page

SECOND FLOOR PLAN

SCALE OF FEET
0 5 10 15

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items are sheathing, flooring, etc., are net areas to be covered with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protections, scaffolding and general equipment and supplies, have not been included.

Such items as are marked "Unit" are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	174 cu. yds.
Excavation for footings	12 cu. yds.
Excavation for areas	5 cu. yds.
Excavation for trench walls	11 cu. yds.
Excavation for leader drains and dry wells	8 cu. yds.
Backfilling around walls, etc	32 cu. yds.
Leader drains and dry wells	
Field stone for dry wells	7 cu. yds.
4 in. salt glazed tile drain pipe	24 lin. ft.
4 in. elbows	4

Masonry

Concrete for cellar walls	675 cu. ft.
Concrete for footings	140 cu. ft.
Concrete of trench walls	145 cu. ft.
Concrete for area walls	100 cu. ft.

BLUE Print Plans and Specifications of many Beautiful Homes of Moderate Cost can be supplied at a nominal price by BUILDING AGE and the BUILDERS' JOURNAL, 912-920 Broadway, New York.

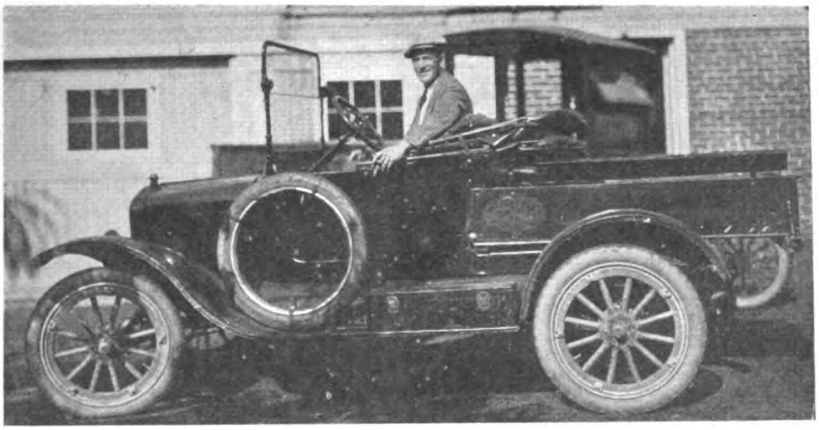
Some Stone Wall

HERE is a picture of what one would think is part of the great Chinese Wall, but we are wrong. It is not the product of the heathen Chinese but the eccentric whim of a New York millionaire.



This would probably be all right in some isolated locality but when such a crazy idea is planted in a big city, it is a detriment and an eyesore and a monument of selfishness.

Who would like to be the owner of the adjoining property? Certainly the owner of the residence next to this wall as shown in our picture must feel rather anarchistic towards a city government that will allow the perpetration of such an outrage.—**Albert Fair.**

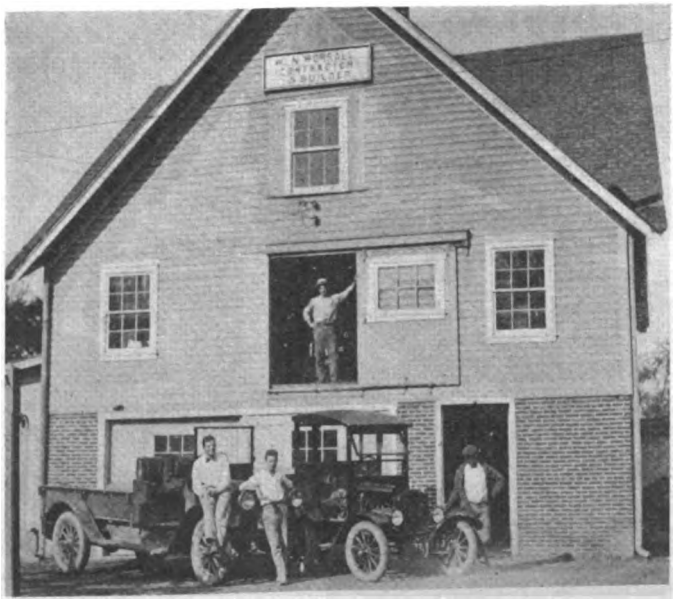
The Story of How William N. Worrall of Kennett Square, Pa., Made Good in the Building Line Will Be an Inspira- to Every Young Man in the Building Industry.

On His Car the Well-Known "W" Trade Mark Appears, Besides Mr. Worrall Always Wears a Good Trade Mark Himself. It Is His Smile. Nobody likes a Grouch.

The Simple Interesting Story *of* One Building Contractor's Success

It Will Encourage the Young Man in the Building Industry to Try His Best

Pictures and Description By C. H. THOMAS



THERE are many mechanics needed in the various branches of the building industry. The proper training of these is quite some problem but like everything that has to be met some method will be evolved to get hold of the proper young men and to train them to fill the places of those that are dropping out of the ranks.

Nothing will inspire the ambitions of a young man so much as reading a story of the success that has been won by a man who has grown up in the business. Likewise many a man with years of experience will find it interesting to know what the other fellow has done and perhaps find a few points that are worthy of following.

The subject of this little sketch is Mr. William H. Worrall, who was born at Kennett Square, Pa., in the same town he is doing business today. This was back in the year 1882 and his education was secured in the public school at that place, and curiously enough, the first job he worked upon in the building line was as a helper on a country school. It was therefore of interest to note that in 1911, when he was twenty-nine years of age, he started in the contracting game himself and the first job he secured was that of building a school house.

Since that time he has given most of his attention to the building of residences, although there are a number of various other kinds of construction that he has successfully erected. In this article we give a few illustrations of some of the buildings erected by him. We give several views of Mr. Worrall's shop for he, like every other successful contractor, finds it convenient to have a shop so that he can turn out work to advantage. Mr. Worrall has found out that doing a good piece of work is his best recommendation, in fact, he states that he stakes his reputation on the class of work he has been doing. "Do a good job at a fair profit" is the motto that Mr. Worrall has followed.

In his local newspaper he carries a short advertisement and when interested parties appear he can refer them to any number of satisfied customers. Mr. Worrall is a typical contractor and has been a reader of BUILDING AGE for many years and has found it a real help in his business.

View of Shop, Trucks and Some of the Men

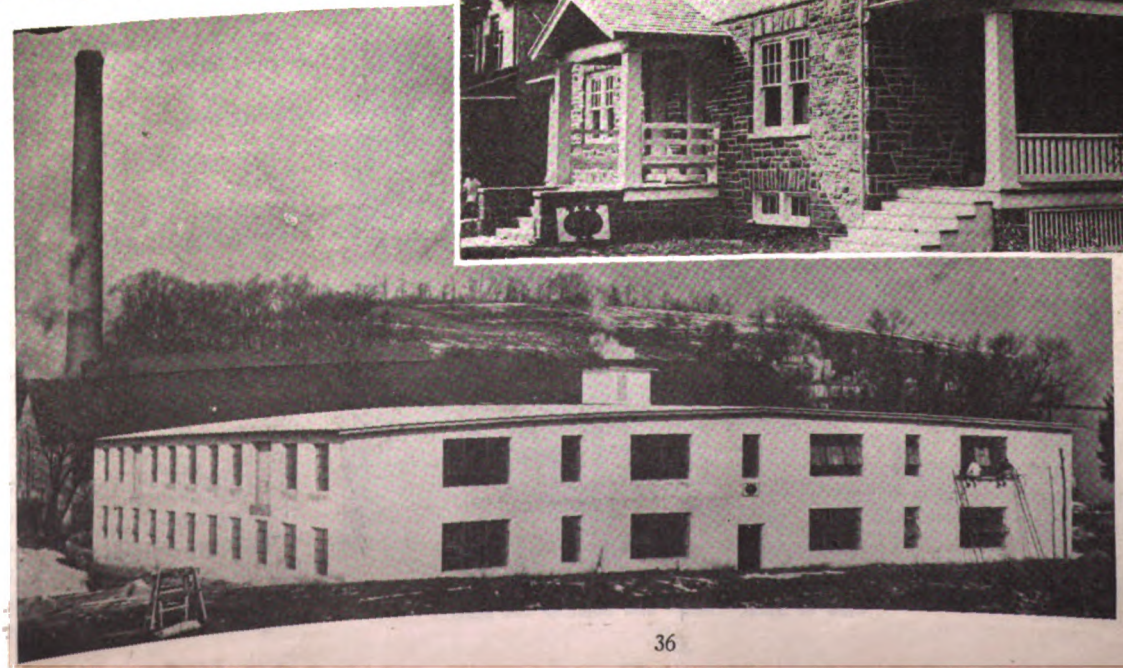
Let us go into his shop. In the office, we find different equipment such as typewriter, adding machine, check protector, etc. Contracting is a regular business and needs such appliances. In his shop he has various woodworking machines. These are driven by electric motors. On the job he has found it economical to have a concrete mixer and a portable saw, these being driven by a gasoline engine.

Digitized by Google

View of the Worrall Quarry at Avondale, Pa., Where He Obtains His Stone.

Gas Engine and Saw Out on a Job Used by Worrall to Cut Rough Timber.

When the building boom came, Mr. Worrall was well equipped with long experience in the building line and was able to launch into larger fields than that which usually is the lot of a small town carpenter and builder. He acquired a stone quarry, built a shop with many modern conveniences and gathered about him a number of the right men.

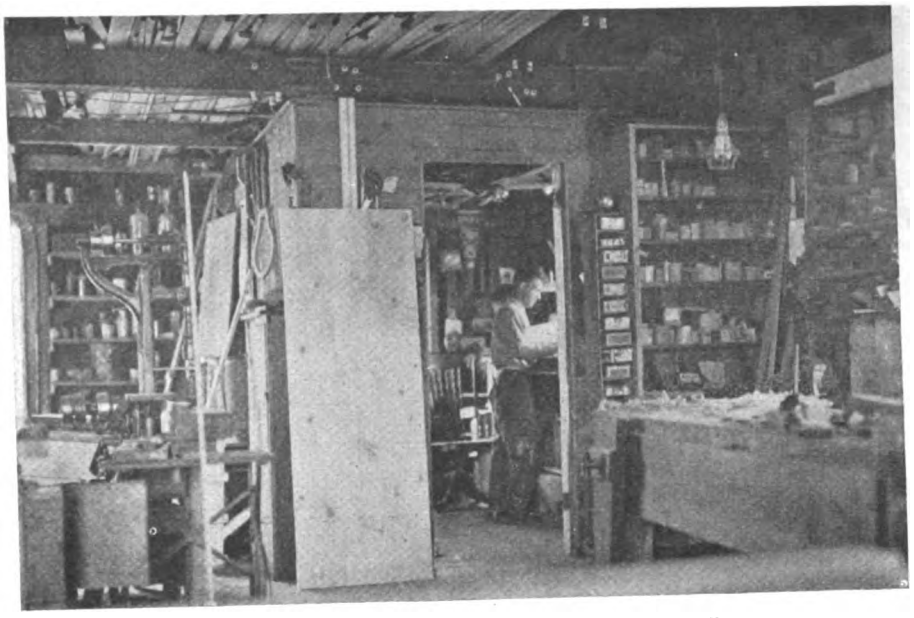


Many manufacturing plants are located in the vicinity and from his reputation he was able to secure contract after contract. A large amount of the residence construction in this locality is stone, therefore he found it economical to work a quarry. The grade of stone is a good one and besides using it for his own contracts he sells a good deal of stone, some of it being shipped to distant points.

To get around and transport materials he finds use for several cars. He makes it a point to be prompt and efficient on all his contracts and everybody knows when he starts a job, for he puts up a quaint and catchy sign representing a finished home and this never fails to get attention from passers-by. Then he has a sort of a trademark that he uses on his cars and other signs. The big "W" reminds everybody that Worrall is on the job.

Mr. Worrall has been engaged for many years in building factories, bungalows, barns, office buildings and apartment houses and on quite a few jobs he was instrumental in transforming some old buildings into modern affairs.

Double House Built by Wm. N. Worrall. Note Sign with "W" Leaning Against Porch.



Large Factory Building Erected During Winter of 1921-22 at Yorklyn, Del., for National Fibre Co. Built by Wm. N. Worrall.

Digitized by Google

Mr. Worrall has found that it pays to keep posted on the new devices both for erecting work and equipping of buildings, therefore when any prospective owner intends having something done they come to him for advice and he is usually able to give some sound, practical information on the subject.

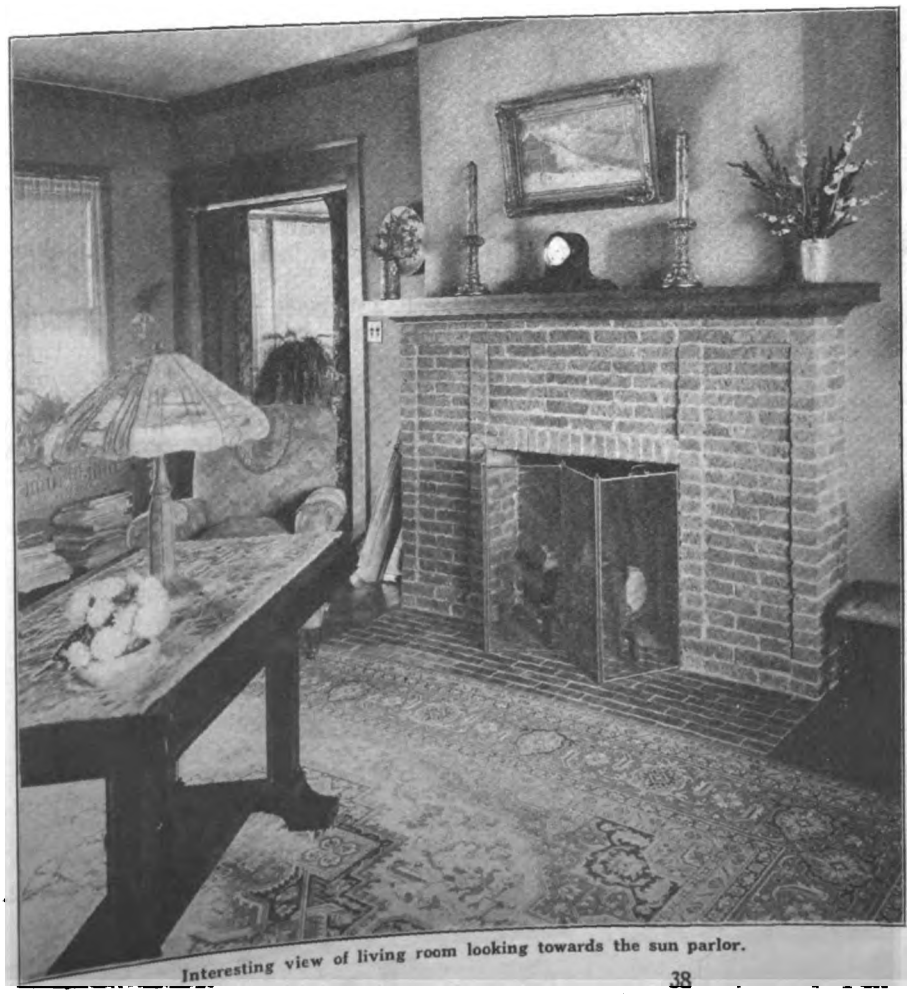
Mr. Worrall gives personal attention to the buying end as he is able to save hundreds of dollars by looking after this detail himself. He knows from his long experience just what materials and supplies will serve the best purpose. It may truly be said that to get the most out of a contract one must be a good buyer, and this maxim is one that is being successfully followed by Mr. Worrall.

Office and corner of workshop of Mr. Wm. N. Worrall

Corner of shop showing power machinery—all with electric motors. Each machine is equipped with guards as Safety First is the motto of this establishment.

One important method that was found of benefit is the daily reports of his men on the progress of each job. With this information on hand he knows the conditions exactly and he can schedule his materials and supplies in an economical way, so that everything will be on hand.

Mr. Worrall has always made it a point in his business to please the customer, and he makes a special point of doing this even if it means a little less profit. There is not a job that he has turned out that he has not left the owner with a hand shake and, on the other hand, the owner, being well satisfied, has been one of the best advertisements Mr. Worrall could obtain. Surely the good word of a satisfied customer is golden and worth earning.



Of course, one necessary element in the success of any business, and especially that of building contracting, is courage and faith in one's self. One important point to be learned by any one wishing to be a successful contractor is not to do too much of the actual work one's self, and Mr. Worrall has learned to supervise. He looks after the running of the business, and that is a man size job. He has efficient help who have become specialists in their respective kind of work. Most of those around him are bright young men and he has carefully trained them to his ideals. They are enthusiastic workers and it is "Get the job done quickly and good" with them.

Mr. Worrall's home is one of the best advertisements he has, proclaiming him a successful home builder. It is solid and substantially built of stone from his own quarry. It contains many features that interests prospective home builders.

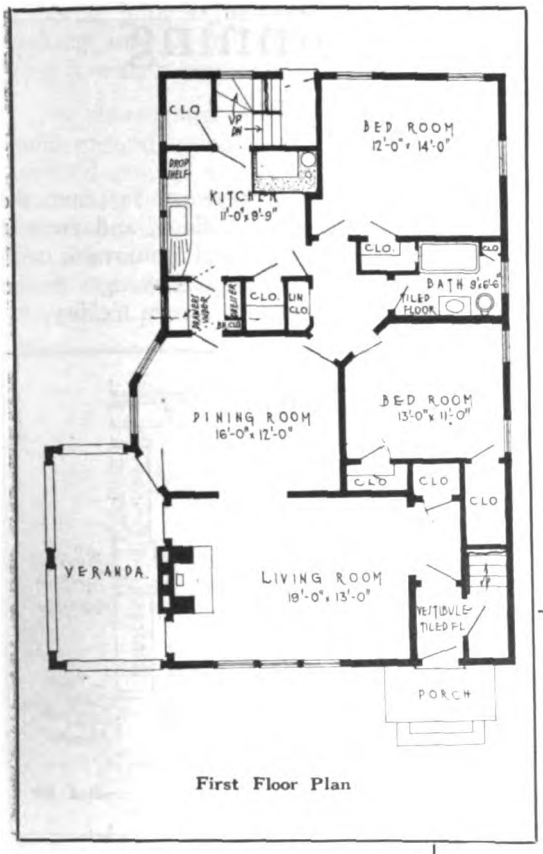
Interesting view of living room looking towards the sun parlor.

Two Family That Looks One Family



H. MESSINGER

BUILDERS are often called upon to submit designs of a two-family house that will have the appearance of being occupied by only one family, and it will therefore be of interest to study this design.

The actual house shown here was recently built at Montclair, N. J., and the casual passerby thinks it a good size one-family residence with large living porch and sleeping porch above.

The builder has a good argument to offer the prospective home owner for building a two-family house. There is always the financial side, which is worth considering, as the rental of one of the floors will go a long way towards paying the upkeep of the entire house, making the cost of ownership very small indeed.

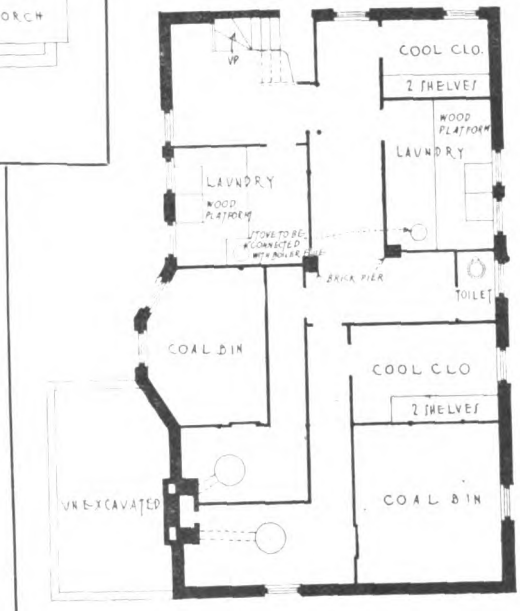
Digitized by Google

First Floor Plan

Dwelling Like a Design

FISHER, Architect

Practically two separate houses are provided in this design. There is, of course, a common entrance vestibule, which gives the one-family house appearance, which is so desired.



In both of these apartments one enters directly into the living room. A very pleasant feature of this living room design is the way the porch extends beyond the end of the dining room. This porch can be closed off by French doors or left simply with a cased opening.

COMPLETE working plans and specifications in blue print form of Beautiful One and Two-Family Homes may be obtained at a nominal price from Building Age and The Builders' Journal, 912-920 Broadway, New York.

An interesting picture of one of these living rooms is given on the opposite page.

A simple but attractive design is given of a brick fireplace. The wood mantel shelf is finished the same as the trim of the room. There is nothing expensive or elaborate about this, but it is certainly a pleasing design.

The dining room has a bay window, one side of this being a door opening onto the porch so that it can be easily reached from either room. This is certainly a very pleasing feature and builders can often introduce it in many homes, as it has many points to commend it.

Basement Plan

The kitchen is entered from the dining room through a small pantry but in a direct line. At the rear of the kitchen there is a large storage closet and the stairway leading to a cellar and upstairs.

There is another closet that opens from the kitchen, useful for pots and pans, etc., and in the small hall a good sized linen closet has been provided.

The attic can be used as storage space or if desired a few extra bedrooms can be provided as there is plenty of room. When this is desired a dormer can be placed in the front so as to make use of this desirable space. Should it be desired that each apartment is to have attic room, privacy can be secured by using the rear stairway for the first floor and making a front stairway for the second floor.

The two bedrooms are of good size and have the bathroom conveniently located between them. One feature that will certainly commend itself is the small sized hall connecting the principal rooms of the house. One may go from the kitchen to the bedroom without passing through or being seen by any visitor who may be in the living room, and this has its advantages that will appeal to the women folks.

The second floor has an additional den over the space used for the vestibule on first floor. This will serve as a den, sewing room, or a boy's bedroom.

Of particular interest is the layout of the basement. Each family here has its own laundry, coal cellar, coal bin and furnace room. Plenty of windows make this cellar a really delightful space. Too often cellars are dingy and dark, but with the introduction of metal frames and sash, more light is obtainable without adding increased window space.

Second Floor Plan

Shoring, Needling *and* Underpinning

How to Use Them in Altering and Remodelling Work

By OWEN B. MAGINNIS

IN the following detailed sketches and descriptive matter, builders and practical readers will realize and learn some of the fundamental principles of "Shoring, Needling and Underpinning," the last term being applicable to foundation and basement walls.

Though these details are almost self-explaining, we must note the following facts: In the larger cities and towns these jobs are generally done by contractors and firms who make it a specialty and possess and keep in stock a plant, consisting of a variety of jack screws, pump screws, shoring timbers, wedges, ladders, hoisting tackle, etc., needful for each and every job, and hire and maintain skilled mechanics and laborers as a force under the direction of expert foremen and superintendents, who can always be relied upon to so support and secure the constituent parts of a building as to allow of the safe removal of certain other parts.

In the smaller towns and villages the practical builder must perforce do his own shoring and needling, so that a knowledge of these branches of the builders' business will be found both useful and profitable. In fact, every carpenter and builder operating in a small way does or ought to possess it. Work of this character is constantly occuring in these days when so much remodelling of the older buildings is going on.

Of course, a general knowledge and experience of building construction is essential, for these operations are important and more or less hazardous; so that no one without these qualificatons should ever attempt to undertake this kind of work. In large cities and communities ability and capacity must be proven before permits are granted to proceed, so in this article we will consider some of the most usual and some unusual features of this auxiliary branch of the practice of building.

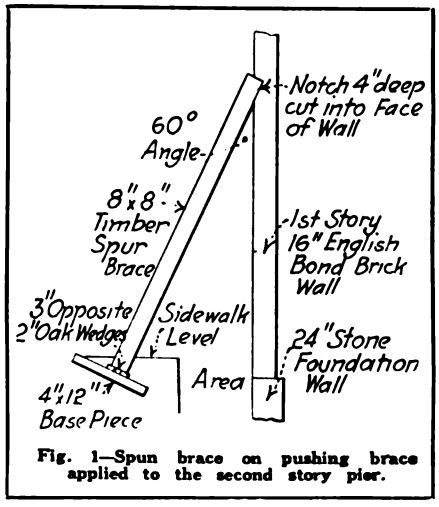

Fig. 1—Spun brace on pushing brace applied to the second story pier.

The first job is that of supporting a pier or any upper portion of a wall in order that the lower section may be safely removed as illustrated in Fig. 1, which can be done in two ways. First by a simple "spur" shore or pushing brace with one end set in a notch cut in the wall with hammer and cold chisel to receive it, the bottom being set on a heavy timber boss or base piece set fast into the sidewalk or area floor, and from it secured tightly and immovable with reversed opposite oak wedges driven simultaneously to a firm fixidity.

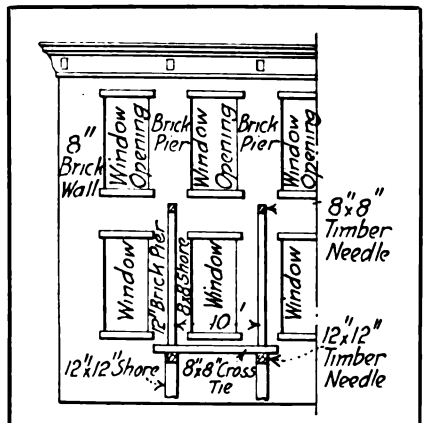

Fig. 2—Front wall properly needled for remodelling operation.

This brace should not slope at a greater angle than 60 degrees and be of good spruce or yellow pine timber, not necessarily new, but sound in heart and fibre, which may be ascertained by striking it with a heavy hatchet or maul. If it gives forth a clear ringing sound from the blow it is good, if not, set it aside and don't use it, as it may be decayed in the heart or dangerously split somewhere not visible.

The above practice is applicable for light 8 or 12 in. walls, but when it is not possible to work from the inside for heavy and high walls, "needling," as shown in Fig. 2, must be resorted to.

Here the wall must be pierced by a square hole cut through slightly larger than the timber intended to pass through it. For instance, an 8 x 8 inch timber will need a 10 x 10 inch hole, 6 x 6 inch, an 8 x 8 inch hole, and for a 12 x 12 inch stick a 14 x 14 inch hole, etc.

An old piece of a steel I-beam, 6, 8, 10 or 12 feet long, forms an excellent needle, as it does not require a large hole and is certainly safer than timber, although somewhat heavier to handle. The upper side of every hole should be smooth and level, so it is best to have it finish at

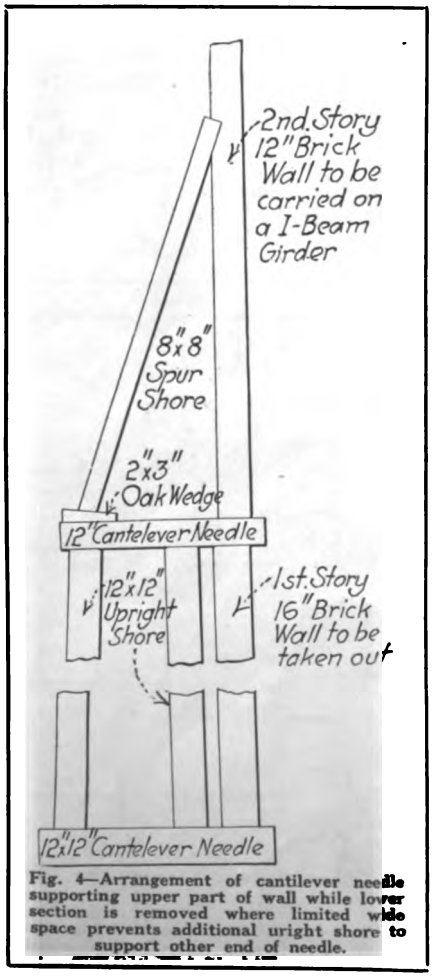

Fig. 4—Arrangement of cantilever needle supporting upper part of wall while lower section is removed where limited wide space prevents additional uright shore to support other end of needle.

Digitized by Google

a mortar joint in the brickwork, etc., making sure of its solidity by tapping it with a hammer.

The shores must be supported from solid ground or solid sidewalks laid on solid ground, not filled in ground, nor ashes, but strong and fit enough to sustain the weight which will be transmitted to and placed from it from the superincumbent weight of the walls, piers, etc. Where weakness exists a pyramid of timbers are used to distribute the load over a larger area.

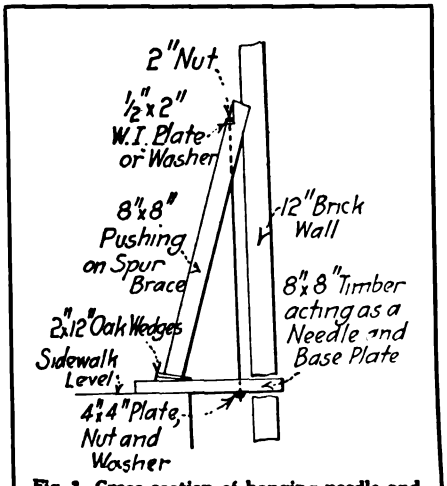

Fig. 3—Cross section of hanging needle and spur shore.

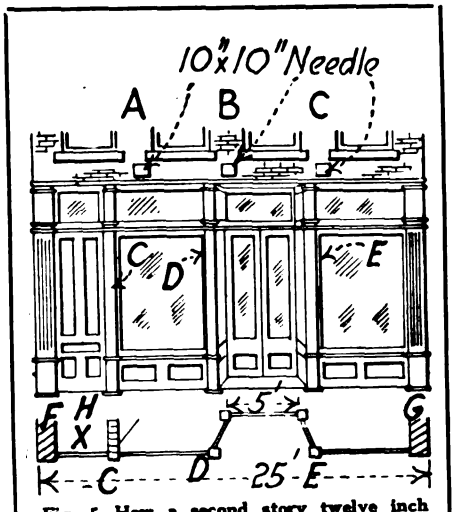
If there be vaults, coal holes, chutes or any vacant space underneath, these must be carefully examined and the bottom or base walks or area floors, if there is such, to be rested upon should be braced and made firm and trustworthy before any shoring or temporary false work is placed upon it. There must be no haste, no doubt, nor carelessness in the performance of these operations. Every detail, large and small, must be exact, sure and secure, as any slip or subsidence will not only crack the walls and plaster above and permanently injure the whole structure, but may perhaps, also cause possible injury to life or limb.

At Fig. 3 readers also will note an interesting and skilful piece of temporary false work recently done at the southwest corner of 40th Street and Sixth Avenue, New York City. To erect shoring in series or stories is somewhat unusual, but in the case illustrated it worked admirably and may be repeated successfully wherever such work may be needed.

We have still another interesting feature shown in Fig. 3 which is technically known as a "hung" shore or needle, this may be employed advantageously from the outside without disturbing either business or occupant, but the cost of making such hanging irons or stirrups is a point against its common usage.

Any application may be used as necessity or expediency may require, as may be seen in the "cantilever" system of shoring and needling represented in the next example, Fig. 4, which is capable of all sorts of placing and adaption according to the parts to be sustained, their weight, structural changes to be made, etc., according as the plans and specifications require.

It has been stated that there is an element of danger in executing the erection of temporary false work, but this can be provided against or almost eliminated by care and good judgment on the part of the man who directs and supervises the work, for it must first be very carefully and systematically thought out and prearranged before any materials are conveyed to the job.



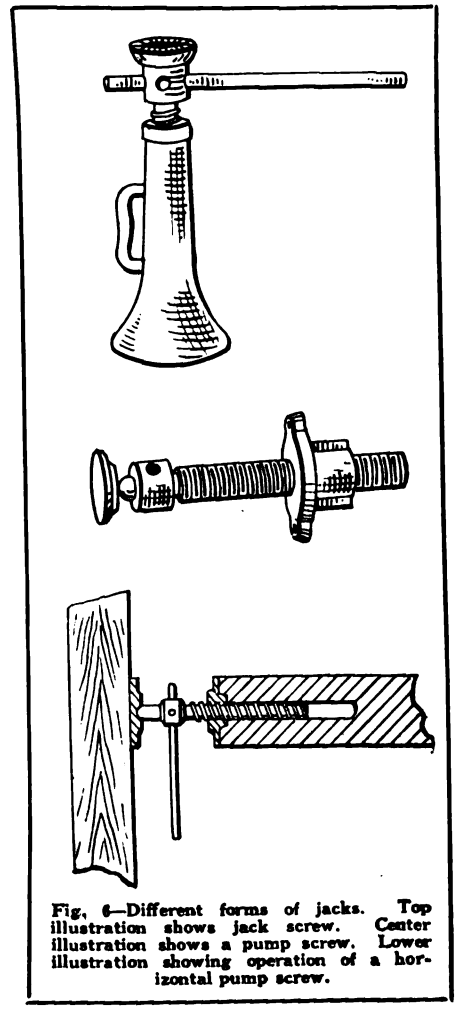


Fig. 5—How a second story twelve inch front brick wall should be supported by needles and shores in remodelling a store front.

The contractor and his foreman generally go over the premises to be altered and examine the structural details minutely, inside and out, testing walls, piers, columns, beams, partitions, etc., as to their condition, whether good or bad, comparing those actually built with the plans of the intended alterations and remodeling; making provisions and arrangements from their critical scrutiny and laying down a scheme of procedure for carrying on the work which will be both successful and profitable.

Frequently the operation cannot be contracted for by reason of extra risk and can only be done by day's work or from time to time, as conditions warrant, for it must be remembered that no two buildings were ever built alike, but always differ as to their structural constituent parts, so only an experienced builder's good judgment can exactly determine how best to act and proceed.

It might be added here that book knowledge of this subject is of very little assistance to anyone who has to actually direct or supervise this branch of building work; only common sense and judgment are needed. The foreman or superintendent should not do any work himself, but direct and supervise it, proceeding slowly and cautiously, with the proper placing and securing of the supporting members, testing each when set so as to be assured of its perfect security and purpose of fully and safely supporting the super-imposed loads which they will be required to carry.

Fig. 6—Different forms of jacks. Top illustration shows jack screw. Center illustration shows a pump screw. Lower illustration showing operation of a horizontal pump screw.

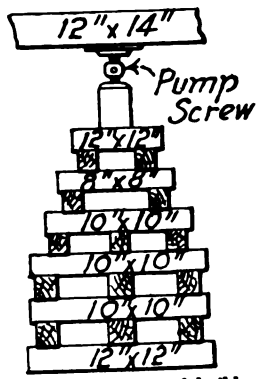

Fig. 7—Manner of building up the stacks of blocking previous to moving a building.

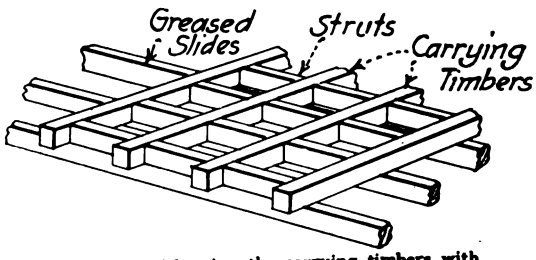

Fig. 8—Method of bracing the carrying timbers with struts under a building to be moved.

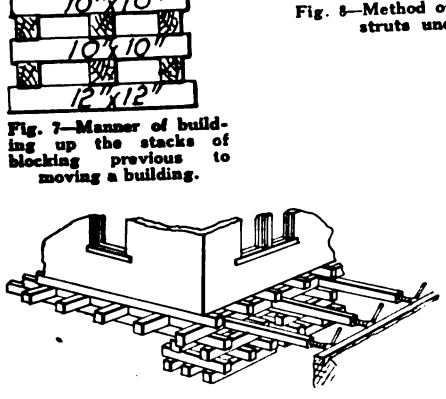

Fig. 9—Manner of bracing the blocking with horizontal screws to start the moving of building.

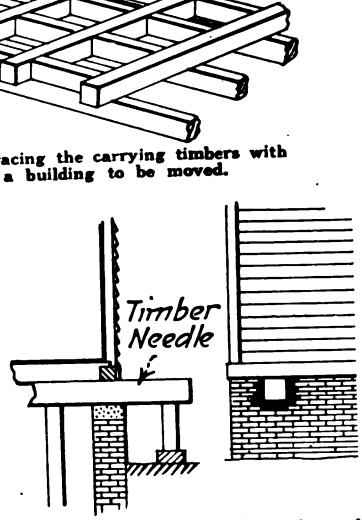

Fig. 10—Portion of underpinning of house showing needle hole in wall and the manner in which the shores are placed.

By a simple remodeling scheme more floor and window space was obtained in a store and a new front installed that modernized its character. To do this, old cast iron columns and horizontal cast iron lintels had to be removed, these being replaced by three 12-inch steel I-beams supported by end piers.

Figure 5 shows in detail the method of procedure. Three needles with their accompanying shores were needed to temporarily hold in position the three 12-inch brick piers A—B—C of the second story. The new I-beam girders were supported by the two side walls F and G, thus giving the clear span necessary for the larger show windows.

A feature of the construction that must be seen to when doing overhauling, is the location of the joists. If the second floor beams are laid parallel to the front wall with their ends resting on the side walls, F and G, then no interior shoring work will be needed. Should they run fore and aft, and have their ends resting on the front wall, then they must have temporary plates and uprights erected under them to keep the tier of floor beams from sagging or dropping when the front wall is being changed; then the beam ends must be cut or blocked up as the case may be to suit the new girder arrangement.

Now regarding the material and workmanship requisite in this important branch of building operation. It must be impressed on all doing this kind of work that every piece of timber and steel, if not of the best quality, must be absolutely safe and reliable. All timbers must be straight grained and free from large knots, shakes, splits, wens and sap, always stronger than strong enough. These remarks apply likewise to all tackle, blocks, bolts, etc., that are used. There should not be any uncertainty in the placing of shores or needles where they are required. Steel or timber needles, must be set level so as to carry on every point of the bearing area. Ends sawn square so they will bear on every inch. Wedges must be driven so as to be tight and not yield to another blow. Material need not be new as long as it is sound and safe.

There is always an element of danger present in remodelings and alterations, which care and caution only can guard against, therefore it behooves those men to make sure that all is carried perfectly safe and secure, before commencing to remove or weaken any bearing construction.

In many locations a special permit is required for the removing or alterations of buildings. There is great danger to adjoining structures in built up portions of cities. All of this, of course, must be carefully guarded against, but when a man is careful and knows what he is doing there is no danger.

In moving buildings there are many special appliances such as rollers, special jacks, tackle, etc., that really make the operation far easier than it looks. Many contractors that are equipped with these special appliances find out that they are able to take on many a profitable job.

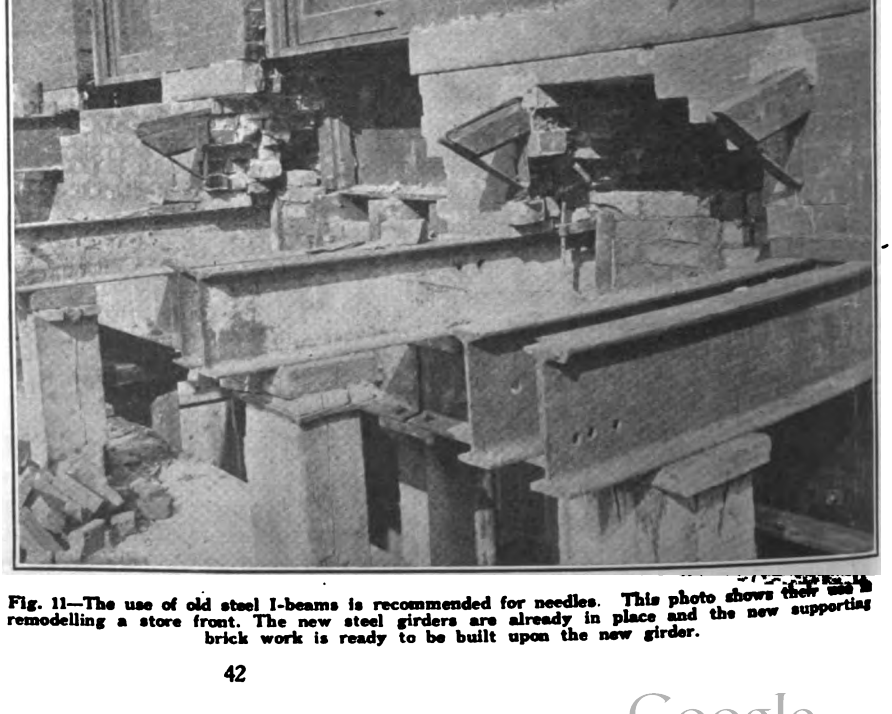

Fig. 11—The use of old steel I-beams is recommended for needles. This photo shows their use in remodelling a store front. The new steel girders are already in place and the new supporting brick work is ready to be built upon the new girder.

Specification *for* Electric Wiring

ONE thing that is always up to the general contractor is the advising of the owner about the electric wiring. Before making out sub-contracts, it will be necessary to give the electrical sub-contractor a specification of what is desired, and the form given here is a model which was prepared by The Frank Adams Electric Company of St. Louis.

General Conditions

The electrical work will be sublet, but all of the conditions of the general building specifications must be considered as a part of the specifications for this section of the construction.

The contractor's bid must be based upon the complete specifications and plans with all materials as specified. He may, however, make an alternate for other material with his price either higher or lower than for the material as specified. No changes will be considered after the contract is let.

All material used in this installation must show the Underwriters' Laboratories' label, unless that entire classification of material is not in the label service, when it must be listed in the Underwriters' Laboratories' approved list of material. The entire installation must be made according to the National Electrical Code standard, and the Inspection Department having jurisdiction must be asked to make their inspection based on these specifications and the accompanying plans. This specification does not include the furnishing or installing of fixtures or lamps.

Service Entrance

The service entrance (in overhead) must not be less than 15 feet from the ground, and the feeder conduit must be equipped with an approved service conduit Type DRF or equal, and have feeder cables extend through the condulet three feet.

Main Service Feeder

From service entrance condulet install conduit and cables to the service switch, install conduit concealed, and make feeders of ample capacity for outlets shown on plans, and with the number of cables to conform with the Lighting Company's feeder system that will connect to this building. Conduit must be galvanized.

Service Entrance Switch and Meter

Where marked on plans in basement and in such a position that the meter can be read through the basement entrance door, place an externally operated service switch of full capacity of feeder and with meter test links and meter trim for the proper sized meter that will be used in this installation.

House Feeder

From service switch and meter continue the same size of feeder in iron conduit to the distributing center as located on plans on second floor.

Electric Range

If an outlet for electric range is installed, then install, either above or alongside of meter, two externally operated switches, one of the full capacity for electric range (having a capacity of not less than three No. 6 cables), and the other full capacity of house feeder, and connect the house feeder to this switch and extend in conduit three No. 6 wires from the range feeder switch to an outlet not less than four feet above the floor, and convenient for connecting to electric range. At this point a special condulet must be furnished.

Distributing Center

Where located on second floor plan, and about five feet to center, place one, standardized safety type panelboard, having a sufficient number of branches to take care of all circuits to outlets for lighting fixture, universal duplex receptacles and hanger outlets, no circuit capacity to exceed 660 watts and for a separate branch circuit for each of the heat and power outlets in each bath room, one in kitchen, laundry, and also spare branch for additional circuit.

Circuit Wiring

All branch circuit wiring must be done under the classification of knob and tube work, with conduit for those outlets and switches installed on brick walls. Wire and cable must be of approved make.

Outlets

All outlets for ceiling fixtures and brackets must be equipped with outlet box and finished with standardized fixture stud.

All switch outlets must be fitted with standard switch box and equipped with single pole flush tumbler switch with plate finished to match surrounding hardware. Wherever more than one switch is located at the same place, they must be located in gang boxes and plates.

There will be separate three-way switches as follows:

For the furnace light in basement with switch on first floor and basement; rear stair lights on second and third floor with three-way switches on first, second and third floors; second floor ceiling lights with three-way switches on the first and second floors; light in reception hall with three-way switch on first and second floors.

Baseboard Receptacle

At each plugging outlet as located on plans, furnish Duplex Universal Receptacle. Locate this in the center of flat space of base board.

Hanger Outlets

At all outlets so marked furnish hanger outlets 7 feet from floor. These outlets must be complete and securely fastened to studs of partition or into brick walls, so as to support either fan, heater, or a picture with lights.

Heat and Power Outlets

At all heat and power outlets place 4 feet from floor an outlet consisting of outlet box and one plate with double pole 20 amp. switch, signal lamp, and 20 amp. standard receptacle and plug.

Inspection

The contractor must notify in writing the inspection department having jurisdiction, and notify them that the specifications call for the inspection department to base their inspection on both the specifications and accompanying plans, and that the certificate for the completed job must particularly signify that the inspection has been made according to plans and specifications. The contractor is to pay the fee for the inspection certificate.

Sound Proof Partitions Feature this Modern Apartment

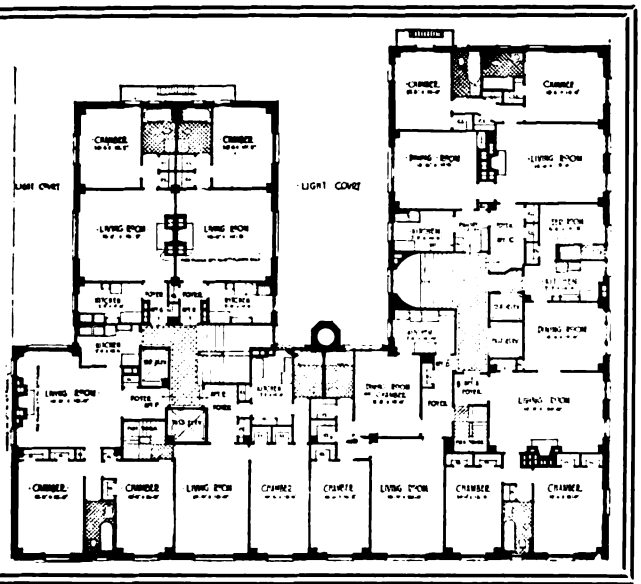
ROUSE & GOLDSTONE,
Architects

IT is rather interesting to note the different floor arrangements made for the modern apartment house. The design shown here is that of a thirteen-story apartment house located at and known as 25 Fifth Avenue, New York City.

In smaller cities apartment houses with practically the same room arrangements can be built two or three stories high, as there are some special features that commend itself to both a large or small apartment building. Each floor contains seven separate apartments.

The way the house is divided it is practically two separate buildings. One entrance on one street and another around the corner. In the one section there are three three-room apartments and one four-room apartment, and on the other side there is one four-room, one five-room and one six-room. Both sides are served with individual elevators, both passenger and service. Each apartment, of course, has a bathroom, and one apartment on each floor has two bathrooms.

Of course, this building is of fireproof construction throughout, being built with a steel skeleton.



One of the bad features of apartment house living is the fact that one too frequently hears the talking, etc., of the people in the adjoining apartments. The architects and builders of this apartment house have solved this problem in a very effective way and still have a very thin dividing partition that has completely deadened the transmission of any sound from one apartment to the other.

The partitions in this particular house are only three inches thick and the saving of space that this provides figures up to be quite an item where rental is figured at so much per square foot.

Tenants have rebelled against apartments where they hear every noise made by their neighbors and where their own conversation may be heard by others. Tenants will not remain in a noisy apartment when they can rent one at equal rental that has the added advantage of deadened floors and partitions. A sound proof partition assures more permanent tenants, therefore, it is an actual economy for builders to make their partitions and floors thoroughly sound proof.

The particular method used in this building is shown by the illustration. Wires were suspended from the concrete ceiling and attached to the concrete floor. These were pulled taut and an eel grass sheathing quilt fastened between these, then gypsum plaster boards were placed on each side and fastened with clips through the wires and over the board, then the plaster coat is applied on each side to make the finished wall. No other lath or studs were used. The result was a fireproof partition that also possesses the desirable property of being soundproof combined with ability to get it in a three-inch space.

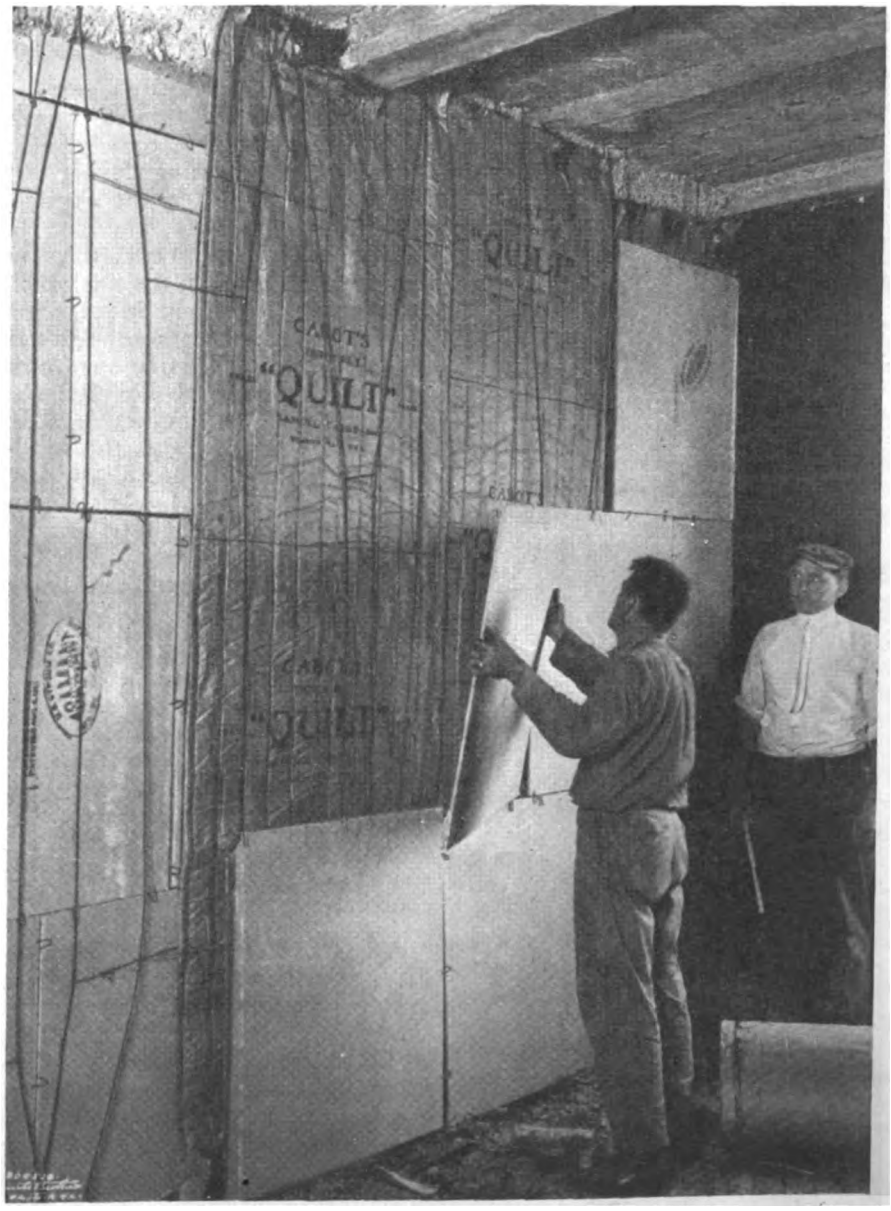
Typical Floor Plan, Showing the Seven Separate Apartments.

HARBY, ABRONS & MELIUS, Inc.
Builders

the exact temperature desired, and the mechanism brings the room to this degree of heat and keeps it there. This is obviously a great improvement upon the common method of rapping on the pipes for more heat or scolding the superintendent over the telephone.

The elevator systems of the newest apartments have been greatly improved. In some of the most expensive modern houses an apartment may have a private elevator for its own exclusive use. The small automatic electric elevator is also becoming more common. It is summoned to any floor by merely touching a button and can be carried to any desired floor by pressing other buttons, and is so controlled by automatic devices as to be perfectly safe and fool-proof.



American apartments readily lead the world today in the completeness of their mechanical equipment. The best engineering skill is constantly busied with new devices which will raise our standards of comfort and luxury. The decorations of high-class apartments in London and Paris may rival our own, but the equipments which make for comfort are distinctly inferior.

The evolution of the apartment is, besides, very rapid. Every new apartment house strives to outclass its predecessors. Although the war seriously checked most building it does not seem to have interfered with the development of labor-saving devices.

The mechanical devices which reduce the drudgery of housekeeping soon become the property of all. The housekeeper reads today of some new equipment in a twenty-five-thousand-dollar-a-year apartment, and tomorrow or the next renting season demanding it in the moderate-priced flat.

A few years ago the icebox and the dumbwaiter were considered luxuries; today they are the necessities of the cheapest flat. By studying the newest equipment of the most costly apartments it is possible to prophesy the features of the cheaper flats of the near future.

The heating of an apartment need no longer be left to the caprice of the janitor or superintendent. The heat supply may be controlled entirely by a thermostat. It is only necessary to push the indicator of the dial to

Gas and Electric Heating *for* Dwelling Houses

How Easily Operated Systems Without the Dirt and Work of Coal May be Installed by Builders in Modern Homes

By CHARLES L. HUBBARD, M. E.

OWING to the present scarcity and high cost of coal it may be well to give some thought to gas heating both as an auxiliary and for regular service.

There are two ways of using gas for auxiliary work, one by means of portable heaters placed in the rooms to be warmed, and another in which a supplementary heater is attached to the regular system for the purpose of operating it at a reduced capacity before a fire is started in the furnace or boiler.

Portable heaters are of two general types, those in which the heat is given out directly from the flame and from hot surfaces of metal, fire clay, asbestos, etc., made in imitation of stoves and fire places; and those in which the gas is made to heat water or generate steam, which circulates through a direct radiator of the usual form, as shown in Fig. 1.

The first type is more easily moved about from room to room, being connected with an ordinary gas jet by means of a flexible tube.

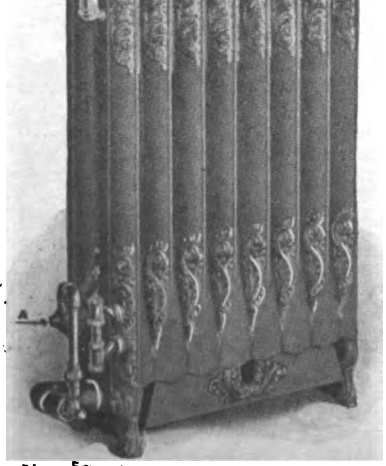

Fig. 1. Gas-Steam Radiator

Gas heaters of the radiator type are portable to the extent that they may be moved, but are connected with the gas system by iron piping and are usually a permanent fixture during the heating season. In some cases they form a part of the regular heating system, being so cross connected that they may be operated either on gas independently before the boiler is started up, or on the main system during the winter.

Gas heaters are very convenient for use in special rooms where heat is required temporarily, also for moderate warming during the spring and fall when the regular system is not in use, and also in helping out on very cold days in the case of certain rooms which do not heat properly in extreme weather. Gas heaters vary in capacity according to size and form and their rating should be obtained from the manufacturers. In the case of small units, the products of combustion are allowed to pass into the room, but for larger sizes a vent pipe should be provided, leading to a chimney flue, out of doors, or into a well ventilated attic.

Gas-steam or water radiators are especially adapted to the warming of rooms which have been finished or added after the house has been completed, and are not easily connected with the main heating system. This applies especially to bedrooms and similar spaces where heat is not required continuously.

A gas heater arranged for auxiliary work in connection with a system of hot-water heating, is shown in diagram in Fig. 2. This is for use when it is desired to warm up a considerable portion of the house, or furnish heat for a short time night and morning or before the boiler is started.

When it is desired to heat only one or two rooms, the portable type is more economical, but for a more general distribution of heat it is better to make use of the regular system of pipes and radiators, shutting off such rooms as are not to be occupied.

Instantaneous gas heaters of the type used for water heating in bath rooms, etc., may be employed for this purpose, provided the water passage through them is not too restricted. Heaters of this type are commonly rated in gallons of water per hour through a given temperature range. When used for house heating purposes the capacity will be considerably reduced owing to the lower velocity of water through coil and its higher average temperature.

A heater rated at 1 gallon per minute, raised through 100 degrees, will furnish $100 \times 83 = 830$ thermal units per minute or $230 \times 60 = 49{,}800$ per hour.

Probably under the conditions shown in Fig. 2 not more than one-

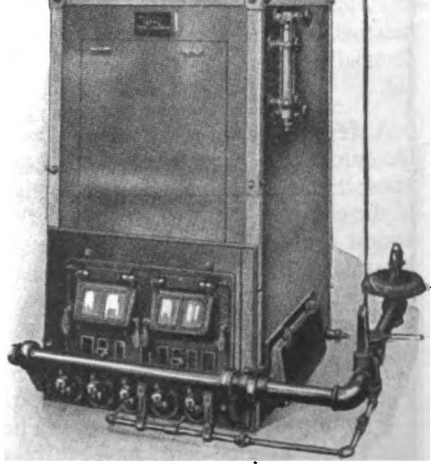

Fig. 3. Gas Fired Boiler

Digitized by Google

fifth of this, or 10,000 thermal units would be realized, or sufficient to supply about $10{,}000 \div 170 = 60$ square feet of direct radiation.

The above assumption is made on the basis of a water velocity of 400 feet per minute through the heating coil when used according to its normal rating, and only 25 feet per minute when used as in Fig. 2.

Recently, special gas boilers have been placed on the market as a substitute for coal burning boilers, one of these being shown in Fig. 3. While they have been confined principally to the natural gas regions, the present high cost of coal and labor makes them worth investigating in connection with regular heating work in other sections.

As a matter of comparison, we may assume that one pound of anthracite coal contains 13.000 thermal units, which is $13{,}000 \times 2{,}000 = 26{,}000{,}000$ per ton. If a moderate size house heating boiler is operated at 55 per cent efficiency, and coal costs $15.00 per ton, then the cost per 1,000 thermal units will be as follows:

$$\frac{\$15.00 \times 1{,}000}{26{,}000{,}000 \times 55\%} = \$0.00105$$

Gas boilers have a higher efficiency than coal boilers and we may safely assume about 80 per cent. for the best designs. Assuming the thermal value of manufactured gas as 650 thermal units per cubic foot, and the cost $1.30 per 1,000 feet, the cost per 1,000 thermal units will be

$$\frac{\$1.30 \times 1{,}000}{650 \times 1{,}000 \times 80\%} = \$0.0025$$

or $0.0025 \div 0.00105 = 2.4$ times the cost of coal for the assumed conditions.

While, at first thought, this might seem to be strongly in favor of coal, it must be borne in mind that the above is for continuous operation, as during the winter months in the northern states. During the spring and fall, or for winter heating in the southern states, the demand for heat is intermittent, and the excess cost of gas over coal is greatly reduced, or may entirely disappear. A gas burning equipment may be regulated to meet every condition automatically without reducing the efficiency. With coal this is not possible to such an extent and the efficiency falls off rapidly with a reduction below the normal rating for which the boiler was designed. Furthermore, if the fire gets low or goes out entirely, a large amount of heat is wasted when it is brought up again.

In the case of individual gas heaters the efficiency is close to 100 per cent., because practically all of the heat of combustion goes into the room in one form or another and is therefore utilized.

In a case recently reported an actual saving was made in a New York City dwelling house ordinarily burning about 15 tons of coal per season, by changing over to gas at current prices. While the cost of fuel was more in the case of gas, the reduction in labor brought the actual cost of heating down to about 9 per cent. below that when coal was used.

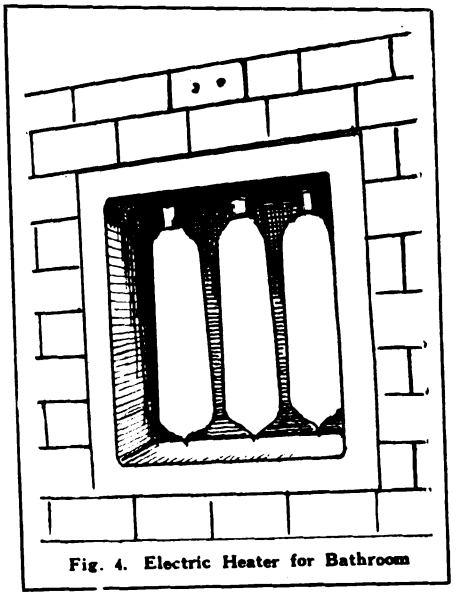

Fig. 4. Electric Heater for Bathroom

Electric heating is used in much the same way as gas, that is, for supplementing the regular heating in special rooms when additional heat is required only for short periods. Electric heat, however, is much more expensive than either that generated directly from gas or coal, and is not a practical method for permanent use, except in certain cases where current may be obtained at an exceptionally low rate from large hydro-electric plants in regions where coal is particularly expensive.

When the electricity must be generated by steam power the cost of heat in this form will run from 10 to 20 times that furnished directly from the steam. In some cases, however, the fuel cost alone may not be the deciding factor and electricity may prove more desirable for other reasons. The substitution of electric heat, purchased from a power company, will often reduce the cost of labor, while the greater convenience, cleanliness, and saving in space may also have a money value. However, this excessive cost practically disposes of the question of heating entire buildings by electricity except under some of the unusual conditions noted above.

CARPENTRY

Good Practice in Frame Construction and Finish

Some Difficult Problems Made Easy

Short Cuts from a Builder's Note Book

By JOHN PARKHILL

YEARS ago fourteen carpenters were directed to place cross braces on the posts of a long inclined trestle, as shown in Fig. 1. Each set of posts being a different height; of course, each pair of braces had a different length and cut.

Some of the men spiked these braces up and cut the ends afterwards, which was rather difficult, as indicated by the illustration. Some put them up, marked, and took them down, then cut them, and again put them up—permanently.

By using the rule here given, two of us found that we could easily accomplish from fifty to sixty-five per cent. more than any other two.

As an example, take Fig. 1, which shows the brace extending twelve feet horizontally, and sixteen feet perpendicularly. Take the hypothenuse of these—from A to B—which is twenty feet, and mark this distance from A at one edge, to B at the opposite edge of the plank.

Place the square with sixteen on it (the height), at A, and twelve (the width), on a straight line joining A B, and mark from A across plank; and the same cut across from B. This gives cuts and length of brace. Using any other width and height, and their corresponding hypothenuse, in the same manner, will give the cuts and length.

The writer originated this rule for this trestle, and over thirty years' investigation has failed to disclose any previous knowledge of it. BUNK

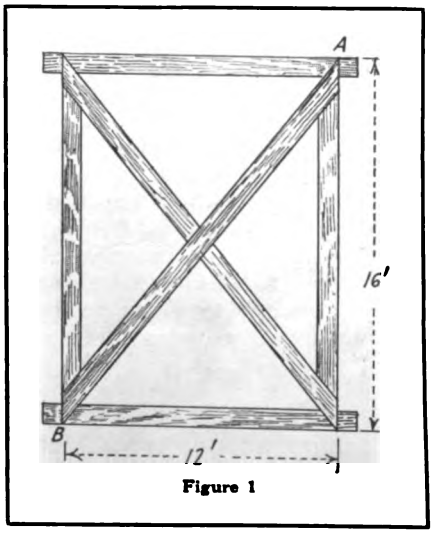

Figure 1

Cut of Hip Rafters

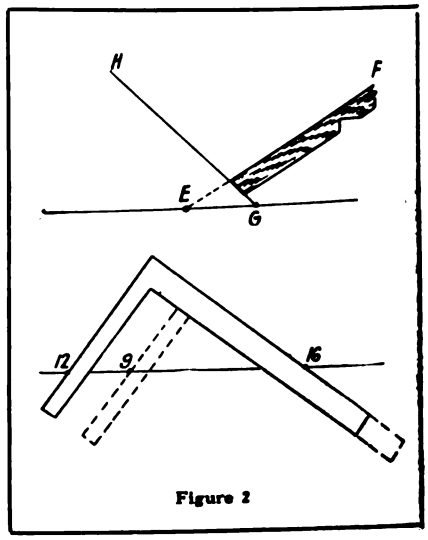
In 1910, when the Professor of Carpentry at one of our foremost state universities was demonstrating to the students the roof framing for a barn, he found himself unable to mark a certain cut. This is the cut on the projecting end of the hip rafter which corresponds with a square cut on the projecting ends of the common rafters.

He told me that after searching through all the building magazines and libraries in the United States to which he had access, he had failed to find a rule for this cut, and asked me whether I could furnish one. After some study I sent him the following:

From any straight edge mark the horizontal cut of the hip rafter. Divide 144 by the rise, and thus get another rise for a second pitch.

Marking the horizontal cut of the hip for this second pitch across that of the first hip, as shown in Fig. 2, gives the desired cut.

In Fig. 2, this cut is shown marked on the end of a hip for a pitch of nine inches rise to one



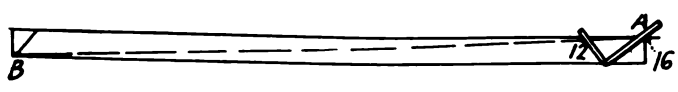


Figure 2

How to Use the Steel Square to Obtain the Proper Lengths and

Cuts for the Diagonal Braces Shown Above in Figure 1.

Digitized by Google

foot—E F being the horizontal cut of this hip.

Then, 144 divided by the rise—nine—gives 16 as the rise for the second pitch, and G H is the horizontal cut of the hip for this second pitch, and gives the desired end cut on the first hip.

If the operator is unfamiliar with arithmetic, even this slight use of it—dividing 144 by nine—may be avoided, if desired, by marking the horizontal cut of common rafter—with a run of twelve, and a rise of nine—and slide the square along on this cut to a rise of twelve, which will give a run of sixteen. This run (16) for a 12 inch rise on common rafter is the rise for the second pitch, and, of course, is identical with 144 divided by nine.

To forestall any question regarding the result of the professor's search, perhaps it should be admitted here that one book on roof framing did purport to give a rule for this cut, but the "rule" was so totally wrong, that a square cut would be much nearer right—for a majority of pitches. And even if this "rule" is tested on all possible pitches—hundreds—or thousands—of them, it happens to be right for one pitch, and for one ONLY.

Siding Circular Buildings

Occasionally carpenters are required to side up circular buildings with thin lapped siding, and oftener than occasionally the result is a bungling job. And yet this need not seem so surprising, since it is simply impossible to bend a straight piece of this siding around on a level, without kerfing it. And kerfing is not usually permissible. Advising the workman to search for, and use, siding which is warped edgewise, gives him mighty little help, as he will do more searching than siding.

He can make a perfect job by cutting curved siding from wider boards, using the radius J K in Fig. 3, for the conditions there shown. If lines coinciding with the face of the siding were extended as shown, K is the point where they converge.

In Fig. 3, the diameter of the building is ten feet, and we find that in a width of 4½ inches the

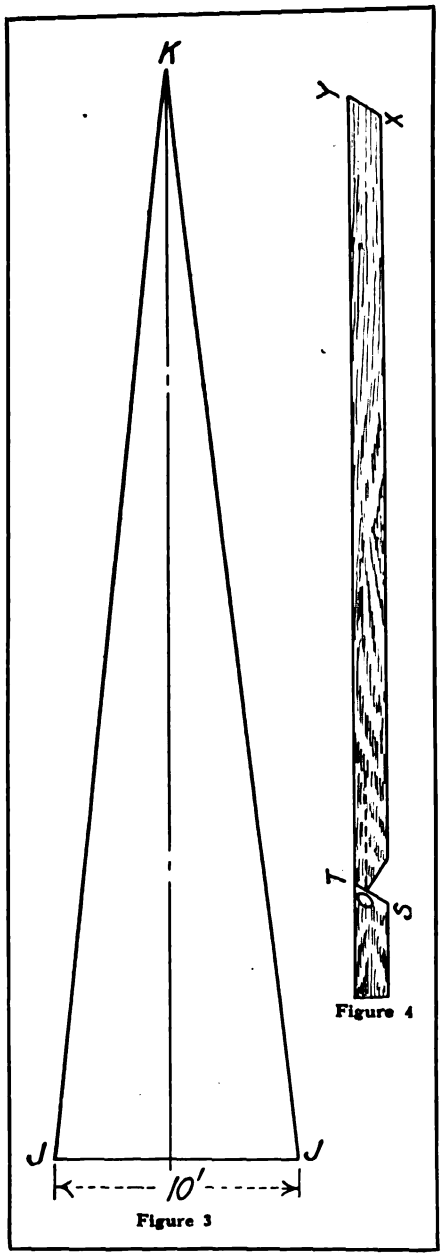

Figure 3

siding inclines one-half inch from the perpendicular. There are 120 half inches in half the diameter, so it will require 120x4½ equal to 540 inches, or 45 feet, to reach from J to K. Siding cut with a radius of 45 feet will bend around this building perfectly level.

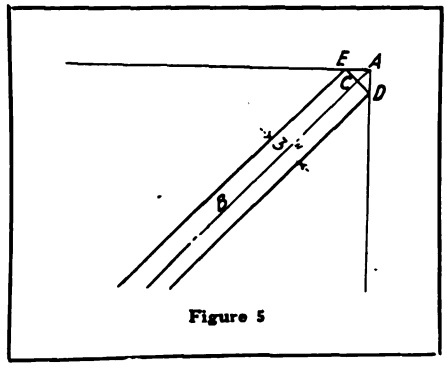

Figure 5

Kerfing a Crown Mould

After having tried it and failed, many competent builders have declared that it is impossible to kerf a crown moulding so that it will bend level around a circular plumb fascia. And yet they are quite mistaken, as this can easily be done by simply keeping the tooth edge of the saw parallel to the plumb side of the moulding when cutting the kerf. Cutting this kerf—or practically most any kerf—on a bevel, will give a much more satisfactory job.

A Roof Framing Myth

What is now a hoary old myth was long ago perpetrated by some muddle-headed builder, and has been perpetuated ever since by roof-framers who shirk much thinking—as most of us do. The author of a most pretentious treatise on roof-framing expresses this myth in these words: "As the lower end of the rafter is notched to sit on the plate, we *must* gauge off a backing line as shown, to run in to the angle of the notch."

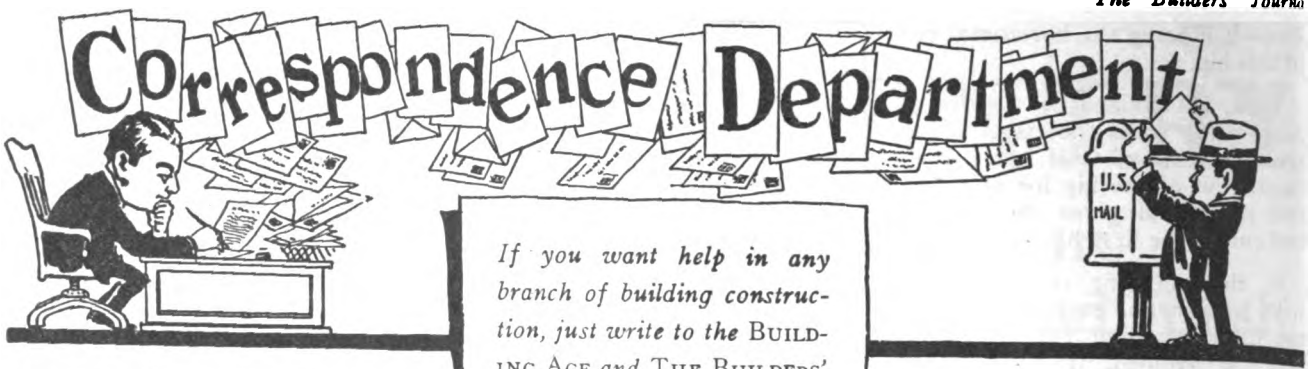

Figure 4

It would be equally true—and equally false—to tell us that we *must* use the rise and run of a hip rafter to get its length. We don't. *Must* is wrong in both cases. No backing line is required, and the attempt to use one only complicates and confuses the problem, and in many cases leads to error. My practice and teaching has always been to mark the length of a rafter between two plumb marks, as shown by S T and X Y in Fig. 4. Then S X or T Y is the length of rafter, regardless of whether the horizontal cut is marked from T or from any point in T S, as for instance, O. Thus a gauge line from O is quite unnecessary—and worse.

No subject in the carpentry line is so interesting as the laying out of roofs—it makes a fellow use his head quite a bit.

There have been instances where some one blundered and the roof was so nicely built that it all had to come down. They sure were a sore lot of carpenters, not to say anything about a mad boss.

If you want help in any branch of building construction, just write to the BUILDING AGE *and* THE BUILDERS' JOURNAL *Correspondence Department. We will be glad to answer all your questions without charge.*

All readers are invited to discuss the questions and answers published.

Laying Concrete Roofing

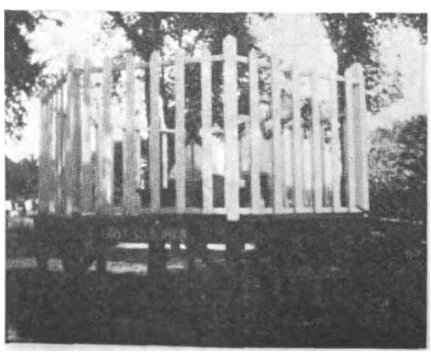
FOR several reasons, concrete makes an admirable roofing material. This is especially to be desired when the building is of monolithic construction. Yet the massiveness and the natural tendency to expand and contract with the changes in temperature gives it its one fault. It cracks when laid over large areas, even though ample reinforcing has been provided.

For this reason it is better to cast the concrete in slabs and to lay them with expansion joints. When these joints are laid over the supports such as the posts or reinforced beams, an ideal roofing material has been secured.

In the drawing is shown such a joint. The slabs, precast and of a size to match closely, are laid with the joints over the supports, with approximately one inch space between. A strip of metal sheeting is bent into a deep "V" shape and laid upside down with each edge under the adjoining edges of the slabs.

The top of the support should be covered with tar paper so that the slabs will move as much as is necessary and with a minimum amount of friction.

After the slabs have been laid and it is assured that surfaces are dry, fill the joints with hot tar or asphalt, first painting the ends of the slabs with an extremely hot mixture to insure a good bond between the two materials. Then a thinner coat is given to the whole of the top.



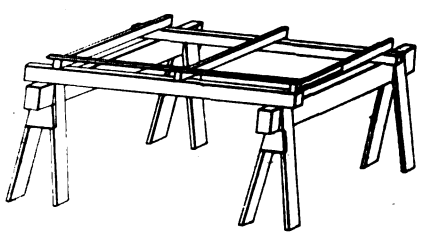
In this way the whole top is made water tight, and yet provision has been made for the expanding and contracting which cannot be prevented. If the top slopes slightly, drainage will be easy.—**Dale Van Horn.**

Pound for Lost Children

EVER so often the builders employed by the great American municipalities are called upon to erect this, that or the other unique structure—large or small, or medium-sized; seldom, however, any more actually unique than that which was completed recently for the good park commissioners of the city of Milwaukee.

Ever so often a youngster will stray away, and when he or she is discovered by the park policeman, sobbing violently for Mother, Daddy or some careless nurse girl, there has been—up to the moment of erecting this enclosure—no way of knowing where the searcher for the mischievous stray child might, in due time, be found. Police went in one direction, parents in another, etc.

So the park officials took counsel over the matter. Then they conferred with the park builders. The result is a very neat and really attractive pound at the big park's heart, reserved for lost children, and to which, as everyone in Milwaukee now knows, all lost children should be brought as soon as found.—**Felix J. Koch.**



Lathing Kink

CARPENTERS when nailing wooden laths on a wall spend unnecessary time in holding the lath in position with their left forearm and elbow, taking a nail from pocket or mouth and putting it in position between the left thumb and finger and holding it there while they drive it home with the chance of pounding one's fingers with the accompanying expenditure of useless profanity.

I had a rush job of plastering and devised the following scheme which saved considerable time and will appeal to any efficiency expert.

Nail three strips of 1 in. x 2 in. x 36 in. Y. P. to two 2 in. x 4 in. x 36 in. Y.

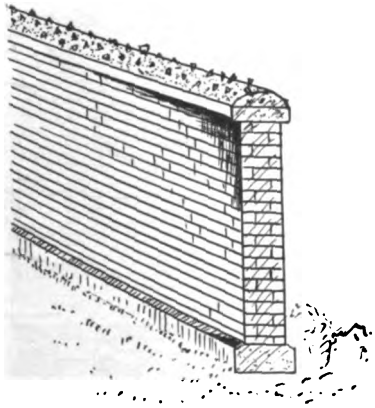
P. scantlings so that the strips will be the same distance center to center as the furring strips on the wall. Place the frame thus made upon two trestles or other means of support. Place a pile of laths on the strips and a box of nails within easy reach, using the strips as gauge lines and anvils, drive nails into the lath until the points project through, then lay aside. Strips may be nailed on the end and front to act as stops or guides. A dozen laths may be laid edge to edge and nailed at one time.

The carpenter simply takes a lath in his left hand, holds it in position and with a few taps of the hammer nails it in place.—**Henry R. Bowman.**

Wire for Bridging

MY attention having been directed to the article "Use of Wire for Bridging" Page 49 of the August issue of BUILDING AGE AND THE BUILDERS' JOURNAL, I have read it with much interest.

Digitized by Google

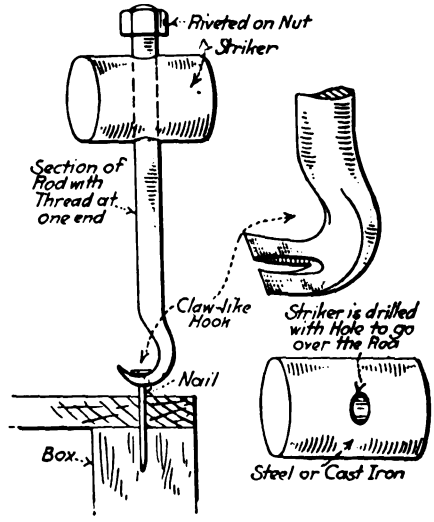


Undoubtedly, the idea must surely have been conceived by a former service man, familiar with the many uses which wire was put to, during the World War. Of its originality and simplicity there is no question, but is it practical?

You are aware, as expert architects and building contractors are, that while wire stretches in length, lumber shrinks in width (dampness excluded). Such being the case, you arrive at no other conclusion but that wire for bridging purposes, cannot compare favorably with wood.

I question very much if any competent architect would specify wire for bridging, where the joists are eight inches, or over.—**Joshua Thompson.**

Glass Topped Wall Gives Protection

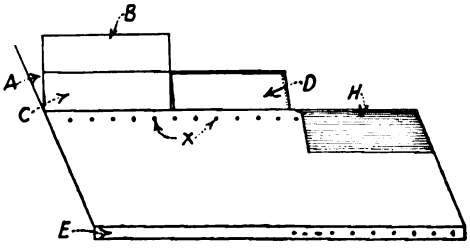


THE high brick wall erected about a suburban home adjacent to Washington, as a protection mainly against burglars and animals, did not meet the requirements so the owner decided upon an additional safeguard to the wall, made up of cement and glass. This consists of a quantity of jagged glass projections, imbedded in the cement while plastic and held solidly when the cement became hard. The cement was rounded out with a high crown so that the sharp glass would be at the uppermost edge and consequently unsafe to attempt to cross, because anyone could not obtain a safe foot or hand hold.

Another protection which this affords, is against cats using this fence for nightly meetings, which is a creditable feature in the prevention of this nuisance. In appearance, the glass does not appear as a disfigurement, rather, the various shades of green blue, red, brown and other tinted glass which are mainly broken bottles and window panes, glisten and bead in the sunshine almost as though they were jewels. Glass evidently was selected in preference to metals inasmuch as it is proof against corrosion, and the sharp edges would remain sharp indefinitely.—**George A. Luers.**

Easily Made Nail Puller

THE nail puller shown in the attached sketch combines, with a hook for starting the nail, a striker for driving it out. The tool is made from a length of bar, threaded at one end and forged to a slotted "V" hook at the other. For a striker any heavy piece of iron or steel with a hole through the center to slide on the rod is provided. As shown in the sketch, this is a piece of shaft end. The manner of using the tool is obvious. For uncrating or opening boxes this tool will pull out the nails rapidly without bending them or breaking the box. The nut should be riveted on the end of the shaft, to avoid the parts being separated.—**W. A. L.**



Bed Moulding in Angles

WORKMEN experience difficulty in "running" bed moulding in the angle of an eave cornice. The subject is here presented in figure 1 and shows the mould tipped out of plumb so as to intersect properly with the same member on the gable end.

This looks all right until the job of nailing this tipped member in this position without shifting or splitting is attempted and then the difficulty attending this operation makes the job impractical, though generally done in that way.

This job can be done to some advantage by setting the bed plumb, turning the corner continuing on a level line as shown on figure 2; cap this return and tinflash the caps. The finished job is more quickly done, looks better, is more substantial and conserves the wear and tear of workmen's dispositions.—**C. A. Doner.**

Leakage at Wall Plate

WAY back in the 80's of the 19th Century, when actual two or more storied business buildings commenced taking the place of "false fronts" in our town, they were usually covered with tin or iron (painted) standing seam roofing. We then experienced a great deal of trouble from leakage a few feet in from the back wall or eave, especially from iron roofs, as they were not double seamed like the tin roofs.

As a remedy, the metal was taken up over the rusted portions and renewed after the pitch of the last set of roof joist had been increased. The connection of the old roof with the new material was made as illustrated.

The seams of the old roof was flattened down, up the roof from the eave as far as necessary to get back of all unsound metal. A chalk line drawn across the roof at this location and the old roof sheared away from this line. The ends of the seam thus brought out are hammered very flat and close for two inches from the end, then graduated with a twist or spiral from the flat end to the regular perpendicular seam of the roof. This flattened end is then framed straight up an inch with tongs (as at B). Measurement is taken from the eave E to the flange B, to this is added ½ inch for the flange C to engage the flange B. Also 1 inch for forming over the eave for nailing. Where formed and fitted into place the new metal is nailed along its entire length as shown at X. The top of the flange B is then formed over C, giving the seam D, where the whole length of the seam is hammered down smooth and tight for soldering if the metal used can be soldered.—**L. S. Bonbrake.**

Brick Home *of* Beauty

HERE is a design for a comfortable Seven Room Home, built of brick, that is dignified and not too ornate.

There are many desirable features to this design. Perhaps the one that will appeal is the large sun parlor. This opens into the living room through two pairs of French doors. The glassed-in portion of this porch is in the shape of doors which are easily removed and replaced by screens for summer use. The sink in the kitchen is placed directly under a double mullion window, assuring plenty of light, and the refrigerator is iced from the outside. Milk, etc., is delivered inside the kitchen by an automatic lock raising door. At the rear, a garage has been built and this may be entered from the kitchen.

This home of beauty is the residence of Mr. and Mrs. H. W. Krause, of Indianapolis. Mrs. Krause had her own ideas of what she wanted and they are embodied in this convenient home. The plans were drawn by Mr. S. P. Seycrest, of H. M. Glossbrenner Realty Company, of Indianapolis, Indiana, who were the building contractors.

SECOND FLOOR PLAN

Digitized by Google

What the Editor Thinks

The Close of a Prosperous Year

THIS month brings the year 1922 to a close and everyone in the building industry has reason to be thankful that they have had such a prosperous year.

More building has been accomplished than in any other previous year of the history of the United States, and it is with great satisfaction that builders can survey the work that they have done as they realize that this work has been something that will add to the permanent wealth of the country and the happiness of quite a large number of families.

The man that owns his own home is a better citizen all around than one that simply rents a few rooms and it is by builders preaching this gospel of owning your own home that has made many to want and strive to build a home of their own.

There is certainly satisfaction in doing a good piece of work where it benefits yourself, your customer and your country.

Index for 1922

WE have in preparation an alphabetical index of the contents of BUILDING AGE and THE BUILDERS' JOURNAL for the year 1922. This we expect will be ready towards the end of December, and a copy will be gladly sent without charge to any reader asking for same. A postal card request will be sufficient.

Our Cover Design

OUR homes have more or less of the delightful appearance in the summer time when trees are in leaf, the grass is green, the flowers in bloom and the sky a glorious background to all.

In the winter time, however, with the barren trees, the snow-covered ground and the bleak sky, it is then that a house should have a welcome look, reflecting warmth and coziness within, together with good cheer.

What could be truly more delightful than the pleasing design shown on our cover this month, on a cold December night, radiating its Christmas cheer to all without.

This house is the residence of Mrs. C. W. Sullivan and was built at Merion, Pa., and Messrs. Savery, Sheetz & Savery of Philadelphia were the architects.

The floor plans of this house were published in our issue of March, 1921, but here we show how the same house appears in the winter time.

Lack of Skilled Mechanics

MANY manufacturers are concerned on the effect the shortage of skilled mechanics in the building trade will have on the sale of their products. At the present time there is a big demand for buildings, more than the normal average, due to construction having been virtually stopped during the war period.

No more brick, timber, plumbing supplies, paint, etc., can be used than there are mechanics to erect and install them. It certainly is regrettable that no concerted action is taken to remedy this situation. Many earnest efforts have been put in operation and have been successful in turning out young men with some knowledge of their rudiments of particular trades.

Builders to Conduct Building Show

BUILDERS Exchange of Pittsburgh, propose to hold a building exposition in their city early next Spring. They feel that a show of this sort properly conducted by men vitally interested in the building industry will greatly aid it and promote home building to quite a considerable extent. Here is a step in the right direction—it is a good example of co-operative advertising that will result for the good of all.

The High Cost of New Men

ONE of the best arguments for winter work is that it keeps a contractor's organization together. To have a group of men about you that know exactly what you want is worth money to you. There is no time lost and no costly mistakes made.

This, of course, is so with skilled workers, but it is even more so with common labor. The cost of breaking in a new man must be charged to overhead, and it is for this particular reason that an employer should hesitate a long while before firing anyone, as he knows it will be an expensive thing for him to do so.

A little more time spent in the selection of men would be worth the trouble. Pick out good men—those who will stick. Wherever possible, hold on to your men during the winter season, so that they will be with you when the spring rush comes again. Most men, especially in small towns, welcome a few weeks off so that they can do necessary repairs around their own house and this helps out the small town contractor to quite an extent.

Poor Concrete Blocks

BUILDERS in buying concrete blocks that are made by some small manufacturer in their locality should be a little careful to see that they get a good product. Too often a man starting to manufacture blocks does so because he has a little piece of land on which a good grade of sand has been discovered and he buys himself a block machine and starts in the business.

Owing to ignorance of their proper manufacture, they are weak in crushing strength, apt to crumble, crack and absorb excessive moisture. It is a wise thing for a builder to make his own blocks unless he can assure himself that the manufactured blocks are up to the proper mark. The result of using poor blocks is that everyone gets more or less of a black eye excepting the guilty manufacturer.

Legal Department

SPECIFYING with as much particularity as is reasonably possible is important when the work is to be done by a sub-contractor. An interesting decision is found in the opinion of the Washington Supreme Court in the case of Washington Monumental & Cut Stone Co. vs. Murphy, 142 Pacific Reporter, 665.

Bulkheads as Part of "Steps" in Stone Sub-contracts

Defendant had the principal contract to erect a high school building, and awarded plaintiff a sub-contract to furnish "granite steps and platforms and the two granite courses around the building as shown," etc. Controversy afterwards arose as to whether plaintiff was bound to provide the bulkheads flanking the steps and platforms. The court finds that no such requirement existed, especially in view of expert testimony tending to show that it was customary to construct bulkheads of the material used in the wall of the building on which they abut, and that it was not customary to require a sub-contractor to construct them under such a contract. The court said, in part:

"The contract itself would hardly seem ambiguous, since, by particularizing the things included: steps, platforms, and courses, it excluded all things not enumerated. If the word 'steps' was used in some broad generic sense, as including everything in any way related to the steps proper, so as to include the bulkhead, why use the word 'platforms' at all? They, at least, are in a sense steps, while the bulkheads are not. It is a matter of common knowledge that a platform in a stairway is, both in use and position, but a broader step or tread. A bulkhead, though sometimes employed as a balustrade, would hardly perform the office of a step in any connection. Nor is it clear that any ambiguity was imparted into the contract by its reference to the plans and specifications. An examination of the plans of the school building shows the word 'granite steps' with an arrow pointing to the steps alone, i. e., the treads. The lower base course is marked 'fine axed granite' and the upper course is marked 'stone.' A front cross section shows the legend, immediately below the upper course (which is referred to in evidence as the base mold), and above the bulkhead, ' all work below base mold to be of stone.' Even the sheet showing the details for the bulkhead, steps, and platforms fails to show that the bulkheads are to be of granite. The steps and platforms are shaded in such a way as to indicate that it was the original intention that they should be made of a different material from the bulkheads. There is nothing whatever, either in the written plans or in the specifications, which would tend to indicate that where the word 'steps' is used in the contract it should be construed in a generic or technical sense."

THE New York Tenement House Law does not require handrails on inclosed stairways leading to a cellar or basement, holds the New York Court of Appeals in the case of Cahill vs. Kleinberg, 135 Northeastern Reporter, 323.

Necessity for Handrails on Inclosed Stairways

The law requires stairways to be provided with proper "banisters and railings," and provides that new stairways leading to the cellar or basement shall be entirely inclosed by brick walls. The Appellate Division of the New York Supreme Court decided that this law required hand-railings on basement stairways, although the stairway might be inclosed. On appeal, the Court of Appeals held that this was erroneous, saying:

"It is perfectly well understood that a banister and a railing mean a balustrade, consisting of balusters or supports upon which is placed a railing. It is the common construction which we see on the outer and open edge of a stairway, and it is clear that by the legislation in question the Legislature intended that such a barrier should be placed upon the outer edge of every stairway as a protection against persons falling over said outer edge and receiving injuries. The entire purpose of the provision and of such a structure is obviated when the side of the stairway is protected by a solid wall, as was the condition in this case. While the Legislature might have provided for a handrail in the case of such a stairway as is involved in this case as a protection against slipping and falling down the stairs, it would be going too far in the processes of interpretation to hold that the language employed in this statute contemplated any such purpose, or that it might be reshaped in its meaning so as to describe a handrail affixed to a wall, instead of an ordinary banister such as is actually described in the statute."

ON an owner discovering after completion of contract construction that fraud was practiced upon him in obtaining the contract, he is liable, not for the contract price, but for the reasonable value of the work done, holds the California District Court of Appeal in the case of Fassio vs. E. L. Goldstein Co., 207 Pacific Reporter, 497. The court finds that in this case the owner's architect connived with the contractor to increase the cost of the work before the contract was let.

Contractor's Measure of Recovery for Work Done Und r Contract Fraudulently Obtained

IN nearly all, if not all, of the states there exists a law known as the "statute of frauds." It requires certain contracts to be in writing. One of these classes of contracts is comprised by contracts by one person to pay the debt of another to a third person. However, the provision is held not to apply where credit is extended in the first instance on the faith of the promise. This exception is illustrated, as applied to the building industries, by the recent decision of the Alabama Supreme Court in the case of Turner vs. Lackland, 91 Southern Reporter, 877.

When Third Person's Promise to Pay Need Not Be in Writing

Plaintiff sued defendant, executor of defendant's wife's estate, on account of millwork, etc., furnished to a building owned by decedent. The vital issue in the case was whether the materials were furnished on the credit of decedent or of the credit of the contractor, one Raub.

Digitized by Google

Holding that under the evidence the jury could find that there was a promise on decedent's part to pay the bill and that the promise was not invalid under the statute of frauds, the Supreme Court says:

"Plaintiff testified to facts from which the jury might have properly inferred that Lackland, who conducted the negotiation with plaintiff, was acting therein as the authorized agent of his wife; that he (plaintiff) informed Lackland, in effect, that Raub had no credit with him, but that, if Lackland would see that he got his money, he would deliver the materials; that Lackland said that he was going to see that Raub did not get away with him and that he would see that he (plaintiff) got his money; that he would keep it out of the contract he had with Raub. From plaintiff's testimony, stated above, the jury had a right to infer that he furnished the materials on Mrs. Lackland's credit; that the promise of deceased, made by and through her husband, as her agent, was to pay her own debt in a particular way, out of a particular fund."

Responsibility for Error in Staking Out Lot

WE are asked for an opinion on the responsibility of a real estate company under the following stated circumstances: H bought a lot from the company in an Ohio city and the company's surveyor promised to survey the same. Later the surveyor stated that the lot had been staked out, and H awarded a contract to a builder for the erection of a cottage. The work was commenced Saturday, and on Sunday a visit to the site disclosed to H that the lot had not been staked out, excepting two stakes which had been placed at front corners before the sale was made. The contractor had lined the cottage up with these stakes, and the building was too far advanced to justify stopping further work. H telephoned the company drawing attention to the omission to make the promised survey, and was assured that this would be done at once. The following Sunday he again visited the site and found that new stakes had been set, but in such a way as to place the building on two lots. There was a variance of 25 feet from the old corners. Can H require the company to bear the expense of moving the cottage, considering the fact that the lot was sold with reference to the original stakes?

I am of the opinion that H has a valid claim for the expense of moving the building, although he was negligent in permitting the construction work to proceed without first getting the true corners. His statement of the case shows that he did not rely on the old stakes as showing the true corners of the lot, for he repeatedly sought to have a new survey made. But in my judgment he had a right to assume that the old stakes were substantially in correct position, so far as the real estate company is concerned. This is particularly so in view of the fact that the lot was sold to him with reference to the old stakes.

On the other hand, there are two points on which H might be defeated in a suit to recover the cost of moving the cottage. If in selling the lot the real estate company did not agree to survey the lot, its promise to do so afterwards, while morally binding, would be legally unenforceable unless there was some new consideration for the promise. Or, if the agreement to survey was a part of the contract of sale and therefore enforceable, but if the real estate company was not notified that immediate building was intended, it might be held that it was not chargeable with foresight that its delay in making the promised survey would result in H going ahead with a building without first having the lot lines defined. And, if the cost of moving the cottage will be comparatively small, I would be inclined to advise H bearing it rather than plunge into litigation which might prove to be expensive in the long run.

However, as a matter of equity the company should bear the expense, and it is quite possible that H could succeed in his suit on the theory first stated—that he had a right to assume that there was no substantial variance between the true lot corners and those pointed out to him. Furthermore, he has the advantage of being in possession of the land occupied by the cottage—parts of two lots—and should he choose to sit back and rely on his possession, I am inclined to believe that he could not be dispossessed by suit until and unless the company first pays him the cost of moving the building.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

Carpenter's Duty to Conceal Plumber's Defective Work

PLEASE answer a question which has come up in a more or less friendly way between a master plumber and me," writes a subscriber. "He claims that if he furnishes twisted or misshapen trays or sinks it is the carpenter's place to make his work conform to the defective material, so that no extra expense will fall on the plumber in consequence of such defective material. The plumber asserts that he should not be expected to go to the expense of returning the defective pieces and getting perfect ones. I claim that if the carpenter makes the changes necessary to conceal the defect, it is a matter of good nature and not of compulsion; separate contracts having been made with owner.

So far as the plumber is concerned, he has no right to have the defects of his work concealed in this manner, and it may not be done without the owner's consent. And, in our judgment, the carpenter should not make his work conform to such defects without first securing the owner's approval. Otherwise, the carpenter may be held.

The plumber cannot excuse installation of defective work on the ground asserted by him. Nothing can excuse that save the owner's assent. If a plumbing supply concern has sent defective material to the plumber, his redress is against the concern. The owner is entitled to what he has bargained for, regardless of the expense that may be entailed against the plumber. And whether the owner will require new installation to conform to the contract, or insist on an allowance of damages, or waive the defect is up to him.

In such a case, the carpenter is under no obligation to the plumber. His obligations are to the owner, and he cannot safely change his work to conform to defects created by a co-contractor, the plumber. A contracting carpenter can excuse departures from his contract only through the assent of the owner, and, in our opinion, is running a risk in concealing defects of other contractors. His good nature toward the plumber should go no further than to give fair warning to the latter that unless the plumbing defects be so far corrected as to permit the carpentry work to be done according to contract, the owner's attention will be drawn to the defects and instructions asked as to whether it is desired that the carpentry be performed to conform to the contract or to the plumbing. It is only in this way that the carpenter can keep "in the clear" with owner.

In cases where the plumber is the carpenter's sub-contractor, it is, of course, strictly up to the carpenter to see that the plumber does his work in a proper manner.

USEFUL CATALOGS

Zinc for Roofs

EUROPE has been using zinc for roofs for more than one-hundred years. How it is used in this country is interestingly described in a booklet entitled "The Roof That is Always New," which is published by the Illinois Zinc Company of 280 Broadway, New York, and a copy will be sent to any interested reader.

Chains for Buildings

THEY are used for many purposes in different parts of a building. For horizontal hung doors on cupboards there is a special use for them. An interesting catalog showing different makes of chains for building purposes is issued by the Bridgeport Chain Company of Bridgeport, Conn., and will be sent to any of our readers who is interested.

Kitchen Improvements

THE modern tendency is to have smaller rooms combined with the maximum amount of comfort. This is especially true of kitchen equipment in small apartments and houses. Builders doing this class of work will be interested in receiving a copy of the catalog of Wasmuth-Endicott Company, Andrews, Ind., describing their standardized "kitchen-maid" unit system of equipment. Many floor plans of kitchen layouts are given together with illustrations and descriptions of various sorts of kitchen equipment.

Washing Machines

BUILDERS are often called upon to furnish some sort of washing machine for the laundry equipment and the speculative builder finds that a house sells more readily if such an equipment is included with the building. A rather interesting folder describing the Laun-Dry-Ette is issued by the Laun-Dry-Ette Manufacturing Company, New York. This machine possesses some advantages that make it much preferred by many housekeepers and as it is the business of the builder to please, it is well if he kept posted on this subject. The folder will be sent to anyone interested.

ON this page we give short descriptions of some very interesting catalogs, etc., that have just been issued by different manufacturers.

They will be sent free on application to any of our readers who are interested, but should you prefer to write us, give the date of this issue and title of the catalog desired, and we will have them sent to you.

Artistic Slate Roofs

THE old English method of slate roofing breaks up the checker board effect that is common in ordinary slate roofs. An interesting circular describing how this is accomplished has just been issued by the S. C. Sheldon Slate Company of Granville, N. Y., and a copy will be sent to any builder on request.

Circular Saws

EVERY builder operating a shop or having a portable power saw on the job will be interested in the new catalog No. 38 issued by Huther Bros. Saw Mfg. Co., Rochester, N. Y. It consists of ninety-four pages and contains a good deal of useful information about the selection of the proper saw for each particular type of work.

Vacuum Cleaner

THE desirability of a cleaning method that is permanently installed in a building is attractively set forth in a catalog issued by the Spencer Turbine Company of Hartford, Conn. A copy of this will be sent to any reader interested.

Casement Windows

CHARMING effects are possible by having the right sort of a casement window. An attractive little catalog describing metal casement sash and frames has been issued by Henry Hope & Sons of 103 Park Avenue, New York.

Door Checks

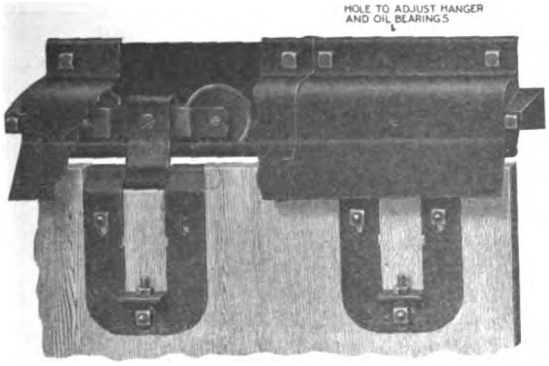
THE booklet describing the Worcester Blount Door Checks has just been issued by the Park Mfg. Company, 48 Lagrange, St., Worcester, Mass. This contains much useful information about installing and setting door checks and will be sent to any reader interested.

Shingle Nails

A RATHER interesting folder comes from the W. H. Maze Company, Peru, Ill., describing zinc coated nails; they make a special zinc shingle nail and the folder contains some good points regarding shingling that will pay any builder to be familiar with. A copy will be sent to any of our readers.

Magnesite Stucco

INTERESTING indeed is the illustrated folder on Flint-Rock Stucco just issued by Flint-Rock Corporation, Ingomar, Ohio. It describes the discovery of magnesite cement by Sorel in 1867 and its later day applications to stucco work. One great advantage of magnesite stucco is that it can be applied in cold weather. A copy of this interesting folder will be sent to any of our readers on request.



Improved Shower Bath

AN improved shower bath that can be easily attached to the bathtub faucet is made by the Kenney-Cutting Products Co., 507 Fifth Avenue, New York. This fixture allows use of the shower or tub by simply turning a valve which directs the flow of water. Four shower heads instead of one direct the needle streams against the body. These shower heads are adjustable to height and to install it no changes or alterations in plumbing are required.

By the use of this attachment, a shower can be used in an ordinary bath tub without splashing and the use of a curtain. It is a handy contrivance for any bathroom which does not have the luxury of a built-in shower and needle bath compartment.

Heavy Doors Made Light

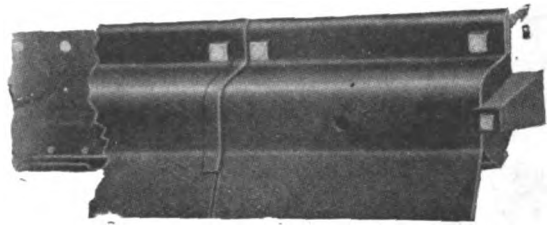
Note how National No. 88 carries the door closer to the rail than any other type hanger.

This feature of carrying the door closer to the rail, and the feature of vertical-and-lateral adjustment indicate our ground for saying that *you* need not put any study into the purchase of hangers and rails—because National has put an exhaustive amount of study into the subject. *Just order Nationals.*

For instance, you want
Simplicity
Generous Capacity
Storm Protection
Right Roller Bearings for
Distribution of Load
Rigidity and Adjustability

No. 88 National has all these factors; its special adjustment construction is also extremely simple and easily operated.

With National No. 88 Door Hanger is used the Storm-Proof Rail with Protective Cover shown in the right hand illustration. This Rail is bird-proof and storm-proof; it requires no brackets or splice covers.



Translating hundred-weights into pound-weights is one of the missions of National No. 88 Door Hanger. Another is adding its quota to the reputation of the Builder who hung the doors.

Every time the owner slides open this easy-gliding door—especially if he has had experience with the sticking, unwieldy type of big door, that has to be tugged or shoved by main strength—he experiences a warm glow of satisfaction that his Builder had the foresight and wisdom to choose

NATIONAL

No. 88 Adjustable Storm-Proof Door Hangers and Rail

for every large or heavy door, in city or country

Note how this Rail protects the top of door

National No. 88 Adjustable Storm-Proof Door Hangers are furnished by dealers, packed 1 pair in a box with bolts for attaching, also lag screws and end-caps for the rail, complete with illustrated instructions for attaching the Hanger and Rail.

Send for valuable catalog, "Builder's Hardware"; it is instructive

NATIONAL MANUFACTURING COMPANY

Review of the Building Situation

BUILDING statistics for October just published by F. W. Dodge Company show that the volume of contracts awarded during October in the twenty-seven Northeastern states were 14% ahead of those reported for October of last year. At this period of the year, a regular seasonal decline is to be expected and this is shown in the drop of 7% from that of the September figures. We, however, have to consider that owing to the fuel and car shortage, construction activity was hindered to a certain degree. Were it not for this, the possibility is that the decline would be very much less. Under the circumstances, however, the showing for October is quite remarkable and shows a continued and healthy activity in the different branches of the building industry.

Residential construction continues in the lead, the October contracts for this class of construction amounting to $110,776,200 or 40% of the month's entire total. This figure is an increase over the amount of contracts in September. The revival of residential construction this year has overshadowed everything else in the building field—has broken all records.

One of the best signs, however, for the prosperity of our country, besides residential construction is the fact that industrial construction has averaged about $27,000,000 per month compared with $14,000,000 per month in 1921. This is an increase of nearly 100% and is indicative of continued prosperity for our country.

In New England the contracts awarded for residential construction for October exceed that spent in September by $2,000,000. In New York the figure has slightly fallen off from that of September, but still amounts to $33,000,000.

According to the reports the amount of new construction for which contracts were awarded from January 1st, 1921 to January 1st, 1922, amounted to the immense sum of $2,887,446,300! 1920 was the next highest year and during a like period the amount of contracts awarded amounted to $2,331,411,000.

In the Mid-Atlantic District there was a decline from the September total and also about 6% from that of October, 1921. Curiously enough, the contemplated new work reported for the same territory amounted to $52,723,000, being an increase of 38% over the amount contemplated as reported in September.

The coal strike in this section was responsible for this condition and now that it is settled it is reflected in the demand for additional building as shown by these figures.

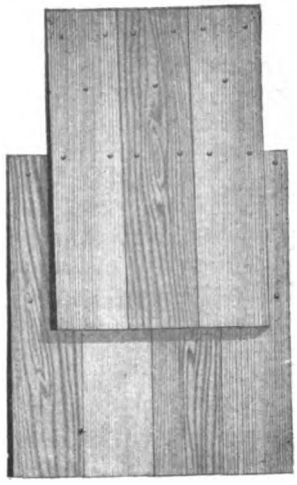
Residence — Highland Park, Illinois. Robert Seyfarth, Architect, Chicago. "Exterior of Redwood Sawn Shingles."



Redwood Special Sawn Shingles

IN residence construction these new style sawn shingles give an appearance of wide clapboards—a style which is fast becoming a distinctive feature of the better class of new residences in the Middle West and the East.

Side walls of Redwood sawn shingles suggest careful specification of the highest grade materials—give an air of distinction to a house which makes it easier to sell.

Redwood Special Sawn Shingles are either 24 inches or 26 inches long, as desired. Both sizes are 5½ inches wide and ¾ inch thick at the butt. Laid 13 inches to the weather, they give the pleasing appearance shown in the illustration.

Made from clear, properly seasoned Redwood, these shingles do not warp. They take paint well and hold it indefinitely. Permeated with a *natural*, odorless preservative during the growth of the tree, Redwood lumber, shingles and millwork are protected against all forms of rot and decay. Their use for exterior construction gives greater permanence and value to any frame building.

Redwood Special Sawn Shingles

Redwood should be specified for

Exterior Construction
including--Colonial siding, clapboards, shingles, door and window frames--gutters, eaves, water tables and mudsills--porch rail, balusters and columns--mouldings and lattice--pickets and fencing--pergolas and greenhouses.

Interior Finish
Natural, stained or painted Wood Block Floors.

Industrial Uses
Tanks and vats for water, chemicals and oil--factory roofs and gutters--wood block flooring.

Wood Specialties
Such as--Caskets and burial boxes--incubators and ice cream cabinets--cigar and candy boxes, etc.

Railroad Uses
Such as--Railroad ties and tunnel timbers---signal wire conduits and water tanks--car siding and roofing.

Farm and Dairy Uses
Such as--Silos, tanks and troughs--hog feeders and implement sheds--wood block floors, etc

For the convenience of builders and architects, we have recently issued our "Construction Digest" and our "Engineering Digest" which either our New York or Chicago office will gladly forward, together with such other information on Redwood as you may request. Write for them.

PAINTING

Practical Points of Interest to the Builder

Painting *and* Bronzing Radiators

By A. ASHMUN KELLY

OLD radiators should be made clean before giving them a coat of paint or bronze liquid, washing off grease with benzine. After cleaning and dusting off apply any desired coating, even white. Aluminum bronze stirred into a good bronzing liquid until of the consistency of thin paint, may be easily applied with a soft hair brush. One or two coats, as required.

You can make a very good bronzing liquid by taking equal parts of gold size japan and light colored baking varnish and mixing together. To each ounce of this liquid add three ounces of turpentine. Shake in a bottle for use. Bronze powder gives a higher luster by being sifted on a tacky varnish surface.

Apply a coat of baking varnish to the radiator and when it has dried to a "tack," or to that condition that when a finger is touched against it there is a feeling of slight adhesiveness.

Apply the dry bronze powder or aluminum with a dry camel hair brush or a bunch of raw cotton. The brush is best, because it enables you to get easily into small recesses, etc. Place a paper under the radiator to catch the bronze powder as it falls.

For ordinary radiator work a liquid made from good copal varnish thinned down with turpentine, will be found satisfactory; let it dry to a tack, then dust on the bronze. Or if you choose to mix bronze and liquid together, let it be in the proportion of equal parts.

To bronze steam pipes and radiators, using dry gold bronze, paint the pipes and radiators with medium chrome yellow, in oil, thinned with a little turpentine and varnish, and when dry enough rub on the powder. When it is hard-dry apply a coat of thinned copal varnish.

RADIATORS are sometimes painted white, a rather difficult color, one may say. The heat yellows ordinary white paint, so that a special paint must be used. The first coats are made with zinc white, thinning with turpentine. The coats are to be made smooth with sandpaper. Or at least as smooth as possible. On this foundation place two coats of the lightest gum copal varnish. Lithopone is said does well as the base.

Here is a factory formula, which gives a radiator paint that dries without luster and is discolored very little by the heat. White zinc oxide, barytes and powdered soapstone are ground together in japan gold size, turpentine and carbon tetrachloride, in equal parts. Or it can be ground in a celluloid liquid, and there will be no discoloration at all. But the better way is to find a dealer who sells radiator white.

Oil paints will not do, as the oil is more than likely to blister, while the color will turn brown and peel off. The best we can do with oil paint is to use zinc white thinned with turpentine to make it dry dead. On top of this the varnish may be applied. But the varnish may soften under the heat, especially the low grade varnishes, which contain rosin. If a baking varnish is used, the purpose being to place the work in an oven, then the varnish coating may be applied much heavier than otherwise it should.

A black radiator varnish is made from the best Syrian asphaltum, or Gilsonite will do as well, heating ten parts over the fire, with two parts of raw linseed oil, until sufficiently fluid. When it is cool thin it down to the consistency of varnish with turpentine.

TO do the logs of gas radiators in imitation of wood, they are usually coated with copper bronze or green bronze, and then blended in with colors that will simulate the natural colors of the barks of certain trees. To make the log look like birch or maple, for instance, or as those barks sometimes appear, asbestos fiber is attached in various parts of the logs.

The pigments used for this work have to be fire-resistant; these are raw and burnt umber, Indian red, mineral brown, oxide of chromium green, or copper green. The medium used in mixing the paint is silicate of soda, for there is neither oil nor gum that will stand the degrees of heat generated by these gas-lit metal logs.

Made to Walk on

Johnson's Floor Varnish dries dust-free in two hours and hard over night. It imparts a beautiful, high lustre—has good body—will give long wear—is absolutely water-proof—and will stand all reasonable tests.

JOHNSON'S FLOOR VARNISH

Johnson's Floor Varnish is tough, elastic and durable. It gives a beautiful, high gloss which will not chip, check, mar, blister or scratch white. Is very pale in color so can be used on the lightest floors and linoleum. Splendid for furniture, woodwork and trim of all kinds. May be rubbed if desired.

FREE TRIAL OFFER

Fill out and mail the attached coupon for a pint of Johnson's Floor Varnish free and all charges prepaid. There is no obligation whatever connected with this offer. All we ask you to do is to test it out in comparison with the brand you are at present using.

S. C. JOHNSON & SON,
Dept. BA-12, Racine, Wis.

Please send me free, all charges prepaid, one pint of Johnson's Floor Varnish. I will test it and report results to you.

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

How Quantity Surveys Cut the Cost of Preparing Estimates

Prepared by the Committee of Quantity Survey Society Construction of Federal Buildings

J. W. GINDER, Chairman

THAT the quantity survey, as a system, has great merit is conceded by all interested in the building industry, but its general adoption in this country has been delayed by several causes, one of which, the World War, resulted in a necessary suspension of all building activities. Of other reasons assigned for the delay in its adoption may be mentioned the dubious attitude of some who imagine that a new, and, as they say, non-producing factor is to be added to the industry: the query, "Who will assume the burden of cost?" is propounded.

The apparent reluctance to abandon old methods, admitted to be faulty, is being dispelled, however, as knowledge of the quantity survey becomes assimilated.

A quantity survey has been defined as a comprehensive and systematically prepared schedule of all the materials to be incorporated in a structure—the result of a thorough survey and check of the required drawings and specifications by highly-trained technical men.

The most important purpose of a quantity survey is that of rendering on the same basis as to quantities all bids of the competitors for the work. Thus, in formulating his bid, the competitor has only to append to the material costs his labor costs, "overhead," profits, etc., which may be applied by the unit system or otherwise.

These schedules are so prepared that contractors or others interested may readily determine the character and value of any article indicated. Such indications are graphic descriptions, supplemented by measurements and diagrams if necessary, but in no case are they to be used in lieu of the drawing and full size details from which to execute the work.

Error Reduced to a Minimum

Some opponents have thoughtlessly condemned the system on the ground that inaccuracies may occur. An indemnifying bond as a guarantee of accuracy has been suggested.

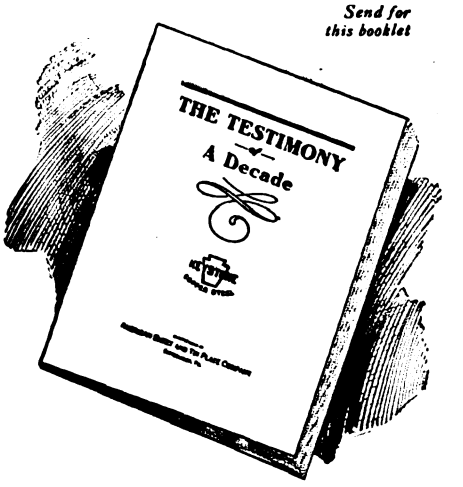
The functional interdependence of a careful survey of quantities and a thorough check of the survey is a feature of the proposed system. The possibility of error is reduced to the minimum. What of the probability of error under the present system? How often is the success of a competitor attributable solely to error in taking off quantities? It may be said that absolute perfection will not be attained, but it is reasonable to assume that the element of error will be no greater than that of any survey made in the office of the contractor under the usual unfavorable conditions under which most estimates are made.

For obvious reasons, adjustments before the award of contract are not generally advocated, but any antagonism due to this fact can readily be dispelled. These adjustments can certainly be made after the award of contract.

In some instances purchases of the materials are made and bids for labor only are required. If after the surveyor's check inaccuracies still remain, and it is discovered during construction or after completion that the scheduled quantities upon which the labor bids were based were either inadequate

The Owner Pays

PROBABLY the chief difficulty in securing the adoption of this Quantity Survey System is that of convincing the owner that the added fee for the quantity surveyor, which may be paid either directly or through the architect, is in reality a saving.



Under the quantity survey system he is paying for this service only once, while under the present practice (though it may not be apparent to him) it is paid proportionately to the number of bids.

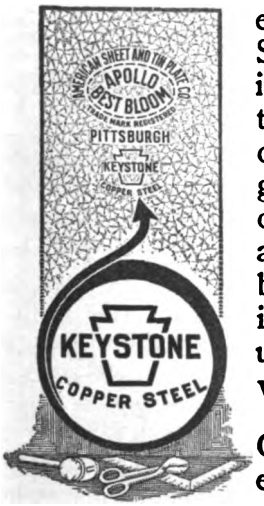
KEYSTONE COPPER STEEL

The Testimony of a Decade



Send for this booklet

Time will tell—*it has told!* Ten years have now elapsed since Keystone Copper Steel was first offered to the trades as possessing greatest *rust-resistance.* Our original claims for this copper steel alloy have been fully substantiated—and the years continue to add to the weight of evidence, and to further prove its superiority for

Black and Galvanized Sheets and Roofing Tin Plates

We have assembled in a brief booklet a few of the outstanding facts showing the excellence of Copper Steel, together with opinions of eminent authorities, official photograph of weather tests and graphic chart showing corrosion losses of steel and iron sheets. This booklet is of particular interest to builders and users of sheet metal—and will be sent upon request.

Our large group of modern works provides us extensive facilities—and with these we combine an able and skilled personnel of long experience, whose earnest desire and purpose is to serve you well, and supply products that always render the full measure of satisfaction.

Our service and brands, known the world over, mean much to the man whose needs require substantial quality and dependability.

For building construction—roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work—use Keystone Copper Steel Galvanized Sheets and Roofing Tin Plates—the highest quality obtainable. Sold by leading metal merchants.

or in excess of the requirements, then the adjustments for labor can be made.

These applications of the system are cited to show that no interests can be jeopardized by the fact that a quantity survey may lack perfection.

Accuracy Guarantee

IT is now possible to obtain, with a quantity survey, a guarantee of the accuracy of same to within a small percentage of the total sum involved. The contractor may assume this differential by omitting it and the cost of the indemnity as components of his bid, or he may transmit them to the owner. With the view of maintaining at the minimum the cost of the quantity survey, some advocates assert that a guarantee of accuracy necessarily involves an additional cost and an element of chance for which some interest must pay, and furthermore, is superfluous if the system is properly applied.

Due to the diverse methods of estimating employed, there really exists in connection with the present system of contract awards a competition in the quantities of materials involved by construction work. To eliminate this quantity competition is a function of the quantity survey, and thus is simplified the whole matter of competition.

The intent of the drawings and specifications may be in some respects quite vague and ambiguities may exist, but to this can be attributed only a very small percentage of the wide varieties of the material bills as ascertained by different estimators. The quantity survey clarifies, and every bidder commences work on his proposal with the satisfying knowledge that the entire job has been carefully examined.

Cutting Out the Gamble

The necessity for improvement of methods has long been felt, and such need is emphasized by the contractor's wail that instead of engaging in a business he is playing a most hazardous game. In any discussion of a contractor's business you will hear the assertion that the business is a gamble, that profits cannot be assured, and that a contractor's hope of salvation is that from some future work an abnormal profit can be derived which will compensate or overbalance the losses sustained on work which has been performed. This is a frank admission and is indicative of an unhealthy condition which certainly calls for the administration of some treatment. Primarily, competition will not permit a realization of the hope for large profits. The uncertainty of chance must be eliminated, or at least reduced to a minimum not in excess of that of any other business.

IN order to procure the necessary volume of work, it must all be on a close margin; and it is seldom, if ever, that a contractor can withstand a loss.

As diagnosed by most authorities, the fault is with the contractor himself, and consists of blindly following precedent, employing methods some of which are now obsolete and others which never had any valid reason for existence; in numbers of cases there is an absolute failure to acquire the requisite knowledge of the materials to be furnished and the work to be performed.

A contractor sustaining losses is prone to communicate them to others with whom he is in contact, and it is thus that the whole industry is rendered ill and in need of a remedy.

Provide for Overhead

In addition to a profit on his material and labor costs, a contractor is entitled to a reasonable margin on his operating costs, inclusive of his own salary and the costs of estimating with other office expenses. In every proposal should also be given due consideration to depreciation on plant and equipment, interest on borrowed capital, taxes, and losses through bad accounts. If the business is to endure, such business principles cannot be ignored or laid aside for the gambling methods, and the contractor who is habitually remiss in making up his bid and who applies his prices and profits by the rule of guess cannot find salvation in the quantity survey system, as through force of habit, he will continue his rule of guess practices and eventually be self-effaced. The contractor who excels in management is an advocate of the quantity survey system.

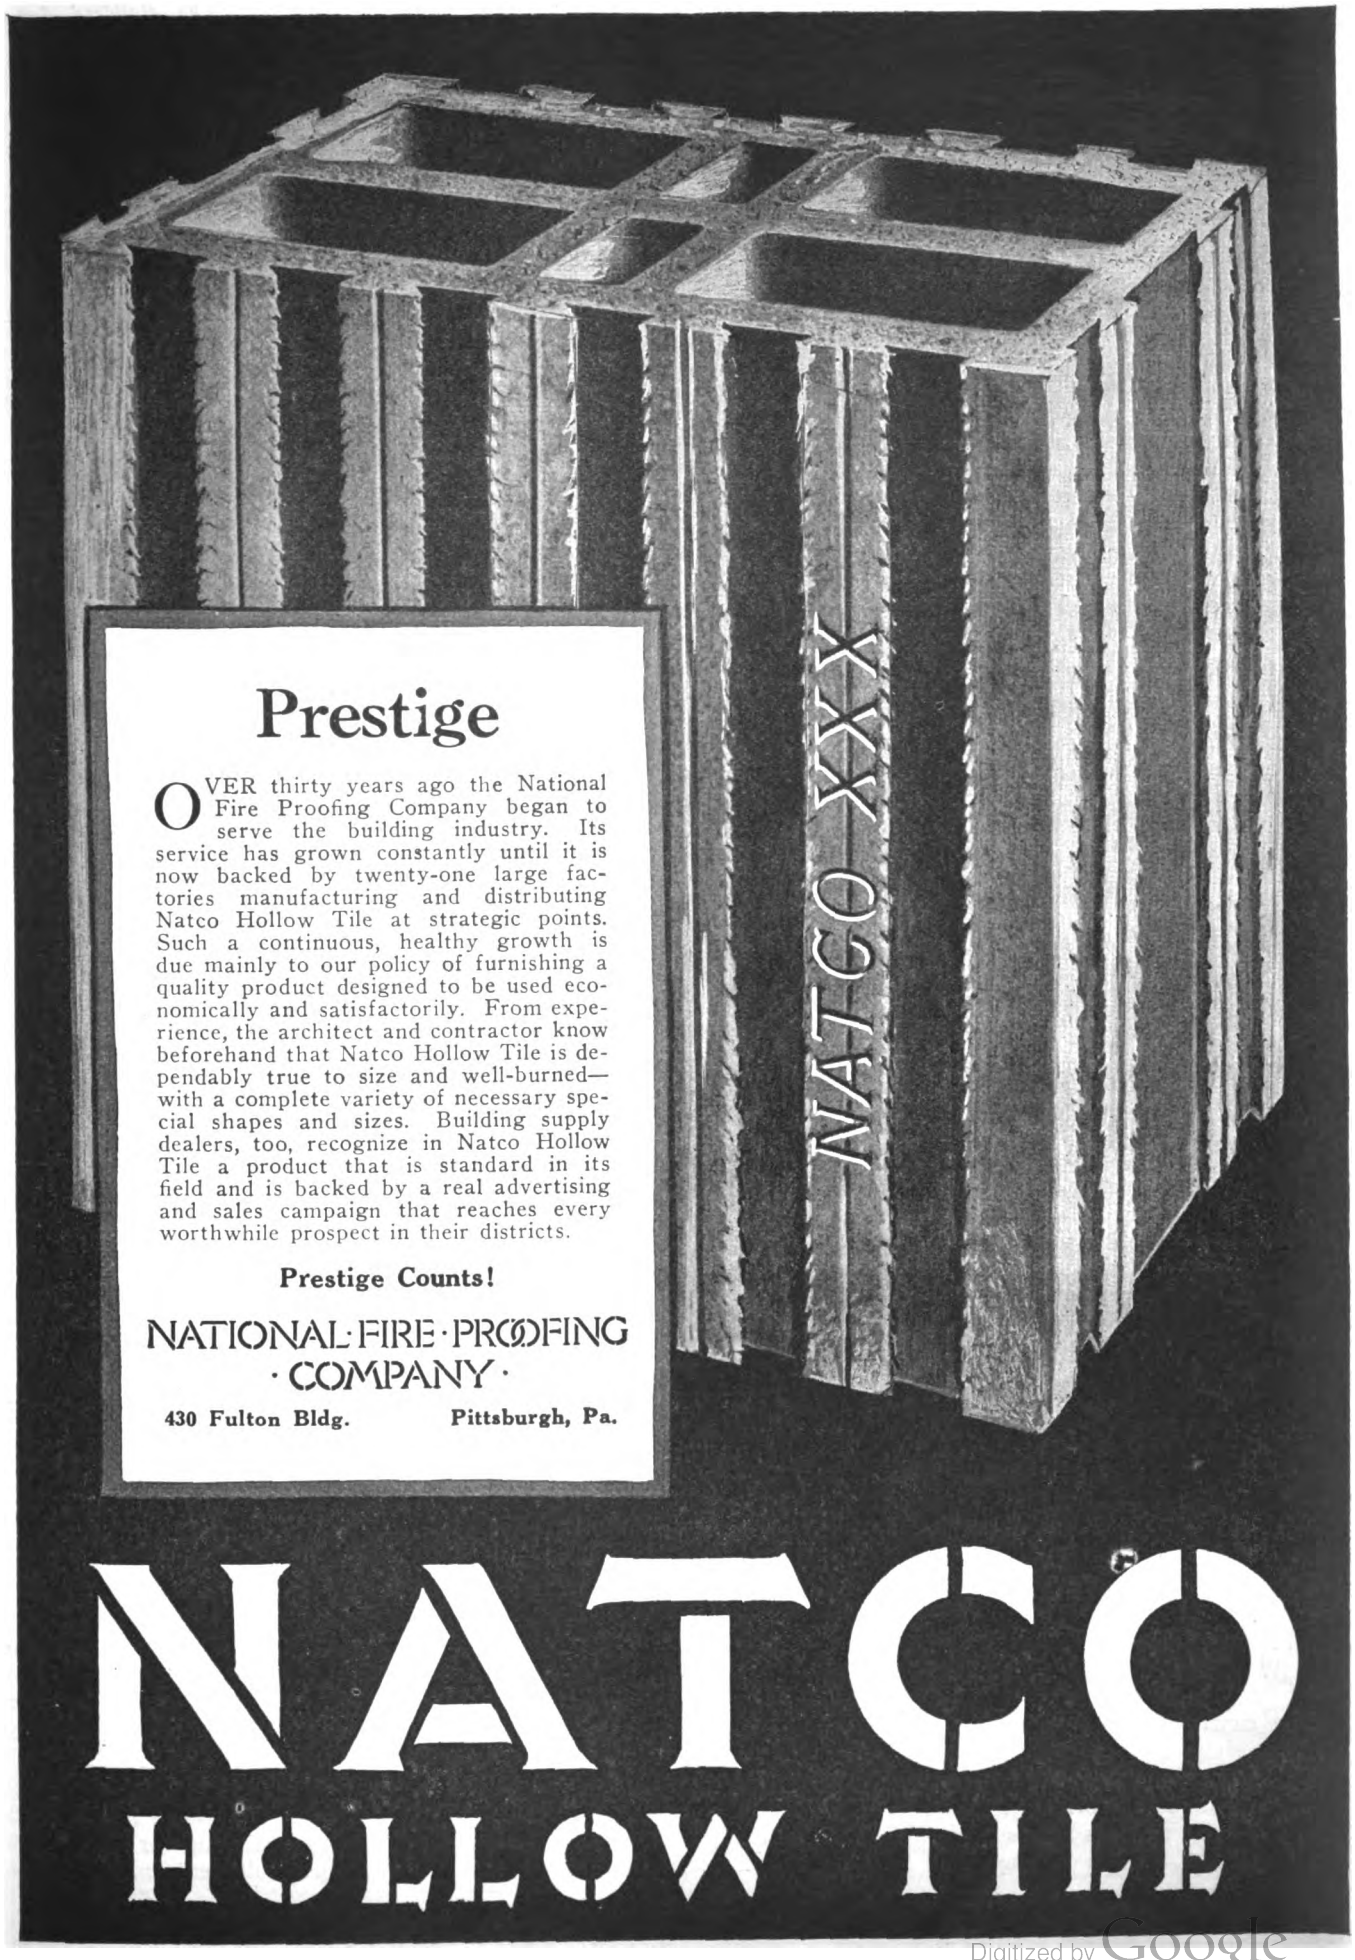
It has been said that the surveys could not be satisfactory, as no two estimators employ the same methods, and that the contractor, whose business it has always been, is as capable of preparing a survey as any other person. Granting the truth of these statements, the fact remains that the one official survey, prepared by one or more surveyors, would govern any competition. There can be but one survey of any protect. If it were otherwise, it is apparent that the present chaotic conditions would be but little improved.

Must Be Official

The profession of quantity surveyor and the surveys must be inseparably linked with the word "official" by virtue of license by the owner or architect. The institution of the system and its operation does not, as some suppose, provide a wide field of operation for competing surveyors, who will sell their products to the contractors.

IN some instances, contractors' associations have established survey bureaus from which could be procured uniform surveys of any desired project, but it is to be noted that even in this connection uniformity is the very essence of the matter.

The survey, in conjunction with the unit rates of the proposal, has a value which will be appreciated by the owner and architect.



The uncertainty of chance being eliminated from the business of the contractor, the owner need no longer fear the possibility of being compelled to assume this chance in some degree unknown.

As in any sound business arrangement, the owner, who corresponds to the consumer, must assume the costs of estimating or overhead of the vendor, the contractor.

Eliminate the Waste

Confronted as we are at the present time by the greatly increased costs of all commodities, which may or may not have reached the peak of their ascen-

Digitized by Google

Digitized by Google

sion, it has obviously become necessary to eliminate from all transactions every source of waste.

Of the various industries none has been more severely affected or feels more acutely the necessity for some relief than building.

With the exorbitant costs of raw materials on the one hand and of labor, skilled or otherwise, necessary to shape them into finished structures on the other, together in many instances with excessive profits or commissions being exacted by distributors and contractors, the tentative builder of limited resources, who may not hope to protect his investment by correspondingly increased rentals, is driven entirely out of the market and the field is largely restricted to investors of unlimited means.

The System in Vogue

For relief, as concerns material and labor costs, we must apparently wait until the law of supply and demand shall ultimately lower or stabilize these, but, in the meantime, it is certain that an appreciable effect may be realized through the adoption of other more efficient business methods and procedure than now obtain, by which the added or "overhead" expenses of operation and administration would be in a measure curtailed.

For instance, by the system generally in vogue at the present time, the drawings and specifications for a proposed building project go into the offices of the various contractors from whom competitive bids are being solicited, in each of which separate estimates may be prepared in more or less detail and with varying degrees of accuracy, according as errors occur in "taking off," etc.

The above, of course, takes no account of that class of contractors referred to above whose estimates, being the result of a general scanning of the work contemplated and a comparison with a similar structure previously built, are only too often disastrous both to themselves and their patrons, which practice will inevitably eliminate them in time from the field.

Experience has shown that an estimate prepared with any degree of accuracy will generally range in cost between one-half of 1 per cent. to 1½ per cent. of the actual cost of the finished work.

Assuming that in the manner prescribed above estimates have been prepared by six competitors, the process has been duplicated six times, which, taking the lower of the above limits, brings the total expenditure for estimating the job in question up to 3 per cent. of its cost, and, under certain conditions, may reach 9 or 10 per cent., as the bidders increase.

It will, therefore, be seen that elimination of this duplication in the taking off or surveying of projects must of necessity produce an appreciable saving in incidental expense. This elimination of duplication is one of the advantages to be realized from a general adoption by the building world of the quantity survey system.

Contractor's Equipment

By I, P. HICKS

IT is quite natural for one to think that the contractor doing a general contracting business should at least be equipped with some of the essential and necessary tools to work with, so that he may be able to do the various jobs that he is called upon to do without being handicapped by lack of the proper equipment to work with.

Just how much and just what the equipment should be depends very much upon how big a business the contractor can reasonably expect to enter into. The bigger the business the more there will be needed and some things are needed even to the small contractor. As a rule, it is the general contracting carpenter who heads the list in the building field and he is the one to whom all others look for guidance on nearly all the work done on or about the building.

The contracting carpenter should have a shop say, 20 x 30 feet or 24 x 30, something like this at least. A place to do shop work on the odd jobs that come along is necessary for there must be a place to work and the place must be handy and convenient to make it pay financially and this it will do if it is properly looked after. It should at least be equipped with a power rip saw, a mortising and tennoning machine and a surfacing machine or planer. If not all installed at once take them in the order as noted above, then you will get what is most needed first and you can add the other as you can.

Make good work benches for it is very hard to work on hollow back and shaky benches. Don't stop with the idea that any old thing is good enough to work on, for it is a mistaken idea. Also make a good light movable bench to take out on jobs when necessary. This is quite essential, for it facilitates work very much to have a good bench on the job. Also have plenty of good saw horses not heavy and clumsy, but light and strong. They should be strong enough for general use.

As the contractor usually has more or less running about to do looking after material and always some material and supplies to take to and from the jobs a light auto truck is a very desirable thing to have.

There are many times in the building business when jack screws are needed and it is well to have from two to six of these on hand.

The contractor should have a floor scraping machine or an electric sander. If you have electricity, use the sander, if not, use the floor scraper, either will save a lot of hard and tiresame hand work.

If the contractor contracts for brick work and cement work on big buildings it will be necessary to have equipment to handle this kind of construction. In this case a good machine concrete mixer is necessary, together with wheel barrows, shovels, hoes, hose, etc.

For tall buildings, a power hoist is necessary to carry on the work in a speedy and satisfactory manner. Man power is too slow and costly for any large job. It is always more profitable to use a power lift on large jobs, but on small jobs it will not pay to put in the power equipment. These are things that the contractor has to size up for himself and use his own judgment on.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

Give a Trade Book This Christmas!

It Will Be Helpful Every Day in the Year

Whether you buy it for yourself or someone else who is interested in building, every one of the practical books listed below will prove unusually serviceable and acceptable. The Authors are leading authorities on their subjects and they have described the very latest methods.

Special Christmas Offer—5% discount on all cash orders received before Christmas. Any of these books may be returned within 5 days after delivery and your money will be promptly refunded.

Arthur's Estimating Building Costs

A book giving short-cuts for estimating materials, output of labor and costs for all kinds of building work. The tables are especially reliable. The book begins with the excavation, and ends when the house is finished. The chapters are: Excavations and Piling, Concrete, Brickwork, Stonework, Plastering, Metal, Roofing, Painting, Plumbing and Heating, Miscellaneous includes Hardware, Electric Wiring, Tiling, Bonds, Tables, Rafters, Cisterns, Weights, Comparisons of Cost Between Brick and Frame Buildings; Hints on Drawings. 228 pages, 4½x7 inches, 29 figures, 91 tables. Flexible Fabrikoid $1.50

Joslin's Plan Reading and Estimating Building Costs

A simple and practical work on costs and superintendence written for Eastern conditions, with important chapters on plan reading, taking off quantities, estimating the cost of labor and materials and a splendid system for keeping track of the progress of the work. There are 29 chapters; four on Reading Architects' Drawings, nine on Masonry, Iron Work, Marble Work, and Metal Work, four on Carpenter Work, five on Miscellaneous Subcontracts, four chapters on Estimating the Cost of Building Alterations, and three chapters on Building Superintendence. 188 pages, 6x9 inches, 41 illustrations. Numerous tables. Cloth $1.25

Hick's Estimators' Pocket Companion

A guide to prices of all kinds of building materials with handy rules, tables and information for the estimator.

The chapter on Carpentry gives the number of board feet and cost of framing lumber per square of 100 sq. ft., and many valuable tables, including timber measure, common and hip rafters for roofs of various pitches and with from one to eighteen feet run, the safe bearing loads of timber and yellow pine posts. Reliable data on figuring the strength and weight of materials is also given.

Contents: Introductory. Preparing Estimates. Excavating. Stone Work. Plain Concrete. Reinforced Concrete. Concrete Cement Stone. Cellar Bottoms and Walks. Brick Work. Hollow Building Tile. Masonry Tables. Estimators' Guide. Plastering. Carpentry. Iron Work. Sheet Metal and Roofing. Plumbing. Heating and Ventilation. Electrical Work. Tile Work. 218 pages, 4x6 inches, 92 tables. Cloth.....$1.00

Hick's Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Space is left at the end of each specification for extra data. 8 pages, 7x10 inches.....20c. each

Joslin's Handy Estimate Blanks

Designed for use by Building Contractors in estimating dwellings, small apartment houses, stables, garages, small public and semi-public buildings. A great time and labor saver in computing cost. 32 pages, 7x10 inches. Paper, $0.25

Arthur's New Building Estimators' Hand Book

Have you bought your copy of this standard work? It gives the latest information on costs on every branch of the building trades taken from work done in all sections of the country and ranging from the smallest job to large municipal work. It tells how long it took and how much material was used on each operation, so it may be used as an accurate guide by anyone. Your money back if you don't find it worth many times its cost. 1002 pages, 7¼x4¾ inches, Flex Fabrikoid Gilt Edges $6.00

THE NEW KIDDER
Architects and Builders Hand Book

Everyone in the Building field uses "Kidder's Pocket Book" and this new edition is larger and better than ever. Prof. Nolan and the other authorities, who have worked with him in the revision and rewriting of the various chapters, have described the latest improvements in the methods and equipment. 1,900 pages of text, 1,000 diagrams and numerous tables. Flexible binding with gold edges.....$7.00

Distinctive Country Homes

A collection of 100 plates of exteriors, doorways, gates and windows and floor plans. They range from the small house for a suburban plot to the more pretentious villa, with a good selection in all cases. 100 plates, 10x12 inches, in heavy envelopes. Price $4.00

Dalzell's Homes of Moderate Size

A collection of photographs and plans of distinctive, but inexpensive suburban and country homes following the Colonial, Italian and English architectural styles, and arranged accordingly. Selected for their artistic merit and adaptability to the needs of the average American family. There are photographs and floor plans of 55 dwellings and one country club. They have all been built recently and architects and real estate operators who have bought it say it is the best collection of medium sized houses they have seen. 160 pages, 9x12 inches, 300 figures. Cloth, $4.00.

Italian, Spanish and French Plates

An interesting collection of exteriors, interiors, gates, etc., of churches, palaces and other buildings. 30 plates, 9x12 inches, in manila envelope $1.00

Comstock's The Housing Book

A new book that covers every class of housing. It contains photographic reproductions, with floor plans of workingmen's homes; one and two-family construction, also four, six and nine-family apartments, showing single houses, blocks of houses, groups and developments that have been built in various parts of the United States. 132 pages, 150 figures, 8½x11 inches. Cloth.....$3.00

Cosgrove's Hollow Tile Construction

A practical explanation of modern methods of designing and building fireproof residences of hollow tile, written so the builder may use it, with chapters on walls, floors, roofs, partitions, framework, estimating, photographs and floor plans of finished structure, etc. 256 pages, 4¾x7 inches, 145 figures, 70 plates, flexible fabrikoid $2.50

Odell's Hardwood Floors

A practical little book from the pen of a man who has an extended experience in the better grades of modern floor finishing. It was written to meet the increasing demand for a simple treatise on the tools required and methods of handling same to turn out an even, well-laid floor. 50 pages, 5x8 inches, 13 figures. Cloth....$0.50

Williams' Stair Builders' Guide

A treatise on the construction of straight flight, platform, cylindrical and elliptical stairs, explaining the theory and practice so the average building mechanic may understand it, with examples of work ranging from the simplest to the most complex forms. 256 pages, 6x9 inches, 360 figures. Cloth $2.00

Otter's Furniture for the Craftsman

Practical instructions and dimensioned working drawings covering the construction and finishing of practically all the articles used in the furnishing and equipment of the modern home, porch and grounds, with hints on upholstering. 308 pages, 6x9 inches, 297 figures. Cloth.....$2.00

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short-cuts" and tables.

Contents by Chapters: Layout of Site. Excavating. Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Water-proofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile, Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing. Roof Framing. Mitering Planceers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Tables. 360 pages, 4½x7 inches, 300 figures. Flexible fabrikoid $3.00

Colwell's Kinks for the Builder

A practical manual on carpenter's work, foundation, cement and plaster work worth many times its cost to the carpenter and builder.

Contents: I, Foundations; II, Short-Cuts for the Carpenter; III, Problems in Framing; IV, Floor Construction and Finish; V, Cornice and Tower Work; VI, Fitting and Hanging Doors; VII, Cement and Plaster Work; VIII, Carpenter's Tool Chests and Mitre Boxes; IX, Miscellaneous Kinks and Wrinkles. 160 pages, 5x7¾ inches, 116 figures. Cloth $1.00

Hool and Johnson—Handbook of Building Construction

Covers thoroughly the design and construction of all types of buildings with their mechanical and electrical equipment. Every detail of practical construction is considered. Every contractor will find this comprehensive work well worth having. Two volumes (not sold separately). 1,474 pages, 6x9, flexible, fully illustrated, per set.....$10.00

McCullough's Practical Structural Design

A complete system for the design of beams, floors, girders, trusses, columns, walls, foundations, footings, etc. The big feature of the book is that no knowledge of algebra or higher mathematics is necessary to understand the explanations, for all calculations, etc., are presented in the form of the ordinary arithmetic that every builder knows. The book contains the most approved practice of up-to-date offices and is profusely illustrated. 320 pages, 6x9 inches, 200 figures. Cloth.....$3.00

Woodsend's Practical Wood Carving

A simple treatise on the rudiments of wood carving embracing the proper method of handling tools, as well as the correct shapes of grinding them in order to produce different kinds of work.

Contents: Tools Required. Example for Practice. Transferring Designs to Wood. Chasing Corner Blocks. Panel Decoration. Border and Book Back Designs. Scroll Designs. The Acanthus Leaf. Capitals. Crockets. Carving a Gothic Finial. Design for a Carved Stool. 85 pages. 6x9 inches, 108 figures. Imitation wood....$1.00

Selected List of Manufacturers' Literature

FOR THE SERVICE OF BUILDERS, CONTRACTORS, ARCHITECTS AND ENGINEERS

The publications listed in these columns are the most important of those issued by leading manufacturers identified with the building industry. They may be had without charge, unless otherwise noted, by applying on your business stationery to BUILDING AGE & THE BUILDERS' JOURNAL, 920 Broadway, New York, or the manufacturer direct, in which case kindly mention this publication. Either the titles or the numbers may be used in ordering.

Listings in this Department are available to any manufacturer at the rate of $5 per listing per month.

(See also Alphabetical Index, Page 112)

ARCHITECTS' SPECIFICATION HAND BOOK

Truscon Company, Detroit, Mich.

270. 52-page-bound, loose-leaf specification book. 8½ x 11 in.

ASBESTONE PRODUCTS

Franklyn R. Muller & Co., 23 Madison St., Waukegan, Ill.

252. *Instructive Catalog* describing the product in full detail.

ASBESTOS PRODUCTS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

1. *Ambler Asbestos Shingles.* Catalog 5½ x 8½ in. 40 pp. Illustrated.
2. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 36 pp. Standard Purlin Spacing Tables.
3. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.
4. *Ambler Asbestos Building Lumber.* Catalog, 8½ x 11 in. 32 pp.
5. *Engineers' Data Sheets.* Catalog, 8½ x 11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

ASBESTOS ROOFING—See also Roofing Materials

ASH HOISTS—See also Hoists

ASH RECEIVERS

Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.

7. *Catalog E.* Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.
8. *Catalog F.* A book for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with tables of dimensions for installation. 8 pp. Illus.

BALANCES, SASH

Caldwell Mfg. Company, The, Rochester, N. Y.

9. *Suggestions for the Present-Day Architect.* Booklet, 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.

10. *Catalog* describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS

American Saw Mill Machinery Co., Hackettstown, N. J.

11. *Catalog No. 22* describing a general line of band saws of various sizes.
12. *Technical Data.* Four-page folder 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires.

E. C. Atkins & Co., Inc., Indianapolis, Ind.

Crescent Machine Co., Leetonia, Ohio.

241. Descriptive 144-page Catalog.

BAR BENDERS AND CUTTERS

Koehring Company, Milwaukee, Wis.

13. *Four-page folder,* giving illustrations and sizes of Koehring Bar Benders and Cutters.

BATHROOM APPLIANCES—See also Plumbing Equipment

Hess Warming & Ventilating Co., 1201 Tacoma Bldg., Chicago, Ill.

Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.

401. *Send for illustrated Folder,* "A Bath a Day Keeps You Fit Every Way."

BEDS

Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.

402. *Eight-page illustrated,* "How to Use the Murphy Bed."

BOILERS—See Heating Equipment

BOOKS

American Technical Society, 58th and Drexel Blvd., Chicago, Ill.

Architectural House Plannnig Service Co., 20 So. 18th Street, Philadelphia, Pa.

Arrow Book Company, 347 Fifth Avenue, New York City.

Buidling Age and The Builders' Journal, 920 Broadway, New York City.

"Beautiful Homes at Moderate Cost." $1.00.

Chicago Technical College, 1038 Chicago Tech. Bldg., Chicago, Ill.

U. P. C. Book Co., 243 West 39th Street, New York City.

BLUE PRINTS

Peerless Blue Print Co., 347 Fifth Avenue, New York City.

403. *Splendid Drawing Board Outfits* are manufactured in conjunction with the making of blue prints.

BRICK

American Face Brick Association, 110 South Dearborn Street, Chicago, Ill.

15. *The Story of Brick.* Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Sent free.
16. *A Manual of Face Brick Construction.* The history of brick making, types of face brick, showing details of construction for walls, chimneys and arches. Details of use of tile and brick construction and different types of bonds are given. A series of plans and elevations of small brick houses, descriptions, useful tables and suggestions are illustrated and described. Sizes 8½ x 11 in. 116 pp. Price $1.00.
17. *The Home of Beauty.* A booklet containing fifty prize designs for small brick houses submitted in national competition by architects. Texts by Aymar Embury II, Architect. Size 8 x 10 in. 72 pp. Price 50 cents.
18. *Architectural Details in Brickwork.* Three series of beautiful half-tone prints of brickwork detail, contained in closed folders suitable for standard vertical letter file. The three series contain 124 prints in all. Size 8½ x 11 in. Price $1.50 per set.

Common Brick Manufacturers' Association of America, 1309 Schofield Bldg., Cleveland, Ohio.

19. *Brick—How to Build and Estimate.* 3rd edition, 32nd thousand, a manual of solid brick and Ideal wall construction. Contains data on the strength of brickwork, on mortars, bonds and joints and equipment, and contains complete estimating tables for quantities of brick, mortar, material and approximate mechanics' time for various thicknesses and square foot areas of solid and Ideal wall. 8½ x 11 in. 72 pp. Price 25 cents.
20. *Brick for the Average Man's Home.* Book, 8½ x 11 in. 72 pp. Color plates. Book of plans for bungalows, houses and apartments for which working drawings are available. Price, $1.00.

Fiske & Company, Boston, Mass.

145. *Tapestry brick, other grades of front brick.* Manufacturers "Fisklock" Brick.

BUILDING CONSTRUCTION—See also Garage Construction

National Manufacturing Co., Sterling, Ill.

404. *An 80-page catalog,* profusely illustrated with various kinds of Garage Hardware.

Truscon Steel Company, Youngstown, Ohio.

21. *Truscon Floortype Construction.* Form D352. Contains complete data and illustrations of Floortype installations. 16 pp. Ill. 8½ x 11 in.
22. *Truscon Standard Buildings.* Form D-398. Describes Truscon Standard Steel Buildings, with diagrams, illustrations of installations, descriptive matter and list of users. 48 pp. Ill. 8½ x 11 in.
23. *Truscon Building Products.* Form D-376. Contains a brief description of each of the Truscon Products. 112 pp. Ill.
24. *Modern School Construction.* Form D-395. Contains illustrations of schools, with typical elevations, showing advantages of Truscon Products for this construction. 16 pp. Ill.

BUILDING HARDWARE—See Hardware

BUILDING STONE—See Stone, Building

BUILT-IN CLOTHES HANGERS

Knape & Vogt, Grand Rapids, Mich.

405. *16-page booklet,* describing the "Garment Care System."

BUILT-IN KITCHENS

Bisk Corporation, Brockton, Mass.

406. *16-page illustrated catalog,* giving the pictures and plans on the installation of the Built-In Kitchens. It describes in detail the various types and sizes.

BUNGALOW AND SMALL HOUSE PLANS

American Face Brick Association, 110 South Dearborn Street, Chicago, Ill.

25. *Four booklets* of small houses from 3 to 8 rooms, containing 98 reversible designs. (1) 3-4 rooms, (2) 5 rooms, (3) 6 rooms, (4) 7-8 rooms; size 8½ x 11 in. Each booklet 25 cents; set, $1.00.

Architectural House Planning Service Company, 20 South 18th Street, Philadelphia, Pa.

CANVAS—See Roofing Materials

CASEMENTS—See Doors and Windows

CAULKING AND GLAZING COMPOUND

Allmetal Weatherstrip Co., 126 West Kinzie Street, Chicago, Ill.

246. *Illustrated catalog* sent on request.

CEILINGS, METAL

The Edwards Manufacturing Company, Cincinnati, O.

33. *Pamphlet of 32 pages,* describing metal ceilings and wainscoting. Well illustrated, with list prices and rules for estimating. 7 x 10 in.

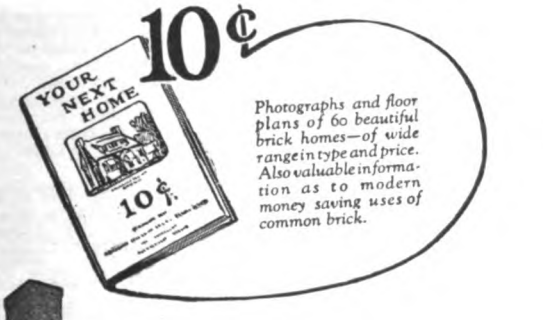
Keighley Mfg. Co., 124 Third Avenue, Pittsburgh, Pa.

407. *Catalog "M"* describes the Lock Joint Metal Ceiling.

CEMENT

The Atlas Portland Cement Co., 25 Broadway, New York, N. Y.

37. *The Atlas Book on Concrete Construction.* A text book written for the average builder in concrete and from the practical rather than from the technical standpoint. Treats on both plain and reinforced concrete. 144 pp. 4½ x 7 in. Cloth bound. Price, $2.00.
30. *Set of Blue Prints.* Drawings showing how to apply Portland Cement stucco to the different standard types of wall construction. Appended are tables of the quantities of cement and sand required to cover a given wall surface.
31. *Concrete on the Farm.* The most comprehensive book of its kind. Practical and thoroughly reliable instructions, with plans and pictures of all possible farm structures for which concrete can be used. Complete directions in practical terms for selection of aggregate and the mixing and placing of concrete.
32. *Other Publications.* The Atlas Portland Cement Company has numerous other publications, covering nearly every phase of concrete construction. Their Service Department will give sound advice on any phase of concrete construction to anyone applying for it.



Portland Cement Assn., Washington Street, Chicago, Ill.

511. "The Concrete Builder," vol. 4, No. 6, devoted to the use of Concrete for Farm and Home. This booklet gives the definite specifications for concrete block bungalows.

60 Selected Brick House Designs —*All for 10c*

Photographs and floor plans of 60 beautiful brick homes—of wide range in type and price. Also valuable information as to modern money saving uses of common brick.

Modest bungalows to five and six room homes and pretentious dwellings—a wide range of carefully selected designs. Every plan a masterpiece—drawn by a competent architect.

These houses are attractive in appearance and in the details that make sales. They are thoroughly practical from both builder's and owner's standpoint, for

Every house has been actually built and lived in

They sell for more because they are worth more. The value of good design is apparent in these dwellings. Yet with all their advantages over ordinary houses these fine brick homes are simple and economical to build. They offer a wonderful opportunity to builders.

Just 10c brings you this book—"Your Next Home"—an offer never equalled before. And specifications, working drawings and complete information for every one of these 60 homes are available at nominal price.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 70*

CHAINS
Bridgeport Chain Co., Bridgeport, Conn.
29. *Catalog No.* 14. Contains 64 pp. Illustrated, of different chains that can be used in all parts of building construction.

CLAMPS
James L. Taylor Mfg. Co., Poughkeepsie, N. Y.
408. *Descriptive catalog* of the various Clamps.

COAL CHUTES
The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.
409. *An interesting folder,* describing the advantages of the Donley Coal Chute.

COLUMN BASIS
S. Cheney & Son, Manlius, New York.
250. *An Interesting Descriptive Booklet,* may be had on request.

COLUMN AND BEAM COVERING
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
39. *32-page booklet,* 8½ x 11. Pyrobar Tile.

COLUMNS
Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
233. *Catalog No. D-47.* 48 pages, illustrated. 7¼ x 10 in. Illustrating the Koll's Patent Lock-Joint Wood Columns.

CONCRETE APPLIANCES
Universal Cement Mould Co., No. Milwaukee, Wis.
41. *Illustrated Folder,* describing mold for building hollow concrete walls for homes, garages, barns, silos, etc.
Van Guilder Double Wall Co., 77 South Avenue, Rochester, N. Y.
42. *A Cataog* describing the Van Guilder system of portable forms for the building of hollow concrete walls on the thermos bottle idea for the erection of homes, ice houses, barns, silos, etc. Walls are dry, as there is continuous air space around entire building.

CONCRETE MACHINERY
The American Cement Machine Co., Inc., Keokuk, Iowa.
410. *An interesting 68-page illustrated catalog,* describing the "Boss" Labor Saving Construction Machinery.
Concrete Equipment Co., 535 Ottawa Street, Holland, Mich.
411. *Catalog No. 22* describes in detail the various products manufactured by this company.
Concrete Block Machine & Mold Co., 114 S. 2nd St., St. Louis, Mo.
253. *Catalogue No.* 38. Describes Building Block Machines. It is a 40-page book, 6 x 10 in.
Construction Machinery Co., 403 Vinton St., Waterloo, Iowa.
251. *Catalog M-33* describes the workings of the plant.
C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
412. *Bulletin No.* 1 describes the Portable Saw Rigs.
413. *Bulletin No.* 2 describes the Power Driven Pumps, Centrifugal, Pistons, Diaphragm, Triplex.
414. *Bulletin No.* 3 describes the Hoists, Mortar Mixers, Material Elevators, Engines.
415. *Bulletin No.* 4 describes the Tractor.
Ideal Concrete Machinery Co., 1334 Monmouth Street, Cincinnati, Ohio.
416. *A 100- page illustrated catalog,* describing the Ideal Machine and also data for manufacturing and curing Ideal Concrete Blocks.
417. *Catalog No.* 37 describes the Ideal-Cincinnatus Batch-Mixers.
Jaeger Machine Co., 216 Dublin Avenue, Columbus, Ohio.
418. *A 40-page catalog,* well illustrated, describing the special features of a Jaeger Mixer.
419. *16-page folder,* illustrating a Jaeger for every mixer need.
Koehring Co., Milwaukee, Wis.
46. *Koehring Construction Mixers.* Booklet. 7¾ x 10½ in. Illustrated. 96 pp. Complete information on construction type concrete mixers.
47. *Koehring Dandie Mixer.* Booklet, 6 x 9 in. Illustrated. 24 pp. Illustrating and describing Koehring line of Dandie light mixers.
265. *"Built to Endure."* A beautifully bound booklet of 36 pages, 7¼ x 10 in., describing Comparative Examples of Notable Ancient and Modern Construction Embodying the Element of Permanency.
38. *Concrete—Its Manufacture and Use.* Book, 4½ x 7 in. Illustrated. 207 pp. Comprehensive discussion from the practical standpoint of concrete.
Republic Iron Works, Box 602, Tecumseh, Mich.
421. *An eight-page illustrated pamphlet,* describing the Republic "Ten."
Standard Scale & Supply Co., 1631 Liberty Ave., Pittsburgh, Pa.
422. *28-page illustrated catalog,* describing quick, efficient and money-saving concrete mixing.

CONCRETE MARBLE
Art Stone Co., Waynesboro, Pa.
45. *Descriptive Circulars* with illustrations of different marbles in colors. Sent free to any interested party.

CONSTRUCTION, FIREPROOF
Central Steel Co., Massillon, Ohio.
423. *In the "National Steel Lumber" Handbook* is embodied complete information and authentic data pertaining to the use of Steel Lumber Sections and kindred materials.
424. *"National" Bulletin No.* 19B describes the National Shelby.
National Fire Proofing Co., 250 Federal St., Pittsburgh, Pa.
226. *Standard Fire Proofing Bulletin* 171. 8½ x 11 in. 32 pp. Illustrated. A treatise on fireproof floor construction.
Truscon Co., Detroit, Mich.
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
48. *Pyrobar Gypsum Tile.* Booklet, 8½ x 11 in. 32 pp. Illustrated. Detail and specifications for fireproof partitions.
49. *Bulletins,* 8½ x 11 in. Containing details and specifications for Pyrobar voids for use with reinforced concrete joist floor construction; Pyrobar roof tile; and monolithic gypsum floors and roofs.

CONTRACT AND ESTIMATE BLANKS
L. Fink & Sons Printing Co., Laurel Spring, N. J.
166. *Samples* of contract sheets, estimate blanks, job tickets, time tickets, time sheets, wage receipts, etc., with prices.

DAMPERS AND ASH DUMPS (Fireplace)
Apex Fireplace Co., Urbana, Ill.
535. Send for mechanism blue print of fireplace damper construction. This describes a most ingenious device.
The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

DAMPPROOFING—See also Waterproofing
Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
425. *Six-page folder,* describing the Nu-Tile 4-in-1 Shingle.
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
426. *Send for catalog* on the advantages of the Asbestos Shingle.
Cortright Metal Roofing Co., 50 No. 23rd Street, Philadelphia, Pa.
Illinois Zinc Co., 280 Broadway, New York.
428. *An eight-page folder,* describing the roof that is always new.
National Sheet Metal Roofing Co., 339 Grand St., Jersey City, N. J.
429. *68-page book,* illustrating the "Shingles That Last."
Rocbond Co., Van Wert, Ohio.
430. *An eight-page folder,* entitled, "Fortifies Your Home Against the Element of Time."
F. C. Sheldon Slate Co., Granville, N. Y.
431. *A 16-page illustrated booklet,* describing "The Most Enduring and the Most Attractive Roof at the Most Reasonable Cost."

DOOR CHECKS
Park Manufacturing Co., Worcester, Mass.
50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS
American 3-Way Luxfer Prism Co., 1309 So. 55th Street, Cicero, Ill.
Detroit Steel Products Co., 2355 E. Grand Blvd., Detroit, Mich.
432. *A 32-page catalog,* describing "Window Walls," their cost and their advantages.
Henry Hope & Sons, 103 Park Ave., New York.
51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¼ x 18½ in. 32 pp.
Truscon Steel Company, Youngstown, Ohio.
52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.
53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill.

DOOR AND WINDOW FRAMES
Andersen Lumber Company, South Stillwater, Minn.
55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¾ x 10¾, 24 pages.
56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.
Casement Hardware Co., 250 Pelanze Bldg., Chicago, Ill.

DRAFTING MATERIALS
A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
433. *A 116-page book,* describing the advantages of "Direct-by Mail" Buying.
Eugene Dietzgen Co., 162 W. Monroe Street, Chicago, Ill.
Keuffel & Esser Co., Hoboken, N. J.
434. *A 486-page Bound Book.* This is the thirty-sixth edition of the catalog.
Peerless Blue Print Co., 347 Fifth Avenue, New York City.
Warren-Knight Company, 136 No. 12th Street, Philadelphia, Pa.
435. *36-page booklet,* describing the "Sterling" Transits and Levels.

DUMBWAITERS
Kimball Bros. Co., 1106 Ninth Street, Council Bluffs, Iowa.
436. *30-page illustrated catalog,* describing the various models of Dumbwaiters.
Sedgwick Machine Works, 156 W. 15th Street, New York.
57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

ELECTRICAL EQUIPMENT
Arrow Electric Co., Hartford, Conn.
General Electric Co., Schenectady, N. Y.
513. *Wires and Cables.* Booklet, 8 x 10½ in. 85 pp. Illustrated. Four bulletins in a binder, describing wires and cables in general, conductors insulated with vulcanized rubber compound, varnished cambric and paper insulated cables, splicing materials and junction boxes for cable installations, armored cables.
514. *Electric Fans.* Folder, 6 pp. 3¼ x 6 in. Illustrated. Describes 1922 line of electric fans, giving catalog numbers, voltages and frequencies.
515. *Reliable Wiring Devices.* Catalog. 3 x 4⅝ in. 206 pp. Illustrated. Pocket catalog giving prices, schedule classifications and data for socket receptacles, switches, rosettes, cutouts and fuses for miscellaneous devices.
516. *Lighting of Public Buildings.* Bulletin. 6 x 9 in. 25 pp. Illustrated. Describes lighting of galleries, banks, museums, libraries, municipal, county and state buildings.

ELECTRIC METER BOXES
The Donley Bros. Co., 3700 East 74th Street, Cleveland, Ohio.

ELEVATORS
C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
Kimball Brothers Company, Council Bluffs, Iowa.
58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.

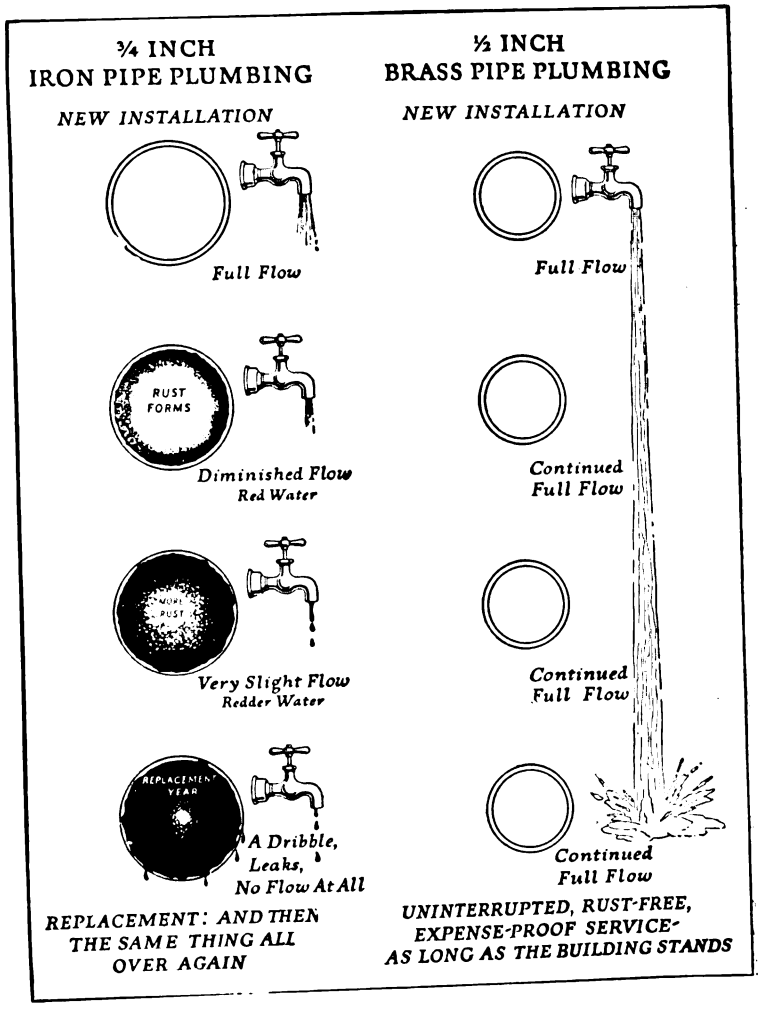
BRASS PIPE



at Almost the First Cost of Iron

WRITING in the Plumbers Trade Journal, Mr. T. N. Thomson, sanitary engineer, compares the sizes of iron and Brass pipe required to carry the same volume of water and presents a table of sizes which, when filled in with prices by the estimator, gives a Brass installation at a cost so little in excess of iron that the difference may be ignored.

To illustrate at a glance the basis for Mr. Thomson's calculations we have prepared the diagram which appears on this page.

Deterioration of iron pipe begins the day it is made and progresses in service until the iron pipe becomes completely clogged with rust.

This corrosion, which is particularly acute in the hot water supply lines, not only discolors the water but greatly reduces or stops delivery at the fixture, and also eats away the pipe wall to such an extent that in many instances leaks

appear within six years and force a renewal of the piping.

On the other hand, Brass pipe delivers at the end of any number of years of service as much water as it does on the day it comes from the mill.

Reprints of Mr. Thomson's article are available upon request to the Association.

Saving in Pipe Size by Use of Brass

From many years' experience on a variety of work, it would appear that reasonable differences in diameter for street service and cold water lines are as follows:

½	inch	Brass	instead of	¾	inch	iron
¾	"	"	"	1	"	"
1	"	"	"	1¼	"	"
1¼	"	"	"	1½	"	"
1½	"	"	"	2	"	"
2	"	"	"	2½	"	"

For hot water lines, the following appear reasonable:

½	inch	Brass	instead of	1	inch	iron
¾	"	"	"	1¼	"	"
1	"	"	"	1½	"	"
1¼	"	"	"	2	"	"
1½	"	"	"	2½	"	"
2	"	"	"	3	"	"

Be a Floor Surfacing Contractor

Make $5,000 to $15,000 or More Yearly

The American Universal Floor Surfacing Machine is the best money maker the contractor can own. It is practically "fool proof" and can be operated by any man of ordinary ability and do only the best grade of work, for its operation is automatic. When your building is about ready to turn over to the owner, it does the last big job, the floors, when everyone is anxious, quickly and perfectly, leaving everyone feeling satisfied. One man and one American Universal does the work of six men and does it perfectly.

Old Floors Made Like New—New Floors Made Perfect

Contractors owning American Floor Surfacing Machines keep them going all the time at big profits on old floors when they are not needed on the new work—this is an excellent source of profits. Often, too, floor surfacing contracts are taken on other jobs. Just read what users say about the labor-saving, money-making ability of the American Universal. Hundreds of others have gone into the floor surfacing business and are independently well fixed.

Saves Labor of Six Men and Does Better Work

We can surface more floor with our "American Universal" machine than six men can scrape by hand, considering the quality of the work.—Schneider & Hein, Nebr.

Would Not Go Back to Old Way

The "American Universal" is a great labor saver, doing the work of about eight men, so naturally I would never consider going back to hand scraping again.—M. R. Warner, Colo.

Surfaces 1500 Square Feet Per Day

The "American Universal" does all you claim, for it has surfaced 1500 square feet of flooring per day for me and is doing the work of six men.—L. F. Walla, Va.

Customers Satisfied—Business Increases

The "American Universal" has replaced five men at least on my payroll, does better work than before, and so, as my customers are so well pleased, I have found my business increasing right along.—A. G. Thompson, Ark.

Afraid to Go Back to Hand Work

Since the "American Universal" has proven such a great labor saver, would not dare to go back to the old method of hand scraping.—C. E. Andrews, Pa.

Saves Six Men

The "American Universal" replaces six men on my pay roll and I find it to be a great labor saver.—E. A. Bittner, Pa.

Light and Easy to Handle

In the first place the "American Universal" machine is light and easy to handle and does lots more work than the other sander of a different make which I have.—Kroffganz and Frank, Mont.

No Kick—Replaces Six Men

Want to tell you that I've never had a kick about unsatisfactory work from any of my customers ever since I bought the "American Universal" and it replaces six men on my pay roll, too.—A. F. Grow Brothers, Nebr.

Saves Ten Men

Your "American Universal" floor surfacing machine is a labor saver. It will do the work of ten men in one and in much better shape.—M. B. Battien, S. D.

Replaces 10 Men

The "American Universal" replaces ten men on my pay roll, and surely does excellent work.—I. O. Fetter, Pa.

Machine Does Better Work Than Hand Scraping

The "American Universal" has replaced five men on my pay roll, and I can do a better quality of work with my machine. than by hand scraping.—L. L. Howard, Kans.

Quality of Work Only Advertisement Necessary to Secure More Work

I want to tell you that the "American Universal" is some labor saver—it replaces at least five men on my pay roll, and the quality of work it turns out is all the advertisement I need for my business.—Hugh A. Cox, Fla.

1 man with an American Universal—Big Profit
6 men surfacing by hand—Small Profit
How are you running *your* business?

The American Floor Surfacing Machine Company

521 So. St. Clair Street *Originators of Floor Surfacing Machines* **Toledo, Ohio**

THE AMERICAN FLOOR SURFACING MACHINE CO.,
521 So. St. Clair St., Toledo, Ohio.

Building "On the Boom" Means Big Jobs for *Trained* Men

Every man whose eyes are open realizes that there are bigger opportunities for building experts today than ever before. Everywhere we see construction of all kinds going on—houses, mills, factories, stores, bridges, warehouses—all needing men to plan the work and men who have the training which enables them to direct those who do the manual labor. The big pay goes to the ones who do the thinking and carry the responsibilities. And everywhere we hear the call going out for more of these **trained men.**

No man can complain today that he "hasn't a chance." Every man who is an expert in any branch of building can get all that his services are worth, and he will find opportunities looking for him.

That man who "isn't getting ahead" is the man who isn't trained to do bigger things. There is a price for each class of ability—and business will pay no more.

As long as a man is willing to mix mortar, lay brick, chisel stone, drive nails, string wires, wipe joints or do other manual work he will be limited to the prevailing scale of wages.

As long as a contractor is satisfied with taking on small jobs he will see the large profits go to men who know how to handle the big jobs. That is why ambitious men are training—getting the knowledge which makes their services worth more. They know that brains always command more money than muscle or skill of hand.

For over twenty years Chicago Technical College has been helping this kind of men to advance—to get where they draw the high salaries or make the big profits that are paid to experts.

Hundreds of these ambitious men have stepped into the big pay class while their fellow workmen remained at the bench.

There, for instance, is J. D. Woodside, of Oklahoma, who was working for $6 a day, who took the Chicago "Tech" Builder's Course and in 3 months was foreman on a big apartment building at $8 a day, 5 months later was superintendent on a reinforced concrete job covering nearly half a block, and is now in business as a contractor.

There, also, is S. J. Dickerson, of Rhode Island, who writes that his Chicago "Tech" training raised his income from $50 a month to $150 a week. And A. C. McEvoy, of Chicago, quickly advanced from a bricklayer to foreman as a result of taking this instruction.

These are only three out of the hundreds of forward-looking men who saw what this training would do for them and who got it.

Chicago "Tech" is ready to give you the same training in **Plan Reading, Estimating, Superintending.** Our Builder's Course makes **building experts**—men who know every practical point about planning, figuring costs and directing all classes of construction.

TRAIN BY MAIL

No need to leave your present job to get this training. We will teach you **by mail** and you can use your spare time for study under the direction of our experts. No special education required.

FREE 2 Books and Blue Prints

Your request brings our 2 books, one on "How to Read Blue Prints," containing a lesson in Plan Reading, and with it we send blue prints, drawings, etc. With this lesson you can test yourself. See how easily you can learn by our method before you decide about enrolling. The other explains the Chicago "Tech" Method of training by mail.

Send the Coupon

To get these books and valuable information just sign your name on the coupon and mail it today to **Chicago Technical College, 1238 Chicago Technical Bldg., Chicago.**

133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels with special clip, ready for plastering.

PARTITION TILE
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PERGOLAS
Hartman-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
235. *Album No.* 33. 7½ x 10½ in. 42 pages of illustrated literature regarding the various types of Pergolas.

PLASTER BASE (See also Stucco Base)

PLASTER BOARD
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PLASTER INTERIOR
National Kellastone Co., 155 East Superior Street, Chicago, Ill.

PLUMBING EQUIPMENT
Bowman Mfg. Co., 886 Progress Street, Pittsburgh, Pa.
512. Leather bound, profusely illustrated catalog of 84 pages describing the entire line of plumbing and heating equipment.
Bridgeport Brass Co., Bridgeport, Conn.
530. *Plumbing Supplies.* Catalog of adjustable swivel traps; basin and bath supplies and waste; basin and sink plugs; low tank bends; iron pipe sizes of brass pipe. 20 pp. Ill. 8 x 10½ in.
Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.
Hess Warming & Ventilating Co., 1205D Tacoma Bldg., Chicago, Ill.
136. *Hess Sanitary Steel Medicine Cabinets.* Booklet, 4 x 6 in.
B. Karol & Sons Co., 806 So. Kedzie Avenue, Chicago, Ill.
465. *Write for Catalog K,* describing the complete line of Plumbing and Heating Supplies.

PUMPS
C. H. & E. Mfg. Co., Milwaukee, Wis.
251. Bulletin No. 2 Pumps.
The F. E. Myers & Bro. Co., Ashland, Ohio.
137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.
138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinder and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illustrated.

REFRIGERATION
McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.
466. *Catalog No.* 95—Refrigerators for Residences.
467. *Catalog No.* 53—Refrigerators for Hotels, Restaurants, Clubs.
468. *Hospitals and Institutions.* Catalog No. 64—Market Coolers and Refrigerator Counters.

ROOF DECKS
Boyle, John, & Co., Inc., 116 Duane St., New York.
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

ROOFING MATERIALS
Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
American Sheet & Tin Plate Company, Pittsburgh, Pa.
140. *"Better Buildings."* Catalog. 8½ x 11 in. 32 pp. Describing Corrugated and Formed Sheet Steel Roofing and Siding Products—Black, Painted and Galvanized; together with directions for application of various patterns of Sheet Steel Roofing in various types of construction.
112. *Copper—Its Effect Upon Steel for Roofing Tin.* Catalog 8½ x 11 in. 28 pp. Illustrated. Describes the merits of high grade roofing tin plates and the advantages of the copper-steel alloy.
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
141. *Specifications and Price List.* Descriptive booklet. Details of Ambler Asbestos Cement Roofing Slates, "Century" Asbestos Shingles and Asbestos Corrugated Sheathings. Tables and drawings. Size 6 x 9 in. 44 pp.
142. *Ambler Asbestos Corrugated Roofing.* Catalog gives complete data for specifying, drawings, methods of applications, tables, etc. Size 8½ x 11 in. 20 pp.
Wm. L. Barrell Co. of N. Y., Inc., 50 Leonard Street, New York.
143. *Prepared Canvas for Roofing.* Samples can be obtained on application. A canvas for every use.
Beaver Board Products Co., Inc., Buffalo, N. Y
469. *Illustrated catalog* will be sent on request.
Blue Ridge Slate Corp, Esmont, Va.
470. *Samples and catalogs* sent on request.
John Boyle & Co., Inc., 112-114 Duane Street, New York, N. Y.
154. *Boyle's Bayonne Roof and Deck Cloth.* List B 93. A prepared roofing canvas guaranteed waterproof for decks and the roofs and floors of piazzas, sun-parlors, sleeping porches, etc.
Copper & Brass Research Association, 25 Broadway, N. Y. City.
267. *"How to Build a Better Home."* 36-page illustrated catalog. 8 x 10½ in. This not only describes but teaches the prospective buyer the essential facts of building, finance, hardware and roofing.
34. *"Copper Roofing,"* a manual for architects and builders. Weights of various roofing materials. Up-to-date practise in the laying of copper roofs—Batten or wood rib methods, Standing seam method, Flat copper roofs, Copper shingles, Suggestions for avoiding error and obtaining the full value of copper. Decorative effects and how to obtain them. Flashings, reglets, gutters and leaders. Cornices. Copper-covered walls. Specifications. 32 pp. Ill. 8½ x 11.
Cortright Metal Roofing Co., Philadelphia, Pa.
236. Four-page circular describing the various shingles.
Creo-Dipt Company, 1025 Oliver Street, North Tonawanda, N. Y.
153. *Standard Stained Shingle.* Samples of different kinds mailed.
154. *Architectural Service Sheets.* 8½ x 11 in. Illustrated. Working drawings of construction, with standard specifications for design and construction of same.
Edward's Mfg. Co., 423 Eggleston Avenue, Cincinnati, Ohio.
471. *Catalog No.* 65 describes fully Metal Roofing, Siding, Ornamental Ceilings and other Sheet Metal Work. This is a 210-p. catalog well illustrated.
C. G. Hussey & Co., Pittsburgh, Pa.
227. *Copper Roofing and Flashings.* Book No. 6. 34 pp.
Illinois Zinc Company, 280 Broadway, New York, N. Y.
155. *"Izco," the Metal of Permanence."* 8-page, illustrated booklet describing the durability, service and maintenance cost of Corrugated Sheets of Pure Rolled Zinc.
156. *The Roof That's Always New.* Booklet. 3⅜ x 6 in. 12 pp. Illustrated. Story of Illinois Zinc Shingles, their everlasting and artistic qualities. Information regarding a complete zinc roof, shingles, starting piece, valley ridge and hip piece.
National Sheet Metal Roofing Co., 339 GrandSt., Jersey City, N. J.
159. *Manufacturers of Metal Shingles* in various designs, both in painted tin or galvanized iron. Samples sent on request.
The Richardson Company, Lockland, Cincinnati, Ohio.
472. *Viskalt Membrane Roofs.* Contains specifications for applying Membrane roof over boards and also for applying over concrete. Illustrated with line drawings of several approved methods of flashings. 3 pp. 8½ x 11 in.
F. C. Sheldon Slate Co., Granville, N. Y.
473. *Sixteen-page colored catalog,* describing the "Most Attractive Roof at the Most Reasonable Cost."
N. & G. Taylor Company, 300 Chestnut Street, Philadelphia, Pa.
160. *Selling Arguments for Tin Roofing.* Booklet. 6¼ x 9¼ in. 80 pp. Illustrated. Describes the various advantages of the use of high grade roofing tin, gives standard specifications, general instructions for the use of roofing tin, illustrates in detail methods of application.
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
161. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins. 8½ x 11. Pyrofill.
Vendor Slate Co., Easton, Pa.
474. *"A Book for Architects"* is the title of the new 24-page well-illustrated catalog. See also listing under Slate.
Vulcanite Roofing Co., Buffalo, N. Y.
475. *Interesting booklets,* describing the "Better Shingle" and "Vulcanite Roll Roofings."
Winthrop Tapered Asphalt Shingles, 19 So. La Salle St., Dept. No. N. D. 20, Chicago, Ill.

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth.
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

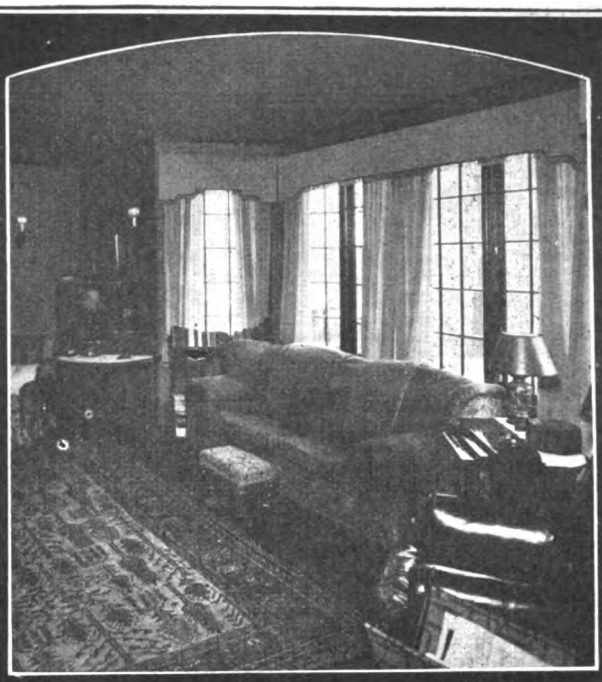
A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

SAMUEL CABOT, Inc., Mfg. Chemists
BOSTON, MASS.
842 Madison Ave., N. Y. **24 W. Kinzie St., Chicago**
Cabot's Conservo Wood Preservative, Stucco Stains, Brick Stains, Damp-Proofing

Residence of Geo. H. Dakin, Grand Rapids, Mich.
Pierre Lindhont—Architect.

Clinton Service



Clinton Mortar Colors are sold by dealers all over the country.

If by chance you are not able to locate a dealer in your town who carries them, wire us, and we will put you in touch immediately with a dealer close at hand from whom they may be obtained.

THE CLINTON METALLIC PAINT CO., Clinton, N. Y.

Clinton Mortar Colors

Nature's permanent colors. Made since 1887.

TRUSS-LOOP is a Real Labor-Saver on Repair Work

In Two Ways—

First— It is not necessary to take off the old plaster—a dirty job. Where it is desired to replaster an old surface to cover cracks or gapping holes where the plaster has fallen from wood lath, simply nail BOSTWICK TRUSS-LOOP over the old plastered surface.

Second—No furring strips are necessary with TRUSS-LOOP. With the loops turned in there is plenty of furring space and a good plaster key is secured.

There's real satisfaction in making wall and ceiling repairs with BOSTWICK Truss-Loop because of the satisfaction it gives your customer.

Write for pocket sample—and catalog.

THE
BOSTWICK STEEL LATH CO.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 78*

RULES
A. S. Aloe, St. Louis, Mo.
A. Beckmann Co., 1004 Jackson St., Toledo, Ohio.
Eugene Dietzgen Co., 162 Ft. Monroe Street, Chicago, Ill.
476. *Write for an instructive circular.*
Keuffel & Esser, Hoboken, N. J.
Lufkin Rule Co., Saginaw, Mich.
Sargent & Co., New Haven, Conn.
Stanley Rule & Level Co., New Britain, Conn.

SASH CHAINS, HOOKS AND ATTACHMENTS
The Bridgeport Chain Co., Bridgeport, Conn.
209. *An interesting catalog* describing fully Sash Chain in Steel (six sizes and six finishes), in Bronze (six sizes), Hooks and Sash Chain Attachments.

SASH—(See Windows)

SASH CORD
Samson Cordage Works, Boston, Mass.
477. *An interesting catalog* with actual samples of the various grades of cordage therein.

SAW MACHINERY
American Saw Mill Machinery Co., Hackettstown, N. J.
162. *Catalog No.* 21, describing Circular Saws of all sizes.
163. *General Catalog No.* 22 and *special Bulletin No.* 77, describing sawing machinery for use on the job in the shop.
W. F. & John Barnes Co., 71 Ruddy Street, Rockford, Ill.
478. *Catalog No.* 84 describes in full detail the Patent Foot and Hand Power Wood Working Machinery.
C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
164. *Bulletin No.* 1, *Saw Rigs.*
Crescent Machine Co., 206 Main Street, Leetonia, Ohio.
479. *This* 1921 *catalog* contains improvements on No. 3 and No. 5 Saw Tables No. 2 Motor-Driven Saw Table, New Motor-Driven Sharper, Hollow Chisel Mortiser.
Huther Bros., B. F., Saw Mfg. Co., Rochester, N. Y.
480. *Catalog No.* 38 describes the complete line of Saws.
Parks Ball Bearing Machine Co., Station A, Cincinnati, Ohio.
482. *Catalog B* describes in detail Wood Working Machines.
Sidney Machine Tool Co., Sidney, Ohio.
483. *Twelve-page illustrated booklet,* describing the "Famous Universal Wood Workers."
484. *One hundred-page pocket-size catalog,* giving full information on the "Famous Woodworking Machinery."

SAWS
E. C. Atkins Co., Indianapolis, Ind.
286. Booklet and chart describing saws. Especially the cross cut saw.
Huther Bros., B. F., Saw Mfg. Co., Rochester, N. Y.

SCREENS
American Wire Fabrics Company, 208 So. La Salle St., Chicago, Ill.
165. *Catalog of Screen Wire Cloth.* A catalog and price list of screen wire cloth, black enamel, galvanized, galvanoid, American bronze. 30 pp. Illustrated. 3½ x 6¼ in.

SHEATHING
Bishopric Mfg. Company, 103 Este Avenue, Cincinnati, Ohio.
171. *Homes Built on the Wisdom of Ages.* Catalog. 6 x 9 in. 48 pp. Illustrated. Describing the use of Bishopric Stucco-Board and Bishopric Sheathing Board.
U. S. Gypsum Company, 205 West Monroe St., Chicago, Ill.
173. *Eight-page Folder.* Describes Adamant Sheathing Board for use instead of wood sheathing.

SHINGLES—ASPHALT
Winthrop Tapered Asphalt Shingles, 19 So. La Salle St., Dept. No. D-20, Chicago, Ill.

SHINGLES—METAL
Cortright Metal Roofing Co., 50 North 23rd St., Philadelphia, Pa.
174. *"Concerning That Roof."* A complete catalog describing and illustrating Cortright Metal Shingles and Trimmings. 7 x 10¼ in. 32 pp.

SHOWERS, CURTAINLESS
Kenney-Cutting Products Corp., 507 Fifth Avenue, New York.
260. *4-page File and Reference Sheet* describing six different models of the shower.

SLATE—See also Roofing
Blue Ridge Slate Corp., Esmont, Va.
Knickerbocker Slate Corp., 153 East 38th Street, New York, N. Y.
485. *Four-page folder,* describing the "Graduated Slate Roofs."
F. C. Sheldon Slate Co., Granville, N. Y.
175. *Commercial and Architectural Roofing Slate* in all colors and textures. Also blackboards, structural and electrical slate. Slate Granules.
Vendor Slate Co., Inc., Easton, Pa.
531. *The Vendor Book of Roofing Slate for Architects.* Contains original information on slate in various architectural uses; history, geology sundry practical matters; complete descriptive classificaton; extended treatise on architectural roof design and specifications. 24 pp. Ill. 8½ x 11 in.

STAIRWAYS
Bessler Movable Stairway Co., Akron, Ohio.
169. *Illustrated catalog,* containing 24 pp., describes how the Bessler Movable Stairway saves floor space and adds an extra convenience to the home.

STANDARD BUILDINGS
Truscon Steel Co., Youngstown, Ohio.
176. *Truscon Standard Buildings.* Fourth Edition. Catalog. 8½ x 11 in. 40 pp. Illustrated. Erection details, cross-section diagrams and adaptations are given.

STONE, BUILDING
Art Stone Co., Waynesboro, Pa.

STORE FRONTS
J. W. Coulson Co., Columbus, Ohio.
278. Store Front Construction simplifies the problem for the builder and owner. It beautifies and enhances the value of store property. A special device prevents glass breaking.
Detroit Show Case Co., 1660 W. Fort Street, Detroit, Mich.
486. *Write for* "Full Size Details of Desco Metal Store Front Construction." This illustrates by means of blue prints the various store fronts.
Kawneer Co., Niles, Mich.
177. *Kawneer Store Front.* Illustrated catalog. Drawings and details of construction. Size 8½ x 11 in. 32 pp.
178. *Full Size Details Kawneer Construction.* Blue prints. Size 30 x 30 in.
179. *A Collection of Successful Designs.* Portfolio. Shows 24 typical store fronts with elevations. Size 9 x 12 in. 32 pp. Catalog B. J. 8. 6 x 9 in. 68 pp. Illustrated. Key to Getting the People In.

STRUCTURAL STEEL
Central Pressed Steel Co., Massillon, Ohio.

STUCCO—See also Cement
American Materials Co., 101 Park Avenue, New York, N. Y.
487. *A 32-page illustrated catalog,* describing "Elastica," the Stucco of Permanent Beauty.
The Atlas Portland Cement Co., 25 Broadway, New York, N. Y.
182. *The Stucco House.* Contains many beautiful illustrations of houses finished with stucco and selected particularly for their architectural value. Detailed illustrations of stucco surface, textures and drawings showing wall construction with revised specifications covering application of stucco. 96 pp. 8½ x 11 in. Price 50 cents.
180. *Guide to Good Stucco.* A book telling of the advantages of Portland Cement stucco, and how to apply it. Shows numerous finishes obtainable with ATLAS WHITE Portland Cement. 28 pages. 8½ x 11 in.
The Bishopric Mfg. Co., 17 Este Avenue, Cincinnati, Ohio.
Muller, Franklyn R. Co., Waukegan, Ill.
National Kellastone Company, 155 E. Superior St., Chicago, Ill.
183. *Specifications for Stucco Work.* A booklet containing complete specifications in detail for the use of Kellastone stucco for new buildings as well as the "overcoating" of old buildings. 13 sheets of text, 2 sheets of illustrations. 8 x 11 in.
184. *The Story of Kellastone Imperishable Stucco.* In this most interesting book the merits of Kellastone are set forth in a convincing manner. Every page contains pictures of beautiful houses stuccoed with Kellastone, and there are two pages in color. 22 pp. Illustrated. 8½ x 12 in.
Rocbond Co., Van Wert, Ohio.
268. *"Fortifies Your Home Against the Elements and Time."* 16-page folder. 3½ x 6 in.
269. *"Better Homes."* 12-page booklet, 7¼ x 8 in., describing the advantages of "Rocbond."

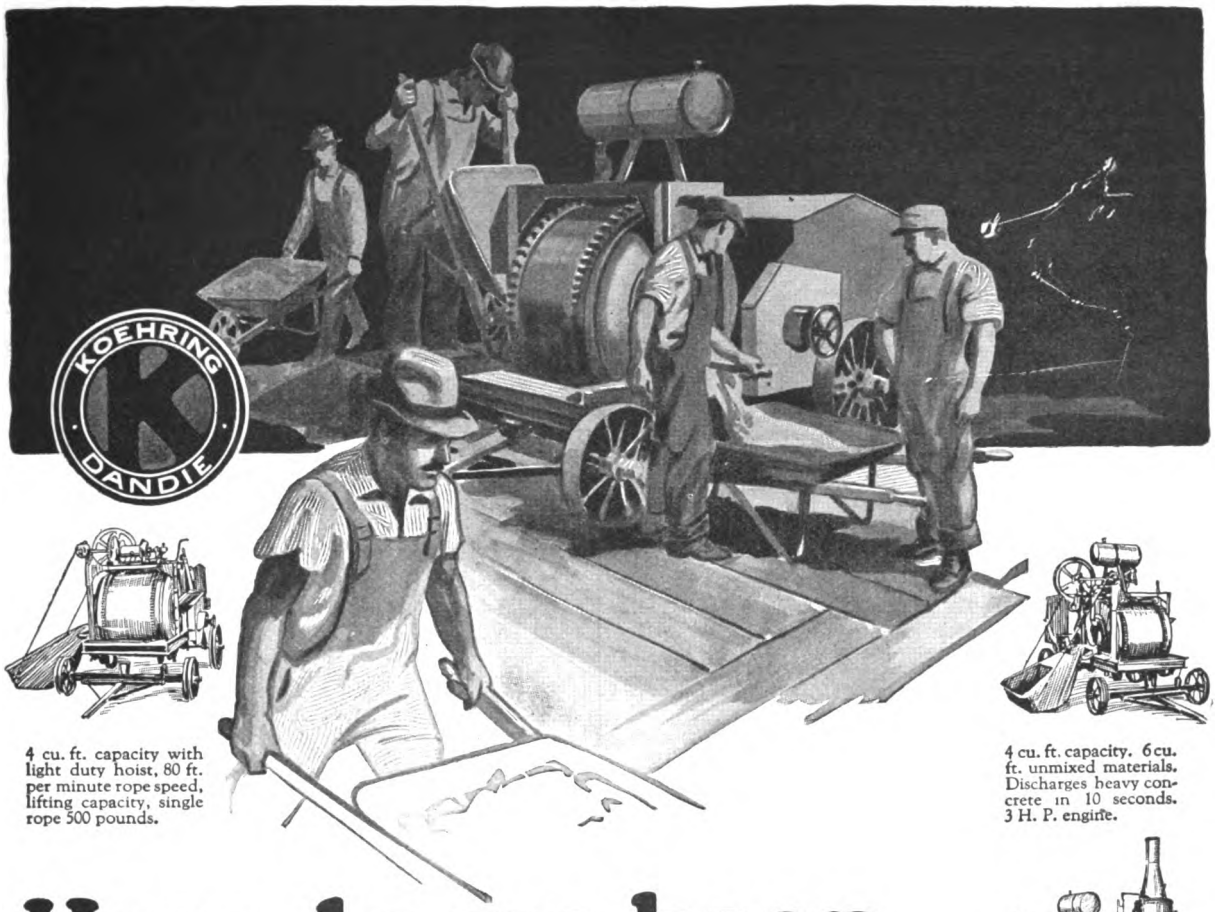
STUCCO BASES
Bishopric Manufacturing Co., 103 Este Avenue, Cincinnati, Ohio.
181. *Bishopric for All Time and Clime.* Catalog. 7½ x 11 in. 52 pp. Illustrated. Describing the use of Bishopric Stucco and Plaster Base and Bishopric Sheathing.

STUCCO-MAGNESITE—See Stucco
American Materials Company, 101 Park Avenue, New York, N. Y.; Weed Street and Sheffield Avenue, Chicago, Ill.
185. *Elastica, the Stucco of Permanent Beauty.* Catalog. 8½ x 11 in. 32 pp. Illustrated. Treatise on composition and application of Elastica Stucco.
Natl. Kellastone Co., 155 East Superior St., Chicago, Ill.
488. *An interesting handbook,* telling the story of "Kellastone."
489. *Catalog No.* 100, giving the specifications for Stucco Work.
United States Materials Co., Weed Street and Sheffield Avenue, Chicago, Ill. See American Materials Co.

SURVEYORS' INSTRUMENTS—See Levels

SUSPENDED CEILING
U. S. Gypsum Company, 205 West Monroe Street, Chicago, Ill.
186. *Loose-leaf Bulletins.* 8½ x 11. Jester-Saskett, consists of plaster board applied to metal channels with special clip, ready for plastering.

THERMOSTATS—See Heating Equipment



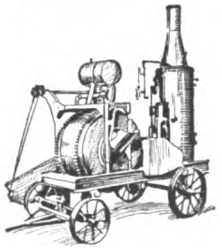
TILE, HOLLOW
Hollow Building Tile Association, Dept. 1812, Conway Building, Chicago, Ill.
187. *Handbook of Hollow Building Tile Construction.* 8½ x 11 in. 104 pp. Illustrated. Complete treatise on most approved methods of hollow tile building construction and fireproofing.
National Fire Proofing Co., 250 Federal Street, Pittsburgh, Pa.
188. *Standard Wall Construction Bulletin* 174. 8½ x 11 in. 32 pp. Illustrated. A treatise on the subject of hollow tile wall construction.
189. *Industrial Housing Bulletin* 172. 8½ x 11 in. Illustrated. Photographs and floor plans of typical workingmen's homes.
190. *Natco on the Farm.* 8½ x 11 in. 38 pp. Illustrated. A treatise on the subject of fire safe and permanent farm building construction.

TIMBER CLAMP
Schenck Timber Clamp Co., 501 Fifth Avenue, New York City.
490. *Several interesting descriptive folders* may be had on request.

TOILET PARTITIONS—STEEL
Hart & Hutchinson, New Britain, Conn.
284. Write for this Catalog, describing the sanitary and durable usages of these partitions.

TOOLS
Mack Tool Co., Inc., Rochester, N. Y.
491. *An interesting Carpenter's Catalog* may be had on request.
492. *"Love Stories,"* a lively booklet, bound to be pleasant and worth while reading.
Progressive Mfg. Co., Torrington, Conn

Digitized by Google



4 cu. ft. capacity with light duty hoist, 80 ft. per minute rope speed, lifting capacity, single rope 500 pounds.

4 cu. ft. capacity. 6 cu. ft. unmixed materials. Discharges heavy concrete in 10 seconds. 3 H. P. engine.

How do we keep the price down?

Not by taking it out of the construction of the mixer! No! The Dandie sets a new standard for light mixers, both in speed of operation, and in long service life. Yet it sells within the price range for light mixers. Big volume production, standardization in every part, and labor saving machinery only possible with the largest mixer manufacturer, keeps down the price.

7 cu ft. capacity. 4 H. P. engine. 5 H. P. boiler.

KOEHRING DANDIE MIXER

A light, easily portable mixer for footings, culverts, foundations, etc. Mixes concrete or mortar. As splendidly engineered as the big Koehring Paving Mixers. Great strength without excess weight! Double drum gear drive. Universal joint bearings. The Koehring heavy duty drum roller construction! Discharge controlled from either side. Extra liberal simple power. Genuinely, a trouble-proof mixer that stands up to all you can give it. Write for catalog.

Dandie Capacities

4 cu. ft. mixed concrete gasoline. 7 cu. ft. mixed concrete steam and gasoline. May be equipped with low charging platform, power charging skip and light duty hoist.

Send Back Coupon

The Dandie is not the cheapest mixer you can buy, but the sturdiest, strongest construction which makes it the remarkable value in the light mixer field. Send back the coupon.

The Wallace Bench Universal Saw

Works Wonders On a Building Job

YOU know how much fitting and sawing has to be done out on the job and how tedious and tiresome it is to work with a hand saw. A Wallace Bench Universal Saw operates from any electric lighting circuit and although it is heavy enough for practically all of the work it is light enough to carry out on the job. Cutting at any angle, rip or cross-cut. Fence and guides make for extreme accuracy. Readily adapted for dado work. Truly a handy machine on any building job.

The Wallace Bench 6" Jointer

This machine is for the endless planing, jointing and rabbetting incidental to building. A sturdy, powerful machine that will do more precise and better finished work. Motor directly connected to circular type three knife cutter head, gives ample power for the biggest bite. You will be interested in the Jointer Bulletin. Send for it today.

For Real Production in the Shop

Most woodworking shops know the benefits to be derived from the Wallace Bench Universal Saw. For quantity production on six foot lengths down to the smallest pieces it has no equal. The other machines in the Wallace Line are equally efficient.

Wallace Bench Universal Saw
Wallace Bench Plain Circular Saw
Wallace Bench 16" Band Saw
Wallace Bench 4" Planer
Wallace Bench 6" Jointer
Wallace Electric Glue Pot

A Jaeger Job

Ninety-nine out of every hundred concrete mixers in Columbus, Ohio, are Jaegers

COLUMBUS is, indeed, a city "built by Jaegers." Practically every good-sized **building erected here during the past 10 years has seen a Jaeger on the job.**

True, this is the home-town of Jaeger Mixers. Yet something more than loyalty to home-town industry prompts Columbus contractors to buy Jaegers—***for they keep on buying them.*** There are over 350 in use in Columbus today.

These men like the speed of the Jaeger tilting-drum feature. They like the simplicity, the perfect mixing quality, the low upkeep of this "Mix a Minute" outfit.

But you don't need to come to Columbus to find Jaeger enthusiasts. Ask almost any contractor in your town about the Jaeger. More than likely he will be one of the 18,000 satisfied Jaeger users. ***Use the coupon today for full facts on this line of 18 mixers!***

More Window Display Space!

the need of every retail merchant!

Store display windows are an important asset in the success of every modern retail establishment. The merchant realizes that his windows—his store front—can be made business builders by attracting passersby through the door.

Store fronts of modern type are now regarded as a necessity—and the contractor's task simply becomes one of installing a store exterior of proven worth—a store front that is attractive.

Through our co-operation any contractor or carpenter can become a Desco Store Front specialist—and without any special knowledge or experience. We have enabled scores of contractors to build up a profitable business in Desco Store Fronts and we can do the same for you. Mail the coupon below and we will explain in detail how Desco Store Front construction is sold to contractors and how we will co-operate with you to increase your profits. See Sweet's Catalog.

What an Architectural Engineer says—

—about

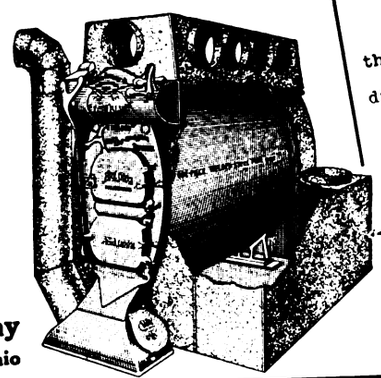
THE FARQUAR SANITARY HEATING AND VENTILATING SYSTEM

The letter reproduced here is typical of the comment of Architects and Engineers after thoroughly investigating FarQuar claims.

Distinctive FarQuar Features

An Automatic Control, actuated by the fire-box itself, which insures a uniform temperature and positively protects against overheat and its consequent dangers, while also making only one firing necessary every twenty-four hours.

A Large Grate Area which insures slow combustion and a Long-Smoke Travel which means fuel economy.



An Electrically welded, one piece, Seamless Fire-box which entirely prevents the escape of fire poisons.

A Vent and Return System which insures distribution of heat to all parts of the house, regardless of the weather, also prevents hot and cold spots in any room.

Write today for full particulars;—ask for free booklet.

The Farquhar Furnace Company

512 FarQuar Bldg. Wilmington, Ohio

MOTT X. CORCORAN
ARCHITECTURAL AND STRUCTURAL ENGINEER
VALPARAISO, INDIANA

October 25th, 1922.

The Farquhar Furnace Co.,
Wilmington, Ohio.

Gentlemen:-

I wish to thank you for the literature which you sent me. I have read it through carefully. Yours is the first real furnace that I have ever seen or heard tell of.

Kindly forward to me the prices together with the trade discounts and oblige,

Yours very truly,

Mott X. Corcoran

High Grade Representatives Wanted

Responsible Dealers are wanted as FarQuar distributors. The many exclusive FarQuar features offer unusual opportunities to those who can qualify.

180 Cubic Feet per Hour of

heat escapes from every window in your building. 90% of Heat Units go up your chimney. Can you afford to waste from 20 to 40% of the 10% that is left? Of course, you can't.

WHY DO IT?
DIAMOND METAL WEATHER STRIPS

PRACTICAL METAL THE DIAMOND WAY WEATHER STRIPPING

DIAMOND CALKING COMPOUND will permanently and efficiently save the waste of fuel and keep out wind, cold, dirt and storm.

If you have a building to heat and you PAY THE BILLS, let us prove how we can save you 20 to 40% on your fuel bills this year and every year your building stands.

We have thousands of testimonials from every section of this country proving our claims.

Our nearest agency is ready to give you an estimate on equipping your building.

Let us send you some information and details on how we do it. We have been doing it for fifteen years for others, why not for you?

A building equipped with our product enables you to maintain an even degree of heat with less fuel.

Can be put in any building, old or new, anytime, anywhere.

DIAMOND METAL WEATHER STRIPS AND CALKING COMPOUND GIVE SATISFACTION WHERE OTHERS FAIL

You'd Be Surprised!

Wouldn't you be surprised if the one from whom you buy fuel would hand you back one-fourth to one-third OF EVERY DOLLAR you spend for heating your home or building? WELL, YOU KNOW he won't, but an investment in DIAMOND METAL WEATHER STRIPS will save you that much and will pay for themselves in from two to three years' time, and then go on doing it for at least ten years to come. Don't take our word for it, but let us refer you to people who are making this saving.

We have stripped thousands of homes, both old and new, in all parts of U. S. and Canada.

Not only do they save fuel, but they keep the heat in, the cold, dirt and storm out, and do it continually.

Write us for some interesting data on the subject. It's yours for the asking.

Building Material and Specialty men, Contractors and Carpenters should write for our Agency Proposition. Some desirable territory still open. Volume of business is big the year round and profits are legitimate.

If we have no agency in your city we want one to supply the demand.

Get This NEW BOOK

THE SHALFORD
From Page 18, "CONCRETE HOUSES"

FIRST FLOOR PLAN

Every Builder needs this Book

Show your prospect the plans in CONCRETE HOUSES when he asks you to build him a beautiful and comfortable house.

Houses of Concrete Block Stuccoed are easily built. They cost little, *if any*, more than frame construction. They are permanent, fire-safe, and need no paint.

This new volume—CONCRETE HOUSES—contains plans of 25 houses of popular types and sizes, designed by good architects. But it is more than simply a book of plans, because there is back of it a

Complete Building Service

You can secure blueprints, specifications and quantity surveys of every plan shown in the book at a nominal cost. These will save you money, and in addition will enable you to bid intelligently on the job, for you will know just how much work there is to be done and what it will cost.

Blueprints

The blueprints for each of the 25 plans are complete in every detail. If the building site makes it desirable, reversed blueprints can be furnished.

Specifications

The specifications are as complete as they can be made, covering plumbing, heating, wiring, and all the usual necessary work. They give a full understanding between yourself and the house owner as to what the building contract implies.

Quantity Surveys

In keeping with the other features of this building service, the quantity surveys go into full detail. When the items listed are totaled, you have the exact cost of the job.

Send for "CONCRETE HOUSES." Every builder needs it!

An "American" Contractors' Portable Variety Woodworker with 20-in. Band Saw

Take Your Shop Right on the Job

Do what a great many other carpenters and builders are doing—take an American Contractors' Portable Variety Woodworker on the job and have the equal of a complete mill right at your elbow.

Those vexing delays and the costs of running back to the shop to do this or that are eliminated when there's an "American" on the job. Each one of its fourteen machines (all in one unit) are high grade woodworking machines—the equal of any single machine. You will actually save money on every building contract that has an "American" on the job.

Write for Catalog No. 77 that illustrates and describes our full line of woodworking machinery.

Level and Plumb With Your Own Instrument

$5.00

BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

BE A BIGGER BUILDER

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

Write for Free Book

Our free book—"Be A Bigger Builder"—tells you how to increase your income—how to get the profitable jobs and become a bigger man in your community. Write for this book today.

OAK FLOORS
(For Everlasting Economy)

35 Years Hence—What?

THE real cost of flooring is its purchase price plus its maintenance *per year of service.*

Oak Flooring one hundred years old is quite common in residences and Oak Flooring fifty years old is not uncommon in factories, warehouses, docks, armories, machine shops, and other structures requiring "high duty" floors.

As years pass owners appreciate more and more the good judgment of the builder who recommended Oak Flooring. They find it reduces their cleaning bills and increases their sales and rental values 25% or more, besides giving its other satisfactory qualities.

Three booklets, in colors, containing much accurate and valuable information for a builder's files, mailed free on request.

All the necessary tables are stamped right on Sargent Framing Squares.

Self-Calculating Squares

You don't have to be a mathematician to use the Sargent Framing Square. Complete tables of measurements are plainly stamped on it. Even the most inexperienced carpenter can use it with speed and depend upon its accuracy.

SARGENT
FRAMING SQUARES

Require no time-wasting figuring for the lengths and cuts of common, hip, valley, jack or cripple rafters. Just measure and read. Results are correct and final. Sargent Squares are made of selected steel in five dependable finishes.

Write today for the Steel Square Booklet which gives full particulars.

Gentlemen:-

Are we satisfied with our new COULSON STORE FRONT?

Perhaps the best answer to that is the innumerable compliments we receive that ours is the most attractive, distinctive and best displaying Front in the city.

The same is true of the Coulson Store Fronts in several of our stores in other cities.

Very truly yours,

Geo Katz

Let us tell you how to make your Store Front more attractive

The best
selling argument

A home built of Rocbond Exterior Stucco is an unanswerable, clinching, sales argument. The beauty and the manifest sturdiness of each Rocbond home or building, are outward signs of the remarkable *bonding strength* and of the non-cracking, non-sagging, weather-resisting qualities of this more carefully prepared stucco.

To get the facts about this easy-selling stucco, should result in permanent profit to you.

The Rocbond Co.
PLANTS
Van Wert, Ohio—Cedar Rapids, Ia.—Harrisburg, Pa.

ROCBOND
EXTERIOR STUCCO

The **FIRMNESS, DURABILITY** and **ATTRACTIVENESS** of **AMERICAN BRAND SCREEN WIRE CLOTH** will appeal at once to the architect, home builder, or screen manufacturer who desires to give maximum Fly Screen satisfaction.

AMERICAN BRONZE: This grade is made of best hard drawn wire 90% copper, 10% non-corrosive alloy, principally zinc. **BRONZE** should last as long as the house in most sections.

Avoid copper substitutes as these are too soft.

GALVANOID: This grade is heavily electro - zincked **after** weaving, then varnished. It is the recognized leader in its field—the **best** grade of zincked cloth made.

We also make
PAINTED, GALVANIZED, COPPER, KOPNIK, MONEL
and many special grades of wire cloth. Samples and descriptive literature sent upon application.
Order from your Hardware Jobber or Dealer. If he cannot furnish, advise us, and we will see that you are supplied.

CHICAGO, ILL.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

280 Madison Avenue, New York

[Cor. 40th Street]

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

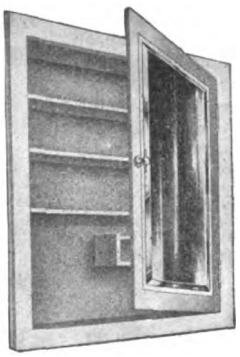
A Letter from the Architect of the Hartford Housing Proposition

"You no doubt remember furnishing 201 Kelsey generators for our housing project in 1920, and after this past winter's service I have made a personal canvass of the 170 house owners and failed to find one occupant who is not more than satisfied and even anxious to recommend the heater to any prospective purchaser as the best and most economical plant of their experience.

"The six room house in all exposures has not exceeded 5 tons of coal for the season."



This is but another proof that the Kelsey makes good, because it is correctly designed and sturdily built.

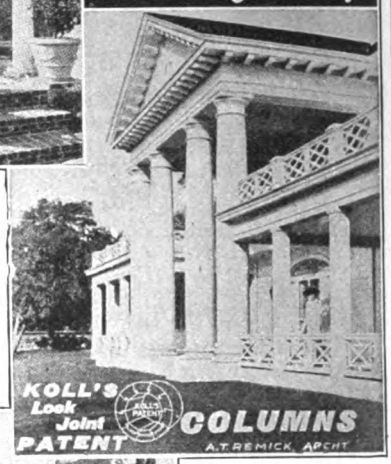
Build to Sell

WHEN conditions have changed and there are more homes than home-seekers you will want special features that make your houses more saleable than the average. First among these features should be the Kernerator—the modern system for the convenient disposal of household waste and refuse.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse—rags, sweepings, wilted flowers, broken crockery, tin cans, garbage—**without cost**, for no commercial fuel is required. Non-combustibles are removed with the ashes.



Write for our interesting literature giving complete information regarding the Kernerator. Also see page 2124, Sweet's 1922 Catalog.

Kerner Incinerator Co.

Smoky Fireplaces

result from faulty interior construction and incorrect size of chimney.

The installation of an Apex Smoke Chamber with Damper will positively produce a clear burning fireplace without smoke trouble at all times and give you the approximate flue area.

Tell us the size of the fireplace opening and we will tell you the correct size to build the chimney.

The Apex Smoke Chamber is installed with a patented Kettle Hook.

The Operating Mechanism is movable and always comes in a bed joint and fits the face perfectly. An indicator is attached to prevent accidental closing when fire is burning. This style of mechanism cannot jam and is extremely simple and comes to you all ready set up.

First cost is the only cost and you are assured of a correct fireplace in the minimum of time.

Mechanism Blueprint Available.

New Tape Hook Makes Pullman Sash Balance

The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

An all "CREO-DIPT" Stained Shingle Residence at Englewood, N. J. Architect Victor Harvey, Englewood, used large 24-inch "CREO-DIPT" Stained Shingles finished "Dixie White" for wide shingle effect on side walls; "CREO-DIPT" 18-inch Moss Green Stained Shingles on Roof.

NO other building material for side walls or roof lends itself so well to this Colonial treatment. The colors enhance the architectural features of the Colonial design.

"CREO-DIPT" Stained Shingles are made only of straight grain, best-quality shingles. There are no flat grains to warp or curl. Sound wood is preserved against dry rot and weather by our special process of driving pure earth pigments ground in pure linseed oil into the fibres of the wood with creosote. The open market does not afford such quality either in shingles or stain. You save painting and repair bills.

Send for Portfolio of fifty large Photographs of homes of all sizes by prominent Architects. Ask about our special "CREO-DIPT" Stained Shingles for Thatched Roof effect; also the large 24-inch "CREO-DIPT" Stained Shingles for the wide shingle effect on side walls, either in Dixie White for the true Colonial white effect, or shades of green, brown, red or gray.

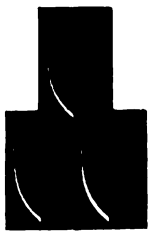

Fig. 157
Note the construction of patent Interlocking Device used on Edwards Metal Shingles and Spanish Tile.

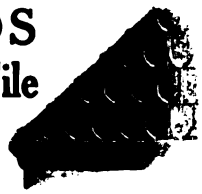

Fig. 367
Metal Spanish Tile for main part of roof.

Edwards "Queen Anne" Metal Shingles

Residence, Senator Geo. S. Nixon, Reno, Nevada. Edwards Metal Spanish Tile used on this building.

EDWARDS Metal Spanish Tile

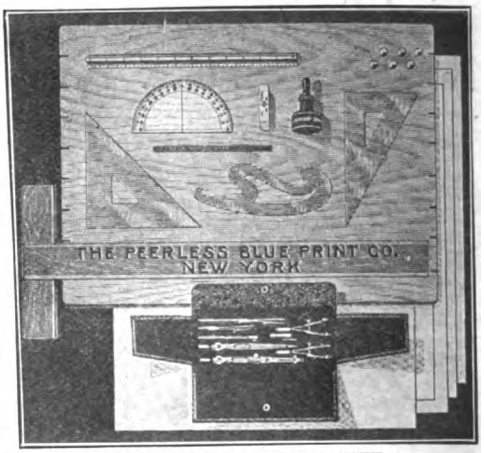
It is wonderful what a remarkable transformation takes place when an "Edwards" Metal roof is properly applied to a house—all of the charm of the Old Spanish Terra Cotta Roofing Tile is preserved, even to the color.

The house takes on a new lease of life. It seems a better place to live in. It helps put the stamp of progressiveness and thrift on a community. An Edwards Metal or Tile Roof is a real commercial asset and will bring a better return in rent or sale.

Edwards Metal Roofings made in various styles, to have the appearance of wood shingles, tile, slate, or any other roofing effect, and none of these fine artistic effects will cost any more than a plain, commonplace roof.

All Edwards Metal Roofing is easy to lay—no big expense for skilled labor—storms and winds will not wrench it loose or make it a rattle-trap. It is lightning-proof and fire-proof —Reduces Insurance Rates.

When an Edwards Roof is laid, it is there to stay.



Send for our literature—it explains.

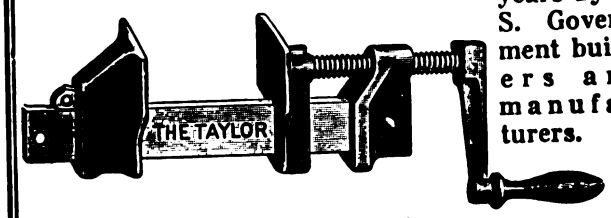
Cardboard Model No. 102

Show Your Customers Models as Well as Plans and They Are Sure to Build

People like to know what their homes are going to look like before they build. Show them models as well as plans and you make easy sales of your contracting or building services.

The plan book, "Small Homes of Character," contains 50 examples of 4-, 5-, 6- and 7-room houses. Plans, specifications and bill of material are available for each house built of frame, brick or stucco. We furnish a cardboard model for each house, scale ½" to the foot, done in colors to show attractive color combinations. The models can be obtained without buying the rest of the service.



Use our plan service to get business and our plans to build from.

Send only $1.00 for the book, "Small Homes of Character," and make a start toward increased business.

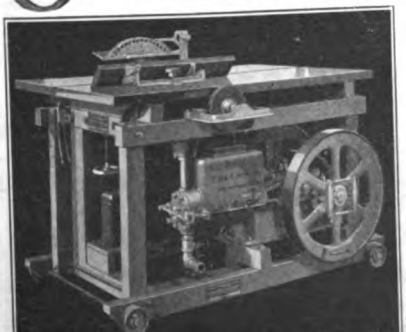
No. 4 SAW

W. F. & John Barnes Co.
71 Rudy St., Rockford, Ill.

Improved Boring Machine



This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

Contractor-Agents Wanted

YOU MAY BE FOLLOWING a trade already or perhaps looking for a new one. Whichever it may be, install Allmetal Weatherstrip and have a real income.

We have a proposition to offer good live men that will put them on the road to success—$5,000 per year income is common among weatherstrip men.

Buildings are well under way now. They will soon be ready for the weatherstrip contractor. Just as soon as you get the new ones equipped, start after the old ones. Owners of old buildings are easy to sell. They are tired of big coal bills, draughty windows, dirty floors, etc.

It costs you nothing to enter the Weatherstrip business. We co-operate with you to land sales.

As for our selling plan

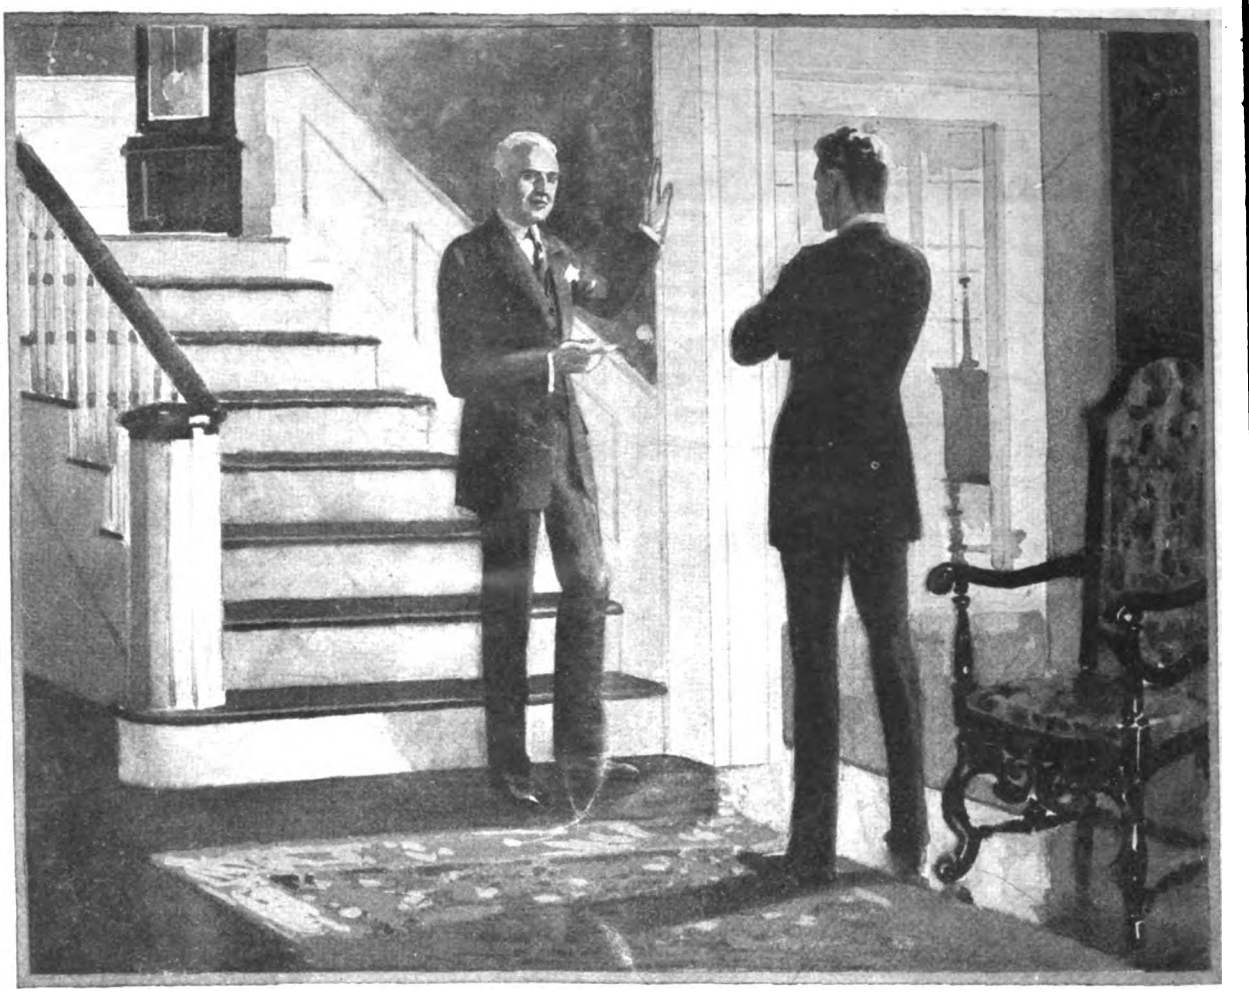
Beautiful Homes of Moderate Cost

A new plan book for the Builder, Contractor, Draughtsman, Lumber Dealer, Realtor, Prospective Home Owner and Building Loan organizations

Published to complete our service to the industry and so priced very nominally—$1.00 the copy, heavy paper cover; $1.50 cloth cover

A NEW book of 100 pages, large size, 9"x12", printed on heavy paper, illustrating the work of architects known nationally for excellence in design of houses of moderate cost—practical, economical. Handsome front cover design, in 3 colors.

The designs include bungalows, one-family and two-family houses; frame, brick, hollow tile, stone, stucco and combination of these materials.



Complete Blue Print Plans, ¼" Scale, and Specifications for each design are available at small cost.

The book also shows Garages, Pergolas, Garden Furniture, Gates and Fences, Kitchen Arrangements, desirable Built-in Features, and articles on Financing, Carrying Charges, Landscaping, Wiring, Furnishing, Decorating, House Building Materials, Roofing, Heating, Plumbing, etc.

"I AM DELIGHTED with Arkansas Soft Pine woodwork—it is the ideal wood for white enamel. We have lived in this home over twenty years and there is not a single sign of discoloration or raised grain in any of the woodwork. Moreover, it cost us just about half the price of other materials often considered as indispensable to a successful white finish."

Arkansas Soft Pine

SATIN-LIKE INTERIOR TRIM

makes a *permanent friend* of every owner, builder and architect who installs it. It is the one moderate priced woodwork of such physical character as assures lasting satisfaction.

Arkansas Soft Pine is the logical woodwork for homes of every size, apartments, offices, and semi-public buildings. See Sweets Catalog and American Architect Manual for specifications, etc.
